in Canada

**Forest Fire**, a moving combustion reaction, spreading outwards in a band from its ignition source. Rates of advance downwind range up to 6 km/h, but few fires spread faster than 1 km/h, and most move at less than 0.5 km/h. Combustible matter includes leaf litter, dead grass, dry moss or lichen, dead and live brush and live tree foliage. Fires are classed mainly according to whether they remain on the ground surface or rise into the tree crowns. In Canada only CONIFER forests support crown fires; no appreciable part of the live tree trunk burns in this type of fire.

On the average about 9200 forest fires occur annually in Canada. Of these, 65% are caused by humans and 35% by LIGHTNING. Lightning fires account for much more damage on the average, because they are generally less accessible: each burns an average of 560 ha (compared to 50 ha for a human-caused fire); of the average 2.0 million ha burned each year (0.5% of the entire forest), 85% is destroyed by lightning fires. Although 85% of all forest fires affect areas of under 5 ha, occasional single fires exceed 100 000 ha and the largest 2% of fires account for 90% of the area burned. During the period 1972 to 1981 the largest area burned in a single year was 5.4 million ha (1981); the smallest, 289 000 ha (1978). Each year about \$250 million is spent in controlling forest fires. About one-fifth of the area burned annually is classified as commercial forest; the remainder is in remote northern areas or in stands which have no current industrial potential. The average annual area harvested is about 800 000 ha.

The amount of damage done by a forest fire depends largely on the related factors of size and intensity. Intensity is best measured as the rate of energy output per unit length of moving fire front, expressed in kilowatts per metre (kW/m). Frontal intensities range up to 150 000 kW/m, with flames 50 m or more high, although a slow-moving surface fire may produce only 200 kW/m, with flames no higher than one metre. The immense variation in the behaviour of forest fires depends on the moisture content of the combustible matter, affected by both current and past WEATHER, current WIND speed and the kind of forest. Similarly, the great variation in burned area (annually and from region to re-

gion within Canada) results primarily from weather variations. Without the efficient and effective action of Canadian fire-control agencies the average burned area would be several times greater. However, when fire weather is critical (strong wind and low humidity after several weeks without rain), it is almost impossible to prevent some fires from becoming very large. A system of forest-fire danger ratings (the Fire Weather Index) is used throughout Canada to measure daily the susceptibility of the forest to fire and to provide fire-control agencies with information on which to base their activities.

Because most forests below 60° N lat are under provincial jurisdiction, fire management is carried out by provincial forestry departments. The Canadian Interagency Forest Fire Centre, established in Winnipeg in 1982, provides information, keeps statistics and co-ordinates inter-provincial exchanges of fire-fighting forces and equipment. The federal government's Atmospheric Environment Service collects and processes daily weather data and provides fire-danger ratings to provincial fire agencies. The Canadian Forestry Service, in co-operation with several universities, carries out most of the research on forest fires in Canada.

Fire detection in Canada is usually by aerial patrols along standard flight patterns; these patrols have superseded the traditional fire tower. Patrols are backed up by lightning-detection systems that pinpoint probable locations and expected numbers of lightning fires. Fire-control methods include aerial water dropping (sometimes with fire-retardant additives), or control from the ground through portable water pumps with hose lines, tank trucks, bulldozers and hand tools. Burning out from a prepared line to stop an oncoming fire is sometimes feasible. Computerized fire-management systems are increasingly improving the efficiency of control operations.

**Fire Ecology and Economics** Fire, along with CLIMATE and SOIL, is one of 3 primary physical factors that have shaped the Canadian forest and have kept it from encroaching on grassland. Most of this forest was historically dependent on ecological recycling by periodic fire for its long-term stable existence. The southeastern hardwood forest and the West Coast coniferous rain forest are exceptions to this pattern. In the boreal forest, for example, the main tree species are black SPRUCE, jack PINE, lodgepole pine, trem-

bling ASPEN and white BIRCH, all of which are adapted to regenerate after fire even though all individuals in a large area are killed. In the pre-industrial era ignition was by lightning, and perhaps 2-3 times as much forest burned annually as does at present. In the absence of either fire or forest management, deterioration would eventually occur, since these species do not reproduce well without disturbance and it is doubtful that a satisfactory fire-free forest of other desirable tree species would arise in its place. Other prominent species, eg, red and white pine, white spruce and DOUGLAS FIR, require ground that has been prepared by fire for optimum regeneration, but some surviving trees are needed to produce seed. ASPEN and POPLAR sucker prolifically from root systems when above-ground trees are killed by fire; other hardwoods sprout from the base of dead trees. Jack and lodgepole pines and black spruce store protected live seeds in their cones for years, only shedding them when the trees are killed. Ecologically then, fire is neither good nor bad, but simply an environmental necessity for the perpetuation of the forest in its natural state.

Economically, fire competes with the forest industry for the annual tree growth on which the industry is based. Some fire-killed timber is salvaged, but salvage is impractical on a large scale. In the ideally managed forest, each stand is regenerated after harvest by silvicultural means, eg, through cultivation and perhaps the use of prescribed fires. Accidental wildfire is excluded. Because it is physically impossible to eliminate all naturally occurring forest fires, an economic compromise is struck. As fire-control efforts are increased, it costs more and more to reduce the average annual burned area. The ideal position is the point at which the cost of further reduction in burned area equals the value of the corresponding potential increase in the harvest (see FOREST ECONOMICS). Other recreational and economic forest uses are also taken into consideration, and the safety of forest towns is a primary concern.

The ecological realities of fire create a dilemma in large natural parks and other unmanaged, or lightly managed, areas because certain kinds of forest cannot be maintained in perpetuity in the absence of fire. The administrators of Canada's national PARKS are aware of this problem and are developing policies to cope with it. The interaction of ecological and economic factors complicates forest-fire management and debate about the optimum level of fire control is actively under discussion throughout Canada. The Canadian Forestry Association and its affiliated provincial forestry associations, as well as provincial forestry departments, maintain fire-prevention programs aimed at reducing the number of human-caused fires. Whatever the policy differences of fire management, the rule "do not start forest fires" remains as valid as ever for the individual citizen.

C.E. VAN WAGNER

Over 9000 forest fires occur in Canada annually, 65% of which are caused by human carelessness and 35% by lightning (courtesy Canapress).

**Forest Harvesting**, the process of cutting TREES and delivering them from the forest to sawmills, pulp mills and other wood-products-processing plants. It includes forest engineering, forest-road construction, logging and log transportation.

Forest engineering is the field of ENGINEERING that specializes in planning forest harvesting (see FORESTRY EDUCATION). A forest engineer working in naturally grown forests must plan and locate permanent roads which meet the long-term goals of forest management and which may later become public-access routes and highways. The logging system best meeting environmental and financial objectives must be chosen; branch-road networks planned; road construction supervised; and logging machines selected. A forest engineer requires knowledge of the prin-

ciples of FORESTRY, SURVEYING, GEOLOGY and SOIL SCIENCE, and familiarity with available machinery. When developing a harvesting plan, the engineer starts with a long-term forest-management plan, usually prepared by government and industrial foresters in consultation with specialists in fish and wildlife habitat, recreation, water and soil quality. This plan shows the timber area to be cut, the proposed rate of cutting and the special requirements of other forest users.

#### Forest-Road Construction

The Canadian forest industry builds approximately 15 000 km of logging roads each year, of which over half are temporary winter snow roads and unsurfaced summer roads. Nevertheless, these roads and associated culverts, bridges and other structures constitute huge engineering and construction projects. Bulldozers are used to build roads over dry, sandy soil. In the flat wetlands of the boreal forest in northern Canada, bulldozers and backhoes are used to build up the road from the soil on a wide right-of-way, creating a dike for the road and a deep ditch on either side.

Roads constructed on the BC coast are very costly because of the difficulty of clearing large trees and blasting solid rock encountered in the mountains. All roads are surfaced because the ground is never dry or frozen for predictable periods. Bulldozers and backhoes usually pioneer the subgrades until they encounter rock and require assistance from rock drills. Roads built on steep ground interrupt natural water-drainage patterns and require carefully constructed culverts and bridges to minimize EROSION.

#### Logging

Cutting methods include progressive clear-cutting, patch cutting and individual tree selection. Progressive clear-cutting is commonly practised in natural, undeveloped forests. It requires the least initial road construction, permits loggers to concentrate their operations and enables foresters systematically to prepare sites and engage in REFORESTATION after cutting. Large cut-over areas are unpopular with the public and cause potential fire hazards. Logging scattered patches requires more initial road construction and exposes the fringes to wind damage. Patch logging is the usual way to cut successive crops from a forest. Individual tree selection is used to thin an immature forest to increase growth and to cut hardwood species which will grow in shade.

The word "logging" may refer to all harvesting operations or may apply only to the stump-to-roadside activities.

**Felling** Hand-held chain-saws are commonly used for felling (or falling) trees. The faller uses an undercut and wedges to control the direction of fall. Felling is dangerous and requires skill, especially if trees are partially rotten or have intertwined branches. Mechanical felling machines mounted on tractors or excavators, which direct or bunch the tree, are used to fell trees up to 80 cm in diameter. Shears are used to cut pulpwood. Mechanical chain-saws, augers and circular saws are used to cut sawlogs where damage to wood from shears is unacceptable. Multi-function tree harvesters are used in stands of small trees (up to 50 cm diameter). They cut, limb and top the trees and move them to the roadside or perform any combination of these functions. These machines are expensive and operate best where large numbers of trees can be cut in one location.

**Skidding** involves dragging logs or trees to the roadside with a horse, wheel skidder or tractor. Horses and farm tractors are used on small private woodlots, but articulated, centre-steering wheel skidders (developed in Canada in the 1950s) have replaced horses on most operations. A faller with a hand-held chain saw and a skid-

der operator often operate as a team: they log "hot," ie, skid each tree soon after it is cut. If mechanical cutters are used, the trees are felled days or weeks before skidding. Trees felled and bunched with a feller buncher are often skidded with a grapple skidder which can pick up the complete bunch. Crawler tractors with bulldozer blades are used for skidding on steep ground where trails are required.

**Yarding** is the dragging of logs from stump to roadside using cables and yarders (winches). The most common methods are high-lead, in which logs are lifted at one end and dragged across the ground, and skyline, in which the log is transported wholly through the air. Normal yarding distances are up to 300 m, but special systems can yard at distances of 500 m and, in some cases, 700 m. Helicopters are used for logging valuable timber from places inaccessible by road or where roads would cause unacceptable damage.

**Slashing** involves cutting the tree into pulpwood bolts, usually 1.25 or 2.5 m long. Roadside slashers are large machines with conveyor systems and circular saws.

**Sorting** Logs are sorted by species and grade so that they can be manufactured into the most valuable products. Sorting takes place at landings, points of transfer from trucks to secondary transportation, or at mills. Front-end loaders, log stackers and cranes are used for sorting. Frequent communication between forest operations and mill is essential to ensure that specific logs go to the correct mill.

#### Log Transportation

Most trees harvested in Canada are transported from the forest by truck. Front-end loaders, cranes and special log loaders are used to load trucks in the landing. Pulpwood is hauled crossways on flat-deck semitrailers, an efficient system which permits hauling of maximum allowable loads. In eastern Canada, tree lengths are also hauled on flat-deck trailers. In BC, where logs are long enough to span the distance between truck and trailer, pole trailers are used.

Logging railways were common in Canada until the 1950s. Because of high track-maintenance costs and the need to have large volumes of timber available to one route, most have been replaced by trucks. Commercial railways are used as secondary transportation for moving logs long-distance over routes already serviced by railways.

Water transport is a common form of secondary log transport on lakes and rivers and on the Pacific coast. Most river drives in eastern Canada have been eliminated because of environmental concerns and log losses through sinkage. On the BC coast, logs are transported by truck to the water and then formed into rafts of log bundles for transport to mills. Bundling logs reduces losses from sinkage and escape. Logs from the Queen Charlotte Is and the W coast of Vancouver I are transported through rough seas on barges and log ships. Water transport is cheap and is the only method of transporting logs from isolated islands or coastal inlets. The forest industry in BC supports a large secondary industry of tugs and barges, which move not only logs but pulp, pulp chips, lumber and other products.

#### Forest Products

Canada's forests produce a variety of commercial products. Higher-grade BIRCH, MAPLE, OAK, DOUGLAS FIR, SITKA SPRUCE and western red CEDAR are manufactured into expensive veneers and finished lumber. White spruce, western HEMLOCK and lodgepole PINE are used for construction lumber; black spruce, jack pine and hemlock are excellent for newsprint. Lower grades of all species are made into pulp. In many parts of the world, fuel wood is the major forest product. In Canada the use of wood as fuel has de-

creased until recently. The ENFOR (energy from the forest) program has stimulated interest in forest waste as a fuel and encouraged the forest industry to produce more of its own energy (see BIOMASS ENERGY). The manufacture and sale of forest products is becoming more integrated, to ensure that each log is cut into the most valuable product. In this way, Canada can conserve its remaining stands of quality trees and ensure that maximum benefits are derived from forests.

G.V. WELBURN

**Forest Ranger** The term ranger probably has its origins in the N American wars of the 18th and 19th centuries, when, because land was heavily forested, armies developed special combat units of woodsmen and marksmen to carry out reconnaissance as well as surprise and diversionary raids. In Canada, similar knowledgeable woodsmen were the fur trappers and COUREURS DE BOIS, who later showed industrialists and government officials the locations of valuable forest stands. Most of these men were capable of withstanding long periods of isolation and had learned from the native people the art of survival in the forest. With the birth of a large-scale FORESTRY industry, supervisors and high-ranking administrators were in many cases drawn from the ranks of self-taught foresters. The need to replace them upon retirement ultimately led, beginning in the 1920s, to the creation in Canada of forest-ranger schools, which provided specialized training, first at the secondary-school level and later at the technical-school level (see FORESTRY EDUCATION). The Maritime Forest Ranger School, NB, is the only such school still using the term forest ranger.

In the US system of national forests, rangers are in charge of administrative units of up to 200 000 ha and manage all renewable resources within the unit. In Canada, as a result of the changing nature and specialization of forestry work, the term has been superseded by more precise designations (eg, forest technician, wildlife manager). Despite the fact that the role and responsibilities of forest rangers or wardens have changed greatly over the years, films and television persist in portraying the ranger as the amiable protector of the forest and its woodland creatures. Young people interested in forestry are encouraged by groups such as the Junior Forest Wardens in western Canada and the 4-H CLUBS in Québec.

MARCEL LORTIE

**Forest Regions** Canada's forest scientists have mapped its great tracts of forest and divided them into 8 regions. A forest region is defined as a major geographic belt or zone characterized by a broad uniformity both in physiography and in the composition of the dominant tree species (see VEGETATION REGIONS). Emphasis is placed on the forest region as an areal entity. The complex effect of CLIMATE and other past and present environmental components have not been taken into account in setting boundaries.

**Boreal Forest Region** Approximately 80% of Canada's forested land is in this immense boreal forest region, which in Canada swings in an arc S from the Mackenzie River Delta and Alaskan border to NE British Columbia, across northern Alberta and Saskatchewan, through Manitoba, Ontario and Québec, terminating in northern Newfoundland on the shores of the Labrador Sea. The northern boreal region consists of open forest with trees growing farther apart and smaller in size as the forest stretches towards the TUNDRA, where only dwarf specimens persist. The southern boreal region presents a denser, closed forest which, at its SW boundary in the Prairie provinces, gives way to a transitional zone dominated by POPLAR. Known as the aspen grove, this part of the forest thins out into open, almost treeless prairie. White and black SPRUCE are the principal species of the predominantly coniferous boreal forest, but other CONIFERS (eg,

balsam FIR, jack pine and, especially, tamarack) also have a wide distribution. There is a general admixture of broad-leaved trees in the region, including white BIRCH, balsam poplar and the wide-ranging trembling ASPEN.

**Great Lakes-St Lawrence Forest Region**, less than one-tenth of the size of the boreal forest, is Canada's second-largest forest region. With the exception of a 322 km gap, where the boreal region touches the N shore of Lk Superior, it stretches from SE Manitoba to the Gaspé Peninsula. It is bordered to the S by the deciduous forest region, and is a transitional forest between the coniferous and broad-leaved regions. Characteristic species are eastern white pine, red pine, eastern HEMLOCK and yellow birch. Sugar and red MAPLES, red oak, basswood and white ELM are also found, as are many boreal species.

**Acadian Forest Region** Closely related to the Great Lakes-St Lawrence Forest Region, this region is confined to NS, PEI and a large portion of NB. Red spruce, balsam fir, yellow birch and sugar maple are commonly found here. Black spruce, white and grey birch, red oak, white elm, black ASH, red maple, trembling aspen and balsam poplar are widely distributed.

**Deciduous Forest Region**, Canada's smallest forest region, borders on the SE shore of Lk Huron and the northern shores of Lakes Erie and Ontario. Despite its small size, this region contains the largest number of native tree species of any region. Along with the broad-leaved trees common to the Great Lakes-St Lawrence Forest Region are found the cucumber tree, tulip tree, black gum, blue ash, sassafras and others which are at the northern limits of their range. Conifers occur only as a scattering of eastern white pine, tamarack, eastern red CEDAR and eastern hemlock.

The remaining forest regions are located almost completely within British Columbia.

**Coast Forest Region** covers the lower slopes of British Columbia's Coastal Mountain Range and extends to the coastal islands. Characteristic species are western hemlock, DOUGLAS FIR, western red cedar and Sitka spruce, all renowned for their value as timber-producing trees. By comparison, the region's broad-leaved trees (eg, black cottonwood, red ALDER, big-leaf maple) have limited distribution and minor economic importance.

**Subalpine Forest Region**, composed of coniferous forests, is situated on the mountain uplands of BC and western Alberta. Characteristic trees are Engelmann spruce, alpine fir and lodgepole pine; occasional species include western LARCH, whitebark pine and limber pine, together with yellow CYPRESS and mountain hemlock on the more westerly ranges. The subalpine region makes an impressive contribution to the scenic splendour of the Canadian CORDILLERA and offers unique features of watershed protection and stream control in high-mountain source areas. Trees at lower elevations are harvested for timber.

**Montane Forest Region** includes British Columbia's central plateau and several valley pockets adjacent to the Alberta boundary, areas which share a prevailing dry climate. The characteristic tree of this region is the blue Douglas fir, a smaller variety of the coast-region type. Lodgepole pine and trembling aspen are generally present and white spruce is found in cooler, shaded, valley locations. In southern parts of the region's more open forest, ponderosa pine is common. Engelmann spruce and alpine fir from the subalpine region, together with western white birch, are important species of this region's northern limits.

**Columbia Forest Region** lies in SE British Columbia between the Rockies and the central plateau and fingers its way through the subalpine region along river valleys and lakes. The forest of this interior wet belt strongly resembles that

of the coast region, although fewer species occur in the interior. Characteristic trees are western red cedar and western hemlock. The blue Douglas fir is widely distributed, and in southern parts western white pine, western larch, grand fir and western VEW are found. Engelmann spruce is found in the upper Fraser Valley and occasionally at higher elevations in the remainder of the region.

C.R. STANTON

**Forestiers et voyageurs**, novel by Joseph-Charles Taché (1863), is a unique blend of fact and fancy. It bridges the folk tale and the episodic novel, humorously recounting the stories and adventures of "le père Michel," a typical Canadian VOYAGEUR. Realistic descriptions of hunting and fishing, with Indians and with seigneurs, develop into the narrative of Michel's escapades further afield, helping the North West Co defeat the Hudson's Bay Co traders. Both locales are nostalgically characterized as the sources of French and aboriginal legends and songs, which form part of the national heritage. Taché's manuscript, containing a wealth of etymological and anthropological lore, was serialized in *Les SOIRÉES CANADIENNES* (1863) and *Le Foyer domestique* (1878-79); it was first published as a book in 1884.

MICHELLE LACOMBE

**Forestry** can be defined as the SCIENCE, art and practice of managing and using for human benefit the natural RESOURCES that occur on and in association with forestlands. The forest resource is of major social and economic importance to Canadians. In 1982 the logging, wood, paper and allied industries of Canada directly employed 260 000 people. An analysis of forest-based communities has established that for each individual employed in the woods and mills, one job is created locally and another elsewhere within the national economy; thus the forestry sector alone generates jobs for over 780 000 workers. Expressed another way, approximately 7.4% of Canada's 1982 work force relied upon the forests for their livelihood. Exports of forest products in 1982 were \$12.1 billion or about 14% of the country's total domestic export values. Forest products' net earnings of \$10.9 billion contributed more to the positive balance of trade of \$16.8 billion than any other major commodity group.

Impressive as the economic contributions of forest products may be, they do not fully reflect the importance of the forest resource and its management. Streamflow, soil erosion, sedimentation, fish and wildlife may all be profoundly influenced, depending on how the resource is managed. Forests remain the home of many of Canada's native peoples and provide a domain for camping, hunting, hiking, angling, photography, nature study and sightseeing for all Canadians and visitors. Such activities generate much of the multi-billion-dollar contribution which the recreation and tourism industry makes to the national economy. Forests provide an additional, although intangible, benefit: the opportunity for renewal of the human spirit.

#### History

Canada's native peoples used forest materials for housing, canoes, etc, and found much of their food in the forest. They drew upon the forest bounty as needed, but because of their relatively small numbers and stone-age tools, their demands upon the resource were limited. The great impetus for the growth of the TIMBER TRADE in eastern Canada came after 1763, as Britain reserved timber in her new colony for naval supplies. By the 1820s, three-quarters of Britain's timber needs were provided by British N America.

Sawmills appeared on Canada's West Coast in 1846. Following the Fraser River GOLD RUSH of the 1850s, many prospectors remained to try logging and were soon joined by veteran lum-

bermen from eastern Canada and the US. Logging in the western forest required different methods than those used in the East because of the profusion of huge trees on rugged terrain. One method employed was hand logging, where trees were simply felled on slopes or near cliffs and then rolled or toppled directly into the sea. In another technique, lines of logs chained together (turns) were skidded from felling sites by large teams of oxen. Oxen were later replaced by horses, which in turn gave way to the steam donkey engine. Soon afterward, steam-driven winches were introduced for moving felled trees by the high-lead and skyline systems. Cables and blocks were attached to spar trees, and logs were either partially dragged along the ground (high-lead system) or totally transported through the air (skyline system) to mills or forwarding points. Logging railways appeared in BC around 1900; by 1917, the year BC became the foremost lumber-producing province in Canada, 62 were operating there. By 1969, however, only 2 logging railways remained; their work had largely been taken over by diesel trucks.

After WWI the eastern lumber industry declined while that of BC expanded to account for over half the country's total output. In the East, readily accessible, merchantable timber supplies had dwindled; costs had risen; and competition with Baltic countries adversely affected trade with Britain. At the same time, US legislation almost closed that market to Canada. From 1933 to WWII, however, a fairly steady improvement took place, as a result of new trade agreements with the US and the establishment of the IMPERIAL PREFERENCE. Britain was again isolated from Baltic suppliers in WWII and Canadian lumber production rose dramatically to meet British and Allied as well as Canadian needs. At the end of hostilities, domestic demand for lumber was high and exports reached record levels. In 1946 lumber production was 12 million m<sup>3</sup>; in 1965, 25.5 million m<sup>3</sup>. Following slight recessions in 1974 and 1975, lumber production reached an all-time high of 46.7 million m<sup>3</sup> in 1979.

A growing demand for paper in the latter half of the 19th century led to experiments which established wood fibre as an effective substitute for rags and straw in papermaking. By 1869 Canada's first chemical pulp mill was in operation near Sherbrooke, Qué, and the 1880s saw the industry expanding in eastern Canada. Wood-pulping operations in BC started in 1909. The output of Canadian PULP AND PAPER INDUSTRIES increased impressively during the first 2 decades of the 20th century, and mills began specializing in producing newsprint, for which Canada was destined to become the world's foremost supplier. Following temporary declines in 1921 and in the early 1930s, the industry made a substantial recovery; by 1939, 100 mills were in operation, 27 making pulp, 24 making paper and 49 producing both. In the first years of WWII wood-pulp production increased markedly. This trend changed as manpower was absorbed by the armed forces and electricity was diverted to manufacture essential war materials. In the postwar era the pulp and paper industry resumed its expansion. By 1961 there were 125 mills shipping goods valued at over \$1.6 billion; by 1970 the mills had increased to 139, shipping \$2.85 billion. Mill numbers increased modestly to 142 in 1982, but the value of shipments more than tripled to \$10.65 billion.

#### Forest Ownership and Administration

Canada's land area (excluding water) is almost 9.2 million km<sup>2</sup>, and of this total about 4.4 million km<sup>2</sup> is forestland. Forest inventories have been completed on 3.4 million km<sup>2</sup>, or about 78% of forestlands. Most Canadian forestland is administered by provincial and federal

governments. Provincial governments are responsible for about 67% of inventoried forestland; the federal government for 27%; private owners for 6%.

The BRITISH NORTH AMERICA ACT of 1867 assigned "The Management and Sale of the Public Lands belonging to the Province and of the Timber and Wood thereon" to the exclusive jurisdiction of each provincial legislature, regardless of when it joined Confederation. However, the federal government continued to administer the forests of Manitoba, Saskatchewan and Alberta and the forty-mile-wide railway belt along the route of the CPR in BC until 1930.

Each province has a forestry agency, usually a branch or service located within a ministry charged with responsibility for natural resources. This agency is normally concerned with a wide range of forestry matters: timber disposal; FOREST-FIRE protection and management; protection against insects and diseases; forest inventory; extension and information services; forest management and silviculture, REFORESTATION and forest research. Forest resources of the YT and the NWT as well as those on federal crown lands (Indian reserves, military bases and national parks) are the responsibility of the federal government. Privately held forestland, 80% of which is located E of Manitoba, is managed by its owners, but provincial governments may subsidize private forest management in some regions and may influence it through taxation policies, protection regulations, etc.

#### Canada's Major Forest Industries

Based on the 5-year period 1978-82, Canada's estimated average annual roundwood cut amounted to 148.6 million m<sup>3</sup>. The 1982 wood harvest reached an estimated 127 million m<sup>3</sup> and the ranking timber-producing provinces of BC, Québec and Ontario were responsible respectively for 44%, 23% and 16% of that total. The timber produced was 91% softwood, 9% hardwood. In 1982 the major forest industries (logging, wood, and paper and allied) employed 260 000 workers, who collectively earned almost \$6.4 billion in salaries and wages. Canada's total forest-products export income for 1982 was over \$12.1 billion: 67% from the US, 7% from Japan, 6% from the UK and the remainder from numerous other trading partners.

In 1982 Canada's logging industry, which produces logs, bolts, pulpwood, pulpwood chips, poles and piling, employed 40 000 people earning a total of \$1 billion. In the same year the industry shipped \$4-billion worth of goods, most of which were processed domestically; exports of raw wood materials amounted to only \$225 million. Japan, the US and the People's Republic of China were Canada's major customers for logs. All pulpwood chips and most pulpwood exported also went to the US and Japan.

The wood industries of Canada include sawmills and planing mills; shingle mills; veneer and plywood mills; sash, door and millwork plants; wooden-box factories; the coffin and casket industry; and miscellaneous wood industries responsible for producing such commodities as particle board, wafer board and cooperage. In 1982 the 97 000 workers employed in these areas earned \$2.1 billion. The value of goods shipped reached \$7.2 billion; exports totalled \$3.6 billion. Lumber accounted for \$2.9 billion of export sales, 66% to the US. Japan, the UK, Saudi Arabia, France, Australia, Algeria and West Germany were also important lumber customers. Exports of shakes and shingles earned \$156 million, with the US accounting for 97% of the market. The US also bought 76% of veneer exports valued at a total value of \$91 million. The main plywood importer was the UK, which took 36% of the \$124-million market; the US ranked next, followed by Belgium-Luxembourg and West Germany.

Loading pine logs near Smithers, BC (photo by Tom W. Parkin/Pathfinder)

The paper and allied industries include pulp and paper mills, asphalt roofing manufacturers, paper box and paper and plastic bag manufacturers, and miscellaneous paper converters producing such items as waxed paper, facial tissue, toilet paper and stationery. In 1982 the 123 000 people engaged in these occupations earned \$3.3 billion. The establishments they worked for shipped goods worth \$14.8 billion and total exports of wood pulp, paper, paperboard and other paper products amounted to \$8.3 billion. The major export items were wood pulp and newsprint, which earned \$3.2 and \$4.1 billion, respectively. The US was Canada's principal customer for each of these commodities, purchasing 52% of the wood pulp and almost 79% of the newsprint. Japan, West Ger-

Forest fire under control in British Columbia (courtesy National Film Board/Photothèque).

many, Italy and the UK also imported substantial quantities of Canadian wood pulp, and the UK, Venezuela, Brazil and West Germany were major customers for newsprint.

No reference to Canada's forest industries would be complete without mention of 2 much smaller forest ventures, the Christmas tree and maple syrup industries. Canada's main Christmas tree species are balsam fir, spruce, Scots pine, lodgepole pine and Douglas fir. Some trees occur naturally and others, particularly Scots pine, are plantation grown. No accurate figures are available for Christmas tree production but it is estimated that approximately 5 million were cut in 1980. Exports for the same year amounted to 2.4 million trees valued at \$14.3 million. Almost half of the exported trees were grown in NS; the balance largely in Québec, NB, Ontario and BC. The US took 96%, the remainder going largely to Caribbean and Caribbean-rim countries.

The 1982 production of maple syrup amounted to 8153 kL. Just over 90% of this volume was tapped in Québec. Ontario was responsible for most of the balance with minor contributions from Nova Scotia and New Brunswick. The gross value of 1982 production was \$25.2 million. Exports for the same year were valued at \$17.7 million and the main buyer was the US, which purchased 93% of this total.

#### Forest Enemies

Canada's forests are constantly threatened by forest fires, INSECT PESTS and PLANT DISEASES. Significant research, management and forest-protection efforts are directed towards mitigating losses. Between 1972 and 1981, an average of 9160 fires burned just over 2 million ha of forest annually; losses of timber, together with real and personal property, averaged \$183 million per year. During the 1982 fire season a total of 8941 fires burned almost 1.7 million ha. Timber and property losses amounted to \$196.6 million and fire-fighting costs reached \$141.6 million, about 32% over budget. In 1982, 65% of forest fires were caused by people; 32% by lightning; the remainder were of unknown origin.

During the 1977-81 period, the average annual loss caused by important forest pests has been estimated at 107.4 million m<sup>3</sup> of wood. This loss, 58% attributable to insects and 42% to diseases, represents a combination of tree mortality and growth reduction. By far the most important of the insect pests is the spruce budworm, followed by aspen defoliators, mountain pine beetle and spruce bark beetle. Decay accounts for just over half of the losses caused by disease; hypoxylon canker and dwarf MISTLETOE are responsible for most of the balance.

#### Forestry Research

The dominant role in forestry research in Canada is assumed by the federal government, through the Canadian Forestry Service (CFS). The CFS, part of Environment Canada, has its headquarters in the National Capital Region. It operates 6 regional forest-research centres across the country and 2 research institutes: the Forest Pest Management Institute at Sault Ste Marie, Ont, and the Petawawa National Forestry Institute at Chalk River, Ont.

Through departments responsible for forestry, the governments of BC, Ontario and Québec support substantial research programs. The remaining provinces generally support smaller programs. Provincial research organizations and industrial research corporations, such as the Centre de Recherche Industrielle du Québec, the Ontario Research Foundation, British Columbia Research, the Pulp and Paper Research Institute of Canada, the Forest Engineering Research Institute of Canada, and FORINTEK Canada Corporation, conduct a wide range of forestry research projects. Major forest-industry companies, along with industrial suppliers, also make

significant contributions, especially in the area of pulp and paper research.

University-based forestry research is closely associated with Canada's 6 professional forestry schools located at the Universities of New Brunswick, Laval, Toronto, Lakehead, Alberta and British Columbia, but considerable work is also accomplished in other university departments and faculties across the country.

### Forest Management

Forest management in Canada is concerned with forest harvesting, site preparation and improvement, forest regeneration, tending and conversion of timber stands, tree improvement, and protection of the forest from fire, insects and diseases. In a broader context, forest management melds the foregoing activities with the country's economic, social and environmental objectives.

From the birth of the square-timber trade to the present, the emphasis in Canada has been on the exploitation of public forests for their timber values. Notwithstanding forest-management commitments to sustained yield in more recent years, the country now finds itself on the threshold of a serious wood shortage. Timber reserves have been reduced to critical levels by a combination of factors, the most important of which has been neglect of forest renewal. Heavier-than-anticipated losses from fire, insects and diseases, coupled with the establishment of parks and wilderness preserves and environmental constraints placed upon timber harvesting, have also contributed to the problem. Only 4 provinces now have uncommitted softwood reserves which, unfortunately, are largely uneconomic to log because of remoteness and other factors. Two provinces appear about in balance; the remaining 4 are in a deficit position. Higher-value hardwood stands in the East have been severely overcut as well, and renewal is virtually nonexistent. More than half the country's hardwood forests consist of poplar species which, for reasons of quality and product suitability, are unattractive commercially.

In light of Canada's economic reliance upon its forest-products industries, the spectre of wood shortages is serious indeed. With substantial increases in world consumption of paper and paperboard, wood-based panels and lumber projected for the period 1980-2000, the urgent need to address the country's timber supply problems becomes even more apparent. Wide-ranging consultations involving departments of the federal government, the provinces, the forest industry, the Canadian Council of Resource and Environment Ministers, the Canadian Forestry Advisory Council, forestry schools and non-government organizations have recently taken place. There has been agreement on findings regarding timber supply, market potential, research and manpower needs, the urgency of forest renewal and the formulation of a new forestry strategy. The key elements of this new approach relate to the application of intensive forest management and improved protection against forest fire, insects and diseases.

Intensive forest management means greater effort in such areas as site preparation, the use of genetically superior planting stock, prompt and effective planting after harvest or natural loss, thinning, fertilization and weed control. Experience suggests that gains of 50-100% in wood volume are possible through application of intensive forest management. Improved protection against fire and pests is believed capable of reducing average annual losses by some 15%. Besides these potential benefits there is a recognized need for a program of timber-stand improvement, and for efforts to rehabilitate some of the inadequately stocked, burned and cutover productive forestland — estimated in 1977 to be close to 30 million ha. Given success in such

Tree planter in the Arrow Forest district near Castlegar, BC (photo by Doug Leighton).

management measures, there is hope of reaching the target harvest level of 210 million m<sup>3</sup> endorsed by the Canadian Council of Resource and Environment Ministers for the year 2000. Achievement of this goal would mean an increase of 65% over the 1982 harvest level.

Canada is necessarily moving out of an era of forest exploitation into one of intensive sustained renewal. Demands on the forestland base have increased to meet such legitimate developments as wilderness areas, parks, urban expansion, highways and reservoirs. However, if Canada, with a finite area of economically productive forestland, is to remain competitive in forest-products production, these demands cannot continue indefinitely and, more importantly, cannot infringe on land regarded as the best available for forest production.

It is possible to manage forestland for such diverse values as recreation, timber, water, forage, wildlife, fisheries and SOIL CONSERVATION, but it is not easy. A complex host of technical factors contribute to the difficulty, but the principal problems arise because people have not yet fully realized that the days of reaping unlimited, wide-ranging benefits are past. Unquestionably, most forestland belongs to the people of Canada, and it is right that their views and desires respecting its use be considered and accommodated to the point where the most desirable mix of economic, social and environmental goals is attained. Such judgements are ultimately the responsibility of Canada's governments. When these judgements are confirmed as essentially fair, wise and practical, forest management in Canada will have become integrated forest-resource management.

C.R. STANTON

Reading: Donald MacKay, *The Lumberjacks* (1978); C.R. Stanton, *Canadian Forestry — The View Beyond the Trees* (1976).

**Forestry Education** concerns training people in the science or art of managing forestlands and their renewable resources to ensure continuous production of forest goods and services. It draws on a number of basic disciplines (eg, BIOLOGY, MATHEMATICS, PHYSICS, CHEMISTRY, GEOLOGY, ECONOMICS) as they apply to such areas as the protection, harvesting, renewal, management and use of the forest and its products. Forestry education has 2 principal objectives: to train students at various levels to apply scientific knowledge to forestry problems and to

make the general public aware of the importance of forests. Depending on the objective, forestry education involves a variety of groups, including universities, specialized schools and associations.

### University Training

**Undergraduate Training** Canada's first efforts in forestry education were devoted to the university training of professionals. University of Toronto established the country's first faculty of forestry in 1907. By 1984 there were forestry programs also at U of New Brunswick, Laval U, UBC, U of A and Lakehead U.

Programs offered in Canadian universities were initially influenced by those in the US, which in turn drew upon European sources.

Objectives of Canadian university forestry programs are tailored to the qualifications needed to practise FORESTRY, labour-market requirements, new concepts such as multiple-use forest management, the growth of knowledge and, more recently, the needs of foreign countries. Initially, forestry schools were professional schools, training specialists.

Since training requirements are becoming increasingly complex and difficult to meet, academic experience has led Canadian forestry schools to abandon monolithic programs and to adopt others which meet the specific interests of students, while providing a common basic training that satisfies the profession. This delicate balance is frequently modified to meet new imperatives of the forest industry.

In the early 1980s in Canada, 400-500 men and women graduated in forestry each year. Under normal conditions, this number would be required to meet the country's various needs, but the recession of 1981-82 has left graduates without jobs. Even in optimum economic conditions the Canadian situation is not comparable to that of several other forested countries. The US, with less forested land than Canada, has 10 times as many university forestry schools and graduates, a fact that reflects the status of forestry in the 2 countries. The continued intensive and multiple-use management in the US cannot, however, be compared with Canadian forestry, with its emphasis on forest harvesting. Many observers suggest that if Canadians wish to continue using their forests to advantage, they must soon change their attitudes toward a resource that, though at first judged inexhaustible, is now beginning to show signs of depletion. The movement toward increasingly intensive management should lead to an increased demand for professional foresters, which the

Canadian university forestry schools should be able to meet, at least until the year 2000.

**Postgraduate Studies** are offered in all 6 Canadian university forestry schools. Nevertheless, despite what could have been a productive experiment, these schools have had trouble achieving their objectives in postgraduate studies. The transformation from professional schools to university faculties concerned with research has proved difficult. The domination of forestry research by the Canadian Forestry Service (CFS) has probably also slowed the growth of university research programs. Some professors, however, have qualified for grants from funding organizations such as the NATURAL SCIENCES AND ENGINEERING RESEARCH COUNCIL (NSERC), or from provincial agencies, eg, the Québec Researcher Training and Co-operative Action Program. In 1981 NSERC created a special program to develop forestry research. Other provincial activities, such as the creation of a forestry research foundation in BC, are being organized. To promote careers in forestry research, the CFS developed a grant program for university forestry schools in the 1960s. However, research positions were rare in the 1970s. Summer employment programs intended to introduce students to research have almost disappeared in the last few years, and candidates interested in careers in research have accepted high-paying jobs in the forest industries. As a consequence of these trends, Canadian universities awarded only a dozen PhDs and about 60 MAs each year during the late 1970s and early 1980s. About 30-40% of graduates are foreign students who return to their own countries upon graduation.

These weaknesses in forestry training are having serious consequences at a time when Canadian forest renewal is beginning. Like the universities, research agencies such as CFS face serious problems in finding trained candidates to carry on the work. The Canadian Forestry Advisory Council indicated that in 1982 the development of postgraduate studies in forestry was the primary concern of forestry education in Canada.

#### Technical Training

For a long time in Canada, there has existed a level of forestry employment the training requirements of which are of a technical, trade or craft nature. These needs were eventually met by the creation of special programs. Apart from attempts made by U of T in 1918 and UBC in the early 1920s, Québec was the first province to establish a FOREST RANGER school (1923).

Today in Canada, about 20 schools, institutions and regional or community colleges offer courses in forestry techniques through 1-, 2- and 3-year programs. Other schools train forest technicians in programs concentrating on particular aspects of forestry, eg, WILDLIFE CONSERVATION AND MANAGEMENT. In the early 1980s, about 800 students graduated annually. In difficult economic times, this number exceeds labour-market demand, but might not meet requirements generated by recovery in Canada's forest sector.

While the content of technical training programs was being refined, programs dealing with forestry practice also became more specialized, particularly in forest operations (eg, training heavy-machinery operators, scalers) and in sawmills (sawyers, wood graders). These courses (usually one year) are part of, or run parallel to, the secondary level of technical training. In most technical programs, theoretical training is supplemented by practical work with commonly used equipment.

The need to improve forest production has resulted in increased demand for silvicultural workers to fill over 20 000 new jobs. This specific need is met, at the moment, by intensive on-site courses, especially for introductory and silviculture training programs which have re-

sulted from government policies concerning private forests. New Brunswick's 1978-82 forest-employment program is a case in point. Programs to train the owners of woodlots are also provided through government advisory services and provincial forestry associations, alone or in conjunction with the Canadian Forestry Association.

MARCEL LORTIE

**Forges Saint-Maurice, Les**, (St Maurice Forges), Canada's first heavy industry. The St Maurice iron-ore deposits near TROIS-RIVIÈRES were developed by the second company endowed with a monopoly grant (25 Mar 1730) and state subsidies, after an earlier company had failed. Iron production began in 1738. Bankruptcy of the company's director, F.E. Cugnet, led to state takeover in 1742, and after the TREATY OF PARIS (1763) ownership passed to the British Crown. The ironworks were then run by lessees, the most important being Matthew Bell in the years 1800-45. The most technically advanced ironworks in America in their first 100 years, the forges had long been obsolete when shut down in 1883. The plant employed over 100 specialized craftsmen and 300-400 labourers, and produced forged iron and moulded products such as pots, pans and stoves. Experiments with steel-making and cannon-founding in 1747 were not fruitful. The work force, originally from the iron-producing regions of Burgundy, developed as a distinctive community, living in Canada's first COMPANY TOWN. In 1973 the St Maurice Forges became a National Historic Park, and archaeological research continues on the site. See IRON AND STEEL.

DALE MIQUELON

**Forget, Sir Joseph-David-Rodolphe**, stockbroker, politician (b at Terrebonne, Canada E 10 Dec 1861; d at Montréal 19 Feb 1919). As a partner in the brokerage firm of his uncle, Louis-Joseph FORGET, Rodolphe Forget became actively involved in the affairs of the Montreal Street Railway Co (later Montreal Tramways), and the Richelieu and Ontario Navigation Co, the Montreal Light Heat and Power Co, Canada Cement and other companies. After the partnership with his uncle was dissolved (1907), he devoted himself to reorganizing the transportation and utility companies in Québec C, and to controversial attempts to sell the securities of the Québec Railway, Light and Power Co in France. Although this company was modelled on Montreal Light, Heat and Power, it was far less successful and Forget had to call on government assistance during WWI. He was chairman of the Montreal Stock Exchange, 1908-11, a Conservative MP, 1904-17, and was created a knight bachelor in 1912.

T.D. REGEHR

**Forget, Louis-Joseph**, stockbroker, politician (b at Terrebonne, Canada E 11 Mar 1853; d at Nice, France 7 Apr 1911). Forget established his own brokerage firm in Montréal in 1873, dealing mainly in transportation and utility company securities. His main business interests included the Richelieu and Ontario Navigation Co, the Montreal Street Railway Co and several Montréal utility companies that were merged to form Montreal Light, Heat and Power Co. In the latter 2 ventures Forget was closely associated with Sir Herbert HOLT. Until 1907 he worked in partnership with his nephew, Joseph-David-Rodolphe FORGET. He was president of the Montreal Stock Exchange, 1895 and 1896, and was appointed to the Senate in 1896.

T.D. REGEHR

**Forillon National Park** (est 1970, 238 km<sup>2</sup>) lies at the outer tip of the GASPÉ peninsula. Wild and beautiful, the PARK is a dramatic product of EROSION. Its coastline is framed by soaring limestone cliffs, pebble beaches and rocks sculptured by the pounding sea. Rugged hills and gorges laced with tumbling streams lie inland. The park is covered mainly by boreal forest, but the limestone cliffs are characterized by tundra species.

Forillon National Park, which preserves the dramatic coastline of the Gaspé Peninsula (courtesy Parks Canada).

Wildlife includes deer, moose, lynx, black bear and red fox. Whales and seals can be seen from coastal cliffs. An estimated 220 bird species visit annually. Some, such as the herring gull, double-crested cormorant and black-legged kittiwake, nest in cliff-side colonies. The area was a traditional summer hunting and fishing ground for the Micmac. Jacques CARTIER explored the region in 1534. French and English settlers arrived 200 years later and harvested cod, herring, mackerel and salmon — fish still abundant in surrounding waters. The park offers opportunities for outdoor recreation.

LILLIAN STEWART

**Forrestall, Thomas De Vany**, painter (b at Middleton, NS 11 Mar 1936). After graduating in 1958 from Mount Allison (where he studied with Alex COLVILLE), Tom Forrestall was assistant curator at the Beaverbrook Art Gallery in Fredericton (1959), but became a full-time painter the following year. His realistic works, often done in egg tempera, convey his ideas of the East Coast landscape and its dwellings. From the early 1960s, Forrestall experimented with panels shaped from triangles to T-forms, each chosen to fit his painterly ideas. He has also painted a large number of out-of-doors watercolours which express much the same ideas as his egg tempera works, but in a more relaxed and joyous mood. His watercolours, in contrast to his more metaphysical and individual canvases, form one long series and deal with a sense of place.

JOAN MURRAY

Reading: P. Duval, *High Realism in Canada* (1974).

**Forrester, Alexander**, clergyman, educator (b in Scot 1804; d at New York C, NY 20 Apr 1869 and buried at Truro, NS). Ordained in the Church of Scotland, Forrester left it in 1843 to help establish the Free Church. In 1848 he immigrated to NS, serving the Free Church in Halifax before being named superintendent of education, and first principal of the Normal School in 1855. Like his predecessor John William DAWSON, he was a strong advocate of compulsory assessment, teacher training and a centralized system of education. Author of *The Object, Benefits and History of Normal Schools* (1855) and *The Teacher's Textbook* (1867), from 1858 to 1860 he edited and published the *Journal of Education*. Many of his proposals were incorporated in the free-school legislation passed by Charles TUPPER's administration in 1864-65. Forrester, an ardent Liberal, was replaced as superintendent, but continued as principal of the Normal School until his death.

WILLIAM B. HAMILTON

**Forrester, Maureen**, contralto, teacher, consultant (b at Montréal 25 July 1930). She first studied piano and then began singing in Montreal church choirs. At 20 she became a student of Bernard Diamant and at age 21 made a successful professional debut with the Montreal Elgar Choir. Assisted by a scholarship from the Ladies' Morning Musical Club and by J.W. MCCONNELL, who undertook to finance the first 2 years of her career, she made debuts with the Montreal Symphony Orchestra, CBC radio and TV, and the Toronto Symphony, and toured Ontario and Qué-

Maureen Forrester, contralto, photographed during a performance of "Dido's Lament" by Purcell for the CBC television series "The Music of Man" (courtesy Canapress).

bec for JEUNESSES MUSICALES. Following her New York Town Hall debut in 1956 she became one of N America's most sought-after contraltos and over subsequent years performed with leading symphony orchestras and appeared in recital throughout N America, Europe, Australia, Israel, Russia, China and Japan. From 1965 to 1974 she sang with Lois MARSHALL in the famous Bach Aria Group. Her operatic career, though successful, has been mostly limited to Canada and the US. Her teaching career included a series of workshops in China, filmed by the National Film Board. A superb musician, Forrester is comfortable in most of the contralto and mezzo literature, particularly the work of German composers, and her darkly rich voice inspired Canadian composer Harry SOMERS to write *Five Songs for Dark Voice* for her. Her appointment in late 1983 as chairman of the Canada Council is an appropriate recognition of her concern for the arts in Canada. In addition to many national and international honours, she was made companion of the Order of Canada in 1967 and received the MOLSON PRIZE in 1971. MABEL H. LAINE

**Forsey, Eugene Alfred**, intellectual, senator (b at Grand Bank, Nfld 29 May 1904). A Rhodes Scholar, Forsey was educated at McGill and Oxford, where he studied philosophy, politics and economics. By the time he became lecturer in the Dept of Economics and Political Science at McGill, his constitutional conservatism and social radicalism were firmly established. He worked for the CANADIAN LABOUR CONGRESS and became well known for his socialist politics; paradoxically, he was also close to Conservative Arthur MEIGHEN, whose views on the KING-BYNG AFFAIR Forsey found compatible. He published one influential study, *The Royal Power of Dissolution of Parliament* (1943), but he is best known for his innumerable debates and acerbic articles and letters on public affairs. He twice ran as a CCF candidate, but he refused to join the New Democratic Party because of its policy of DEUX NATIONS. Appointed to the Senate, Forsey sat as a Liberal 1970-79 but left the party in 1982 after disagreements over constitutional amendments.

ROBERT BOTHWELL

Reading: Eugene Forsey, *Freedom and Order: Collected Essays* (1974).

**Forster, John Wycliffe Lowes**, portrait and landscape painter, writer (b at Norval, Canada W 31 Dec 1850; d at Toronto 24 Apr 1938). In 1869 he began studying portraiture in Toronto. He traveled to England and Europe in 1875 and 1879 and studied painting in Paris. He returned to Toronto to establish a permanent studio in

1883, and over the next few decades he exhibited with the Ontario Soc of Artists, the Royal Canadian Academy, the Art Assn of Montreal and the Canadian National Exhibition Fine Art Dept, as well as internationally at the large exhibitions.

The successor to G.T. BERTHON, Forster was among the most popular academic portraitists in Toronto during the late 19th and early 20th centuries. His sitters included Alexander Graham BELL, Bliss CARMAN, Timothy EATON, and PMs LAURIER, MACDONALD and MACKENZIE, among others. His commissions for the Ontario government included portraits of historical figures, James WOLFE, John Graves SIMCOE, Isaac BROCK and William Lyon MACKENZIE. He is represented in the federal and Ontario parliamentary collections and numerous other public collections. His writings include 2 volumes of autobiography and a survey of early Ontario artists.

ROBERT STACEY

**Forsyth, Lionel Avar**, lawyer, industrialist (b at Mount Benson, NS 1 Aug 1890; d at Montréal 1 Jan 1957). Forsyth graduated from King's College (Windsor, NS) and attended Harvard before joining the BANK OF NOVA SCOTIA in 1913. After 18 months in Havana, Cuba, he became a professor of modern languages at King's. Forsyth taught himself law and was admitted to the NS bar in 1918. In 1926 he left a successful Halifax law practice to join Montgomery, McMichael, Common, Howard and Ker in Montréal. There he developed a large corporate clientele and by 1946 was a director of over 40 companies. In 1950 he became president of Dominion Steel and Coal Corp, which employed one-sixth of Nova Scotia's work force. Forsyth rejuvenated the company, developing an ambitious and successful expansion program and establishing harmonious industrial relations.

CHRISTOPHER G. CURTIS

**Fort Amherst**, on the W shore of Charlottetown Harbour, PEI, built in late 1758 by the British. The site had been known previously as Port La Joie, established 1720 as the capital of the French colony of Île Saint-Jean. During the SEVEN YEARS' WAR British troops captured Port La Joie in mid-Aug 1758 following the surrender of LOUISBOURG. With the end of hostilities Ft Amherst soon fell into disrepair, and in 1768 the garrison was permanently withdrawn to Halifax, the centre of maritime defence. Nonetheless, in 1799 a blockhouse and battery were erected near the site, although the major defence works were at Charlottetown. In 1967 Fort Amherst National Historic Park was created. See HISTORIC SITE.

ROBERT ALLEN

**Fort Battleford** When the settlement of BATTLEFORD, in what is now W-central Saskatchewan, was named the capital of the North-West Territories (1876), the North-West Mounted Police established a post to deal with anticipated native problems. Adjacent to the territorial government complex and a developing townsite, the fort consisted of about 10 buildings, including officers' quarters, a barracks, a storehouse, a workshop and stables. By 1880 a palisade enclosed the buildings in an area 145 by 155 m. During the NORTH-WEST REBELLION in the spring of 1885, the fort became a shelter for white settlers and an operations base for troops, as Métis and native insurgents sacked the Battleford townsite and farmsteads within the region. The post continued as a divisional headquarters and barracks until 1924. In 1951 the site became a national historic park, with many of the buildings restored or reconstructed for public visitation.

MARK RASMUSSEN

Reading: A. McPherson, *The Battlefords: A History* (1967).

**Fort Beauséjour**, on the W bank of the Misquash R near present-day Sackville, NB, built 1751-55 by the French as a counter to nearby

British Ft Lawrence (near Amherst, NS). Ft Beauséjour was in poor condition in June 1755 when an attacking force of Massachusetts volunteers and British regulars laid siege. Within 2 weeks, and after suffering a direct hit on a "bombproof" shelter, French commander Du Pont Duchambon de Vergor capitulated. The British renamed the site Ft Cumberland and strengthened the works. In Nov 1776, during the AMERICAN REVOLUTION, Ft Cumberland, under Lt-Col Joseph Goreham of the Royal Fencible Americans, thwarted an attack by New England colonial rebels. Some repairs were made to the fort at the beginning of the WAR of 1812, and a military presence remained until 1833. In 1926 Fort Beauséjour National Historic Park was established. See HISTORIC SITE.

ROBERT ALLEN

**Fort Chambly**, est 1665 as Fort Saint-Louis by the French CARIGNAN-SALIÈRES REGIMENT on the Richelieu R near modern Chambly, Qué. By 1709 strategic considerations demanded that the site be strengthened, and a stone fort replaced the original wooden structure. Chambly subsequently became a warehouse and supply depot for other forts on the Richelieu. In Sept 1760 the crumbling and weakly defended Chambly surrendered to the British without a shot being fired. Early in the AMERICAN REVOLUTION, Chambly was captured by the colonial rebels, but in June 1776 the British reoccupied it, and for the rest of the conflict Chambly was not threatened. In 1813, during the WAR of 1812, construction of a vast military complex was undertaken. Insufficient maintenance reduced Chambly to a dilapidated condition, and it was abandoned in 1851. Private restoration in 1882-83 preserved the site, which became Fort Chambly National Historic Park in 1921.

ROBERT ALLEN

**Fort Churchill**, see PRINCE OF WALES'S FORT, CHURCHILL.

**Fort Duquesne**, located at the confluence of the Allegheny and Monongahela rivers at the site of present-day Pittsburgh, Pa, was begun by the British in 1753. In Apr 1754 it was captured by the Sieur de Contrecoeur before completion; the French completed construction. In 1755 Gen Edward Braddock and a powerful force were soundly defeated in an attempt to recapture the fort. The British recovered the site in 1758 but the French destroyed the fortifications before withdrawing. The site was renamed Ft Pitt and rebuilt by the British after 1761. It was unsuccessfully attacked by PONTIAC in 1763. See FORTIFICATION.

JAMES MARSH

**Fort Erie**, Ont, Town, pop 24 096 (1981c), inc 1931, located at S entrance to the NIAGARA R, opposite Buffalo, NY. LOYALISTS settled in the area in 1784, followed by German immigrants, but

Peace Bridge across the Niagara R at Fort Erie, Ont, one of the busiest border crossings between Canada and the US (photo © 1984 Hartill Art Associates).

forts had guarded this strategic point since 1764. The village near the British fort of the same name amalgamated with the town of Bridgeburg, a railway centre, and became the town of Fort Erie, in 1931. The town is the site of one of Canada's largest horse-racing tracks; it also includes summer cottages and recreational communities along Lk Erie, eg, Crystal Beach, and is the S entrance to the Niagara R Parkway, as well as the terminus of the Queen Elizabeth Way from Toronto. Two early forts were destroyed by the powerful Niagara R, and the third was partly destroyed by American soldiers in 1814 — the last troops to occupy Canadian soil. Today the Peace Bridge (1927) soars across the river and the town is one of the busiest border crossings between Canada and the US. JOHN N. JACKSON

**Fort Frances, Ont, Town, pop 8906 (1981c), inc 1903,** located at the mouth of the Rainy R where it drains into RAINY LAKE in northwestern Ontario. The river forms the boundary with the US and Fort Frances is linked by a bridge to International Falls, Minn. Located along the traditional canoe route to the western fur country, it was the site of Ft Saint-Charles — the first in a chain of posts constructed (1731) by LA VÉRENDRYE. The NORTH WEST CO built Fort Lac La Pluie here around 1770 and subsequently the HBC also established a post, which was named Fort Frances after the wife of the HBC governor, Sir George SIMPSON. As settlers were attracted to the western plains it became a staging post on the Dawson Road, an artery of lakes, rivers and wagon roads linking Lk Superior to Red R, inaugurated 1870. The turbulent falls at the site attracted milling activity and the town became a centre for sawmilling, and later pulp and paper manufacturing. It is also at the hub of popular fishing and hunting country. DANIEL FRANCIS

**Fort Frances Case (1923)** In 1917, under the WAR MEASURES ACT, the government fixed the price and quantity of newsprint paper produced; subsequent legislation created the Paper Control Tribunal which set retroactive prices through 1919, although wartime conditions had ceased. In *Fort Frances Pulp and Paper Co Ltd v Manitoba Free Press Co Ltd*, the Judicial Committee of the Privy Council ruled that Parliament, because of its authority under the PEACE, ORDER and GOOD GOVERNMENT clause of the Constitution Act, 1867, may adopt a measure such as the War Measures Act and authorize the governor-in-council to enact orders-in-council concerning the control and supply of newsprint. The emergency power may outlive the duration of the conflict which gives rise to it; Parliament may adopt measures which normally would fall within provincial jurisdiction. GÉRALD-A. BEAUDOIN

**Fort Franklin, NWT, Hamlet, pop 521 (1981c),** is located about 10 km NE of the head of the Great Bear R, 544 air km NW of YELLOWKNIFE. Named after Sir John FRANKLIN, the settlement was a trading post for both the NORTH WEST CO and HUDSON'S BAY CO. The local DENE retained a nomadic life-style until about 1950 when the community became more settled with the establishment of a tipi-shaped Catholic mission, a school and store. Today the local residents still subsist mainly on hunting, fishing and trapping. ANNELIES POOL

**Fort Frontenac** was located at the mouth of the Cataraqui R, at the site of present-day KINGS-

Fort Henry's sunken, star-shaped pattern was typical of 19th-century fortifications. It was built during the War of 1812 and rebuilt in 1836 to defend the Rideau Canal (photo by Malak, Ottawa).

TON, Ont. Construction began during negotiations between GOV FRONTENAC and a delegation of Iroquois in July 1673. Ostensibly the fort, initially known as Ft Cataraqui, was meant to provide protection for Ville-Marie (Montréal), but it was intended as much to further fur-trading interests in the Great Lakes and Ohio Valley areas. After the Iroquois assault on Lachine in 1689 GOV DENONVILLE ordered the fort abandoned. When Frontenac returned to New France he revoked the order and the fort continued to serve French interests on Lake Ontario, acting as a counterpoise to the English Ft Oswego across the lake. In 1756, at the beginning of the SEVEN YEARS' WAR, Ft Frontenac was an arsenal and naval base for French forces on the Great Lakes. Reinforced by troops under François-Charles de Bourlamaque and later MONTCALM, it nevertheless fell to the British under John Bradstreet in Aug 1758. See FORTIFICATION. JAMES MARSH

**Fort Good Hope, NWT, UP, pop 463 (1981c),** is situated on the E bank of the MACKENZIE R, 805 air km NW of YELLOWKNIFE. Established by the NORTH WEST CO in 1805, it was the oldest fur-trading post in the lower MACKENZIE Valley. The settlement is known for its picturesque and unusual church, Our Lady of Good Hope, which was decorated with murals by a Catholic priest in 1878. In recent years the settlement has become known as the home of many DENE political leaders. Most of the residents still trap, hunt and fish for their livelihood. ANNELIES POOL

**Fort Henry, Kingston, Ont,** originally built during the WAR OF 1812 on Pt Henry, beside Lk Ontario, to guard the outlet to the St Lawrence R and the Kingston Navy Yards. The strategic importance of the location increased after the completion of the RIDEAU CANAL, which provided a military supply route between Montréal, Bytown (Ottawa) and Kingston; the fortress was rebuilt in 1836, the better to defend the end of the canal most vulnerable to American attack. It was the principal fortress of UPPER CANADA, garrisoned by troops of the British Army until 1870 and then by units of the Canadian Militia until

1890, when the fort was abandoned as a defensive structure. In both world wars it housed PRISONERS OF WAR. During the 1930s it was acquired by the Ontario government, which had it restored as a historic park as part of a Depression works project. Today Old Ft Henry, a major historic attraction in a city that boasts many fine old buildings, houses a museum of military arms and equipment. During the summer the "Fort Henry Guard" demonstrates precision drill manoeuvres. See HISTORIC SITE; FORTIFICATION.

C.J. TAYLOR

**Fort Langley, est 1827** on the Fraser R, 32 km E of Vancouver near present-day LANGLEY, BC, was important in the province's development until the post's abandonment in 1886. Part of a network of trading posts established by the HUDSON'S BAY COMPANY on the Pacific slope, it was initially a FUR-TRADE post, but soon became a provisioning and administrative centre for the company's Columbia District. The old fort was abandoned in 1839 and a new one was built 35 km upstream. After a fire it was rebuilt in May 1840. The fort operated a large farm, initiated fish packing and became a commercial centre for the colony of British Columbia. By the time it became a national HISTORIC SITE in 1923 its buildings were crumbling. But beginning in 1955 several buildings were reconstructed, and Ft Langley is now an important tourist attraction. C.J. TAYLOR

Fort Langley, located on the Fraser R, was first established in 1827. It was declared a national historic site in 1923 (courtesy Parks Canada/Steve Shaw).

**Fort Liard**, NWT, UP, pop 405 (1981c), is located on the S bank of the LIARD R, 544 air km SW of YELLOWKNIFE and about 25 N of the BC border. One of the oldest continuously occupied aboriginal sites in the NWT, the area has been used as a fishing camp by Indian cultures for about 9000 years. As late as 1966, most of the DENE residents still lived the traditional life-style and spent winter months away from the settlement and on the trapline. Today, trapping and hunting are combined with a wage economy. The community was isolated until the opening of the Liard highway in 1983. ANNELIES POOL

**Fort Macleod**, Alta, Town, pop 3139, inc 1892, is located on the Oldman R, 165 km S of CALGARY. In Oct 1874, 150 North-West Mounted Police established the first police post in present-day Alberta on an island in the Oldman R, and named it after Asst Commissioner James F. Macleod. Annual flooding forced the post's move to the present site 10 years later. It was the headquarters of the force 1876-78, a divisional centre to 1919 and thereafter a subdivisonal headquarters. The centre from which the whisky trade was wiped out in the southern plains, Fort Macleod was a judicial seat and the scene of several famous trials, including that of Charcoal, arrested for the murder of an NWMP sergeant. Even as it declined as a police centre, Fort Macleod continued to function as a regional distribution point for a ranching and farming hinterland. Today tourism is a major industry. The Fort Museum (a reconstruction of the original fort) and the heritage buildings located on the main street attract over 60 000 visitors a year. FRITS PANNEKOEK

**Fort McMurray**, Alta, City, pop 31 000 (1981c), inc 1980, is located near the confluence of the Athabasca and Clearwater rivers in northeastern Alberta. A former NWMP post, it was rebuilt in 1870 and named after HBC Factor William McMurray. It functioned primarily as a fur-trade post and transportation centre connecting Edmonton to the Athabasca country. The horse and stern-wheeler were critical to its survival until 1922 when the railway reached Waterways, 12.8 km S. Several fish plants and a salt-extraction industry developed thereafter. During WWII the town was an important base for the Canol project. Fort McMurray is located in the midst of the 78 000 km<sup>2</sup> oil sands, said to contain an estimated 3.9 billion m<sup>3</sup> of recoverable synthetic crude oil. Experimentation in oil recovery and its impact on the town's economy date from the early 20th century. In 1964 the Great Canadian Oil Sands project was given permission to start construction and modern Fort McMurray was born, growing from 1200 people that year to 10 000 a decade later. FRITS PANNEKOEK

**Fort McPherson**, NWT, UP, pop 632 (1981c), is located on the E bank of the Peel R, 1107 air km NW of YELLOWKNIFE. Named for an HBC trader, the settlement has been a Loucheux DENE village since 1852, when Dene moved there because the site commands an excellent view of the MACKENZIE R Delta. It is the home of Chief John Tetlich, who became the first Dene member of the NWT Territorial Council in 1967, and Wally Firth, who was elected in 1972 as the first native

MP. Although the community has now been influenced by the construction of the Dempster Hwy and oil exploration, the Loucheux inhabitants maintained an independent bush life-style well into the 1960s. ANNELIES POOL

**Fort Nelson**, BC, Village, pop 3724 (1981c), inc 1971, is located in the NE corner of BC, 410 km N of FORT ST JOHN. A NORTH WEST CO trading post was established here 1800 (re-established by the HBC 1865). The area has grown rapidly in recent years through new developments in the forest industries and renewed interest in local petroleum and natural-gas resources. Services for the transportation sector are also part of the local economy. Completion of the BC Rail extension from Fort St John in 1971 played a large role in the area's subsequent expansion. ALAN F.J. ARTIBISE

**Fort Norman**, NWT, UP, pop 286 (1981c), is located at the junction of the MACKENZIE R and Great Bear R, 624 air km NW of YELLOWKNIFE. Because of its location at a river junction, the site has always been of seasonal importance to the Slavey DENE. Sir John FRANKLIN used it as a transportation centre for his explorations into the region. A notable feature of the settlement is the Anglican church, built of squared logs in the 1860s. The trapping life of the Dene is now supplemented by employment in the oil industry at nearby NORMAN WELLS. ANNELIES POOL

**Fort Prince of Wales**, see PRINCE OF WALES'S FORT.

**Fort Providence**, NWT, UP, pop 605 (1981c), is located on the NE bank of the MACKENZIE R, 233 air km SW of YELLOWKNIFE. Local Slavey DENE were attracted to this community after a Roman Catholic mission and an HBC trading post were established at the site in the mid-1800s. Prior to 1950, agriculture was an important feature of life, but today the small community is a stop on the Yellowknife highway and the site of a Mackenzie R ferry crossing. The Dene residents still enjoy the traditional hunting and trapping life-style, combined with a wage economy. ANNELIES POOL

**Fort Qu'Appelle**, Sask, Town, pop 1827 (1982), inc 1951, is located 70 km NE of Regina in the scenic Qu'Appelle Valley. Named for the QU'APPELLE R, Fort Qu'Appelle was the hub of several historic trails that traversed the northwest. An Anglican mission was established there in 1854, and 10 years later the HBC erected a provisioning post and district headquarters. The Cree and Saulteaux signed Treaty No 4 at this site in 1874, and a year later a NWMP outpost was established near the present townsite. In 1881 Chief Sitting Bull and a party of Sioux warriors travelled to Fort Qu'Appelle to secure provisions and negotiate with Supt James WALSH. The fort was chosen by General MIDDLETON as a temporary headquarters and base of operations for his troops on the way to Batoche during the NORTH-WEST REBELLION (1885). Though it lost out to Regina in a bid to succeed BATTLEFORD as the territorial capital in 1882, the town has prospered through the exploitation of its considerable recreational potential and benefited from the mixed farming that predominates in the area. GARTH PUGH

**Fort Reliance**, YT, is an abandoned post, established 1874, located on the E bank of the YUKON R, 13 km downstream from Dawson. It remained the centre of the fur trade and mining on the upper Yukon R for more than a decade. In 1886 a gold discovery drew miners to the mouth of the Stewart R, and when a new post was built there, the buildings at Ft Reliance were dismantled and used for fuel on riverboats. Many of the creeks and settlements on the Yukon, such as FORTY MILE, were named for their distance from Ft Reliance. H. GUEST

**Fort Resolution**, NWT, UP, pop 480 (1981c), is located on the S shore of GREAT SLAVE LK, 153 air

km S of YELLOWKNIFE. This community, where trapping still provides the livelihood for the majority of DENE and MÉTIS residents, dates back to the establishment of the North West CO trading post in 1786. The HBC established a post in 1815, and when the companies united in 1821, the post was called Fort Resolution. The community became an important medical and educational centre when the Oblates and Grey Nuns built a large tuberculosis hospital there in 1938-39. When the responsibility for the care of TB patients was transferred to Edmonton in 1956, Fort Resolution began to decline in importance as a regional centre. The traditional hunting-trapping economy of the community was diversified in 1964 with the construction of a local sawmill. Today, many residents are employed in the wage economy provided by nearby Pine Point Mines. ANNELIES POOL

**Fort St John**, BC, City, pop 13 891 (1981c), inc 1975, is located in northeastern BC, about 500 km N of Prince George. In 1793 Alexander MACKENZIE reached a point on the Peace R south of here. A series of forts were established during the fur-trading era, and over the years the community has moved from one side of the river to the other. Towards the end of WWI and into the 1920s, settlers moved westward to the fertile agricultural lands on both sides of the Peace R. Population increased greatly after completion in 1942 of the Alcan Military Road. The discovery of oil S of the city in 1951 attracted more people and turned the town into a BC oil-exploration centre. Fort St John has since become the largest centre in BC north of Prince George, with a trading area population of 26 000. Agriculture, forestry and the oil and gas industry are the basis of the expanding local and regional economy. Taylor, an incorporated community just S of the city, is the site of a refinery, a sulphur plant, natural gas and oil pumping stations, and a large sawmill. The city's facilities include a campus of Northern Lights Community College. ALAN F.J. ARTIBISE

**Fort Selkirk**, YT, is an abandoned settlement located at the confluence of the YUKON R and Pelly R. Formerly Yukon headquarters of the HBC (est 1848 by Robert Campbell), and after 1898 of the Yukon Field Force, it was abandoned permanently after the completion of the Alaska and Klondike highways brought an end to commercial traffic on the Yukon R. H. GUEST

**Fort Simpson**, NWT, Village, pop 980 (1981c), inc 1973, is located on an island at the confluence of the MACKENZIE and LIARD rivers, 378 air km SW of YELLOWKNIFE. The original fort, called Fort of the Forks, was built by the NWC in the early 1800s; in 1821 it was named after HBC governor Sir George SIMPSON. The oldest continuously occupied trading post on the Mackenzie, the community in the late 1960s became a base for oil exploration and a NWT government administration centre. It is the terminus of the NWT highway system. The mixed native-white population is employed in government, the transportation industry or traditional hunting and trapping activities. ANNELIES POOL

**Fort Smith**, NWT, Town, pop 2298 (1981c), inc 1966, is located on the SW bank of the SLAVE R near the Alberta-NWT border, 724 air km N of Edmonton. Situated on the river that was an important link between the Prairies and the MACKENZIE R Valley, the site was a portage route around 3 sets of rapids. The HBC established a trading post here in 1874. The post was named in honour of Donald SMITH, later Lord Strathcona, an HBC governor and member of the first NWT Council. The settlement was affected by the YELLOWKNIFE gold rushes when prospectors rushed through the area. Fort Smith was the first administrative centre in the NWT and served as government headquarters until the territorial capital was established in Yellowknife in 1967. Today the town's residents depend on trapping, tourism and government employment for their livelihood.

ANNELIES POOL

**Fort Steele**, BC, UP, pop 100 (1983e), is located at the junction of Wild Horse Cr and the Kootenay R, 17 km NE of Cranbrook. The Wild Horse gold rush opened the area to settlement in 1863. An estimated \$9 to \$20 million was taken out of creeks in the area. Prospectors found a black stallion, giving rise to the original name "Stud Horse Creek." A second rush for gold in 1884 led to friction between miners and Kootenay Indians. Sam STEELE and the North-West Mounted Police were brought in, and they built the post named Fort Steele. After 1904, when the railway bypassed it to make Cranbrook the region's principal centre, Fort Steele became a ghost town. In the 1960s the province made the town a heritage site and reconstructed it on an 1880s theme. Tourism and some ranching are the area's chief enterprises.

WILLIAM A. SLOAN

**Fort Walsh**, located in the CYPRESS HILLS, 170 km SW of present-day Swift Current, Sask, was an early North-West Mounted Police post constructed in 1875 by men under the command of Insp James WALSH, for whom it was named. It became headquarters of the force in the West in 1878, and until it was dismantled and abandoned (1883), Fort Walsh played a vital role in preparing the Canadian West for peaceful settlement. A bustling frontier town sprang up near the fort. Following the Custer massacre (1876), the Mounted Police centered on Fort Walsh were called upon to mediate with refugee Sioux who had followed Chief SITTING BULL across the US border, thereby creating an inter-

national incident. With the coming of the railway, the signing of treaties and the return of the Sioux to the US in 1881, Fort Walsh was abandoned. In 1942 the RCMP established a remount ranch to breed and raise horses for the force. In 1968 the property was transferred to Parks Canada and became a national historic park.

GARTH PUGH

**Fort William** In 1803 the NORTH WEST COMPANY constructed a new fort at its Lk Superior headquarters, replacing GRAND PORTAGE, which had come under US jurisdiction. At the mouth of the Kaministiquia R some 50 km N of the international boundary, the new depot served until 1821 as the site for the NWC's annual summer rendezvous of Montréal agents and WINTERING PARTNERS, and as its major transshipment point for furs and trade goods. Named in 1807 after NWC chief superintendent William MCGILLIVRAY, Ft William occupied a pivotal place in the company's vast trading network. In 1816-17 Lord SELKIRK occupied Ft William for 10 months as a consequence of the SEVEN OAKS INCIDENT. This occupation, combined with major financial difficulties, led to the NWC merger with the HUDSON'S BAY COMPANY in 1821. With the Montréal transportation system virtually abandoned in favour of the HBC's, Ft William lost its importance in the FUR TRADE. As a post and fishing station of the HBC, it gradually declined until its closure in 1883. In 1902 its last standing structure, the NWC's Stone Store, was demolished to make way for the CPR's expanding grain and freight shipping facilities. The only reminders of Ft William's fur-trade past now at its original site are the local historical society's cairn, unveiled 1916, the Historic Sites and Monuments Board's marker, erected 1981, and neighbouring street signs bearing the names of renowned NWC and HBC fur traders.

Prompted by the community's active interest in Ft William's role as gateway between East and West, and also by the recognized potential of heritage attractions for tourism, the Ontario government decided in 1971 to reconstruct Ft William to the NWC period. Known as Old Fort William, the reconstruction is located in Thunder Bay, Ont, at Point de Meuron, 14 km upriver from the original site. Through its costumed staff, the fort's living historical program depicts the activities of the rendezvous, the annual gathering of Scots traders, French Canadian VOYAGEURS and Indian trappers. It also portrays the fur-trade society and material culture of the early 19th century. Other facilities include an interpretive centre, a resource library, a gift shop, a historic-food outlet and programs for

Fort William was constructed in 1803 to replace the NWC post of Grand Portage. Until 1821 it was the pivotal transshipment point for furs and trade goods. The present reconstruction is located in Thunder Bay, Ont, 14 km upriver from the original site (courtesy Ontario Ministry of Tourism and Recreation).

schools and special-interest groups. See HISTORIC SITE.

JEAN MORRISON

**Fort William Freight Handlers Strike** by 700 nonunionized immigrants occurred 9-16 Aug 1909. Greek and Italian strikers engaged Canadian Pacific Railway police in a protracted gun battle on Aug 12, whereupon Col S.B. STEELE restored order using the local militia and the Royal Canadian Mounted Rifles from Winnipeg. A federal conciliation board granted a satisfactory settlement, but in 1910 the CPR fired its 400 southern European employees. J. MORRISON

**Forteau**, Nfld, Community, pop 520 (1981c), inc 1971, is a fishing and services centre on Forteau B in southern Labrador, 25 km across the Str of Belle Isle from insular Newfoundland. Its name likely derives from the French *fort* ("strong"), referring to the bay's strong winds. A major site of Maritime Archaic Indian, Montagnais and Inuit habitation from 7000 years ago, Forteau was used by BASQUE whalers, and later by French, English and Newfoundland fishermen from the late 1500s. A garrison fort was erected in Baie Forteau 1710, and the bay was a base for the French migratory fishery; after the British were granted Labrador in 1763, Jersey and British merchant firms took over the fishery. In 1857 the Pointe Amour navigational light, the tallest (33 m) in Newfoundland and Labrador, was built, and remains today. A GRENFELL Mission nursing station opened 1909 and a Grenfell boarding school by 1939. The first high school on the Labrador coast opened there in 1964. The modern town, still dependent upon the fishery, services much of the southern coast of Labrador.

**Fortier, Paul-André**, dancer, choreographer (b at Waterville, Qué 29 Apr 1948). A strong, unsettling presence, Fortier emerged from the cradle of Montréal indépendantiste dance, Groupe nouvelle aire, in the mid-1970s. Given the Jean A. Chalmers Award for choreography in 1981, he founded his own company, now Fortier Danse-Création. His 14 choreographies, ranging from *Derrière la porte un mur* (1978) to *Ça ne saigne jamais* (1983), comment on society, using sex and violence as a metaphor for power. His style oscillates between post-modern minimalism and the hard-edged German expressionism of the 1930s. He taught literature and theatre at Granby 1971-75 and dance at Concordia and UQAM 1981-82.

KATI VITA

**Fortification**, a barrier thrown up between a defender and his assailant, its sophistication depending mainly upon the skills of the defender and the weapons available to the assailant, and whether the structure is permanent or a temporary defence. The earliest fortifications probably consisted of felled trees, interlaced thornbushes

Fort Walsh, in the Cypress Hills of SW Saskatchewan, was constructed in 1875 and played a vital role in preparing the West for peaceful settlement (photo by Jim Merrithew).

or stones rolled together. Fortifications of this type were built by the HURON and other Iroquoian groups before the arrival of the Europeans. Among Europeans these primitive forms eventually developed into walls of earth, timber, stone or baked brick. Although the barrier posed by these walls was sometimes increased by setting a ditch below their outer faces, fortification did not progress beyond this rather simple conception until the 16th century. The chief reason for the lack of innovation is that the main agent of assault continued to be infantry, to which a good wall was a formidable barrier, while such infantry-support weapons as the battering ram or machines for throwing stones posed relatively little threat to solid walls. The technological breakthrough of the late 15th century was artillery, and the early modern revolution in fortification was a response to this new threat. Gunpowder first appeared in Europe in the 14th century, but it was not until the 15th century that tubes using it to launch projectiles were effective. From the late 15th century, when several Italian fortresses fell to French artillery, defensive designs changed rapidly.

Early modern fortresses used elements of medieval defences but builders covered them against artillery fire by sinking the complexes into the ground. A deep ditch in front of a low wall remained a barrier to infantry while offering a smaller target to artillery. The earth from the excavation was piled on the outer side of the ditch in a long slope which further reduced the target area of the wall and also slowed charging infantry. Although there were refinements, these were the basic elements of the new fortifications, and the star-shaped designs of the central complex allowed every point of the fortified perimeter to be swept by the defenders' guns.

Both medieval and early modern fortification styles were built in Canada, the choice depending upon whether a place would have to face artillery. Artillery was used only by Europeans, and — because of the cumbersome nature of early guns — the only fortifications built for defence against artillery were normally those near water transportation routes accessible to Europeans. Thus, the PORT-ROYAL habitation built by Champlain in 1605 in Nova Scotia — the earliest European fortification in America N of the Spanish settlements — is but a few connected buildings huddled around a court, presenting solid blank walls on the outside. However, the small complex is embellished with a little walled battery for light guns facing the water. Champlain built a similar structure at Québec in 1608. The choice of style was determined more by location than by the period during which construction took place: simple palisaded strong-points were constructed well into the 19th century in the West, whereas LOUISBOURG, built on Cape Breton I in the second quarter of the 18th century, is the most highly developed example of early modern fortification in N America.

In NEW FRANCE most forts were built on the Lake Champlain-Richelieu R invasion route (see FORT CHAMBLY), although fortified trading posts were built deep in the interior (see FORT DUQUESNE); later, in UPPER CANADA, the focus was on the threatened Niagara frontier (see NIAGARA HISTORIC FRONTIER). Around 1800 the British built high, round stone towers to strengthen the ports of Halifax and Saint John. In the North-West, simple wooden palisades sufficed except at PRINCE OF WALES'S FORT on Hudson Bay and at Upper and Lower Fort Garry on the Red R, where stone walls were built as protection against attack.

The WAR OF 1812 ended in a stalemate, thanks in part to British naval power on the Atlantic and Lake Ontario, and the RUSH-BAGOT AGREEMENT OF 1817 severely limited warships on the Great Lakes and Lake Champlain. Because the

*Rendezvous of the North West Company (1805), engraving by an unknown artist. Fort Kaministiquia (which was renamed Fort William in 1807) was the hub of the NWC's activity. Similar fortified posts were strung out across the Northwest (courtesy Public Archives of Canada).*

US, with a 10-to-one population advantage over British North America, had a greater potential to build ships in the interior, the British government built the RIDEAU CANAL so that gunboats could be rushed from the Atlantic to vital Lake Ontario; and elaborate stone forts in sunken star-shaped patterns were built at Kingston (FORT HENRY) where the Rideau Canal would reach Lake Ontario, at Ile-aux-Noix where the Richelieu R flows out of Lake Champlain, at oft-besieged Québec City (see QUÉBEC CITADEL) and at Halifax, the Royal Navy's N American base.

A technological revolution in warfare in the mid-19th century upset long-established assumptions about the relative strengths of attack and defence. Ironclad enemy steamships, firing conical shells from rifled cannon, might suddenly destroy the Royal Navy in its bases. Britain reacted by overstressing coast defences, first at Portsmouth and Plymouth and then in British North America. When the AMERICAN CIVIL WAR briefly renewed the possibility of war with the US, the British government undertook major new forts in Bermuda and Halifax and at Lévis, opposite Québec City (see MARTELLO TOWERS).

With a half dozen new batteries, Halifax harbour was fortified on a scale to resist the combined fleets of the world. An example shows the rapid evolution of the fort-maker's art. In the early 1860s the lower (and thus more vulnerable) battery on George's I was remodelled to give its rifled, muzzle-loading cannon protection behind iron-shielded, stone portholes in thick earthworks. In the late 1880s York Redoubt's guns were remounted in circular concrete pits to permit all-round fire and placed be-

hind gently sloped parapets designed to deflect, rather than to resist, incoming shells. In the early 1890s Halifax began the changeover to breech-loading guns, and complete rearmament took place 1898-1906 (see HALIFAX CITADEL).

In 1905-06 the Canadian government took over the British fort at Halifax and a similarly defended one at Esquimalt, BC. As the 20th century progressed, the range of artillery batteries became but one element in an integrated harbour-defence system which included mines, submarine nets and aircraft. During WWII Canada built a new system of modern coastal forts at Esquimalt, Prince Rupert, Vancouver, Halifax, Sydney, Saint John and a number of Newfoundland ports. Since WWII self-propelled missiles and atomic warheads have created a technological revolution necessitating another reappraisal of techniques of defence. See ARMAMENTS. G.A. ROTHROCK AND C.S. MACKINNON

**Fortin, Marc-Aurèle**, painter, engraver (b at Ste-Rose, Qué Mar 14 1888; d at Macamic, Qué 2 Mar 1970). Fortin's work, devoted entirely to landscape, demonstrates his love for a rich and bountiful nature. His brush transforms heavy clouds, thick foliage and rising hills into large, free forms, vibrating with colour. Despite studying in the rather conservative setting of the École du Plateau with Ludger LAROSE, the Monument national with Edmond DYONNET (1904-08), and at the Chicago Art Institute (1908-14), he developed a modern view of rural subjects. The Laurentian lowlands, the Montréal suburbs, the Charlevoix region and the Gaspé Peninsula in turn attracted his attention. Only relatively late in life did this solitary painter receive limited recognition: the Jessie Dow Award (Art Assn of Montreal, 1938), associate of the Royal Canadian Academy of Arts (1942) and a retrospective exhibition at the Musée du Québec (1944). Fortin remained unfathomable for most of his contemporaries. His prolific production, constant experimentation with various media and personal vision of nature have established him as a pioneer of modern art in Québec.

Laurier Lacroix

The governor's bastion, Louisbourg. The fortress, built on Cape Breton I in the second quarter of the 18th century, is the most elaborate example of an early modern fortification in N America (courtesy Network/R.K.S. Davies).

**Fortin, Pierre-Étienne**, politician, surgeon, conservationist (b at Verchères, Lower Canada 14 Dec 1823; d at La Prairie, Qué 15 June 1888). After graduating from the Petit Séminaire de Montréal (1841) and McGill Coll (1845), he practised medicine at GROSSE-ÎLE (1847-48). As the first magistrate responsible for protection of fisheries in the Gulf of St Lawrence 1852-67, he initiated early conservation efforts, provided early faunal studies, promoted new marine initiatives, and sought greater rights for Canadian fishermen. He represented Gaspé in the Commons 1867-74 and 1878-87 and in the Québec legislature 1867-78, serving as commissioner of crown lands 1873-74 and Speaker 1875-76. His efforts helped initiate fire protection, forest conservation, the Baie de Chaleur Ry, and portions of telegraph, postal and lighthouse services for the Gaspé. He was appointed to the Senate in 1887.

MARTIN K. McNICHOLL

**Forty Mile, YT**, is an abandoned settlement on the YUKON R. named for its distance from FORT RELIANCE. Gold was discovered in the area, and in 1887 A. Harper and L. McQuesten built a store at the mouth of Forty Mile R. William C. BOMPAS opened an Anglican mission the same year, and a rival store opened 1893. The 2 posts formed the nucleus of a thriving community which served several thousand miners until their exodus to the KLONDIKE in 1896.

H. GUEST

**Forty-ninth Parallel** is the line of latitude that forms the boundary between Canada and the US from LAKE OF THE WOODS to the Str of GEORGIA. The section from Lake of the Woods to the summit of the ROCKY MTS was agreed to in the Convention of 1818 and that from the Rockies to the Str of Georgia in the OREGON TREATY of 1846. As ultimately surveyed and demarcated, the boundary actually consists of several chords drawn between astronomically determined points on the curved parallel. The parallel also forms the first baseline for the Dominion Lands Survey System by which the territory that became the provinces of Manitoba, Saskatchewan and Alberta and some adjacent parts of British Columbia and Ontario was subdivided. It and the baselines every 24 miles (38.6 km) N of it are E-W survey control lines which are run as 6-mile (9.6 km) chords to curved parallels of latitude.

N. L. NICHOLSON

**Forward, Frank Arthur**, engineer, educator, inventor (b at Ottawa 9 Mar 1902; d at Vancouver 6 Aug 1972). Known internationally for his metallurgical-process discoveries, Forward was also a prominent educator and science administrator. Forward taught and conducted research at UBC from 1935 to 1964, serving in WWII as technical director of the War Metals Research Board. In the 1950s he invented and developed a highly successful process for leaching NICKEL and other metals from sulphide ores, an achievement that brought him international recognition and many honours. Director of the Canadian Uranium Research Foundation in the 1960s, Forward was also president of both the Canadian Council of Professional Engineers and the Canadian Institute of Mining and Metallurgy. In 1964 he became the first director of the Science Secretariat of Canada (a Privy Council office) where he helped to formulate a SCIENCE POLICY for Canada.

JOHN LUND

**Fosheim Peninsula**, about 10 230 km<sup>2</sup>, on western ELLESMERE I. is bounded S to NE by Bay Fjord, Eureka Sound, Greely and Cañon fjords. The northwestern part is low and undulating, but low mountain ranges in the E reach 1295 m, dotted with small ice fields and glaciers. Protected on all sides by mountain ranges, the peninsula is relatively sheltered and supports a polar semidesert. Arctic hares are periodically abundant; muskoxen are common, but caribou are scarce. The peninsula was sighted by A.

Greely of the US Army in 1881, but was first explored in 1899 by the expedition led by Otto SVERDRUP, who named it after a member of his party, Ivar Fosheim.

S. C. ZOLTAI

**Fossil** [Lat *fossilis*, "dug up"], trace of an ancient ANIMAL or PLANT preserved in the Earth's crust. PALEONTOLOGY is the modern, scientific study of fossils, but these curious objects have attracted attention since ancient times. Opinions were divided as to whether they were relics of once-living creatures, or were random results of processes without any particular significance. A few original thinkers deduced that not only were they products of ancient life, but that they also recorded the former distribution of land and sea. The Greek scholar Herodotus concluded that the presence of marine shells in the interior of Egypt demonstrated that the area had been inundated in former times. In the 16th century, Leonardo da Vinci not only accepted fossils as relics of former life but also argued, from their presence high in the mountains, that there had been profound changes in the level of the sea. Glimpses of the true meaning of fossils were offered by the 17th-century English physicist Robert Hooke, who suggested that fossils recorded changes in climate and succession of life.

The great breakthrough that established fossils as the chronicles of GEOLOGICAL HISTORY was made independently, early in the 19th century, by William Smith in England and Georges Cuvier and Alexandre Brongniart in France. They discovered that a distinct succession of fossils exists in stratified layers of SEDIMENTARY ROCKS. They also noted that while deposits of the same age carry the same kinds of fossils, rocks of different ages carry different fossils. Study of the succession of fossils in rock layers (biostratigraphy) provides a basis for establishing a history of the Earth. By 1842, the broad divisions of geological time had been defined for Europe and N America, and much detail had been worked out on local sequences of rock formations and their fossil contents.

L. S. RUSSELL

**Fossil Animals** The first ANIMALS were microscopic in size and left no known FOSSIL remains. The oldest animal fossils occur in sediments deposited under shallow equatorial seas over 600 million years ago. Probably less than 100 species are known, most being jellyfish and leaflike, soft corals. These fed on microscopic organisms filtered from seawater, while less abundant, wormlike animals sifted organic debris from soft sediments on the seafloor. The most important fossil sites in the Western Hemisphere, both for their great age and the relatively deepwater environments they represent, are located on the Avalon Peninsula, Nfld.

By 500 million years ago, primitive jointed-legged animals (eg, TRILOBITES) were abundant in the seas, together with small, shelled animals and primitive, noncoralline, reef-forming organisms. The BURGESS SHALE, a UNESCO World Heritage Site in YOHONATIONAL PARK, has yielded superbly preserved fossils of archaic soft-bodied animals, buried in fine-grained mudstones at the base of a tropical algal reef. Approximately 140 species have been identified at this site alone, including antecedents of backbone animals. It is the most diverse fauna known for this time. The nutrient-rich coastal margins of shallow equatorial seas provided a centre of origin for new kinds of marine animals, which usually displaced the more primitive forms toward the ocean basins. Accordingly, about 450 million years ago, the trilobite faunas were displaced by shallow-water communities dominated by primitive corals, lamp shells, sea lilies and straight-shelled MOLLUSCS. Their fossil remains are found in flat-lying marine limestones, shales and sandstones throughout Canada (eg, at Stony Mountain, Man).

An extinction interval occurred approxi-

*Albertella limbata* (Rasetti) fossil was collected from near Bow Lake, Alta. It is 530 million years old.

*Ogygopsis klotzi* (Rominger), 530-million-year-old trilobite moults.

*Olenoides serratus* (Rominger), a fossil collected from rocks about 530 million years old, near Field, BC. This animal was a predator which grasped its prey with the sharp spines on the inside of its powerful walking legs (photos by Brian D. E. Chatterton).

mately 435 million years ago, coinciding with the spread of continental ice sheets over what has become the Sahara Desert, and the withdrawal of shallow seas from the continents. However, representatives of most major groups of marine organisms survived and repopulated the seas. The Hagersville, Ont, site containing large, shallow, marine shellfish is dated at 380 million years old.

A symbiosis between FUNGI and green ALGAE gave rise to the land PLANTS, which spread across fertile deltas and coastal lowlands 400 million years ago. Terrestrial arthropods also appear in the record at this time. About 350 million years ago, a brackish water lagoon near Miguasha, Qué, was the burial site of outstandingly preserved specimens of about 2 dozen species of lungfish and lobe-finned FISHES. Among them are the remains of the oldest known AMPHIBIANS. Another profound extinction of unknown cause occurred shortly thereafter.

By 300 million years ago, the major groups of marine animals were again highly diverse. The oldest, truly terrestrial, backbone animals were lizardlike REPTILES, the skeletons of which are preserved in still-standing hollow tree trunks, buried in sediments now exposed in the sea cliffs near Joggins, NS. These reptiles fed on arthropods, initiating an ecological relationship between the 2 major groups of terrestrial animals which has continued to the present. Backbone animals did not begin to feed directly on land plants until 20 million years later. From this period on, the number of major

groups of terrestrial animals was at least half that of major groups of marine animals. Fossils of primitive, mammallike reptiles estimated to be about 275 million years old are found on ancient semiarid deltas at Charlottetown, PEI.

The greatest recorded mass extinction occurred about 230 million years ago. It has been estimated that 90% of marine animal species disappeared, and major groups were unable to regain their former importance. Land animals were reduced similarly. The extinctions have been linked to the coalescence of continental blocks into a single super-continent, although the brevity of these extinction intervals is seen by some to be incongruent with ponderous continental movements. Marine faunas, hereafter, were characterized by an abundance of molluscs, arthropods and bony fishes; on land, large reptiles close to the ancestry of MAMMALS were replaced by reptiles related to crocodiles. As during other extinctions, small insectivorous, backboned animals did not seem to suffer as greatly as many of their larger relatives. Another, less severe, extinction occurred 195 million years ago. Crocodilelike terrestrial faunas were then replaced by communities dominated by mammals and DINOSAURS. Mammals were small during the period of dinosaurian ascendancy and probably possessed high metabolic rates in relation to their body size. These rates enabled insectivorous mammals to match activity levels sustained by INSECTS as a consequence of their still smaller body size. Primitive BIRDS, descended from small carnivorous dinosaurs, are also presumed to have had high metabolic rates. Conversely, herbivorous dinosaurs became large, in part as a result of economies gained by a relative decrease in the effort required for locomotion and a reduced basal metabolic rate associated with increased body mass. They were energy-efficient browsers of bulk vegetation. The largest and most diverse assemblage of dinosaurs known is represented by skeletons preserved in the badlands of DINOSAUR PROVINCIAL PARK, Alta, another UNESCO World Heritage Site. More than 300 specimens belonging to 31 species have so far been collected. The wealth of fossil materials has served as a basis for studies on dinosaurian ecology of about 75 million years ago.

About 65 million years ago, a mass extinction abruptly eliminated the dinosaurs and an estimated three-quarters of then living species. The extinctions are associated with a chemical anomaly in the sediments of the time which suggests the impact of an asteroid. Marine molluscs, arthropods and bony fishes soon regained and surpassed their former levels of diversity. By 50 million years ago, Earth had ceased to be predominantly a water world, as many vital substances were captured and retained in terrestrial ecosystems. Birds and mammals diversified on land, their generally smaller body sizes favouring the existence of a larger number of species than was the case in dinosaurian faunas. Fossils of early mammals, turtles and crocodiles in warm, broadleaf forests estimated to be about 50 million years old occur on ELLESMERE ISLAND, NWT. In the CYPRESS HILLS, Sask, an abundant and diversified fauna of large, fossil mammals (about 35 million years old) occurs. The ancestors of man appeared in equatorial regions of Africa and Asia about 3 million years ago. In the OLD CROW BASIN, YT, 30 000-year-old fossils of Ice Age mammals and early man are found in unglaciated terrain (see PREHISTORY).

During the past 400 million years, arthropods have dominated land faunas in number of species and individuals, and in the volume of organic material consumed. This domination is now being challenged by one uniquely successful species of backboned animal, *Homo sapiens*, which has acquired a highly complicated brain giving it an enormous selective advantage over other animals.

The fossil record retains an enormous amount of unexplored and interesting information on the evolution of animal life. It can reveal the physical or biological conditions that will produce evolutionary stagnation or evolutionary acceleration. The record will provide the means to measure the progress of trends such as the differentiation of primitive, segmented worms into more complex organisms like butterflies and birds; the development of simple communities dominated by archaic jellyfish into the intricate animate realms of modern coral reefs; and the appearance of similar structures in unrelated animals (eg, the brain in an octopus and an owl). The record will also have important implications for the study of the evolution of animate organisms in extraterrestrial worlds. It will show whether mass extinctions stimulate evolution toward higher levels of animal complexity or the converse. The record of animal life on Earth should provide a framework for projecting its evolution into the next few million years. In a general way, the specialization of animal structures and multiplication of animal species has been stimulated by competition in the struggle for existence. Thus the rate at which the number of animal species increased, over periods of tens of millions of years, has been approximately proportional to the number of species in existence. The total number of species present on Earth, accordingly, tends to grow ever more rapidly. In a similar manner, humanity's most valuable competitive asset, its brain, has evolved according to a pattern that suggests that the rate of increase in brain size is proportional to brain size. This implies that competition between individuals of our species generates the selective pressure in brain evolution, and increase in brain size should continue. A long-term trend toward an increase in the variety and complexity in animal life has been interrupted periodically by shorter intervals marked by severe extinctions. The causes of individual mass extinctions may differ. Man-kind is clearly implicated in the extinctions that began toward the end of the last ICE AGE (10 000 years ago) and which continue today. After earlier mass extinctions, the few surviving organisms soon differentiated into an array of different species, which developed many modifications of the successful ancestral body plan. Perhaps our species is the primitive stem of a new kind of animal, the intellectual qualities of which will differentiate and expand into another array of different and increasingly complex animals in the history of terrestrial life.

DALE A. RUSSELL

**Fossil Plants** Paleobotany is the study of ancient PLANT life using FOSSIL evidence. "Plant" refers to familiar land plants, and also to aquatic plants, MOSSES, LIVERWORTS and ALGAE. Although not plants, FUNGI and bacteria are often included. The first organisms to evolve on Earth resembled bacteria. They consumed organic molecules from which they themselves originated and molecules formed by the combination of carbon dioxide, water and nitrogen, accumulating since oceans first formed. These organisms reproduced rapidly and, over millions of years, devoured all available food. Greater success required the EVOLUTION of plants — organisms capable of manufacturing their food using sunlight and inorganic molecules. The simplest living photosynthesizers are BLUE-GREEN ALGAE, which now live in nearly every environment and, in some aquatic habitats, produce stromatolites — mounds composed of layers of sediment. The earliest signs of life are 3.5-billion-year-old cells in Carbonaceous cherts from western Australia, which resemble modern blue-green algae. Stromatolites 3 billion years old have been found in Africa. The Canadian SHIELD contains stromatolites as old as 2.5 billion years.

On the shores of Lk Superior, near Kakabeka Falls, stromatolites and the microscopic organisms that grew on them 1.9 billion years ago have been preserved in silica; these organisms compare closely with living blue-green algae. Their description, by E.S. Barghoorn and S.A. Tyler in 1965, startled geologists and biologists. Before this, although it had been hypothesized that such ancient organisms existed, it had not been proven. These fossils, the first indisputable evidence that life existed at such an unimaginably distant time, started investigation of Precambrian algae around the world.

Throughout most Precambrian time, Earth was dominated by blue-green algae and bacteria; complex algae and ANIMALS appeared less than 1 billion years ago. Complex life forms appeared so late because of the chemistry of life. Free oxygen (O<sub>2</sub>) is necessary for the aerobic (oxygen-requiring) metabolism common to all living plants and animals (except anaerobic blue-green algae and bacteria). Ancient Earth had no free oxygen, so most modern life forms could not exist. The origin and maintenance of free oxygen on Earth derives from plant photosynthesis. The oxygen produced by early blue-greens quickly reacted with elements (eg, iron, to produce rust). Algae literally had to "rust" Earth for 2 billion years before oxygen began accumulating in the air and oceans. Transition from anaerobic to aerobic conditions occurred near the close of the Precambrian. Evolution then proceeded, fueled by the fires of aerobic metabolism, at a great and seemingly ever-increasing rate. Survival of such ancient organisms as blue-green algae is due to their remarkable adaptability in an ever-changing world, and to the ever-present place in the environment for such small and simple life forms. The fossil record of higher algae is poor, except for lime-secreting red algae and green algae. Since Cambrian time, these algae have been important in the construction and cementation of reefs. The Leduc, Swan Hills and Rainbow Lk reefs of Alberta form natural reservoirs for some of Canada's oil.

Invasion of land by plants from an aquatic environment occurred about 410 million years ago, after the build up of atmospheric oxygen and formation of the ozone layer, shielding Earth from deadly ultraviolet radiation (UV). Water, of prime importance to living things, is easily available to aquatic organisms, but ancestors to land plants had to develop water-conserving features for survival out of water: cuticle, a waterproof waxy coating; roots for absorbing water; a conducting system for water transport; and watertight reproductive bodies. With life possible on land, a vast, new habitat was available to any algal group overcoming the water barrier. Many must have tried; only 2 succeeded, both evolving from green algae: bryophytes (mosses and liverworts); and vascular plants, with internal woody tissue for support and water movement. Since the initial colonization of land in the Silurian, no new groups of land plants have evolved from algae. Competition with pre-existing, increasingly well-adapted groups became too severe. Bryophytes, bound to a life-style and structure that keep them small, are usually fragile, and seldom occur as fossils. Mosses and liverworts first appear in Devonian rocks. Forty-five-million-year-old fossil mosses from BC are very similar to living mosses, suggesting that many species of bryophytes are ancient and evolve very slowly. Vascular plants have been the dominant land vegetation for over 400 million years and have been continually evolving in response to climatic and environmental change. Evolution of new, extinction of old, and survival of well-adapted forms is the recurrent theme.

The earliest vascular plants, rhyniophytes, were small, naked, simply branched herbs with-

out roots or leaves. They gave rise to 2 groups in the early Devonian: zosterophylls, usually covered by soft spines; and trimerophytes, tending to complex branching and a shrubby habit. Well-preserved fossils of all 3 early Devonian groups are found at famous fossil plant locations at Gaspé and Chaleur bays (Qué and NB, respectively) and the Abitibi R near James Bay, Ont. These fossils provide much information about plant structure and evolution. J.W. DAWSON first examined them and recognized their significance. His discovery of these strange, leafless plants was largely ignored; none believed such a world existed. Dawson persevered and is now recognized as the founder of Devonian paleobotany. In the middle to late Devonian, several new groups evolved. Zosterophylls gave rise to plants with leaves which evolved from spines: CLUB MOSSES and giant scale TREES (Lepidodendrales). The trimerophytes left, by far, the greatest number of descendant groups: HORSETAILS, with whorled appendages; FERNS, with compound leaves evolved from large branching systems; and progymnosperms, woody, free-sporing ancestors to SEED PLANTS, which were of 2 types — those with compound, fernlike leaves (seed fern type), and those with simple leaves evolved from small terminal branches (CONIFER type). Progymnosperms developed thick, woody stems and formed the first extensive FORESTS, some preserved at Escuminac Bay and Gaspé, Qué; Ghost R area, Alta; and Hess Mts, YT.

The Mississippian period differed markedly from the Devonian as rising sea levels flooded most of the continent. Few fossil plants are known from this time in Canada. As sea levels fell in the Pennsylvanian, great swamps developed on old seafloors. Sydney and Pictou coalfields, NS, and Minto coalfield, NB, are legacies of these swamps. Pennsylvanian fossils from these coalfields, extensively studied by W.A. Bell, reveal a strange world of scale trees, giant club mosses over 30 m tall, and calamites — giant horsetails 30 m tall. Calamite twigs with star-shaped whorls of leaves are abundant and easily recognized. Cordaites, extinct relatives of conifers, were the only tough, woody plants of the swamps. Ferns and seed ferns, unrelated groups, produced similar types of fernlike foliage; many types of fernlike leaves actually bore seeds.

Plants that grew in dry uplands of the Pennsylvanian were rarely fossilized. True conifers, hardy ferns and seed ferns were evolving in these dry areas. The Permian and Triassic periods brought further lowering of ocean levels, GLACIATION in the Southern Hemisphere, and desert conditions in much of N America. Pennsylvanian swamp plants became extinct and plants adapted to dry conditions flourished. Triassic forests of conifers, cycads and cycadeoids (seed fern descendants with stubby trunks and stiff, feather-shaped, compound leaves), ferns and seed ferns are preserved in coal-bearing rocks of AXEL HEIBERG and ELLESMERE islands. The "Age of Conifers and Cycads" had begun and continued for over 100 million years, paralleling the "Age of Dinosaurs." When ocean levels rose and moisture increased in the Jurassic and Cretaceous, these plants spread to available habitats. Many early Cretaceous fossils are found in western Alberta coalfields (Canmore, Luscar and Grande Cache). In the early Cretaceous, seed ferns became extinct but, before doing so, gave rise to flowering plants. These angiosperms developed advantages over contemporary groups (eg, rapid reproductive cycle), which made them highly efficient plants, well adapted to "weedy" growth. These modifications, including flowers for attraction of insect pollinators, proved advantageous in many habitats. Interaction between plant and pollinator has been a driving force behind diversification of both groups. Some of the earliest known flowering plants

are found in northeastern BC coalfields. These fossils vaguely resemble living angiosperms, but represent archaic, extinct groups. Late Cretaceous floras of the Dawson Creek area of BC, and Milk R, Alta, reveal increasing dominance by angiosperms, but relationships to living groups remain unclear.

At the end of the Cretaceous, the climate cooled, inland seas covering much of western Canada drained, and DINOSAURS became extinct. For the first time, fossil plants took on a modern appearance. Leaves of sycamore, katsura, dawn redwood and maidenhair are common. Although the climate had cooled, forests grew as far N as Ellesmere I. Early Tertiary (Paleocene) fossils are found over much of Alberta (eg, Red Deer R, Lk Wabamun coalfields, Robb to Coal Valley coalfields) and southern Saskatchewan (eg, Eastend to Ravenscrag area, Estevan coalfield). Climate warmed briefly in the early Tertiary (Eocene). Eocene fossils in BC (Princeton, Kamloops, Smithers areas) reveal increasing numbers of modern plant families, with extinct species of birch, maple, beech, willow, pine and fir. Climate began cooling again in the middle Tertiary, culminating in the glaciation of Canada 2 million years ago. Miocene peat beds on Banks and Meighen islands, containing spruce, birch, walnut, pine and larch, represent some of the last high arctic forests. Late Tertiary fossil plants are uncommon in Canada. The most recent ice advance ended about 10 000 years ago. Tertiary cooling and glaciation eliminated the old northern forests from Canada. Many plants found refuge in southeastern N America and China, where their descendants still live. Floras in these 2 areas are similar even today. Most modern Canadian plants are recent migrants from unglaciated areas and are very different from those of previous ages. The modern world is only the most recent chapter in the long and fascinating history of life. It is fortunate that the rocks of Canada preserve, often in exquisite detail, such a significant part of this history. See GEOLOGICAL HISTORY.

JAMES BASINGER

**Foster, Sir George Eulas**, politician (b in Carleton County, NB 3 Sept 1847; d at Ottawa 30 Dec 1931). Educated at UNB, he became professor of classics there, 1873. Elected to the Commons as member for Kings in 1882, he was appointed minister of marine and fisheries (1885) in the MACDONALD government. In 1888 he took over finance, a portfolio he kept through the succeeding prime ministerships of ABBOTT, THOMPSON, BOWELL and TUPPER. A leading member of the Conservative Opposition, he joined the BORDEN government as minister of trade and commerce, 1911. He was a Canadian delegate to the 1919 peace conference and was appointed to the Senate in 1921. Foster was intelligent, able and hardworking. Borden also found him remarkable for lack of tact, for having an incredibly messy office — where Cabinet papers could disappear — and a penchant for extending his jurisdiction in every direction. Though never greatly loved, Foster was respected for his rigorous administrative abilities. P.B. WAITE

**Foster, Harold**, artist, author (b at Halifax 16 Aug 1892; d at Spring Hill, Fla 28 July 1982). Father of the adventure comic strip, Foster crossed Halifax harbour on a 12-foot (3.6 m) raft at age 8, skippered a 30-foot (9 m) sloop at 12, and after moving to Winnipeg helped support his family by hunting and fishing. He discovered a million-dollar gold lode near Rice Lk, Sask, and when he lost it to "claim jumpers" he bicycled 1600 kilometres to Chicago, Ill, for formal art training. He twice revolutionized newspaper comics. His *Tarzan* (1929-37) introduced adventure and realistic artistry, and in 1937 he created *Prince Valiant*, an original "illustrated historical novel" with complex, realistic characters, plotting and a literate text. Foster wrote and

illustrated *Prince Valiant* for 42 years. His work, based on visits to the locales used and on research into medieval life, has been praised by both historians and teachers. GERALD J. RUBIO

**Foster, John Stuart**, physicist (b at Clarence, NS 30 May 1890; d at Berkeley, Calif 9 Sept 1964). After receiving a doctorate from Yale, Foster was appointed assistant professor of physics at McGill in 1924. A specialist in experimental spectroscopy, he made important contributions to the study of the "Stark effect" (the effect of an electric field applied to an atom), which played a critical role in the transformation of modern physics. Elected a fellow of the RSC in 1929, he received the Levy Medal of the Franklin Institute in 1930 and in 1935 was elected to the Royal Society of London. During WWII Foster was liaison officer for the NATIONAL RESEARCH COUNCIL at the Radiation Laboratory of MIT, centre of the US effort in radar development. His most important contribution to the war effort was a rapid scanner now known as the Foster scanner. He returned to McGill in 1944, and worked on constructing a proton accelerator, completed in 1949. In 1964 his laboratory, which had trained almost 80 nuclear physicists, was named after him. YVES GINGRAS

**Foster, Walter Edward**, businessman, politician, premier of NB (b at St Martins, NB 9 Apr 1873; d at Saint John 14 Nov 1947). Chosen Liberal Opposition leader in 1916 and premier following the Liberal victory in 1917 he sat for Victoria in 1917 and Saint John City in 1920. An advocate of Maritime Rights, his government established the Dept of Health 1918, enfranchised women (1918) and created the NB Electric Power Commission 1920. Owing to personal financial problems, he resigned in 1923. He was named secretary of state in 1925 but was defeated in a federal election that year. Appointed to the Senate in 1928, Foster acted as Speaker, 1936-40. DELLA M.M. STANLEY

**Foster, William Alexander**, barrister, essayist (b at Toronto 16 July 1840; d there 1 Nov 1888). He was a leading spokesman for a Toronto-centered group of intellectuals and public men who, in the wake of Confederation (1867), came to believe that without a unifying sense of purpose Canadian nationhood would succumb to American hostility, British indifference, racial animosity and political partisanship. In *Canada First* (1871) he described a Canadian national identity forged out of the process of nation-building, particularly Canadians' continuing confrontation with an inhospitable northern environment. Pride in their accomplishments and a belief in their destiny would give Canadians a sense of purpose before the forces of national disunity and dismemberment. In the wake of the PACIFIC SCANDAL, Foster and his friends launched the Canadian National Assn and the CANADA FIRST Party in 1874. They intended to enter politics on a platform of pure administration, political reform, protective tariffs and patriotism, but failed to nominate or elect a single candidate. DAVID GAGAN

**Foulis, Robert**, civil engineer (b at Glasgow, Scot 5 May 1796; d at Saint John 26 Jan 1866). Foulis studied medicine, engineering and painting in Glasgow and Edinburgh. In 1818 he was painting in Halifax and in 1821 moved to Saint John. He installed the machinery in the second and third steamers to ply the Saint John R, established the Saint John Foundry, lectured in chemistry, established a "School of Arts" and was a founding member of the Mechanic's Inst. He presented his plan for a steam fog whistle to the Lighthouse Commissioners in 1853. A steam alarm was installed on Partridge I in 1860 but not until a government report recognized Foulis's earlier contribution did he gain recognition as inventor of the world's first steam-

operated fog alarm. He also invented a "Tide Machine" designed to harness the tides of the Bay of Fundy, an "Amphocratic Steam Engine" for use in sawmills, an "Illuminating Gas Apparatus" for making coal and water gas, and a method of telegraphing by means of steam whistles.

HAROLD E. WRIGHT

**Foulkes, Charles**, army officer (b at Stockton-on-Tees, Eng 3 Jan 1903; d at Ottawa 12 Sept 1969). Educated in London, Ont, Foulkes joined the Canadian Army in 1926, commanding the 2nd Canadian Infantry Division in Normandy before taking over the 1st Canadian Corps in Italy (Nov 1944) and then Northwest Europe (Feb 1945). He accepted the surrender of German forces in Holland in May 1945 and returned to Canada as chief of the general staff. In 1951 he was appointed chairman of the chiefs of staff. An advocate of close military ties with the US, he resigned in 1960 in opposition to the non-nuclear policies of the Diefenbaker government. He taught strategic studies at Carleton (1968-69).

STEPHEN HARRIS

**Foundations** are "non-governmental, non-profit organizations with funds (usually from a single source, either an individual, a family, or a corporation) and program managed by (their) own trustees or directors, established to maintain or aid social, educational, charitable, religious, or other activities serving the common welfare primarily through the making of grants" (F. Emerson Andrews, first president, The Foundation Centre, NY).

The development of charitable foundations in N America has been a phenomenon of the 20th century. Unlike the US, however, it is only in the past 20 years that foundations have assumed a major role in Canadian philanthropy. A study by The Canadian Centre for Philanthropy in 1982 suggests that only about 2% of Canadian foundations existed prior to 1940. In the following decade another 5% were founded, followed by 17% in the 1950s, 29% in the 1960s and 47% in the 1970s. Figures for the 1980s are not available, but new foundations are being established.

Reflecting the minor role of foundations in Canadian society, prior to 1977 the rules governing the establishment and donations practices of foundations were extremely relaxed: a foundation had only to be registered with the Dept of National Revenue if it wished to issue income tax receipts for donations received. In that year, however, major legislation was enacted governing the establishment of foundations and their disbursement practices. The new rules required that all foundations be registered with Revenue Canada to obtain tax-exempt status and that substantial minimum disbursement levels be met on an annual basis. Foundations were required to register as "private" (established by an individual or family) or "public" (where a fixed proportion of board members are not related and funds are from more than one source) foundations, and the actual disbursement requirements depended on that classification.

Most foundations found these rules to be equitable, but the federal government apparently perceived that they were open to abuse. The budget proposals of 12 Nov 1981 indicated an intention to effect drastic increases in disbursement requirements that would have eroded foundations' capital so as to effect their eventual disappearance. Following vigorous representations from all sectors of the philanthropic community, these proposals were modified in a release from the minister of finance dated 21 Apr 1982. An accompanying statement indicating the government's support for the idea of foundations should once again ensure growth in this sector.

**Role and Responsibilities** Foundations occupy a unique place in Canadian philanthropy.

Unlike most other granting sources, their incomes are generally constant, sometimes even greater every year. They have relative freedom from outside pressures, which gives them continuity and stability and offers opportunities to provide "venture capital" for innovative programs or support to new or unpopular causes. Generally, however, their support is given to traditional activities. Foundations have played an important role in the maintenance of a pluralistic Canadian society — historically a healthy and productive balance between government measures and private philanthropy. As their role in Canadian society expands, foundations are finding it necessary to assume new responsibilities, including a high level of public accountability, the provision of expert or technical advice to charitable organizations, and as "lead" donors for major charitable campaigns.

**Facts About Canadian Foundations** There are little more than 700 foundations in Canada, compared to over 22 500 in the US, yet the relative impact on philanthropy is greater for Canadian organizations. In Canada it is estimated that foundations account for 8.2% of all charitable giving; in the US they are responsible for only 4.9%. Total assets held by Canadian foundations now exceed \$1.2 billion, and from that base in 1980 grants of more than \$110 million were made. They ranged in size from hundreds of thousands of dollars to a single dollar provided for a subsidized rent, charged for the premises in which an Edmonton group runs a shelter for battered women and children. Canada's top 50 foundations now hold 88% of foundation assets and make 74% of all grants.

Canada's Largest Foundations

<sup>1</sup> Combined with the Griffith Foundation

<sup>2</sup> The foundation received most of its funding during 1980

**Regional Analysis** Although western Canada has 27.74% of Canada's foundations, Saskatchewan and Manitoba are seriously underrepresented with 0.40% and 3.3%, respectively. Québec with 26.2% lags behind Ontario with 44.68%. NS has 0.98%, NB has 0.40%, and PEI and Newfoundland have none at all. Since many foundations restrict their giving to their own province or regions, the most economically disadvantaged regions of Canada are also those with the least access to foundation support.

**Foundation Interests** Because of the lack of commitment to research on the part of both governments and business in Canada, a multitude of research areas are funded by foundations: aeronautical, agricultural, applied scientific, auditing, behavioural science, biological, communications, education, energy, environment, epidemiology, industrial society, medical research, social science, theological and transportation. Grants are also made to the arts, educational, health and religious institutions, and to social welfare (see EDUCATIONAL FOUNDATIONS).

**Types of Foundations** Canadian foundations fall into 4 principal categories. *Family Foundations* Most Canadian foundations have been established by an individual, a family or related group of people: 44 of the country's 50 largest foundations are family foundations, the typical "private" foundation. These foundations are usually established to support causes of interest to the original donor or donors and, even after their deaths, family foundation boards are likely to maintain the general direction established by the founders. *Community Foundations* The funds of community foundations come, most commonly, from bequests of the citizens of the community. These "public" foundations, having a broad, representative board of directors, can provide a continuing source of funds that can be used for innovative or preventive programs within a community that cannot be funded by governments or annual campaigns. In the words of Alan G. Howison, executive director of the Winnipeg Foundation, "the main funders in the social welfare scheme, government and The United Way, have their plates so full of 'have to do' projects that there is little money left for prevention." *Corporate Foundations* Although they provide an excellent opportunity for stabilizing corporate donations programs, corporate foundations have not been widely used by Canadian companies. Through the foundation mechanism a reserve can be built up in good years so that a consistent donations program can be maintained during economic downturns. In 1980 Canadian corporate foundations listed only \$7 million in assets and grants totaled just over \$3 million. These figures suggest that corporate foundations are used primarily as a management tool for centralizing the corporate donations program. Recent tax measures may encourage growth of Canadian corporate foundations to match that of the US, where they are the fastest growing members of the foundation sector. *Special-interest Foundations* are those whose assets have been acquired from a variety of sources, usually for quite specific purposes. The Physicians' Services Incorporated Foundation, founded with money from a private medical insurance plan that was superseded by government, is an example. Another, and growing, example is the hospital foundation, of which there are close to 100 in Ontario alone. Five of Canada's top 50 foundations fall in the special-interest category and together they hold assets in excess of \$171 million.

ALLAN ARLETT

Reading: Allan Arlett, ed, *The Canadian Directory to Foundations and Granting Agencies* (1982).

**Four Seasons Hotels Ltd**, with head offices in Toronto, owns and manages hotels and properties. Incorporated in 1968, the company owned

and operated Toronto's Inn on the Park hotel. In 1969 the Four Seasons Israel opened and the company launched a joint venture with Sheraton Hotels to open the Four Seasons Sheraton in Toronto. Further international expansion began in 1970 when Four Seasons opened the Inn on the Park in London, Eng; today the company also has interests in the US. In 1983 it had sales or operating revenue of \$306.7 million (ranking 205th in Canada), assets of \$143.7 million (as of 31 Dec 1981) and 8000 employees. Four Seasons Holdings Ltd holds 100% of the shares.

DEBORAH C. SAWYER

**4-H Clubs** The 4-H movement began in the US at the turn of the century; the first similar club in Canada was organized in Roland, Man, in 1913, and the concept quickly swept through the settled agricultural regions of the country. As the movement spread across Canada, national agencies (eg, the railways, the federal Department of Agriculture) became involved, helping, for example, to sponsor a national judging competition in connection with the Royal Winter Fair in Toronto. By 1930 the need for a national organization to help sponsor and co-ordinate the program across Canada became apparent, and in Jan 1931 the Canadian Council on Boys and Girls Clubs was organized. In Canada the name "Boys and Girls Clubs" was used until 1952 when the name 4-H, used in the US and many other countries, was adopted. The Canada 4-H Council combines private and government efforts and resources and offers a forum for national discussion and exchange of information as well as many national programs for 4-H members and their leaders.

The stated purpose of the early Boys and Girls clubs was to provide rural young people with the opportunity to learn farming and home-making skills. The 4-H program now emphasizes all aspects of the mental, emotional, social and physical growth of its members. The motto "Learn to Do by Doing" is the basis of all 4-H activities. Members are responsible for developing and executing projects as varied as raising a calf, sewing a dress or learning photography. By helping members acquire a positive attitude toward learning, 4-H helps them increase their knowledge and develop skills that are valuable personally, economically and socially.

Agricultural Extension Services (see AGRICULTURAL EDUCATION) have traditionally provided organizational leadership, while encouraging members actually to run their clubs. Volunteer leaders are vital to the success of the 4-H program. In Canada about 17 000 volunteers provide guidance to the approximately 70 000 club members between the ages of 9 and 19 who regularly recite the 4-H pledge: "I pledge my Head to clearer thinking, my Heart to greater loyalty, my Hands to larger service, and my Health to better living, for my Club, my Community, and my Country." HELGI H. AUSTMAN

**Fowke, Edith Margaret**, née Fulton, folklorist, collector, writer, teacher (b at Lumsden, Sask 30 Apr 1913). After receiving an MA from U of Sask, Fowke moved to Toronto and became interested in Ontario FOLKLORE, collecting and recording on her field trips throughout the southern part of the province many of the folk songs she presented weekly on CBC "Folk Song Time" (1950-63), "Folk Sounds" (1963-74), "Folklore and Folk Music" (1965) and "The Travelling Folk of the British Isles" (1967). In 1971 she began teaching folklore at York U. An avid collector of folk song recordings and prolific writer on Canadian FOLK MUSIC, Fowke was a founding member of the Canadian Folk Music Society, becoming editor of the *Canadian Folk Music Journal* in 1973.

MABEL H. LAINE

**Fowke, Vernon Clifford**, economic historian, professor (b at Parry Sound, Ont 5 May 1907; d at

San Francisco, Calif 24 Feb 1966). He graduated from U Sask in 1929, and immediately joined the teaching staff. He continued his graduate studies at U of Chicago and U of Washington, where he received his PhD in 1942. His doctoral thesis, published as *Canadian Agricultural Policy* (1946), remains a key study and established him as the most influential historian of Canadian agriculture. It was supplemented by *The National Policy and the Wheat Economy* (1957) and (with George BRITNELL) *Canadian Agriculture in War and Peace* (1962) and numerous articles. Fowke also advised numerous royal commissions including the Rowell-Sirois Royal Commission on DOMINION-PROVINCIAL RELATIONS and, after 1946, served on the Transportation Advisory Board, where he played a key role in defending the CROW'S NEST PASS AGREEMENT.

One of the most influential Canadian economists of his day, he was elected a member of the Royal Soc of Canada in 1954, an honorary life member of the Canadian Assn of University Professors and first Britnell Professor of Economics at U Sask in 1962.

PAUL PHILLIPS

**Fowler, Daniel**, painter (b at Champion Hill, Eng 10 Feb 1810; d at Amherst I, Ont 14 Sept 1894). He studied 1831-34 with painter and lithographer J.D. Harding, then spent a year in Europe sketching and painting. In 1843 he came to Canada for health reasons, bought a farm on Amherst I, and did not return to painting until 1857. The slightly mannered style of his Euro-

pean period gave way to an original and lively approach as he worked directly from nature, painting flowers, dead birds and landscapes. He was unique in Canada at that time in exploring broken brushwork, the spatial composition and structure associated with the French impressionists and Cézanne.

FRANCES K. SMITH

**Fowler, Robert MacLaren**, lawyer, executive (b at Peterborough, Ont 7 Dec 1906; d at Hawkesbury, Ont 13 July 1980). Fowler played many roles but was best known for chairing a royal commission and a federal committee on broadcasting. He attended U of T and Osgoode Hall, and built a career as president of the Canadian Pulp and Paper Assn. A friend of Liberal politicians and bureaucrats, Fowler was named to head the Royal Commission on BROADCASTING of 1956. His report the next year strongly supported the CBC but called for a new regulatory authority to administer public and private broadcasting. The Conservative Diefenbaker government did not accept all the recommendations, and in 1965 Fowler headed a new investigative committee. Widely reported was his comment that in broadcasting all that matters is program content; all the rest is housekeeping. Fowler again recommended changes to the regulatory authority, and this led eventually to the creation of the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION. J.L. GRANATSTEIN

**Fox**, small, carnivorous MAMMAL of the dog family. Four species inhabit Canada: red or coloured, grey, arctic and swift foxes (*Vulpes vulpes*, *Urocyon cinereoargenteus*, *Alopex lagopus*, *V. velox*, respectively). Red and arctic foxes have circum-

The red fox (*Vulpes vulpes*) is common in farming and wooded areas across Canada, from the US border to the tundra (photo by Stephen J. Krasemann/DRK Photo).

polar distribution; grey foxes are New World foxes; swift foxes are common in the US. Red foxes are largest (2.5-6.5 kg) and may be reddish with a "cross" on the back or, rarely, black or may have silver-tipped hairs. Feet and ear tips are black; tail tip, white. Common in farming and wooded areas, they extend from the US border to the tundra in all provinces, but are absent from coastal BC and southern Alberta-Saskatchewan. They eat rodents, insects, frogs, seeds, fruit, eggs and some poultry. They breed in Jan-Feb; usually 4-5 cubs (1-10) are born 52-54 days later in a den or earth. Both parents feed them. They become independent at about 6 months and breed in their second year. Arctic foxes are smaller, with rounded ears and heavy, white winter fur and dark brownish summer fur. They are normally restricted to the tundra and northern coasts. Diet is similar to that of red foxes, and they scavenge other carnivore kills. Mating is in Feb, with 5-6 (maximum 14) cubs born 50-57 days later. Red and arctic foxes were farmed for their pelts, but artificial furs have destroyed the market. Grey foxes, similar in food habits and size to red foxes, are slimmer, with slightly rounded ears, a black back stripe and speckled, grey sides. Undersides are off-white; neck, back of ears and legs are yellowish buff. They are found in southernmost Manitoba, Ontario and Québec. They prefer wooded or broken country, live in hollow logs or overhangs, often climb trees, enjoy sunning themselves, and are not strictly nocturnal. Mating is in Feb-Mar with litters averaging 4 cubs (1-7), born about 63 days later. Young become independent in autumn and breed the following season. Swift fox, the smallest Canadian fox, may be a subspecies of kit fox (*V. macrotis*). It occurred from southern Alberta to SW Manitoba, but is now considered extinct. A program to reintroduce it is underway. Its habits are essentially the same as those of red foxes. See FUR FARMING.

C.S. CHURCHER

**Fox, Gail**, poet (b at Willimantic, Ct 5 Feb 1942). Fox immigrated to Canada in 1963 and came to public attention in the late 1960s and early 1970s as part of a group of writers centred at Queen's and led by poets Tom Marshall and David Helwig and associated with the journal *Quarry*, which she later edited. Her collections of intense yet often lyrical poetry have included *Dangerous Season* (1969), *The Royal Collector of Dreams* (1970), *Flight of the Pterodactyl* (1973), *The Ringmaster's Circus* (1973), *God's Odd Look* (1976) and *Houses of God* (1983).

**Fox, Irving Kingsbury**, professor, resource planner, conservationist (b at Bolton, Mich 7 Dec 1916). After obtaining a U of Mich MA, Fox served with the US government and in 1955 joined Resources for the Future Inc, as VP, devoting himself to water resources. A period as director of the Water Resources Center at U of Wis preceded his joining UBC as director of Westwater Research and professor of community and regional planning. There, through teaching, research and public activity, he pioneered river basin studies in Canada, integrating social and environmental considerations. In his many publications, which include a monograph on the Yukon and the organization of studies related to the Fraser River estuary, and other works, he has made a remarkable impact upon resource use in Canada. IAN McTAGGART COWAN

**Fox, John Richard**, painter (b at Montréal 26 July 1927). Trained by Goodridge ROBERTS, Fox also worked under John LYMAN at McGill. In 1952 he entered the Slade School of Art, London, Eng, and later spent 2 years in Italy and France before finally returning to Montréal in 1957. In 1964 he completed a mural for Charlottetown's Confederation Centre. Fox was well known for his intimist figure and landscape paintings when in 1972 he began to paint large abstract

works influenced more by European and American modernism than by a Québec sensibility. Without the distraction of recognizable imagery, Fox pursued his preoccupation with figure-ground ambiguity in his manipulation of colour, texture and structure, and moved through abstract impressionism to collage-inspired symbolic abstraction. He has been shown widely in Canada, including a recent retrospective exhibition.

SANDRA PAIKOWSKY

**Fox, Luke**, also spelled Foxe, explorer (b at Kingston-upon-Hull, Eng 20 Oct 1586; d c15 July 1635). He left for the Arctic in 1631, 2 days after Thomas JAMES left on a rival voyage. He explored the W shore of Hudson Bay and met James by chance near Cape Henrietta Maria, turned N and was the first to sail beyond Foxe Channel (named for him later by W.E. PARRY), into Foxe Basin, and along the Foxe Peninsula. His report of impenetrable barriers cancelled the zeal for arctic exploration for almost 200 years. Fox answered criticism that he had given up too easily with a remarkable book, *North-West Fox* (1635), a rare document of arctic exploration.

JAMES MARSH

**Fox, Terrance Stanley**, "Marathon of Hope" runner (b at Winnipeg 28 July 1958; d at New Westminster, BC 28 June 1981). Terry Fox was a good athlete studying kinesiology when, in 1977, it was discovered he had osteogenic sarcoma, a rare form of bone cancer. It was necessary to amputate most of one leg. While recovering, he developed the idea for a "Marathon of Hope" — a run across Canada to raise money and generate publicity for cancer research. After extensive training, he began his run at St John's on 12 Apr 1980, and ended it on 1 Sept in Thunder Bay, Ont, after cancer was discovered in his lungs. During that period, he had run 5373 km at a pace of nearly 40 km per day. Inspiring millions of people around the world, he drew nationwide attention and raised \$1.7 million. Gripped by an outpouring of emotion, Canadians donated an additional \$23 million to the fund. For his effort, he was named a companion of the Order of Canada. Thousands annually participate in a fund-raising run named after him.

J. THOMAS WEST

**Foxe Basin**, NWT, is bordered on its eastern and northern sides by the coast of BAFFIN I and in the W by the MELVILLE PEN. Named for 17th-century arctic explorer Luke Fox, it is a smaller version of HUDSON BAY, being an enclosed depression in the Canadian SHIELD, with an ancient land surface preserved under limestone sediments beneath its shallow waters. Maximum depths in Foxe Basin only reach 90 m, but much of the basin is shallower, with long, gently shelving shorelines, making navigation hazardous. The basin's shallowness keeps it ice covered for long periods. Grounding of sea ice on the bottom disturbs silt, which is incorporated into the ice, turning it a distinctive brown colour. The basin's shape acts to confine the movement of water, and some of the greatest tidal ranges in arctic waters are found at its outlets, reaching 3.5 m at Fury and Hecla Str and 7 m through Foxe Channel. Because of its shallowness, ice and tidal ranges, Foxe Basin has been bypassed as a route to the Arctic. D. FINLAYSON

**Franca, Celia**, stage name of Celia Franks, dancer, choreographer, director, teacher (b at London, Eng 25 Jun 1921). As founder of the NATIONAL BALLET OF CANADA, Franca — a strong-willed, dynamic woman — has played a central role in the development of BALLET in Canada. She was trained in England at London's Guildhall School of Music and at the Royal Academy of Dancing. She performed there with various companies, among them the Ballet Rambert and Sadler's Wells Ballet. Her earliest CHOREOGRAPHY

Celia Franca, dancer, choreographer and founder of the National Ballet of Canada (courtesy National Ballet Archives).

was also created in England. Her artistic and marked organizational gifts caused Franca to be recommended to a group of Toronto ballet-lovers who in 1950 wanted to establish a classical ballet company in Canada. Franca agreed to become founding artistic director of the National Ballet of Canada in 1951 and remained its head until 1974. Despite a lack of adequate financial support and the short supply of well-trained classical dancers, Franca succeeded in developing a well-schooled repertory ballet company that by the early 1970s had gained an international reputation.

Franca continued to dance leading roles until 1959 (she continues to appear in character parts as a guest artist) and choreographed or staged from memory established works in the classical repertory as well as a number of her own works. Sometimes accused of trying to produce a copy of Sadler's Wells (later the Royal) Ballet and of failing to develop Canadian choreographers, Franca did offer opportunities to a number of Canadian choreographers, but more importantly she provided emerging dancers an opportunity to dance the established classical repertoire. Franca, who moved to Ottawa on leaving the National Ballet, remains active as a teacher and lecturer. Appointed to the Order of Canada in 1967, she became a member of the Canada Council in 1983. Among her many other honours is the Molson Prize 1974. MICHAEL CRABB

**Franchère, Joseph-Charles**, painter, illustrator, church decorator (b at Montréal 4 Mar 1866; d there 12 May 1921). After studies at the Conseil des arts et manufactures, at the school run by Abbé Chabert, and a period in the studio of painter-decorator F.-X.-E. Meloche, Franchère left for Paris in 1888 to complete his training. For 2 years he worked at the Colarossi studio and the Académie Julian. Returning to Montréal in 1890, he was commissioned to do 3 large paintings for the Sacré-Coeur chapel of Notre-Dame. He returned to Paris to paint *La Vierge de l'Apocalypse* (1892), *La Multiplication des pains* (1893) and *Le Christ consolateur des affligés* (1895). During this stay, he was admitted to the Ecole des Beaux-Arts and began sending works to the annual exhibitions of the Art Assn of Montréal and the Royal Canadian Academy. Franchère's work was exhibited at the world fairs in Chicago (1893), Buffalo (1901) and St Louis (1904). As well as doing church murals in Québec during these years, he taught at the Conseil des arts et manufactures and the Monument National, and illustrated several books, including P.E. Prévost's *Chansons canadiennes* (1907) and Abbé Lionel GROULX's *Les Rapailles* (1916). Trained in the academic tradition, Franchère specialized in subject pictures idealizing country life, and in works inspired by symbolism. L. LACROIX

**Franchise**, the right to vote in public elections for members of Parliament, provincial legislatures and municipal councils. The Canadian franchise dates from the mid-18th-century colonial period when, as a general rule, restrictions

effectively limited the vote to male property holders. Since then the particular voting qualifications and the pace of expanding the categories of eligible voters have differed according to jurisdiction and have reflected changing social values. For the first 50 years after Confederation the federal franchise was manipulated in a blatantly partisan fashion by both national parties. At various times up to 1920 the Dominion franchise was based either on the electoral lists drawn up by the provinces for provincial elections (thereby ensuring that the "national" franchise differed from one province to another) or on a federal list compiled by enumerators appointed by the governing party in Ottawa. From 1867 to 1884 it was based on provincial laws and included a property qualification. The resulting "staggered vote" benefited the Conservative Party. Canada's most controversial franchise legislation was adopted by Parliament during WWI. The Wartime Elections Act and the Military Voters Act of 1917 enfranchised female relatives of men serving with the Canadian or British armed forces as well as all servicemen (including minors and Indians); it disenfranchised conscientious objectors and British subjects naturalized after 1902 who were born in an enemy country or who habitually spoke an enemy language. Not surprisingly, the government of the time openly admitted that the legislation was biased in its favour and the 1917 election results proved it right. Such abuses and shifts in the policies governing the right to vote ended in 1920 with the adoption by Parliament of an Act establishing a standard Dominion-wide franchise.

Although occasional instances were recorded of women voting in pre-Confederation Nova Scotia and Lower Canada, between 1809 and 1834, Canadian women were systematically and universally disenfranchised. Apart from their temporary and selective enfranchisement under the Wartime Elections Act, women were first granted the right to vote federally in 1918. Not until 1940 were all Canadian women guaranteed the right to vote provincially. In 1916, Manitoba became the first province to enfranchise women for provincial elections; in 1940, Québec was the last. From the time they first began arriving in the 19th century through much of the first half of the 20th century, most Canadians of oriental ancestry were denied the right to vote in federal and provincial elections. With the extension of the federal franchise to Japanese Canadians in 1948, the last statutory disenfranchisement of Asians was removed. Non-status Indians received full voting rights at the provincial level, starting in BC in 1949 and ending with Québec in 1969. The federal franchise was extended to the Inuit in 1950 and to status Indians in 1960.

Canada now has a virtually universal franchise at both the provincial and federal levels. In federal elections all Canadian citizens 18 years of age and older (from 1920 to 1970 the minimum age had been 21) are eligible to vote, except those barred by the provisions of the Canada Elections Act — federal judges, inmates of prisons and mental institutions, and any person disqualified for corrupt or illegal electoral practices. These restrictions may be challenged under the Constitution Act, 1982, which stipulates "every citizen of Canada has the right to vote in an election of members of the House of Commons or of a legislative assembly and to be qualified for membership therein."

JOHN C. COURTNEY

**Franck, Albert Jacques**, Albie, painter (b at Middelburg, Holland 2 Apr 1899; d at Toronto 28 Feb 1973). He was long-distance swimming champion of Belgium in 1924, worked as a swimming coach at the central YMCA in Montréal after immigrating to Canada, and then

held various jobs in Toronto and Montréal. The turning point in Franck's career came after WWII when he rented a shop on Toronto's Gerrard St, the city's "Greenwich Village" and he restored pictures, designed Christmas cards and displayed his paintings. Franck, generous with food and advice, became *paterfamilias* to a considerable group of younger artists.

Franck tried to paint all the seasons of the year, but winter became his subject, and he found his true *métier* in the tumbled houses and the acrid lanes of Toronto neighbourhoods. His work took on a new plastic power, the colour deepened, and detail was reduced in a design that gave freedom to heightened feeling. Franck gradually received critical and financial success as his love of old brick, dirty snow and lane fences spread into the larger texture of Canadian life. He made people see the ordinary that is home. His vision of Toronto was a fulcrum for the simple idea that cities become great by what they preserve.

HAROLD TOWN  
Reading: Harold Town, *Albert Franck* (1974).

**Francks, Don Harvey**, or Iron Buffalo, actor, jazz musician, environmental activist (b at Burnaby, BC 28 Feb 1932). Talented, international entertainer and honorary Cree, he achieved "failed Broadway star" status 16 Feb 1964 when the musical *Kelly* folded after one night. Other New York stage excursions included *The Flip Side* and *On a Clear Day*. Frequently on CBC radio and TV including *Nero Wolfe* (1982) and *This Land* (from 1979), he won 2 successive ACTRA Awards for performances in *Drying Up the Streets* (1980) and *The Phoenix Team* (1981). His American TV series appearances include *Jericho*, *The Man from U.N.C.L.E.* and *Mission Impossible*, and he was also featured in such films as *Finian's Rainbow*, *The Drylanders*, *Ivy League Killers*, *The Tomorrow Man* and *Old Fish Hawk*.

DAVID GARDNER

**Franco-Americans** From the mid-19th century to around 1930, over 900 000 francophone Québécois emigrated to the US. They migrated in waves, especially after the AMERICAN CIVIL WAR and around 1890, managed to feel at home and, in a few generations, adopted the habits and customs of their new surroundings. Their descendants are known as Franco-Americans, though the term did not appear in New England until the end of the 19th century and even today is unknown to the majority, who instead talk about "French Canadians." The approximately 5 million Franco-Americans constitute the largest element within the Québec diaspora in all N America.

The magnitude of the huge migration ("La Grande Hémorragie") shook Québec society and led to a renewal of nativism in New England, where almost half the emigrants settled. Most of the emigrants came from underdeveloped rural areas of Québec. They were looking for financial and job security, especially in textile and shoe factories. Franco-Americans' job skills diversified over time, however, and they gained access to commercial positions and to the liberal professions. Around 1930, when the GREAT DEPRESSION put a stop to emigration, the New England states had gained a significant Franco-American population, most of it in industrial cities like Lowell, Lawrence and New Bedford (Mass), Woonsocket (RI), Manchester and Nashua (NH), and Biddeford and Lewiston (Me).

These French, Catholic Franco-Americans created "little Canadas" in some districts in the major American cities, faithfully reproducing their cultural life and Québécois religious institutions. Until WWII, and despite their Americanization, the descendants of the Québécois emigrants probably managed better than other ethnic groups to preserve their identity. Several major figures in Québec history had Franco-American roots, including journalist Olivier

Asselin, writer Honoré Beaugrand, essayist Edmond de Nevers and ultramontane Jules-Paul TARDIVEL. Some Franco-Americans were repatriated to Canada around the beginning of the 20th century, and formed the core of numerous francophone settlements in the West (see FRENCH IN THE WEST). With time, however, most Franco-Americans succumbed to the attractions of the American way of life and the English language, especially since they lived primarily in heavily urbanized surroundings. Nevertheless, today some Franco-Americans continue — though primarily in English — to take an interest in their historical roots, and preserve their network of ethnic relations and certain folkloric or gastronomic traditions. This mixture of the modern and the conservative has not prevented some Franco-Americans, eg, writer Jack Kerouac and athlete Napoleon Lajoie, from having a major impact in the US. However, the secularization of Québec society and its profound changes since the QUIET REVOLUTION have caused Franco-Americans and Québécois to have less in common than they once had.

PIERRE ANCTIL

**Franco-Ontarians** are those Canadians whose mother tongue is French and who live in Ontario. In the 1981 census, 467 885 Ontarians (5.5% of the total population) indicated that French is their mother tongue, and an estimated 75% of these use French at home. Four out of 10 Franco-Ontarians live in the eastern part of the province between Ottawa and the Québec border; 33% are spread throughout the cities and towns of northern Ontario, and more than 25% live in major industrial centres and in long-established rural communities to the south.

French have lived in Ontario since the beginning of the French regime. In 1610 Etienne BRÛLÉ, on a reconnaissance mission for Samuel de CHAMPLAIN, was the first white man to set foot in what is now Ontario. French soldiers were later garrisoned in Fort Pontchartrain [Detroit] and FORT FRONTENAC [Kingston], while settlers lived near the forts, and COUREURS DES BOIS, missionaries and VOYAGEURS roamed the province.

The first agricultural settlement was established in the Detroit region in 1710, but French officers and colonial administrators returned to France after the territory was ceded to England. There was no further reinforcement of the small francophone communities until after 1840 when the rapidly growing population of Québec began to spill over into eastern Ontario, then (after 1880) into the Sudbury region, and finally at the turn of the century, into the "clay belts" of the north (Haileybury-Hearst). The industrial cities of the south have been attracting both Québécois and northern Franco-Ontarians for more than 100 years. ACADIANS, as well as Francophones from Belgium, France, Switzerland and North Africa joined many of these communities.

The great majority of Franco-Ontarians sought to recreate in Ontario their traditional cultural institutions — francophone Catholic parishes and French schools, co-operatives, and CAISSES POPULAIRES (a form of credit union developed in Québec). In 1910 they founded the Association canadienne-française de l'Ontario (ACFO) and, 3 years later, the Ottawa daily newspaper, *Le Droit*. Since 1910 Franco-Ontarians have battled, sometimes bitterly, to maintain and encourage school programs taught in French, particularly during the crisis caused by Regulation XVII (see also LANGUAGE POLICY; ONTARIO SCHOOLS QUESTION).

Because of their small numbers, Franco-Ontarians do not play a significant collective role in provincial or federal politics, but they wield considerable influence in a few ridings in the north and the east, and can therefore make their voices heard in Toronto and Ottawa. Their political energies are focused on defending their language and affirming their culture through

such instruments as the ACFO and various provincial, regional and community-based volunteer organizations.

As a group, they are strongly represented in the primary sector (forestry, agriculture, mining), the public sector, and education.

Many Franco-Ontarians still center their lives around the more than 200 active French Catholic parishes in the province. Dozens of "centres culturels" bring together Franco-Ontarian craftspeople and artists. The 2 cultural areas in which Francophones are most productive are theatre, both amateur and professional, and poetry. French radio and television, primarily Radio-Canada and to some extent the Ontario educational television network, serve the Franco-Ontarian community.

Increasingly, Franco-Ontarians are migrating to the large anglophone cities and losing touch with the religion that has constituted a strong bulwark of French culture. Anglo-francophone marriages are now more common than in the past and the home language of such families is usually English. However, a significant number of Franco-Ontarians seem determined to preserve their distinctive culture in a province that is developing its multicultural identity. The OFFICIAL LANGUAGES ACT of 1969 and the policy of the Ontario government to provide bilingual services to Francophones have provided some support for these efforts.

PIERRE SAVARD

**Francophone-Anglophone Relations** "Two nations warring in the bosom of a single state," was Lord DURHAM's assessment of the relationship between Lower Canada's 2 cultural and linguistic communities during the 1830s. Observers of the continuing debate over Québec's role within Confederation might be tempted to believe that Durham's assessment can be applied as a general principle to the entirety of the Canadian experience, but in fact the quality of francophone-anglophone relations over the past 200 years has ebbed and flowed in response to changing socioeconomic, political and ideological factors as well as in response to the unrelenting commitment of French Canadians to survival and equality.

Any search for a theme to francophone-anglophone relations must take into account the fact that the francophone community constitutes a cultural minority; today, Francophones comprise only 27% of the Canadian population. Only in Québec do Francophones constitute a majority, yet even in Québec many contemporary Québécois nationalists feel that their majority position is threatened by an English-speaking minority that is concentrated predominantly in metropolitan Montréal. Furthermore, when the intellectual and political elites of both communities have proposed and then attempted to reach divergent rather than co-operative social and political goals, the relationship between Francophones and Anglophones has been severely strained.

From 1763 to 1800, the relationship between the British colonial rulers and the traditional clerical and seigneurial leaders of French Canada was tense yet cordial. They shared the same commitment to Ancien Régime values and institutions. Both the QUEBEC ACT of 1774 and the CONSTITUTIONAL ACT, 1791, were deliberate attempts to reinforce the existing colonial social and political structures. However, this social contract began to break down after 1800 when Québec's economy and social structure were altered in fundamental ways. By 1820 Montréal was no longer the centre of the fur trade and the wheat economy of Lower Canada was in a serious crisis.

The seigneurial class, lacking its traditional access to wealth in the army, in the bureaucracy and in commerce, declined very rapidly after

1800, and the Catholic Church was unprepared at this time to assert control over Québec society (see SEIGNEURIAL SYSTEM). It was into this unstable context that a new francophone professional middle class emerged. This ambitious new class used the ideologies of nationalism and political liberalism to gain control over the Assembly of Lower Canada by 1810, and then began to push for full control over the office of governor and the legislative and executive councils. When successive governors, with the support of the Anglo-Scottish merchants, refused to share power in any meaningful way, the francophone middle class, under the banner of the Parti patriote, advocated political reforms that would grant it full control over the appointed councils. When British colonial officials rejected these reform proposals, the Parti patriote attempted (1837-38) to seize power through a resort to arms. They intended to create an independent French Canadian republic under the presidency of Louis-Joseph PAPINEAU. The revolt failed because it lacked widespread popular support, strong and courageous leadership, and because of the quick and harsh counteroffensive of well-armed British troops (see REBELLION of 1837). The Parti patriote was left in total disarray and the separatist option was discredited for several generations.

In the aftermath of the rebellions, the DURHAM REPORT and the ACT OF UNION of 1840, which united Upper and Lower Canada in the PROVINCE OF CANADA and placed French Canadian society firmly under the control of an anglophone-controlled assembly and executive and executive councils, the francophone professional middle class divided into 2 groups. One group, under the leadership of L.H. LAFONTAINE and E. PARENT, pursued a strategy of maximizing the autonomy of French Canada's cultural, social and religious institutions, hoping thereby to undermine the assimilationist intentions of Lord Durham and the British colonial officials. In order to achieve their goal they co-operated with Upper Canadian reformers in the struggle for and achievement of RESPONSIBLE GOVERNMENT. The second group, comprising remnants of the Parti patriote and a younger generation of nationalists in the Institut Canadien and the PARTI ROUGE, rejected the Act of Union and campaigned for its repeal. As committed political nationalists they fought for the creation of a politically autonomous, secular and democratic Québec nation-state. After the achievement of responsible government in 1848, the reform party of La Fontaine and Parent evolved into the PARTI BLEU, which under the leadership of Joseph-Edouard CAUCHON and George-Étienne CARTIER became part of the Conservative Party.

The Conservative Party, with the full support of a reinvigorated Catholic Church, sought further to enhance the autonomy of French Canada's cultural, social and religious institutions. The party also co-operated with the Anglo-Scottish bourgeoisie, represented by the Liberal-Conservative Party of J.A. MACDONALD, in the pursuit of economic development through the building of railways and the expansion of trade with the US and Great Britain. By 1865 a political deadlock developed in the Assembly because an increasing majority of Upper Canadians, led by George BROWN and his CLEAR GRIT faction, wanted out from under the yoke of a Union dominated by anglophone Montréalers and Cartier's blues. The deadlock was broken when all members of the Assembly, except those belonging to the *rouge* movement, agreed to pursue the implementation of a federal system for Upper and Lower Canada or for all the British N American colonies.

After a lengthy and at times heated debate in the Assembly of the Canadas in 1865, the Québec resolutions, which called for the creation of a central government and a number of prov-

inces, including Québec, were passed. Members of the *rouge* movement objected to the new constitution because, they claimed, it was too centralist and did not guarantee the survival of the francophone community. A slight majority of francophones, convinced by the Conservative Party and a very cautious Catholic Church that the new constitution did offer certain guarantees, were willing to face the new risks primarily because of the increased political and cultural autonomy of the new province of Québec. During the 1867 federal and provincial elections the Conservative Party gained 45 of the 65 seats, a clear demonstration of the general support for the new constitutional arrangement. French Canadian secular and clerical leaders were beginning to participate in a small way in the commercial and industrial development of Québec. The modernization of the agricultural sector as well as the INDUSTRIALIZATION of the province in the last quarter of the century helped the francophone community pursue and achieve some of its cultural, social and political aspirations.

Within 30 years of Confederation, Québec's French Canadian majority developed a new attitude toward the Canadian federal system, for 2 reasons. First, there was a growing sense of confidence based on economic, cultural and religious renewal and expansion of the French Canadian society in Québec. Second, there was the increasingly difficult plight of the francophone minorities outside the province as evidenced by the 1871 abolition of the informal separate schools used by New Brunswick's Acadians; the RED RIVER REBELLION of 1869-70 and the NORTH-WEST REBELLION of 1885 (which both English- and French-speaking central Canadians interpreted as a struggle between French Catholics and English Protestants over who would determine the character of the West); the 1890 decision of the Manitoba Liberal government to abolish funding for Catholic schools recognized under the MANITOBA ACT of 1870 (see MANITOBA SCHOOLS QUESTION); the curtailment of separate schools in the 1905 Act creating the provinces of Alberta and Saskatchewan; and finally, Ontario's Regulation XVII, which undermined an informal system of bilingual separate schools by outlawing the use of French as a language of instruction until the late 1920s (see ONTARIO SCHOOLS QUESTION). As a result of these crises, Québec's French Canadian majority increasingly identified with the beleaguered francophone minorities as they came under attack from an aggressive and vocal English-speaking Canadian society determined to create a strong and homogeneous British Canadian national state.

In fact, many French Canadians felt their society was being forced to choose between provincial rights and minority rights, a choice that was simply not acceptable because provincial autonomy was considered the very root of the survival of the French Canadian nationality in Canada. In order to resolve this dilemma, a number of prominent French Canadians, led by Judge LORANGER and the journalist and politician Henri BOURASSA, began to supplement the "compact of provinces" theory with a "compact of nationalities" theory. It was argued that the concept of 2 nations, or 2 founding peoples, constituted the heart of Confederation. Consequently, francophone leaders responded to the minority-rights crises by appealing to the federal government to enforce the Constitution; only the full acceptance of a bilingual and bi-cultural country could prevent renewed and politically divisive attacks on francophone minorities. PM Wilfrid LAURIER attempted to apply the "two-nation" concept in his 1897 agreement with Premier GREENWAY of Manitoba. The agreement, which provided some restitution for Manitoba's Catholics, was abolished in 1916 by the Roblin administration in Manitoba.

There was even less agreement between French- and English-speaking Canadians over foreign policy, especially the issue of Canada's role in the British Empire. From 1900 to 1920, French Canadian and British Canadian nationalists clashed repeatedly. French Canadian nationalists, led by Henri Bourassa, objected vociferously to Canada's increased participation in Imperial schemes, whether economic, political or (especially) military. Bourassa strongly opposed the participation of Canadian troops in the SOUTH AFRICAN WAR on the grounds that all forms of IMPERIALISM were immoral and that the incident would serve as a precedent for future participation in other British imperial wars. Laurier tried to hold the moderates of both communities together by avoiding commitments and by creating, in 1910, a Canadian navy that could be put at the disposal of the Royal Navy in times of war, but this strategy merely aroused the ire of the nationalists on both sides and contributed to Laurier's downfall in the 1911 election (see NAVAL AID BILL). The inevitable clash between the 2 sides reached its climax in the 1917 CONSCRIPTION crisis and was symbolized by the formation of Borden's UNION GOVERNMENT that same year. The conscription issue divided the political parties along ethnic lines, as the vast majority of English-speaking MPs supported conscription and the Union government, while all French Canadian MPs were re-elected as anti-conscriptionist Liberals.

The impact of this crisis on anglophone-francophone relations was devastating, especially for the intellectual and political elites of both communities. For the federal Conservative Party it proved a long-term disaster. French Canada's nationalists turned inward, away from Bourassa's laudable goal of achieving a bilingual and bicultural country. Abbé Lionel Groulx and his nationalist colleagues in *l'Action française* focused their attention on protecting the French Canadian society of Québec from the onslaught of rapid industrialization and urbanization. They began to think seriously about the growing economic inferiority of French Canadians as individuals and as a collectivity. The French Canadian professional and commercial middle classes encountered increased competition from English Canadian and American conglomerates. On occasion, out of desperation, Groulx and his colleagues dreamed of an independent, traditional and rural French Canadian nation. Much of their desperation stemmed from the fact that the majority of French Canadians supported the Liberal government's policy of economic expansion through the development of Québec's abundant natural resources, particularly its forests and hydroelectric potential.

With the GREAT DEPRESSION, the serious economic disadvantages of French Canadians as a community and as individuals were made clear to the public. Middle-class French Canadians reacted by advocating socioeconomic and political reforms, eg, the creation of co-operatives, state support for francophone entrepreneurs, nationalization of the anglophone hydroelectric companies, regulation of large corporations and "buy-French-Canadian-made-products" campaigns. These measures, they claimed, would shore up traditional French Canadian society while giving middle-class French Canadians greater control over the economic development of Québec.

The UNION NATIONALE under Maurice DUPLESSIS made up of old-line Conservatives, disenfranchised Liberals and traditional nationalists, took advantage of the nationalist reawakening created by the Depression to defeat the Liberal Party in 1936. Despite English-speaking Canadians' fears, Duplessis, who was essentially a constitutional nationalist, refused to proceed with the economic nationalist reforms championed by the nationalists inside and outside of

the party. His party was defeated in the 1939 provincial election, which he chose to contest on the use of conscription, by the direct intervention of the Liberal Party of Mackenzie King and Ernest LAPOINTE, King's French Canadian lieutenant. Lapointe and his francophone colleagues had threatened to resign and allow the conscriptionist Conservative party to take over the federal reins if French Canadians refused to turf out the troublesome Duplessis. In return for a promise of no conscription for overseas service, French Canadians reluctantly agreed to Canadian participation in WWII.

With the fall of France in the 1940s, the demand for conscription from parts of English-speaking Canada intensified. PM King hoped to undermine the conscriptionist movement, especially its Tory leader Arthur MEIGHEN, by holding a plebiscite in which all Canadians would be asked to relieve the federal government of its pledge of no conscription for overseas service. Haunted once again by the threat of conscription, various French Canadian nationalist movements came together in the League for the Defence of Canada to campaign vigorously and successfully for a NO vote in the April 1942 plebiscite. Canada was again a country divided between the 2 communities.

King heeded the message and declared that there would be "conscription if necessary, but not necessarily conscription." His government was able to delay the implementation of conscription until late in 1944, when a vocal Cabinet minority and rebellious military officers forced King to consent to conscript 16 000 of the home-defence forces. French Canadian nationalists were incensed, but the decision had come too late to help their movement, the BLOC POPULAIRE CANADIEN, during the 1944 provincial election. In the 1945 election, French Canadians helped re-elect the Liberal government.

Relations between Anglophones and Francophones had weathered both the depression and the war. Both communities had continued to play by the rules established in 1867, while nevertheless continuing to challenge the interpretation of those rules, especially in the area of social policy. Between 1945 and 1975 this situation changed dramatically as a result of several factors. The most important political factor was Ottawa's postwar decision (which was supported by a new generation of English Canadian nationalists) to forge ahead with the creation of a centralized WELFARE STATE. Ottawa's predominantly anglophone politicians and bureaucrats argued that the federal government needed full control over all forms of direct TAXATION to ensure stable economic development and to defray the cost of programs such as unemployment insurance, family allowances, old-age pensions, and hospital and medical-insurance schemes.

While the provinces rejected Ottawa's arguments they were slow to make counter-proposals. In Québec, however, the French Canadian nationalist movement exerted sufficient pressure on the Duplessis government to ensure that it would reject Ottawa's tax-rental scheme and its more audacious measures, such as federal grants to universities. For a younger generation of French Canadian nationalists this defensive strategy was insufficient. These "neonationalists," as they came to be called, led by André LAURENDEAU, Gérard FILION and Jean-Marc LÉGER and supported by a new francophone middle class educated in the sciences and social sciences, advocated the creation in Québec of a secular, interventionist, francophone-controlled state which would undertake the development of natural resources by French Canadians for French Canadians. Only an active nationalist state could help create an appropriate environment for the emergence of a strong francophone industrial and financial bourgeoisie. In order to ensure that a sufficient number

of French Canadians were prepared to assume control of a modern secular society, the state would proceed with comprehensive modernization of education at all levels, and to ensure that the welfare-state apparatus as it affected Québec was controlled by Francophones, neo-nationalists proposed that all social programs be taken over by the Québec government. This exercise of Québec's constitutional prerogatives, both established and new, would require a significant increase in the province's ability to collect taxes.

The socioeconomic changes in Canada that were caused by growing industrialization and urbanization and the influx into Canada of thousands of immigrants who spoke neither English nor French created new strains on the French Canadian society; at the heart of the tension lay the realization by Francophones that their economic and social future was urban and industrial. The francophone community's search for survival and equality clashed with the postwar national aspirations of English-speaking Canadians, and the stage was set for conflict over available resources and jobs. Moreover, with the rapid secularization of French Canadian society, Catholicism no longer distinguished French Canada from the rest of N America. With the increased assimilation of Francophones outside Québec and the overwhelming integration of Québec's neo-Canadians into Québec's anglophone community (which comprised nearly 50% of metropolitan Montréal's population), it was inevitable that language would become a dominant issue in contemporary Québec.

The defeat (1960) of the Union Nationale by the Liberal party of Jean LESAGE ushered in the QUIET REVOLUTION, which signalled the beginning of a dual struggle: one involving the new middle class' political and socioeconomic battle for greater control over Québec's economic resources, and another involving a bitter and divisive attempt to redefine the role of the francophone society within Canada. Since the early 1960s successive Québec governments have tried to change the socioeconomic relationship between that province's francophone majority and its English-speaking minorities. In the first stage of the Quiet Revolution, the Lesage government modernized and expanded the public and para-public sectors to provide employment for the postwar BABY BOOM generation of highly educated Francophones. For example, private hydroelectric companies were nationalized. As a result, HYDRO-QUÉBEC (est 1944) became one of the largest CROWN CORPORATIONS in Canada. Francophones were able to work entirely in French and to demonstrate their technical, scientific and managerial skills, a process which also occurred in the fields of education, social welfare and health services, and in the government bureaucracy in all departments and at all levels.

French Canada's attempt to redefine its role within Canada has produced vigorous public debates during the past 20 years. In their 1965 royal commission preliminary report on BILINGUALISM AND BICULTURALISM, the commissioners stated that Canada was in the midst of its most serious political crisis since Confederation. Beginning in 1963, several bombs had been set off in Montréal's mail boxes, and 2 separatist parties were successfully recruiting francophone university students. By the mid-1960s a wide variety of proposals for restructuring, renewing and even dismantling the Canadian Constitution were forthcoming.

Drawing upon the recommendations of the Tremblay Commission Report of 1956, many Québec neo-nationalists advocated the entrenchment, in a renewed Constitution, of "special status" for the province of Québec, while others demanded a form of "associate-state" status. In fact, by 1966 the political parties were

leapfrogging one another in a desperate attempt to keep pace with the nationalist momentum sweeping Québec. Daniel JOHNSON, the leader of the Union Nationale, issued an ultimatum to Ottawa entitled *Equality or Independence*. Special or associate-state status would entail very extensive decentralization of what was considered by many Canadians already a far too decentralized federal system. Yet there were also a number of neo-nationalists who argued for the complete political independence of Québec.

By the mid-1960s, the neo-nationalists encountered opposition from all national parties and a number of prominent Francophones such as Jean MARCHAND, Pierre Elliott TRUDEAU and Gérard PELLETIER. These men had been recruited by the Liberal Party of Prime Minister PEARSON to enhance francophone participation in the national government and help Ottawa head off potentially dangerous political clashes with Québec's increasingly separatist-oriented neo-nationalist movement.

The federal forces, under PM Pierre Trudeau, proposed a twofold strategy: to enhance the full participation of Francophones in all national institutions through a policy of official bilingualism and to insert into a renewed Constitution guarantees for all minorities via an entrenched Charter of Rights. While the first goal was met in 1969 with the passing of the OFFICIAL LANGUAGES ACT, the second was not accomplished until 1982 (see CONSTITUTION, PATRIATION OF).

Québec presented the major obstacle in the path of a renewed Constitution. The new liberal leader and premier of Québec by 1970, Robert BOURASSA, attempted to secure increased provincial powers in the area of social policy in return for his government's consent to patriate the Constitution and entrench a Charter of Rights. When Bourassa failed to accomplish his goal, neo-nationalist pressures forced him to reject the 1971 Victoria Charter.

In 1976 the PARTI QUÉBÉCOIS, committed to the achievement of political independence for Québec, was elected. The PQ government moved quickly to accomplish its election promises, especially in the highly sensitive area of language legislation. When it had become apparent by the late 1950s that room for expansion in the public sector was not infinite, pressure had begun to build in nationalist circles for language legislation making French the dominant language of work in the private sector. By 1975 the Liberal government of Robert Bourassa had implemented BILL 22, under which French became the official language of Québec and enrolment in English-language schools was restricted. While this legislation was too drastic for Québec's anglophone and allophone communities, it did not go far enough for an increasing majority of French Canadians, who felt BILL 22 did little to ensure that French would become the effective language of work for all Québec's citizens. In response to strong and widespread nationalist pressure inside and outside the party, the PQ government passed BILL 101, known as the Charter of the French Language, which made French the only official language of Québec, established a schedule for making French the dominant language of work and stipulated that all immigrants entering Québec from other parts of Canada and the world must enrol their children in French-language schools.

These developments heightened considerably the tension in anglophone-francophone relations, not only in Québec but throughout Canada. The federal Liberal Party, after its re-election to office in 1980, campaigned hard to ensure a defeat of the PQ-sponsored referendum requesting that Quebecers grant the PQ government a mandate to negotiate SOVEREIGNTY-ASSOCIATION.

The Trudeau government's decision to pursue the patriation of the Constitution with an

amendment formula and an entrenched Charter of Rights was prompted by the victory of the federalist forces in the QUÉBEC REFERENDUM campaign. The constitutional agreement was approved by Ottawa and all the provinces except Québec. The tragedy was that, in the process of political maneuvering, Québec had agreed with several other provinces to relinquish its traditional veto over constitutional changes crucial to the survival of the French Canadian nationality. A process of constitutional renewal set in motion largely in response to the new needs of Québec resulted in an agreement which could, under the appropriate set of circumstances, create new tensions and even overt hostility between Canada's 2 linguistic communities.

Since the early 1980s a greater degree of cordiality has characterized francophone-anglophone relations, although it remains to be seen what impact the entrenched CANADIAN CHARTER OF RIGHTS AND FREEDOMS will have on the minorities inside and outside the province of Québec. The serious economic recession that plagued the country in the early 1980s and the reduced power of the Quiet Revolution brought about a lull in tensions between the 2 communities. The achievement of some of the goals of the new francophone middle class, such as increased occupational mobility and the Québec Charter of the French Language, coupled with the defeat of the independence option, undermined the thrust towards an independent Québec. FRENCH CANADIAN NATIONALISM has not ceased to be an important element in Québec society and politics but appears to be taking on, once again, a more conservative role of consolidating and defending gains that have been achieved. How this will affect francophone-anglophone relations in the future is unclear. See OCTOBER CRISIS; QUÉBEC SINCE CONFEDERATION. MICHAEL D. BEHIELS

**Francophonie** is a term that emerged in the 1950s and has 2 main meanings. The primary one designates the grouping of peoples and communities throughout the world with French as their maternal or customary language. Of the approximately 100 million people who speak French worldwide, the major groups outside France are found in Africa, Canada, Belgium, Switzerland, the West Indies and Vietnam. In its second sense, the term has come to mean an increasingly large and complex network of private and public organizations promoting special ties among all Francophones. The term "International Francophonie" will be used in this article to refer to this relatively new, rapidly evolving phenomenon.

Except for international institutions created and run by France, such as Alliance française (1883), International Francophonie is relatively young. Truly multilateral associations devoted to closer ties between francophone groups began to appear shortly after WWII, eg, la Fédération internationale de la presse de langue française (Paris, 1948), l'Association des universités partiellement ou entièrement de langue française (Montréal, 1961) and l'Institut international de droit d'expression française (1964). These are all private bodies, although they often benefit from government subsidies. The private sector of International Francophonie continues to develop rapidly. In 1984 there were some 50 international French-language federations, communities, academies, associations and institutes working to increase co-operation in many different fields, and each year new bodies join.

In 1967, elected members of some 20 national parliaments met as delegates in Luxembourg to set up the Association internationale des parlementaires de langue française. Two years later, an international conference in Zaire brought together an equal number of ministers of education, this time officially representing their governments. However, a permanent body was

not formed until 1970, when ministerial delegates from 21 countries met in Niamey, Niger, to found l'Agence de coopération culturelle et technique (ACCT), an international organization devoted to multilateral governmental co-operation. The *Annuaire de la francophonie* (1980 edition) describes ACCT this way: "These States come together largely because of their use of French . . . ; their goal is to develop the education, culture, sciences and technologies of each member-state, fully respecting the sovereignty of the States and in a spirit of strict equality and complementarity of activities with those carried out by governments, international organizations, etc." In 1984 ACCT's member-states were Belgium, Benin, Burundi, Canada, Central African Republic, Comoros, Congo, Djibouti, Dominica, France, Gabon, Guinea, Haiti, Ivory Coast, Upper Volta, Lebanon, Luxembourg, Mali, Mauritius, Monaco, Niger, Rwanda, Senegal, Guinea-Bissau, Laos, Morocco, Mauritania and St Lucia. Two Canadian provinces, Québec and New Brunswick, have the status of participating governments.

The comparison is often drawn between Francophonie and the COMMONWEALTH. The similarities are evident: each includes developing and developed countries; each consists largely of former colonies, most of which achieved independence after WWII; finally, each has the same general objectives of mutual assistance, co-operation and development in all fields. But Commonwealth structures are very different from those adopted by Francophonie. Despite much discussion of the idea, for example, there is no equivalent in Francophonie of the biannual summit meetings held by the heads of state of Commonwealth countries.

Canada has been active in International Francophonie since its beginnings, in both public and private sectors. In a speech in Paris in the fall of 1982, PM Pierre Trudeau summed up why Canada participates in the worldwide francophone community: "We cannot remain indifferent to anything that contributes to unity or that builds bridges between peoples. Although much ground must still be covered, the francophone community is a unique entity and an eminently favourable influence which can bring about the cohesiveness we are all seeking and the co-operation that must exist if there is to be harmony among nations. Founded on undeniable natural affinities, on mutual respect and negotiation, the francophone community is not an intruder amidst the institutions that have preceded it. It is a member of regional organizations and of the United Nations, but it does not duplicate the work of any. It has a position and characteristics of its own; it is important for the world that it exist, that it develop and that it expand." GÉRARD PELLETIER

**Francq, Gustave**, typographer, labour leader (b at Brussels, Belgium Mar 1871; d 5 Jan 1952). Sometimes considered the father of international unionism in Québec, Francq immigrated to Québec C in 1889 and learned typography. In Montréal, he became an official in the Union typographique Jacques Cartier and in the Conseil des métiers et du travail de Montréal and was VP of the Trades and Labor Congress of Canada 1909-11. In *Le Monde ouvrier/The Labour World*, the journal he founded in 1916, he defended the international union movement against criticism by clergy and Catholic unions. In 1908 Francq ran in the provincial election on behalf of the Parti ouvrier. From WWI he grew closer to the Liberal Party. In 1926 he was appointed the first president of Québec's Minimum Wage Commission. He became honorary life president in the Fédération provinciale du travail du Québec for his outstanding contributions to international unionism in Québec.

JACQUES ROULLARD

**Frank Slide** At 4:10 AM on 29 Apr 1903, 74 million t of rock crashed down from Turtle Mtn in the CROWNEST PASS, obliterating a mine entrance and wiping out the eastern outskirts of Frank, NWT (Alta). It swept 1.6 km across the valley, covering roads, railways, houses and farms. After 13 hours of heroic effort, 17 men entombed in the mine, fighting a dwindling air supply, dug a new shaft and emerged to freedom. Rescuers found in the rubble 23 men, women and children who had miraculously escaped death, but at least 70 others died in the sudden disaster. The town was evacuated as a precaution against further slides. When none occurred the residents returned and reopened the mine. The slide was caused by mine shafts weakening the mountain; in 1911 the mine was closed to prevent further undermining. Turtle Mtn is monitored regularly for signs of another massive slide. See DISASTERS.

**Franklin, Sir John**, naval officer, arctic explorer (b at Spilsby, Eng 16 Apr 1786; d 11 June 1847 aboard HMS *Erebus*, in Victoria Str, NWT). From 1801 to 1804 Franklin developed surveying skills and an interest in natural science, which determined his future as the best-known and perhaps greatest explorer in the British-American Arctic. He owes his fame to the long and much publicized search for him and his lost vessels; he earned it by charting Canada's arctic seaboard. He has been called discoverer of the NORTHWEST PASSAGE, but not one man lived to report his success, which only became known 9 years after its discovery by Robert MCCLURE had been announced.

Sir John Franklin, arctic explorer, best remembered for the long and much-publicized search for him and his lost vessels. He perished in his icebound ship off King William Island (courtesy Public Archives of Canada/C-1352).

In 1818 Franklin was second in command of an abortive voyage into the Spitsbergen ice. In 1819 the British ADMIRALTY appointed him to map N America's unknown arctic seaboard. He was to descend the turbulent and supposedly unnavigable COPPERMINE R and explore eastward by canoe. In 1821 he surveyed about 340 km of intricate, ice-infested shoreline, but through cold and hunger lost about 10 men on the overland homeward trek owing to the inadequacy of canoes in ice pack and his unfamiliarity with traders, VOYAGEURS and northern conditions. In his well-organized second expedition (1825-27), he made the approach in seaworthy boats by the Mackenzie R, and from its mouth sent 2 boats east to map as far as the Coppermine R while he headed west. Hindered by ice and fog he surveyed 640 km of shoreline before turning back from an inlet he named Prudhoe Bay. The eastern detachment completed its assignment and, as prudently arranged by Franklin, made a quick, safe return overland.

Thomas Simpson of the HBC extended these surveys, and to the N ships explored among the islands. In 1845 Franklin was sent with 2 vessels, *Erebus* and *Terror*, to join these discoveries together and sail through the Northwest Passage. He never returned, and after a 12-year search by numerous vessels it was learned that on the brink of success his ships had been frozen in W of King William I. Franklin had died 11 June 1847, and command devolved on Capt Francis Crozier who abandoned ship and with 105 surviving crew trekked southward toward the Back R. All perished, most of them near Victory Point. The fame of Franklin's "mystery" and the many voyages made to solve it have obscured the explorer's solid merits. He had shown boldness and resource in pioneering a new method of discovery in the Arctic and had added more to the coastal map of Canada than any other explorer except George VANCOUVER. See also ARCTIC EXPLORATION; FRANKLIN SEARCH.

L.H. NEATBY

**Franklin, Ursula Martius**, physicist, educator (b at Munich, Germany 16 Sept 1921). A specialist in the structure of metals and alloys, she pioneered the development of archaeometry, which applies the modern techniques of materials analysis to ARCHAEOLOGY. She was educated at the Technical U of Berlin and did postdoctoral studies at U of T. After working for the ONTARIO RESEARCH FOUNDATION 1952-67, she joined U of T's dept of metallurgy and materials science in 1967. Franklin has helped develop SCIENCE POLICY through the SCIENCE COUNCIL OF CANADA and the NATURAL SCIENCES AND ENGINEERING RESEARCH COUNCIL OF CANADA. She worked on gathering and analysing data on the strontium 90 accumulation in the teeth of children in Canada as a result of fallout from tests of nuclear weapons; the dating of copper, bronze, metal and ceramic artefacts of prehistoric cultures in Canada and elsewhere; and she has tried to educate society and scientists to the impact of science and technology on human survival and quality of life. She is a tireless advocate for Science for Peace. Her work has received world-wide recognition. ROSE SHEININ

**Franklin Search** The disappearance of Sir John FRANKLIN and his crew in what is now the Canadian Arctic set off one of the greatest rescue operations in the history of EXPLORATION. Franklin's 2 ships had sailed from England on 19 May 1845 and were last sighted in late July heading for Lancaster Sd. A 3-way search was organized in 1848, with Sir James Clark Ross proceeding through Lancaster Sd, Capt Henry Kellet via Bering Str, and John RAE and Sir John Richardson trekking overland from the Mackenzie R. No trace of the expedition was found and in 1850 more search parties were sent out. The Admiralty sent Richard Collinson and Robert MCCLURE via Bering Str, and Horatio Austin and

*Abandoning Ships, Sir John Franklin's Last Expedition* (c1860). This watercolour by an anonymous artist depicts the final drama in Franklin's last expedition (courtesy Royal Ontario Museum).

William Penny from the E. The HBC sent its own expedition under Sir John Ross, and the first American expedition to the North was led by E.J. De Haven. Lady Franklin financed an expedition under Charles Forsyth.

Franklin's winter quarters on Beechey I were found, but his fate remained unknown and Lady Franklin sent another search party out in 1851. The Admiralty sent its last and greatest expedition in 1852 under Sir Edward BELCHER, as concern mounted not only for Franklin but for McClure and Collinson, who had not been heard from. Belcher returned ignominiously in 1854, having lost the supply ship BREADALBANE. The expedition had managed to rescue McClure, who with his crew was awarded the Admiralty prize for completing the NORTHWEST PASSAGE. It was John Rae who in 1854 was given the £10 000 reward for settling Franklin's fate: on the basis of Inuit reports and evidence of personal effects belonging to the crew, he concluded that all had perished. Lady Franklin was not convinced, and sent Leopold MCCLINTOCK in 1857. This expedition explored KING WILLIAM I, and in 1859 found further relics and the only written record of the tragedy.

Searches for other evidence, notably for Franklin's diaries, continued into the 20th century. In 1930 a party sponsored by the Canadian government and flown by bush pilot Walter Gilbert found some artifacts on the N side of King William I, but too few to be of great significance. The Franklin searches resulted in a great expansion in the knowledge of the Canadian Arctic, including the discovery of numerous islands and of Bellot Str — the much-sought opening to the west. JAMES MARSH

Reading: L.H. Neatby, *The Search for Franklin* (1970).

**Franquelin, Jean-Baptiste-Louis**, cartographer, royal hydrographer, teacher of navigation (b at Saint-Michel de Villebernier, France 1651; d in France after 1712). The first official cartographer in Canada, Franquelin drew some 50 richly illustrated manuscript maps of NEW FRANCE between 1674 and 1708. Although not published, his maps were important sources for French mapmakers, especially Guillaume Delisle (*Carte du Canada*, 1703). Franquelin came to Canada as a trader in 1671. Recognizing his talents Governor Frontenac recruited him to draw maps (see CARTOGRAPHY). Between 1674 and 1684 he recorded the explorations of Louis JOLLIET and Cavalier de LA SALLE, and in 1686 Franquelin was appointed king's hydrographer. In 1692 he went to France to complete a series of maps on the New England coast. His wife and 10 of 13 children were to join him the following year but were drowned in a shipwreck. Although he held his Canadian appointment from 1686 to 1697 and again from 1701 to 1703 he never returned and from 1694 to 1707 he seems to have been working for Louis XIV's military engineer, Vauban. C.E. HEIDENREICH

Armand Frappier, founder of the first French-language school of hygiene in the world (1945) and pioneer in the use of vaccine for infant leukemia (photo by André Larose, *Portraitiste/Montréal*).

**Frappier, Armand**, physician, microbiologist (bat Salaberry-de-Valleyfield, Qué 26 Nov 1904). After receiving his MD (1930) and MSc (1931) from U de M, Frappier won a scholarship from the Rockefeller Foundation (1931-32). He studied tuberculosis and BCG (bacille Calmette-Guérin) vaccine in the US and at the Institut Pasteur in Paris, working in the Calmette, Guérin and Nègre laboratories. He returned to the Institut in 1937 to study applications of immunology and anatoxins.

In 1933 Frappier became chief of the laboratories at Hôpital Saint-Luc and professor of bacteriology at U de M. In 1938 he founded the Institut de microbiologie et d'hygiène de Montréal (renamed INSTITUT ARMAND-FRAPPIER in 1975), with the complementary goals of research, post-academic teaching, certain health services, and services to industry in the production of biological products. In 1945 he founded the first French-language school of hygiene in the world at U de M, and was its dean 1945-65.

Frappier was one of the first N Americans to confirm the safety and efficacy of BCG and to develop original study and utilization methods for the vaccine. With his colleague Paul Lemonde and his daughter, Lise Davignon, he showed for the first time a nonspecific preventive effect of this vaccine in cases of infant leukemia. For years he studied the mechanisms of infection and of resistance (specific or non-specific) to certain infections. He has encouraged the international study of leprosy at the Institut and helped bring about the establishment there of one of the few laboratories devoted to this work. Frappier, who retired in 1974, remains a consultant and is professor emeritus of U de M. Foreign associate of the Académie nationale de médecine de France, he was president of the BCG committee of the International Union Against Tuberculosis and a member of the experts' panel of TB for the World Health Organization. Among other honours, he is a companion of the Order of Canada and officer of the Order of the British Empire, and holds honorary doctorates from Laval and the universities of Paris, Montréal, Québec and Krakow. CLAUDE VÉZINA

**Fraser, Blair**, journalist (b at Sydney, NS 17 Apr 1909; d on the Petawawa R, Ont 12 May 1968). Fraser was one of the leading journalists of the 1950s and 1960s, and as Ottawa editor of *Maclean's* 1943-60 he had a unique opportunity to influence a national audience. Educated at Acadia, Fraser worked on Montréal's English dailies

1929-43, and went to *Maclean's* to cover wartime politics. His success was based on his close friendships with politicians and officials; he had unrivalled access to government secrets when the Liberals were in power and only slightly less when the Conservatives were at the helm. When he left Ottawa in 1960, he became editor of *Maclean's* for 2 years and was then the magazine's London correspondent, before returning to Ottawa in 1963. He drowned in a canoeing accident. J.L. GRANATSTEIN

**Fraser, Frank Clarke**, physician, medical geneticist (b at Norwich, Conn 29 Mar 1920). After graduating from Acadia in biology in 1940, Fraser received an MSc in 1941 and a PhD in 1945 from McGill. Interested in genetics as applied to human conditions as well as the genetics of malformations in mice, he entered medical school at McGill and graduated in 1950. He started the first medical genetics clinic in a Canadian hospital at Montréal Children's, was president of the American Soc of Human Genetics (1961-62), of the Teratological Soc (1962-63) and of the Canadian Coll of Medical Geneticists (1980-83), and has served on numerous human-genetics committees. A prolific and valuable contributor to the literature, he has published more than 200 works dealing with the genetics of congenital malformations in mice and humans and has greatly influenced a generation of physicians and geneticists. P.A. BAIRD

**Fraser, Graham**, industrialist, community leader (b at New Glasgow, NS 12 Aug 1846; d there 25 Dec 1915). Following training in the US, Fraser returned to New Glasgow in 1867 to work in J.W. CARMICHAEL's shipyards. In 1872 he and George Forrest Mackay formed the Hope Iron Works, which became the Nova Scotia Forge Co in 1874. In 1882 Fraser organized the Nova Scotia Steel Co at Trenton. At nearby Ferrona, Fraser built North America's first coal-washing and re-tort ovens for making coke. Fraser led Scotia's development of iron-ore deposits at BELL ISLAND, Nfld, and coal at SYDNEY MINES, Cape Breton. He resigned in 1903, however, over questions of financial management, and for a short time was director of works for Dominion Iron and Steel. Fraser served New Glasgow variously as town councillor, water commissioner, mayor and director of the Aberdeen Hospital. LD McCANN  
Reading: J.M. Cameron, "The Steelmakers," NS Historical Soc Collections 40 (1980), and *Political Pictorians* (1967).

**Fraser, John Arthur**, artist, illustrator, teacher (b at London, Eng 9 Jan 1838; d at New York C, NY 1 Jan 1898). Soon after emigrating from England in 1858, Fraser joined the firm of William

John Arthur Fraser was instrumental in the founding of the Ontario Soc of Artists and taught at its School of Art. He was a belligerent man, often embroiled in disputes with fellow artists (courtesy Ontario Archives).

NOTMAN in Montréal as a tinter of photographs, and in 1868 he moved to Toronto to establish the partnership of Notman and Fraser. He was the prime mover behind the formation of the Ontario Soc of Artists in 1872 and he taught in its School of Art, founded in 1878. He was also involved in the Royal Canadian Academy (est 1880). A belligerent man of strong opinions, Fraser was frequently embroiled in bitter disputes with fellow artists. During the last 14 years of his life, Fraser lived in the US. His landscapes were praised by reviewers for the artist's photographic realism, observation of detail and use of light and colour. MARY F WILLIAMSON

**Fraser, John James**, lawyer, premier and Lt-gov of NB (b at Miramichi, NB 1 Aug 1829; d in Italy 24 Nov 1896). An outstanding lawyer, in 1865 Fraser won a seat in the provincial legislature as an anti-Confederation candidate. From 1871 to 1872 he was president of the executive council and from 1872 to 1878 provincial secretary. He was premier and attorney general 1878-82. He was appointed to the Supreme Court of NB in 1882 and from 1893 to 1896 was Lt-gov. He was a mild-mannered, popular man who was liked even by his opponents. His colleagues apparently ran his government, however, and his administration did not produce much significant legislation. ARTHUR T DOYLE

**Fraser, Simon**, fur trader, explorer (b at Mapletown near Bennington, Vt 1776; d at St Andrews, Canada W 18 Aug 1862). Fraser was the youngest son of a Loyalist officer, who was captured by revolutionaries and died in prison. His widow brought Simon to Montréal, where his uncle, Judge John Fraser, educated him. In 1792 he joined the NORTH WEST CO as a clerk; in 1799 he was serving in the Athabaska Dept and he became a partner in 1801. Fraser's main achievements occurred between 1805 and 1808. In 1805 he was placed in charge of the company's operations beyond the Rockies, and he founded the earliest settlements in the area he named NEW CALEDONIA (central BC). He established Ft McLeod in 1805, Ft St James and Ft Fraser in 1806, and Ft George (at present Prince George) in 1807. In 1808, he set out to explore the river he thought was the Columbia. Following the stretch explored by Alexander MACKENZIE in 1793, he entered territory unknown to white men and struggled through the perilous stretch now known as the FRASER RIVER CANYON. At the hostile village of Musqueam at the river's mouth, he took bearings and realized he could not be on the Columbia. Greatly disappointed, he turned back. David THOMPSON, who explored the real Columbia, named Simon's river the FRASER R.; Simon had already named the THOMPSON R in David's honour.

Fraser wearied of the FUR TRADE and in 1815 sought retirement, but was persuaded to go back to Athabaska. He was one of the NWC officers arrested by Lord SELKIRK at FT WILLIAM in 1816 and charged with complicity in the SEVEN OAKS INCIDENT. Fraser was eventually acquitted; meanwhile he had retired to St Andrews among the Scots of Glengarry County, where he spent the rest of his life uneventfully. The documents relating to his great journey, *The Letters and Journals of Simon Fraser, 1806-08*, were edited by W. Kaye Lamb and finally published in 1960.

GEORGE WOODCOCK

**Fraser Institute**, a nonprofit group established in 1974 under federal charter and headquartered in Vancouver. The institute, which has been noted for its conservative views, operates as a research and educational organization that supports free enterprise and attempts to influence public policy through publication of studies by staff economists and academics; representations to governments; placement of materials in schools, universities and churches; media inter-

views; and speeches and symposia. It is funded by private donations, fees and sales of publications. GORDON W. STEAD

**Fraser River**, 1368 km long, with a drainage basin of 238 000 km<sup>2</sup>, rises in the western slopes of the ROCKY MTS near Jasper National Park at an elevation of 1109 m, and flows slowly NW in meandering channels along the flat valley floor of the ROCKY MTN TRENCH to PRINCE GEORGE, BC, where it bends to a southward course. The gravel banks of the Fraser then increase in height to 50-100 m where the river has cut down into the glacial deposits of the central Interior Plateau; the river's velocity of flow increases S of Prince George as it is joined by several tributaries, the largest being the NECHAKO R from the NW.

The Fraser enters FRASER RIVER CANYON S of QUESNEL, and where it is joined by the Chilcotin R from the W, the river has cut down 300-600 m into the bedrock of the Interior Plateau. At the southern end of the canyon, near Yale, the river flows between the N end of the CASCADE MTS to its E and the COAST MTS on the W. In this middle section the Fraser is joined by large tributaries such as the Quesnel and THOMPSON rivers from the E and the West Road and Chilcotin rivers from the W. At HOPE the Fraser is only about 5 m above sea level, though this height varies seasonally. Its average annual flow here of 269 000 m<sup>3</sup>/s varies between an average low of 70 800 m<sup>3</sup>/s in March and an average peak flow of 850 000 m<sup>3</sup>/s in June. The Lower Fraser R bends westward at Hope and its valley broadens into a delta that is about 50 km wide where the river empties into the Str of GEORGIA. The southwestern part of the Fraser delta is in Washington state, USA.

The river was named by David THOMPSON after Simon FRASER of the NWC, the first European to follow its course to its mouth in 1808. Little use was made of its central portion, because of its turbulent currents, until the discovery of gold on sandbars N of Yale in 1857. The Cariboo gold rush which followed to the N brought the first narrow road (CARIBOO ROAD), carved into the canyon walls, and later the CPR followed the gash of the Thompson-Fraser rivers as the only low-level route through the Coast-Cascade mountain barrier to southwestern BC.

The Fraser R basin is well forested in its central sections, but has grassland vegetation and cattle ranching in the SW along the Chilcotin R and in its dry lower altitudes, as near ASHCROFT. Numerous large sawmills and pulp and paper

The spectacular Fraser River Canyon was formed some 20 million years ago when the river cut down into the uplifting southern part of the Interior Plateau (photo by Michel Marengere/Reflexion).

mills are the basis of the urban economies in the largest cities of KAMLOOPS, Prince George and Quesnel. Mining of gold, copper, molybdenum and mercury has flourished at various times and places throughout the basin. The headwaters of the river's many tributaries are the spawning grounds of PACIFIC SALMON, which are caught later off the mouth of the Fraser.

J. LEWIS ROBINSON

**Fraser River Canyon** was formed during the Miocene geological period (about 20 million years ago) when the river cut down into the uplifting southern part of the Interior Plateau of British Columbia. The canyon characteristics of this middle section of the FRASER R extend about 270 km N of Yale. At HELL'S GATE, S of LYTON, the canyon walls rise about 1000 m above the narrow, rushing river; 2 transcontinental railways and the Trans-Canada Hwy have been carved into the rocky canyon sides. Fish ladders were built along the river's side to permit migrating PACIFIC SALMON to pass a former rock slide that partially blocked the river. J. LEWIS ROBINSON

**Fraser River Lowland** is a triangular area in southwestern BC at the mouth of that river. The eastern apex of the triangle is at HOPE, about 160 km inland from the Str of GEORGIA, and the lowland broadens to the W to a width of about 50 km. The international boundary between BC and Washington state crosses the southwestern part of the lowland. The COAST MTS form the northern boundary of the delta-lowland. The lowland is the largest area of level land with suitable agricultural soils in coastal BC.

The lowland is formed from both glacial and alluvial deposits laid down more than 10 000 years ago as a delta at the mouth of a much larger postglacial Fraser R. Following postglacial uplift of the land and erosion into the deposits by the modern FRASER R, the older delta deposits are now about 100 m above sea level. Lower-level lowlands, almost at sea level, are the result of recent alluvial deposition along the floodplain of present Fraser R channels and are protected from flooding by dikes. Dairy farming is typical on the alluvial soils of the lowest areas; the poorer soils of the postglacial, raised delta are used for small fruits, berries, poultry farming and forests.

Known locally as the Lower Fraser Valley or the Lower Mainland, the lowland holds more than half of the population of BC, including on

its NW edge the city of VANCOUVER. Much of the western section of the delta-lowland has been occupied by the outward spread of residential, commercial and industrial land uses of Metropolitan Vancouver; in other parts of the lowland, agricultural land is protected from urban encroachment by zoning regulations. Indians occupied fishing sites near the mouth of the Fraser for a few thousand years before the establishment of FORT LANGLEY in 1827. Agricultural settlement came after the Fraser and Cariboo GOLD RUSHES 1856-62, but the full agricultural use of the lower lands with better soils had to await improvements in drainage and diking early in the 20th century. J. LEWIS ROBINSON

**Fraud** The criminal law of fraud has developed relatively recently. According to traditional English common law, it was generally no offence to defraud someone, particularly if the victim failed to exercise common prudence. Under the Canadian CRIMINAL CODE everyone who by deceit, falsehood or other fraudulent means defrauds the public or any person of any property, money or valuable security is liable to either 10 years imprisonment, if the value of the subject matter is over \$200, or up to 2 years if it is not. In addition, the Criminal Code sets out a number of offences involving fraud in special circumstances, eg, in the use of the mails, concerning precious metals, etc. In *Theft and Fraud*, the federal Law Reform Commission recommended that the law of fraud be simplified but that its substance remain essentially unchanged.

LEE PAIKIN

**Fréchette, Louis-Honoré**, poet, playwright (b near Lévis, Qué 16 Nov 1839; d at Montréal 31 May 1908). Fréchette was the most important man of letters in 19th-century Québec. The son of an illiterate contractor, he studied first under the Brothers of the Christian Schools and then in 3 classical colleges: the Petit Séminaire de Québec, Ste-Anne-de-la-Pocatière, and Nicolet. After graduation he studied law at Laval. He was already writing poems and his first play, *Félix Poutré* (1862); his first collection of verse, *Mes loisirs*, appeared in 1863.

After unsuccessful attempts at practising law and founding Liberal newspapers, Fréchette emigrated to Chicago, where he remained for 5 years (1866-71) working for the Illinois Central Ry. While there he launched other newspapers and wrote for the stage, but his manuscripts perished in the Chicago fire of 1871. His only surviving work from this period is a violent verse polemic, *La Voix d'un exilé* (1866-69), denouncing the Canadian Confederation of 1867 and its Conservative sponsors.

Returning to Canada, Fréchette threw himself into politics, sitting as federal member for Lévis from 1874 to 1878. After marrying into a wealthy family in 1876, Fréchette devoted himself increasingly to literature, and his second verse collection, *Pêle-mêle* (1877), was well received. By distributing complimentary copies in France, Fréchette paved the way for his recognition by the French Academy, which awarded him a Prix Montyon in 1880. Henceforth Fréchette was the unofficial poet laureate of French Canada, composing odes for public occasions, issuing collections of his poetry and adapting the works of others for the stage. His best-known volume of verse is *La Légende d'un peuple* (1887), a series of historical tableaux tracing the history of Québec from Jacques Cartier to Louis RIEL. Subsequently Fréchette wrote chiefly in prose, polemical letters on Québec education (1893), replies to the attacks of his rival William Chapman (1894), and Christmas stories in English (1899) and French (1900). Decorated in France and England, honorary doctor of 4 Canadian universities, and president of the RSC (1900-01), Fréchette was the most widely honoured literary figure of his time in Canada. DAVID M. HAYNE

**Fredeen, Howard**, agricultural research scientist (b at Macrorie, Sask 10 Dec 1921). He received an MSc from U Sask in 1947 and joined the staff of the Lacombe RESEARCH STATION, Alta, subsequently obtaining a PhD in ANIMAL BREEDING and GENETICS from Iowa State College (1952). Fredeen spent his entire career with Agriculture Canada's Research Branch, retiring 6 July 1984. With the late J.G. Stothart he was the co-developer of the Lacombe breed of HOGS, still renowned for its excellence. Fredeen played a major role in developing Canadian livestock breeding policies and in introducing innovative breeding practices and new techniques for carcass evaluation. As well as writing more than 300 scientific and technical papers, he has established an international reputation by frequently representing Agriculture Canada abroad. He has received numerous honours, including a fellowship in the Agricultural Institute of Canada, the Public Service of Canada Merit Award and the Genetics Society of Canada Award for excellence. Fredeen has edited a history of Lacombe district and has received a Lacombe Citizen of the Year Award. ADRIANA A. DAVIES

**Fredericton, NB**, City, pop 43 723 (1981c), inc 1848, provincial capital, is located in central New Brunswick, just below the head of tide on the SAINT JOHN R. 135 km inland from the Bay of FUNDY.

**Settlement** The founding of Frederick's Town between 1783 and 1785 was inextricably interwoven with the attempts of the LOYALISTS and their sympathizers to create a new province and a "haven for the King's friends" in British North America. Carefully planned ahead of any permanent settlement, Fredericton (named after Prince Frederick of Osnaburg) was to be their capital and the centrepiece of their new society. Besides assuming the seat of government with the creation of NEW BRUNSWICK in 1784, Frederic-

ton was to become a British military headquarters, a centre of education and culture, and a stronghold for the Anglican Church. The capital was to take on an appropriately "aristocratic flavour" in contrast to the fledgling commercial entrepôt of SAINT JOHN, already distastefully dominated by "men in trade."

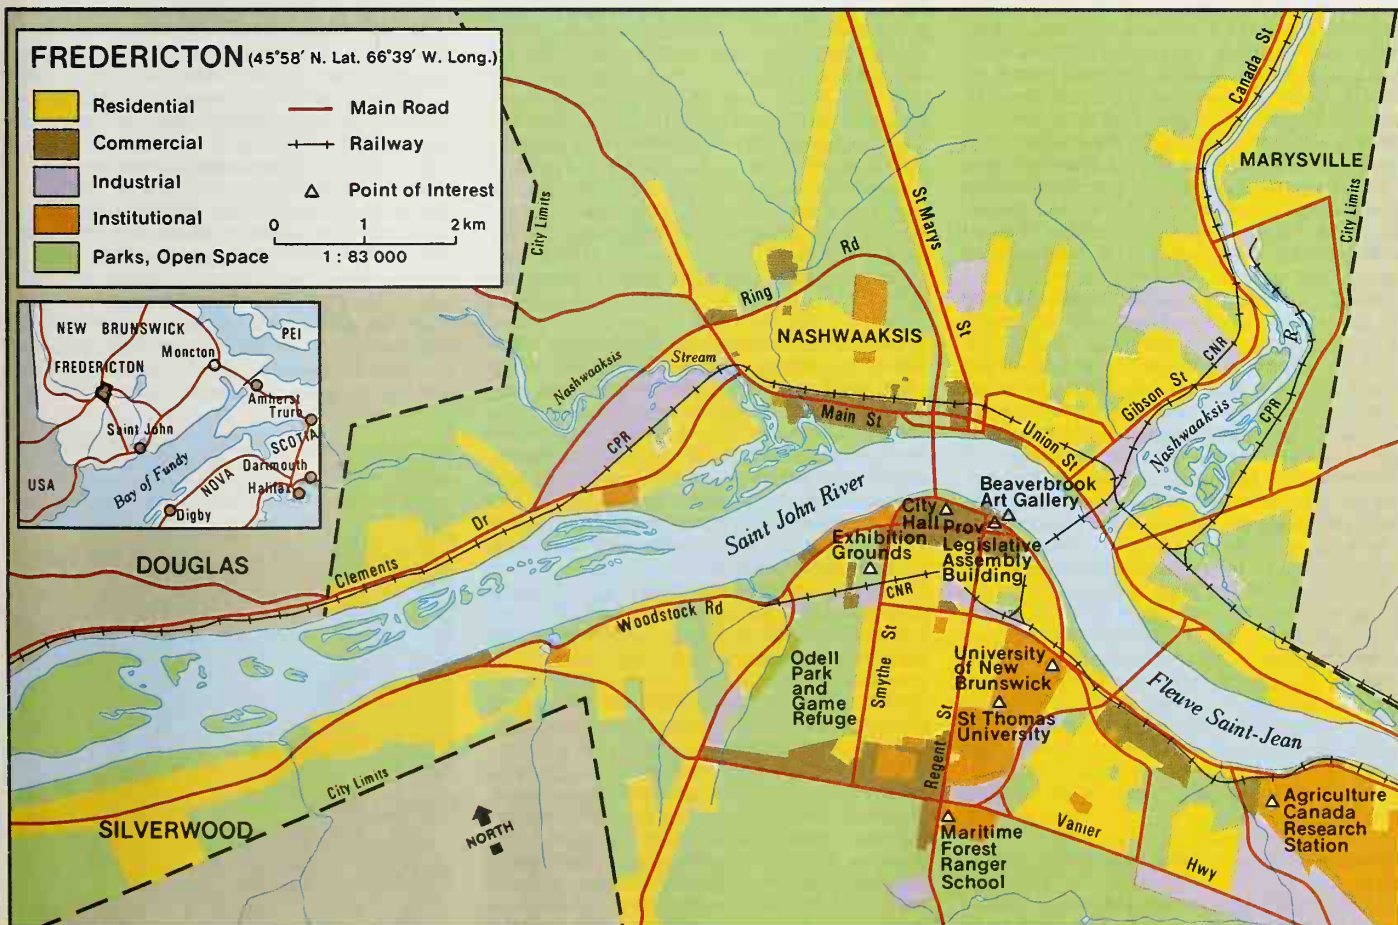

Prior to the arrival of the Loyalists, both the advantages and disadvantages of the future site of Frederick's Town had been realized by Indians and Acadians. The MALISEET recognized the value of the scenic alluvial plain that had formed at this central, inland river junction. It marked the terminus of an important portage route from the MIRAMICHI R and for several generations was the site of Maliseet camps and a burial ground. The strategic advantages of St Anne's Point (as it became known) were not fully recognized, however, until 1691 when Gov Joseph Robinau de Villebon decided to establish the capital of ACADIA at the mouth of the Nashwaak R, opposite the alluvial plain. The site afforded a fine deepwater anchorage on the main artery into the region, and it could be defended more easily from the attacks of the British or New Englanders than a location closer to the Bay of Fundy. Yet by 1698 de Villebon abandoned Fort Nachouac. Eminently secure in wartime, in times of peace the site was too isolated from the main routes of trade, commerce and communication to do well economically. In the 1730s Acadian farmers established a settlement on the rich soils of the plain at St Anne's; but less than 20 years later they were described as "exceeding poor" and had "become half savage from neglect." The final remnants of the settlement were violently swept aside in 1759 as part of the British Conquest of Canada, clearing the way for the Loyalists and their "design."

**Development** In the 200 years following 1783, Fredericton unfolded very much as its founders had hoped. In addition to its role as

provincial capital, it became the shiretown of York County (1785). Substantial pieces of land on the town plot were set aside for government, for a university, for the Anglican Church and for the military. The university was chartered as the Anglican King's College and began to grow "Up the Hill," especially after the construction of a fine stone building in 1828. Equally grand stone barracks and a military compound grew up in the centre of the town; and Bishop John Medley's selection of the community as the site for Christ Church in the newly created Anglican see of NB in 1845 was directly responsible for the elevation of Fredericton to city status in 1848, despite its meagre population of 4400. A magnificent cathedral was constructed from 1846 to 1853, close to the government buildings and the university.

In time, modifications were made to the Loyalist design. King's College was reorganized into the nondenominational UNIVERSITY OF NEW BRUNSWICK in 1859, as Methodists and other nonconformists from Saint John and all corners of the province assailed Fredericton and its Anglican "establishment." The British garrison left in 1869 with the coming of the Canadian Confederation, by which time Irish, Presbyterians and Catholics had altered the demographic and religious base. Lumbering, and to a lesser extent agriculture, plus Fredericton's role as a point of transshipment between the lower and upper Saint John R, brought some prosperity throughout the century.

**Population** The city grew slowly — to only 7117 by 1901. In 1941 it still contained only 10 062 inhabitants. The immigrants brought diversity, divisions and community tensions; an Irish Catholic was killed in "Orange-Green" riots in 1847, and there were less violent political conflicts between the poorer Upper Towners and the more affluent, "established" Lower Towners over town-clock, marketplace and wharf sites.

View of Fredericton from River (1830), watercolour by an anonymous artist. As a Loyalist haven and capital town, Fredericton took on an appropriately aristocratic and genteel flavour (courtesy Beaverbrook Art Gallery).

Yet a "gentlemanlike" atmosphere prevailed in the city. Fredericton's genteel society was responsible for producing such literary figures as Bliss CARMAN and Sir Charles G.D. ROBERTS. In the 20th century, Max AITKEN donated a fine art gallery (Beaverbrook Art Gallery) and a playhouse was built, both in the Lower Town nexus adjacent to the cathedral and provincial assembly.

**Cityscape** A different kind of society emerged on the N side of the river during the 19th century. In 1862 Alexander "Boss" Gibson began the construction of his industrial empire at Marysville with a lumber mill on the Nashwaak. Before he was done he had constructed one of the largest cotton mills in Canada (1883-85) and an entire community to go with it. He built brick row houses for his workers, detached homes for management, a boarding house, a company store, a magnificent Methodist church and a railway to Chatham, though Gibson was forced to sell out in 1908 under pressure from a central Canadian cotton consortium that he refused to join, the mill limped on until 1973, and Marysville added another very different, industrial working-class community to the Fredericton area.

Overall though, Fredericton continued to be dominated by its government and university functions, and has retained its air of gentility. Industry has come and gone, yet politics and education have expanded substantially since WWII, stimulating the city's largest-ever surge forward in physical and population growth. In the last 30 years it has expanded to an area of 130 km<sup>2</sup> and a population of over 43 000, annexing the north-side communities of Marysville, Devon and Nashwaaksis in the process. As before, this growth has added further complexities to the city's society and created major tensions over such issues as a highway bridge across the Saint John R, largely for the benefit of the people on the N side, which threatened to level half of the gentility's south-side downtown in the process. Still, Fredericton remains much as its founders would have wished: small, intimate and personal, cultured, refined and with an air of prosperity and importance in the midst of a relatively poor province more influenced by "men in trade" and rugged, coarser woodsmen.

ALAN BROOKES

**Freedman, Harry**, composer, English-horn player (b at Lodz, Poland 5 Apr 1922). He is one of the first nationally known composers to have trained almost entirely in Canada. Initially dis-

posed to a career as an artist, Freedman attended the Winnipeg School of Art at age 13. After an interest in big band jazz led to clarinet lessons at age 18, he was introduced to the symphonic repertoire by teacher Arthur Hart. This early experience with painting and jazz has influenced much of his subsequent work. Continuing his musical education in Toronto, Freedman took up the oboe and studied composition with John WEINZWEIG 1945-51. He was with the Toronto Symphony playing the English horn 1946-71. In 1971 Freedman was appointed the orchestra's first composer-in-residence and thereafter dedicated most of his time to composing. Weinzwieg's influence is manifest in Freedman's use of various aspects of the 12-tone technique: strictly in *The Tokaido* (1964) for chamber ensemble, more informally in *Tangents* (1967) for orchestra. Several important compositions were inspired by Canadian paintings: *Tableau* (1952), *Images* (1958), *Klee Wyck* (1970). Freedman first won critical acclaim for his superb orchestration, a legacy of his symphonic experience, with *Symphony No 1* (premiered 1961). Wit and humour are displayed *The Explainer* (1976), a satire on the jargon of the music-appreciation lecturer. Freedman has also written music for theatre, television and film, notably Paul ALMOND's *Act of the Heart*. He collaborated with Brian MACDONALD on *Rose Latulippe*, a ROYAL WINNIPEG BALLET commission, and on several other Royal Winnipeg ballets.

ANNSCHAU

**Freedom of Information** During the 1960s and 1970s citizens, as users of government services, began to feel entitled to certain rights arising out of their relationship with government. Initially, this was manifested in the growth throughout Canada of the institution of the OMBUDSMAN, generally designed as a mechanism to redress government wrongs and reduce the "red tape" characteristic of government bureaucracy, but later extended largely to the issue of access to government information.

Government information and its accessibility may be divided into categories, first, that concerned with access to government information concerning oneself stored in government data banks. Federally, this information became accessible to individuals in 1978, with the enactment of so-called PRIVACY legislation. Essentially, the federal government established an index of federal government data banks; individuals could apply to a given data bank contained in the index for access to information concerning themselves. The enabling legislation did, however, provide for a series of exemptions in categories such as national security, federal-provincial relations, ongoing law-enforcement meant to invoke an exemption and withhold the

investigations and others. If the government invoked a "blanket" exemption, universally eliminating specified data banks from access, or an exemption in respect to an individual application, part or all of the information might be withheld, but individuals did have recourse to a privacy commissioner who could represent the interest of a dissatisfied applicant. If the decision of the particular government department remained unchanged, no further recourse was available. If information was provided and applicants believed it to be erroneous, the privacy commissioner could again come to their assistance; and if there was a refusal to change the information, at the very least it would be noted in the data bank that a request for a change in the information had been made and denied. The legislation was amended in 1982, effective 1 July 1983, to allow a further recourse in the event of either a denial of information through the invocation of an exemption or a refusal to change allegedly incorrect information. If the privacy commissioner does not succeed in convincing the appropriate government department of either or both an entitlement or a change of allegedly erroneous information, there is now a right to have the matter reviewed, *in camera*, by a justice of the Trial Division of the Federal Court of Canada. A decision by this judge is binding on all parties and must be followed.

The second kind of government information is what might be described as policy information, eg, anything contained in government files that contributes to the making of a government decision, including any decision relating to the enactment of either legislation or regulation or both (see OFFICIAL SECRETS ACT). This information may take the form of consultants' reports, internal studies, etc. Following a complex legislative history — which included private members' bills, a federal government Green Paper, draft legislation by one government and subsequent legislation enacted by another government — the Access to Information Act was finally passed in 1982 and took effect on 1 July 1983, chiefly as a result of strenuous lobbying by the Canadian Bar Association. This "freedom of information" law entitles an individual to examine this kind of government information and it provides for the speedy provision of the information at reasonable cost. It establishes an information commissioner, with a role and function similar to that of the privacy commissioner and also provides for certain exemptions under which some or all of the information may be withheld. Again, an applicant may apply to the Trial Division of the Federal Court of Canada for a review, *in camera*, of the decision by government to invoke an exemption and withhold the

Cartoon by Duncan Macpherson (Oct 1978) mocks the attitude of government in preventing access to information. The rationale for freedom-of-information laws is that an informed citizenry has a right to evaluate its government in an enlightened way (Public Archives Canada/C-112688/Toronto Star Syndicate).

information. One of the controversial features of the 1982 law is a section which provides that Cabinet documents, and in effect any other document referring to or flowing from Cabinet documents, fall outside the law. Such documents are not only unavailable, but are also not subject to the review procedure.

Some provinces have freedom-of-information laws and others have conducted studies on the subject, but generally most provinces have not entered this field as deeply as has the federal government.

The main rationale for the enactment of freedom-of-information laws is that an informed citizenry must have access to government information in order to assess, evaluate and select government in an enlightened way. Secondly, presuming that knowledge is power, it is argued that citizens are entitled to share that power with government and are best able to do so with access to government data. The users of freedom-of-information laws, judging from the American experience, have tended to be investigative journalists, academics (particularly historians) and defence counsels.

G. GALL

**French, Sir George Arthur**, soldier (b at Roscommon, Ire 19 June 1841; d at London, Eng 7 July 1921). A Royal Artillery officer, French established the Canadian Militia gunnery school at Kingston in 1871. As commissioner of the NWMP (1873-76), he organized the force and gave it its military character. A.B. McCULLOUGH

**French Canadian Nationalism**, a wide variety of manifestations of the collective will of much of Canada's French-speaking population to live as a distinct cultural community. Its innumerable ramifications have been not only cultural, but also political, economic and social. Historians disagree about its beginnings. Guy Frégault suggests that the inhabitants of colonial NEW FRANCE in the early 18th century were sufficiently different from those of France for a distinct national sentiment to exist. Michel Brunet argues that the CONQUEST of 1760, by transforming the French in Canada into a conquered people, sharpened a defence mechanism that has endured. Others, such as Fernand Ouellet, are convinced that NATIONALISM had its origin soon after 1800 when social strains and economic crises increased animosity between French and English inhabitants of LOWER CANADA. Political scientist Léon Dion distinguishes 4 types of French Canadian nationalism: conservative (dominant until 1960), liberal (post-1960), social-democrat and socialist (both "challengers" since 1960). Wherever the debate may lead, it is clear that French Canadian nationalism has been present for at least 150 years and that, because of its nature, it will probably endure as long as there are French-speaking Canadians (SEE HISTORIOGRAPHY IN FRENCH).

For over a century, French Canadian nationalism was generally linked to conservative causes and to the perpetuation of a traditional society. For the clerical and professional elite, fidelity to language, culture and religion implied respect for the acceptance of the established social order in which the Roman CATHOLIC Church dominated, agriculture was lauded as society's material and moral foundation, parish and family were the basic social institutions, commercial and industrial pursuits were disdained, and foreign influences were shunned. To what extent was this concept of nationalism shared by the common man? The very insistence with which the clerical elite defended its concept of society betrayed the existence of challenges to social orthodoxy, especially when nationalist credos seemed to conflict with conditions for individual material betterment. An agricultural way of life was vigorously defended by the nationalists, but by 1921 half of Québec's population was urban and migration to the cities

showed no signs of abating, except during the GREAT DEPRESSION, when industrial jobs were scarce.

Nationalism between the 1840s and the 1940s also had important political aspects. It meant refuting the death sentence pronounced, in the celebrated DURHAM REPORT, on the "inferior" French Canadian nationality, and struggling against the conditions imposed by the 1840 ACT OF UNION which in 1841 joined Upper and Lower Canada into a single colony. It signified fighting for recognition of French and Catholic rights at CONFEDERATION, notably within Québec, and later in the English-speaking provinces in the face of attempts to abolish French or Roman Catholic schools (SEE MANITOBA SCHOOLS QUESTION). It encompassed Jules-Paul TARDIVEL's efforts to promote an independent French state in N America, a sort of reconstituted New France. It also meant an unrelenting campaign, with considerable popular support, against what was regarded as British imperialism — political, economic and especially military. Henri BOURASSA's nationalist group led this battle, which culminated in the 1917 CONSCRIPTION crisis when French Canada massively refused compulsory military service overseas. This crisis was replayed during WWII, though with somewhat less dramatic political consequences.

After 1900 some nationalists became increasingly preoccupied with economic questions. Errol Bouchette argued that French Canadians must take hold of their industry and avoid yielding the province's natural resources cheaply to foreign control. In the 1930s, members of ACTION LIBÉRALE NATIONALE proposed nationalization of certain foreign-owned (ie, non-French Canadian) monopolies, such as the electricity trust. Others, in an effort to promote French Canadian commerce, led "Buy French Canada" campaigns and warned against patronizing Jewish establishments.

Following WWII, rapid changes in French Canadian society, characterized by increasing diversity, led to new expressions of nationalism (SEE QUIET REVOLUTION). Economic and political themes became central and, particularly after 1960, the province of Québec became principal supporter of the French Canadian collectivity, or at least of those French Canadians (about 80% of the Canadian total) living within Québec. For example, after the 1962 provincial election, in which nationalist themes predominated, the government nationalized private electric power companies, integrating them with the existing HYDRO-QUÉBEC; in 1982 it ranked as Canada's largest crown corporation as judged by assets.

But the major debate centered on the place of Québec and French Canada in Canada. Daniel JOHNSON, Québec premier 1966-68, Claude RYAN, editor of the daily newspaper *Le Devoir*, and others favoured a new Canadian constitution that would expand Québec's area of legislative jurisdiction and establish a bilingual and bicultural Canada, ensuring the equality of the 2 founding peoples (SEE DEUX NATIONS). Still others attacked the so-called Canadian dream as unrealistic; for them the solution was political independence. In the early 1960s several parties and movements sprang up, preaching independence within a variety of social frameworks ranging from the extreme left to the extreme right. Of these, the Rassemblement pour l'indépendance nationale and the Ralliement national participated actively in the 1966 provincial election. In 1967 René LÉVESQUE, a former member of Jean LESAGE's Liberal Cabinet, founded the Mouvement Souveraineté-Association, transformed the following year into the PARTI QUÉBÉCOIS, which was elected in 1976 and again in 1981. In 1977 that government adopted a French Language Charter (SEE BILL 101) which generally responded to nationalist language desires. In May 1980 the government held a provincial referendum

in which it asked for a mandate to negotiate sovereignty-association with the rest of Canada. Nearly 60% voted "No," although French-speaking Québécois were split almost evenly.

Canada's new CONSTITUTION, adopted Apr 1982, was welcomed rather coldly by most French Canadian nationalists, regardless of political affiliation, since it seemed to end, at least temporarily, their hopes to gain greater power for Québec. Political events since 1980 as well as difficult economic and social conditions within Québec seem to render necessary a redefinition of nationalist goals, as well as signalling upheavals within the nationalist camp itself.

RICHARD JONES

Reading: R. Cook, *French Canadian Nationalism* (1969); D.B. Miquelon, *Society and Conquest* (1977); S.M. Trofimenkoff, *The Dream of Nation* (1983) and ed, *Abbé Groulx* (1973).

**French in the West** In the 17th century Frenchmen travelled west from Montréal as COUREURS DE BOIS and explorers, searching for furs and an overland route to the MER DE L'OUEST. Pierre RADISSON and Médard Chouart DES GROSEILLIERS, who journeyed to Lk Superior 1659-60, persuaded the English to establish posts on Hudson Bay (SEE HUDSON'S BAY CO), and in 1682 Radisson explored 300 km inland from the bay. In the 1730s Pierre LA VÉRENDRYE and his sons extended the French fur routes westward, establishing a chain of forts in the Winnipeg Basin. After the Conquest (1760), French traders in the West worked for the NORTH WEST CO and the HBC, aiding in the expansion of the FUR TRADE to the shores of the Arctic and Pacific. The first white woman to live in the West was Marie-Anne Lagemodière, the wife of a fur trader.

From the earliest times, many French traders married native women. Their children, the MÉTIS, lived throughout the Prairies. Seminomadic, many of them worked as guides and interpreters for the fur-trading companies. At the request of Lord SELKIRK, missionaries were sent from Québec to the North-West; Fathers Provencher and Dumoulin reached the RED RIVER COLONY in 1818. In 1844 the diocese of the Red River became the Apostolic Vicariate of the North-West under Father (later Bishop) Provencher's guidance. Schools were established by the Grey Nuns and the Christian Brothers. The Métis were encouraged to settle on the land. By 1845 Bishop Provencher had persuaded the Oblate Order in France to send missionaries; one of the first to arrive was Alexandre TACHÉ, who later recruited Father GRANDIN. Grandin, with Father Albert LACOMBE, helped found the Catholic Church in what is now Alberta.

Taché was a witness to the events leading to the formation of Louis RIEL's provisional government in 1870 and he pleaded with John A. Macdonald for a general amnesty (SEE RED RIVER REBELLION). The Métis rebellion led by Riel was quashed at BATOCHE in 1885, and Riel was hanged for treason in Nov 1885 (SEE NORTH-WEST REBELLION). Riel's execution further divided the new Dominion along ethnic and religious lines.

Under the 1870 MANITOBA ACT both French and English had been granted equal rights, but by 1890 the large influx of English-speaking immigrants had altered the ethnic structure of Manitoba. The Manitoba legislature passed an Act depriving French and Catholics of certain rights (SEE MANITOBA SCHOOLS QUESTION). By 1892 the same situation had developed in the North-West Territories. The French Canadians in Québec, who until that time had considered the West part of their heritage, were now given to understand that a French-speaking western province would not be tolerated and that the constitutional rights of French Canadians regarding religion and language would be disregarded.

In 1976 a French Canadian, Georges Forest of St Boniface, Man, refused to pay a parking ticket

written in English only. The county judge ruled in his favour and after a series of appeals that went to the Supreme Court of Canada, Manitoba was once more declared a bilingual province. Further attempts to entrench French services for the French-speaking population, made by the Pawley government in 1984 met with strong opposition in the legislature and throughout the province. Conservative Opposition tactics prevented a vote from being taken in the House and the Pawley government was forced to withdraw its amendment. The Conservative tactics were severely censured by the federal representatives of all parties, and the French Canadians have once more taken their case to the Supreme Court.

Over the years the western provinces have attracted a variety of French-speaking immigrants. Some have been from Québec, although in the last decades of the 19th century Québec discouraged its inhabitants from moving west; too many people were already leaving the province for the New England states. Nevertheless, French Canadian missionaries promoted francophone settlement in the West, especially between 1880 and 1912. Many of the settlers came from France, while others were from Québec, New England and Belgium (though WWI ended immigration from Belgium and France). Most of them settled in the Prairie provinces. During the GREAT DEPRESSION another group of French-speaking settlers established themselves in the PEACE RIVER LOWLAND. The oil boom in Alberta and the development of the pulp and paper industry in BC have attracted the most recent migrants from Québec to the West. There are now some 320 000 persons of French extraction living in the 4 western provinces, some 180 000 of whom claim French as their mother tongue. The 1981 census gives the following statistics by province: Manitoba 74 050; Saskatchewan 46 915; Alberta 111 865; BC 92 310.

French Canadians have contributed to the economic and political structures of western Canada from earliest times. They sat in the Council of the North-West Territories and in the first legislatures of the Western provinces. Men such as Lessard, Gariépy, Côté, Blais, Giroux, Déchêne, Joly, Beaudry, Tremblay, Villeneuve, Tellier, Maynard, etc. were actively involved in the Albertan and federal political scene, either as senators or members of Parliament. The list is much longer for Manitoba. Québec established banking institutions in the West; the Banque canadienne nationale (or Banque D'Hochelega as it was earlier known) helped fund new settlers of all ethnic groups. Hospitals, colleges and convents were founded and financed by Québec religious institutions. Insurance companies such as La Sauvegarde and La Familiale in Saskatchewan offered their services to French Canadians in the West; CAISSES POPULAIRES, founded during the Depression, still prosper.

In business, French Canadians participated in the development of the West and as doctors, lawyers, judges, engineers, architects, etc. have been strongly represented in the professions. French-speaking western Canadians have included outstanding writers in the fields of journalism, history and literature (see Gabrielle roy, Georges BUGNET). A recent publication, *Répertoire littéraire de l'ouest canadien*, lists 84 literary authors who wrote and published in French in western Canada. This anthology is published by CEFEO in St Boniface, Man.

ROGER MOTUT

**French Language** In the early 17th century France founded 2 colonies in N America: ACADIA and NEW FRANCE. In 1755 the English deported over 10 000 of the approximately 14 000 Acadians. Many of the exiles subsequently returned to settle in New Brunswick, Nova Scotia and PEI. Today their descendants number more than 350 000, and three-quarters of them still speak French. New France developed slowly; it had a

population of less than 13 000 in 1695 and approximately 70 000 in 1763, when it became a British colony. Today over 5 million descendants of these early French settlers live in the province of Québec, and almost a million more are scattered W of Québec from Ontario to British Columbia (see also FRANCO-AMERICANS).

The early settlers of Acadia and New France came from various localities in Europe (mostly from France), and the forms of language they spoke reflected their different regions of origin. In Acadia, according to records for 1707, 51% of the population came from Poitou, Aunis and Saintonge; 3% from Guyenne and Pays Basque; 11% from Brie, Orléans, Paris, Normandy, Maine and Brittany; 1% from Champagne and Burgundy; in addition, 26% were of unknown French origin, 5% were of English and 4% of other origins. In New France in 1700, 29% had originated in Poitou, Aunis, Saintonge and Angoumois; 5% in Limousin, Périgord and Guyenne; 22% in Normandy and Perche; 15% in Paris and Île-de-France; 13% in Anjou, Touraine, Beauce and Maine; 9% in Brittany, Picardy and Champagne; and 7% in other regions. This distribution reveals that over half of the Acadians came from western France, between the Loire R and the Pyrénées, and that about one-eighth came from N of the Loire. In Canada the reverse was true: well over half came from N of the Loire and about one-third from S of that river. This difference in origins is at the root of the difference between today's 2 closely related dialects, *Acadian* and *Franco-Canadian*.

The colonists who settled in Canada simply reflected the linguistic situation prevailing in France in the 17th and 18th centuries, when dialects flourished. French was spoken only by those from Paris and Île-de-France (administrators, functionaries, members of the church and army officers). Those from elsewhere spoke various *patois*, and true French speakers were rare. Upon arrival in the New World, the *patois* speakers did not establish linguistically distinct communities; French dominated, and this resulted in the creation of a common Canadian tongue, very close to French, by the end of the 17th century. By mid-18th century the various *patois* no longer existed in Canada, although their influence on Canadian French could still be heard in isolated words, morphological forms, pronunciation and intonation.

**Canadian French Today** The 1981 census reported over 6 million Canadians claiming French as their mother tongue. Dialectologists and sociolinguists have conducted many studies of French, particularly since the 1960s, in the Maritimes, Québec and Ontario, in both rural and urban areas; the 4 western provinces have been virtually neglected.

Acadian and Franco-Canadian speakers understand one another easily. Acadian, spoken in the Maritimes and in parts of Québec (Magdalen Is, southern Gaspé and certain villages on the N Shore of the St Lawrence, including Havre-St-Pierre and Natashquan), is characterized by certain distinctive phonetic features. It is also characterized by numerous words originating from regions S of the Loire, eg, *éparer* (Fr *étendre*, "to hang out [fishing nets] to dry"), *charrette* (*tombereau*, "cart"), *remeuil* (*pis*, "cow's udder"), *coquemar* (*bouilloire de cuisinière*, "kettle"), *lissee* (*perche de clôture*, "fence post"), *amoureux* (*capitules de bardane*, "burdock flowerhead"), *barge* (*meule de foin*, "haystack") and *bargou* (*gruau*, "gruel").

Franco-Canadian, although spoken throughout an extensive region and having certain regional differences in vocabulary (Montréal, Québec City, central Québec, Saguenay-Lac Saint-Jean) is characterized by archaisms, dialectalisms, borrowings from N American Indian languages, and anglicisms. The many archaisms (a feature common to emigrant languages) include such expressions as *mitan* (modern Fr *mi-*

*lieu*, "middle"), *serrer* (*ranger*, "to tidy"), *gager* and *gaguer* (*parier* and *pari*, "to bet" and "a bet"), *noirceur* (*obscurité*, "darkness"), *dalle* (*gouttière d'un toit*, "eavestrough") and *menterie* (*mensonge*, "lie"). The several hundred Indian borrowings, which are proof of a long history of contact between Francophones and Canada's indigenous peoples, include *babiche* (*mince lanière de cuir*, "thin strip of leather"), *nigog* (*(variété de) harpon*, "[type of] harpoon"), *boucane* (*fumée*, "smoke"), *atoca* (*canneberge*, "cranberry"), *micouenne* (*cuiller en bois*, "wooden spoon"), *sagamité* (*bouillie de maïs*, "cornmeal"), *pimbina* (*viorne trilobée*, "viburnum"), *achigan* ("black bass") and *manitou* ("God").

Canadian French has also been much influenced by English. Anglicisms are used in the language of general administration, justice, business and industry where, not long ago, borrowed English words were very numerous. For example, unilingual francophone forest workers had only English technical words, eg, "cull" (*bois de rebut*, "boom" (*estacade*), "skid" (*longeron*), "skidder" (*débusqueur*) and "cant-hook" (*sapi or levier*; see PEAVEY). Since the 1960s the pressure exerted by the English language has been weaker, because of an increased general awareness of French vocabulary on the part of workers and as a result of legislation designed to make French the language of work in Québec.

Spoken and written Canadian French is used at many different levels: the written language of a theatrical play set in a working-class quarter of a large city (see JOUAL), for example, is different from the language of a philosophical treatise. In the early 1980s English words were used less than 1% of the time in working-class areas.

Since the early 1960s, and in step with the QUIET REVOLUTION, the general level of college and university education among Francophones has risen greatly, particularly in scientific fields. This fact, together with federal and provincial legislation and pride on the part of French speakers, indicates that the French language in Canada, particularly in Québec, New Brunswick and Ontario, is assured not only of survival but of continued change and growth. See LANGUAGE POLICY.

**French River**, 290 km long (to head of Sturgeon R), rises in Lake NIPissing, splits into 2 branches around Eighteen Mile I, reunites and plunges through a narrow channel towards GEORGIAN BAY. Its rocky shores are a maze of channels and bays, and its course follows a complex of natural fissures and faults in the Canadian SHIELD. The river was a swift, one-day run for the VOYAGEURS, and played a part in the fur trade as early as 1615, when it was travelled by CHAMPLAIN. It is still a popular canoe route, and muskellunge, walleye, bass and pike are plentiful. Fur-trade artifacts have been recovered, and Indian rock paintings are visible near Keso Point.

JAMES MARSH

**French Shore** was an area of coastal Newfoundland where French fishermen enjoyed treaty rights granted by the British from 1713 to 1904. Anglo-French rivalry in Newfoundland began in the 1500s, intensified in the 1600s over the establishment of fishing stations and colonies, and was ultimately decided by European wars. In 1713 the TREATY OF UTRECHT recognized British sovereignty over all French colonies and fishing territories in Newfoundland, except for the right to use for fishing, but not settlement, the coast westward from CAPE BONAVISTA, around BONAVISTA B, NOTRE DAME B, White Bay and the Great Northern Pen, S to Point Riche, near PORT AU CHOIX. In peace negotiations between Britain and France 1713-1814 the French Shore was usually an issue. The TREATY OF PARIS (1763) confirmed the 1713 boundaries but ceded SAINT-

PIERRE AND MIQUELON to France. The Treaty of Versailles (1783) altered the French Shore boundaries to the coast between Cape St John on the W side of Notre Dame B, around the Great Northern Pen, and southward along the entire W coast of Newfoundland to Cape Ray, NW of CHANNEL-PORT AUX BASQUES. These terms were confirmed by the 1814 Treaty of Paris.

Between 1815 and 1904 the French Shore ceased to be a wholly Anglo-French issue as Newfoundland gained representative (1832) and responsible (1855) government and began to challenge France's claim to exclusive use of the shore. Settlement radiated W in the 1800s and the colony pressed its claims to a concurrent fishery. Despite numerous conventions and commissions, it was not until the Anglo-French Convention of 1904 that France ceded all fishing rights, except for an equal summer fishery and the islands of Saint-Pierre and Miquelon. Though the French Shore disappeared, its influence is still felt in some areas, in the language, music and folk culture as well as in modern place-names.

**Frenkel, Vera**, artist, independent film and video producer, writer (b at Bratislava, Czech 10 Nov 1938). Recognized internationally as a printmaker and sculptor, Frenkel, since 1974, has been in the forefront of the visual, spatial and narrative uses of video. Her first video work, *String Games: Improvisations for Inter-City Video* (1974), a live-to-tape telecast between Montréal and Toronto, dealt with questions of language, codes and signs, and the invention of meaning. The video installation, *Signs of a Plot: A Text, True Story and Work of Art* (1978) and *The Secret Life of Cornelia Lumsden* (1979), a trilogy written, directed and performed by the artist, is located at the boundary between documentary and fiction. *The Last Screening Room: A Valentine* (1984) continues her work with the mythic properties of popular and narrative structures. At U of T, 1970-72, and York U since 1972 Frenkel has gained a reputation as an innovative teacher. Her fiction and poetry have appeared in *Descant*, *Impressions* and *C Magazine*, and a collection of her poetry and drawings, *Image Spaces*, was published in 1972.

JOYCE ZEMANS

**Frezenberg Ridge** Princess Patricia's Canadian Light Infantry, composed largely of British-born former regular soldiers, had gone to Flanders in Dec 1914 in advance of 1st Canadian Division, as part of the British 27th Division. When the Germans launched a major attack into the YPRES Salient, over Frezenberg Ridge, on 8 May 1915, the PPCLI held the S shoulder of the breach. Despite incurring 392 casualties out of an initial strength of 546, the battalion held on and prevented the Germans from rolling up the British line S towards Armentières, France. See WORLD WAR I.

BRERETON GREENHOUS

**Friedman, Sydney Murray**, scientist, scholar, physician (b at Montréal 17 Feb 1916). A 1940 medical graduate of McGill, Friedman served in the RCAF during WWII. He returned to McGill and earned his PhD in anatomy (1946) and thereafter began a distinguished career in academic medicine. He was appointed the first professor and head of the Dept of Anatomy at UBC (1950-81). His scientific research on the effects of sodium and hormones on blood vessels in hypertension has spanned 40 years. He is known internationally as a scientific author and lecturer. Friedman's many honours include RSC membership, the J.C.B. Grant Award and outstanding service awards from the Heart Foundation and the Ciba Foundation. He is also a founding member of the BC Heart Foundation.

C.E. SLONECKER

**Friendship Centres**, are nongovernment native agencies, funded primarily by the Dept of the Secretary of State but autonomous in running their own affairs. These voluntary associations sponsor activities such as cultural events, dances, sports and recreation, job-training and educational services, and economic co-operatives, and are often located in urban areas. Regardless of their explicit functions, they are small and intimate enough to provide a social environment that is psychologically comfortable, and so function as friendship centres. Individuals help each other cope with the problems and anxieties of racial discrimination, poverty and alienation experienced in urban areas. Friendship and support networks can be established.

RENÉ R. GADACZ

Reading: J.A. Price, *Native Studies* (1978).

**Fripp, Thomas William**, painter (b at London, Eng 23 Mar 1864; d at Vancouver 30 May 1931). Grandson of the founder of the Royal Watercolor Soc (Nicholas Pocock) and son of George Arthur Fripp, under whom he studied, he also studied at St John's Wood Art School, the Royal Academy Schools (1887), and in France and Italy. Fripp immigrated to BC in 1893. He farmed at first then moved to Vancouver in 1904 where he worked in a photography studio for 2 years before turning to painting full time. He gained acclaim for his watercolours of the Rocky Mts and Pacific coast landscapes and painted some oils and portraits. A member of the BC Art League, he was founder and first president of the BC Society of Fine Arts (1909).

PATRICIA E. BOVEY

**Fritz, Madeleine Alberta**, paleontologist (b at Saint John 3 Nov 1896). She was educated at McGill and U of T and, while a student of William Arthur PARKS (and later as associate director of the Royal Ontario Museum of Paleontology), was a leader in the N American study of Ordovician bryozoa. For many years a professor of geology at U of T, she was the second woman in Canada to be elected a fellow in the Royal Soc of Canada. Her studies on the paleontology and stratigraphy of Toronto and vicinity stand as a definitive work.

JOAN BURKE

**Frobisher, Benjamin**, fur trader (b in Yorkshire, Eng, c1742; d at Montréal 14 Apr 1787), brother of Joseph and Thomas FROBISHER. After coming to Québec about 1763, he and his brothers entered the fur trade of the North-West. For the most part he managed business affairs in Montréal and England while his brothers traded in the field. The family was original shareholder in the NORTH WEST CO.

DANIEL FRANCIS

**Frobisher, Joseph**, fur trader, merchant (b at Halifax, Eng 15 Apr 1740; d at Montréal 12 Sept 1810). In partnership with brothers Benjamin and Thomas FROBISHER he was one of the "pedlars from Quebec" engaged in the fur trade in western Canada after 1770. In 1774-75 he wintered on the Churchill R in an attempt to intercept furs coming downriver to the HBC. This pioneering excursion led a few years later to the penetration by Québec traders into Athabasca Lk country. In 1776 Frobisher settled in Montréal where he became one of the great fur merchants. He was an original partner in the NORTH WEST CO and in 1787 joined Simon MCTAVISH to form McTavish, Frobisher and Co, the NWC's principal outfitter and sales agent. After his retirement in 1798, he lived at his stately home, Beaver Hall.

DANIEL FRANCIS

**Frobisher, Sir Martin**, mariner (b near Wakefield, Eng 1539; d at Plymouth, Eng 22 Nov 1594). In 1576 he searched W of Greenland for a passage to Asia, discovered FROBISHER BAY, and returned with ore thought to contain gold. He made a second voyage (1577), hauling back more earth. On his last expedition (1578), he

Sir Martin Frobisher, Elizabethan mariner, who in his search for a Northwest Passage to Asia ended up in remote Frobisher Bay on SE Baffin I (courtesy Public Archives of Canada/C-11413).

commanded a flotilla of 15 vessels. Driven by storms across the entrance to HUDSON STR, he landed at Kodlunarn I, in Warwick's Sound, where his men excavated tonnes of ore which proved worthless. Depressions in the rock where the miners dug and the ruins of a stone house are still visible. His patron, Michael Lok, was ruined, but Frobisher's seafaring career continued. He accompanied DRAKE to the West Indies and was knighted for his heroism against the Spanish Armada (1588). He died of wounds sustained in action against the Spanish at Crozon.

JAMES MARSH

**Frobisher, Thomas**, fur trader (b in Yorkshire, Eng 1744; d at Montréal 12 Sept 1788). After arriving in Québec in 1769, he joined his brothers Joseph and Benjamin FROBISHER in the western fur trade. In 1776 he founded the first trading post at ÎLE-À-LA-CROSSE, a stepping stone to the Athabasca Lk country.

DANIEL FRANCIS

**Frobisher Bay**, NWT, Town, pop 2333 (1981c), inc 1980, is located near the NE head of FROBISHER BAY on southern BAFFIN I, 1944 air km N of MONTRÉAL. The town is near the site of a traditional South Baffin Inuit fishing camp. The first European contact was made by Sir Martin FROBISHER on his search for the NORTHWEST PASSAGE in 1576. Today there is a mixed population of white and Inuit. It is the government administrative, communications and transportation centre of the eastern Arctic. Many in the community still subsist on fishing, sealing, trapping and carving.

ANNELIES POOL

**Frobisher Bay** is a deep indentation in the extreme SE coastline of BAFFIN I, over 230 km long and 40 km wide at the mouth, narrowing to 20 km towards its head. The configuration of the bay has a funnelling effect, so that the harbour of the settlement of FROBISHER BAY at the bay's head experiences a twice-daily tidal range of 7-11 m. The bay's general physiography is the result of tectonic events associated with the rifting of the N Atlantic in the early Tertiary, during which time that part of the Precambrian SHIELD in the Frobisher Bay area was downfaulted and the blocks on either side were uplifted and tilted up to the NE. An abrupt contact between these units is marked by the high cliffs rising from the bay, which because of the tilting are 330 m high on the N shore and twice that height on the S shore. Overdeepening occurred during the Pleistocene glaciation, when the Frobisher Bay trough was filled by a major outlet

glacier from ice centered over FOXE BASIN. The bay is named for Sir Martin FROBISHER, who discovered it in 1576. He believed the bay was a strait, and it first appeared on maps as Frobisher Strait.  
DOUG FINLAYSON

**Frog**, AMPHIBIAN belonging to order Anura. The adult, typically, has no tail or ribs, longer hindlimbs than forelimbs, well-developed eyes and skin equipped with mucus and venom glands. Frog eggs are usually fertilized externally and develop into the free-swimming larval stage (tadpole or polliwog). The tadpole is transformed into its adult state through metamorphosis. This process involves numerous morphological and physiological changes: loss of tail and gills, limb and lung development, restructuring of the digestive system from vegetarian to carnivore and alteration of sensory receptors to suit a terrestrial life-style. Frogs, the largest group of amphibians (about 2700 living species), are found on all continents except Antarctica. They are grouped into about 20 families but this varies according to classification methods. The frogs of the large Bufonidae family, known as TOADS, generally have relatively drier skin and reduced webbing between their toes. Other frogs commonly called toads include the N American spadefoot toad (family Pelobatidae), the Mexican burrowing toad (Rhinophrynidae) and the European midwife toad (Discoglossidae).

Frogs appeared very early in the FOSSIL record. *Triadobatrachus*, found in Triassic deposits (230 million years old) in Madagascar, is the earliest known frog. Jurassic deposits (160 million years old) in S America contain frogs having a general body plan similar to some present species. Truly amazing adaptations permit frogs to exploit habitats ranging from rain forests to deserts and from the tropics to the Arctic Circle.

Only 21 or 22 species of frogs live in Canada; most are restricted by climatic limitations to extreme southern Canada. The western mountains form an effective east-west barrier restricting such species as red-legged frog to coastal BC, Pacific tree frog and tailed frog to low and high elevations in BC, and western spotted frog to BC and the foothills in western Alberta. The tailed frog lives in mountainous streams in southern BC and has some interesting specializations. Adapted to fast-flowing streams, male tailed frogs use the tail for internal fertilization of eggs. Tadpoles have expanded mouthparts for adhering to rocks. The western toad is cold tolerant enough to live at high altitudes in BC and Alberta. The wood frog ranges above the Arctic Circle in the Yukon, where forest extends along river valleys. This species has an extensive Canadian range occurring from coast to coast except in arid areas and on the SW coast. The bullfrog is the largest Canadian frog and, although originally an eastern species, has been introduced in BC. Green frogs have been introduced to the Vancouver area and leopard frogs to Vancouver I. Newfoundland has no native frogs,

Most of the 21 or 22 species of frog native to Canada — such as the leopard frog seen here — live in the extreme southern regions (photo by Mary W. Ferguson).

#### Canadian Frogs and Toads

Common Name	Scientific Name	Range
bullfrog	<i>Rana catesbeiana</i>	Ont to NS, introduced BC
green frog	<i>R. clamitans</i>	Ont to NS, introduced Nfld, BC
mink frog	<i>R. septentrionalis</i>	E Man to NS
pickerel frog	<i>R. palustris</i>	Ont to NS
northern leopard frog	<i>R. pipiens</i>	coast to coast, N to NWT
wood frog	<i>R. sylvatica</i>	coast to coast, N to NWT, YT
western spotted frog	<i>R. pretiosa</i>	Alta, BC
red-legged frog	<i>R. aurora</i>	Vancouver I and SW mainland
cricket frog	<i>Acris crepitans</i>	extreme SW Ont
striped chorus frog	<i>Pseudacris triseriata</i>	Ont, SW Qué to northeastern BC, N to NWT
spring peeper	<i>Hyla crucifer</i>	Man to NS
tetraploid grey tree frog	<i>H. versicolor</i>	E Man to SW Qué, NB
diploid grey tree frog	<i>H. chrysoscelis</i>	southern Man
Pacific treefrog	<i>H. regilla</i>	southern BC
tailed frog	<i>Ascaphus truei</i>	southern BC
American toad	<i>Bufo americanus</i>	NWT to NS
Great Plains toad	<i>B. cognatus</i>	BC to Ont
western toad	<i>B. boreas</i>	BC & W Alta, N to YT
Fowler's toad	<i>B. fowleri</i>	SW Ont
plains spadefoot	<i>Scaphiopus bombifrons</i>	S Alta to Man
Great Basin spadefoot	<i>S. intermontanus</i>	southern BC

but green, leopard, wood and chorus frogs, as well as toads, have been introduced and have become established.

Frogs are ecologically important, in that as vegetarian tadpoles they are primary consumers in the food chain and later serve as food for various invertebrates and vertebrates. The carnivorous adults consume insects and are in turn consumed by fish, birds and mammals. Although frogs are a relatively minor food item for humans, they are useful in the biological control of INSECT PESTS and certain large species have been introduced to various parts of the world. Frogs are also used in many fields of research and for anatomical studies in educational institutions. Collection for teaching and research purposes, and harvesting for frogs' legs and fish bait, may be factors in the reduction of natural populations of commonly used species, but yearly climatic fluctuations and the increasing drainage of habitat are equally important.

Frogs are frequent subjects of folklore and ritual. In dry regions they are associated with life-giving rain and symbolize fertility. European folklore often features frogs and toads as evil. The nocturnal vocalizations of frogs, usually associated with storms or rains, are considered by some American native peoples to be spiritual outcries. In fact, male vocalizations serve to attract females to favourable breeding sites. In some species, the female perceives only a narrow frequency range, hearing only her own species. The call in some species may also delineate a male's breeding territory. JAMES P. BOGART

**Front de libération du Québec (FLQ)**, a revolutionary movement that used propaganda and TERRORISM to promote the emergence of an independent, socialist Québec. The movement was founded in March 1963, when Québec was undergoing a period of remarkable change (industrial expansion, modernization of the state), but it was also stimulated by international factors such as the decolonization of Algeria. Pierre Vallières, the author of the book *NÈGRES BLANCS*

D'AMÉRIQUE, joined the FLQ in 1965 and is generally considered the "philosopher" behind the organization.

In 1963 underground FLQ activists (some of whom were arrested) placed bombs in mailboxes in 3 federal armories and in Westmount, a wealthy upper-middle-class anglophone area of Montréal. In 1964 another group of FLQ members stole approximately \$50 000 in cash and military equipment, and at a holdup at International Firearms the company vice-president was killed by the FLQ and another employee was killed by the police, who mistook him for one of the thieves. From 1965 to 1967, the FLQ associated itself with the activities of striking workers. It was involved in over 200 bombings between 1963 and 1970, and in 1968 it began using larger and more powerful bombs, setting them off at a federal government bookstore, at McGill University, at the residence of Jean DRAPPEAU and the provincial Department of Labour, and at the Montréal Stock Exchange, where 27 people were injured. In the fall of 1969, the movement split into 2 distinct cells: the south shore gang (which became the Chenier cell) led by Paul Rose, and the liberation cell, under Jacques Lanctôt. Both cells, Montréal-based, claimed about 12 members.

In the fall of 1970 (see OCTOBER CRISIS) the FLQ kidnapped Pierre LAPORTE and British trade commissioner James Cross. Laporte was later murdered. Under the WAR MEASURES ACT, more than 450 people were arrested, including 150 "suspected" FLQ members. Paul Rose and Francis Simard were eventually sentenced to life imprisonment for the murder of Laporte. Bernard Lortie was convicted of kidnapping Laporte and Jacques Rose was convicted as an accessory. Of the Cross kidnappers, 5 fled to Cuba and then to France, and eventually returned to Canada. One had remained in Montréal but was arrested in 1980 and sentenced in 1981. The movement had ceased activities in 1971. MARC LAURENDEAU

**Frontenac, Louis de Buade, Comte de**, gov gen of New France (b at St-Germain, France 22 May 1622; d at Québec C 28 Nov 1698). This imperious count had been an officer in the French and Venetian armies. In 1672 he obtained the governorship of Canada, in part to put off his creditors. With the INTENDANT absent 1672-75, he extended his viceregal and military authority to civil matters. His pretensions, such as being the Conseil Souverain's chairman, were resisted by other officials, whom he sometimes exiled or placed in confinement. The clergy were offended by his approval of selling brandy to the Indians. After 1675 he conflicted with Intendant Jacques DUCHESNEAU who had his own faction in the FUR TRADE. The quarrels led to the recall of both officials to France in 1682.

Frontenac gave France a territorial empire acquired in defiance of his instructions. The king and the minister for the colonies told administrators in Canada to confine French settlement to areas with direct maritime links with France, to gather colonists into defensible communities and to occupy settlers in farming and manual trades. The fur trade was blamed for the dispersal of manpower and for the military and economic weakness of New France. Frontenac used his authority to send out exploratory parties and to establish forts — trading posts really — to benefit his confederates in the fur trade. A network of forts appeared on the Great Lks and along the tributaries of the Mississippi. Denial of this territory to the expanding British colonies led inevitably to war and the eventual end of France's N American empire.

Frontenac was reinstated as governor in 1689, when nations of the Iroquois Confederacy were attacking New France. He had orders to seize the Iroquois supply base, the colony of New York. Instead, he sent raiding parties against frontier

settlements there and in New England. As a result, a seaborne expedition under Sir William Phips besieged Québec. When summoned to surrender, Frontenac responded, "I have no reply other than from the mouths of my cannon and muskets." Sickness and cold weather forced the invaders to withdraw. Frontenac wrongly believed he could end Iroquois hostility with diplomacy. In 1696, under ministerial orders, he commanded a punitive expedition that destroyed Oneida and Onondaga villages and crops (see IROQUOIS WARS). Though less quarrelsome in his second administration, Frontenac still used his powers to profit from the fur trade, which he was accused of underwriting with military funds. Frontenac might have been dismissed had he not died in 1698.

PETER N. MOOGK

**Frontier Thesis** was formulated 1893, when American historian Frederick Jackson Turner theorized that the availability of unsettled land throughout much of American history was the most important factor determining national development. Frontier experiences and new opportunities forced old traditions to change, institutions to adapt and society to become more democratic as class distinctions collapsed. The result was a unique American society, distinct from the European societies from which it originated. In Canada the frontier thesis was popular between the world wars with historians such as A.R.M. LOWER and Frank UNDERHILL and sociologist S.D. CLARK, partly because of a new sense of Canada's American character (see CANADIAN-AMERICAN RELATIONS).

Since WWII the frontier thesis has declined in popularity because of recognition of important social and cultural distinctions between Canada and the US. In its place a "metropolitan school" has developed, emphasizing Canada's much closer historical ties with Europe. Moreover, centres such as Montréal, Toronto and Ottawa had a profound influence on the settlement of the Canadian frontier. Whichever argument is emphasized, however, any realistic conclusion cannot deny that both the frontier and the ties to established centres were formative in Canada's development. See also METROPOLITAN-HINTERLAND THESIS.

DOUG OWRAM

**Frost, Leslie Miscampbell**, lawyer, politician, premier of Ontario (b at Orillia, Ont 20 Sept 1895; d at Lindsay, Ont 4 May 1973). After service in WWI and convalescence from a severe wound, he graduated from Osgoode Hall in 1921. With his brother he purchased a law practice in Lindsay and became an active member of the Conservative Party. Elected to the legislature in 1937, he was appointed provincial treasurer and minister of mines in the Cabinet of George Drew in 1943. Six years later he became Conservative leader, inheriting the premiership. A genial master of pragmatic politics who personified the values of small-town Ontario, he led his party to 3 sweeping electoral victories. His governments initiated progressive legislation in health, education and human rights, and encouraged growth in the private economic sector through fiscal policy and public investment. He resigned as leader and premier in 1961.

ROGER GRAHAM

**Fruit and Vegetable Industry** This important sector of Canada's FOOD AND BEVERAGE INDUSTRIES is made up of companies that process fruits and vegetables. Their primary products are canned, frozen or otherwise preserved fruits and vegetables, vegetable and fruit juices, soups, pickles, jams, jellies and marmalades, cider, sauces and vinegar. The industry employs more than 13 500 permanent workers; during the harvesting and processing seasons temporary help expands the work force considerably. In 1981 the industry spent more than \$1.1 billion on the purchase of raw agricultural products, packaging and other

necessary materials and supplies. It shipped finished products valued at more than \$1.9 billion.

The industry began in the late 1880s when George Dunning established the country's first fruit and vegetable canning factory in Prince Edward County, southeastern Ontario. By 1900, 8 canning plants were in production in the county, half of the total in Canada at the time. During the early 1900s, the industry became firmly established in all the major fruit- and vegetable-growing regions of Canada. By 1980, as a result of plant consolidation and reorganization, only 232 fruit and vegetable factories remained in production; this number should change little in coming years. Of the 232 plants in operation in 1984, PEI had 3; NS, 11; NB, 5; Qué, 59; Ont, 108; Man, 6; Sask, 2; Alta, 5; and BC, 33.

Prior to the mid-1940s, the primary food-preservation techniques were drying, pickling and high-temperature canning. The last procedure, by far the most important, involves filling metal or glass containers with a partially cooked product, then sealing the container and heating it to high temperature for varying lengths of time. This method completely sterilizes the contents and permits storage at room temperatures for long periods. The first Canadian frozen fruit and vegetable operation was established by William H. Heeney. In 1932 his company, Heeney Frosted Foods Ltd of Ottawa and Montréal, produced the country's first commercial frozen food, a strawberry pack. From a slow beginning the market for frozen fruit and vegetable products has grown strongly in the last 10-15 years. By 1980 there were 34 frozen fruit and vegetable operations in Canada distributed as follows: PEI, 2; NS, 3; NB, 2; Qué, 2; Ont, 11; Man, 2; Alta, 3; and BC, 9. In that year, the value of factory shipments of finished frozen fruits and vegetables was \$348 million. Canned fruit and vegetable production still far outweighs frozen, but future production of frozen goods will increase at the expense of canned products.

The industry is subject to many federal, provincial and municipal regulations, but the primary governing body is Agriculture Canada (see FOOD LEGISLATION). All Canadian fruit and vegetable processors are federally licensed and must conform to regulations enforced by inspectors from Agriculture Canada's fruit and vegetable inspection branch. It is mandatory for food plants that ship products across provincial or international borders to be federally inspected.

Unlike the processing industries of some other countries, the Canadian industry does not own an extensive amount of land for agricultural production. It does, however, exert considerable control over what crop varieties are grown. In most cases, Canadian farmers contract to grow certain crops for a specific processor or group of processors. Most vegetables destined for canning or freezing are picked by mechanical harvesters, usually owned by the processing companies. Increasingly, fruit crops (eg, Ontario's grape crop) are being harvested mechanically, also with harvesters owned by processing companies. Canned and frozen fruits and vegetables are graded to meet federal government regulations as follows: fancy (top quality), choice (good quality) and standard (bottom quality). Most Canadian canned and frozen fruit and vegetables are of "fancy" or "choice" quality.

The processing sector is represented by 2 Ottawa-based national associations and their provincial counterparts: the Canadian Food Processors' Assn and the Canadian Frozen Food Assn.

ROBERT F. BARRATT

**Fruit Cultivation** Most of the fruit species cultivated in Canada belong to the ROSE family, the most important genera being *Malus* (APPLE), *Py-*

*rus* (PEAR), *Prunus* (PEACH, nectarine, PLUM and prune, CHERRY, APRICOT), *Fragaria* (strawberry), *Rubus* (raspberry) and *Vaccinium* (cranberry, blueberry). Other major families having cultivated fruit species are Saxifragaceae, with *Ribes* (currant and gooseberry), and Vitaceae, with *Vitis* (GRAPE). Each fruit species has many cultivars (commercial varieties), developed for various characteristics. For example, in Canada adaptation to a specific climatic factor (eg, cold winters) is important. Breeding and selection programs give priority to these requirements; crop research programs have developed many cultivars.

The FRUIT AND VEGETABLE INDUSTRY is an important part of the AGRICULTURE AND FOOD distribution sectors of the economy. More than 40% of all foods consumed in Canada are fresh and processed fruits and vegetables. About 30 major fruit and vegetable crops are grown commercially, with an annual farm-gate value of about \$650 million. About 40% of this figure is for fruits (see BERRIES).

Canadian-grown fruit is marketed fresh or is processed in various ways; eg, 56% of apples are sold fresh (at harvest or later), the remainder being processed into juice, sauce, pie filling, frozen slices and other products. Similarly, about 66% of the "tender" fruit (cherries, peaches, pears, plums, prunes) are sold fresh and the remainder processed. Sweet cherries are processed for brining (for maraschino cherries) or frozen (for ice cream and baking use). Tart cherries are frozen or canned (pie filling, jams, jellies, juices). Most Canadian-grown grapes are processed into wine and juice. The perishable fruits (strawberry, raspberry, blueberry) are preserved by freezing or canning. Some fruits, particularly apples and pears, are stored at harvest rather than being processed or immediately sold fresh. The fruit continues to live after harvest, using oxygen, giving off carbon dioxide and generating heat (ie, by respiration). This process eventually leads to breakdown of fruit tissues. Refrigeration and controlled-atmosphere storage allow orderly marketing of fresh fruit almost year round.

Fruit growing is usually restricted to areas where winter temperatures do not go much below -20°C. Commercial fruit growing in Canada occurs in NS, NB, southwestern Québec, southwestern Ontario and BC.

**Nova Scotia** Production is confined to the ANAPOLIS VALLEY, where SOIL type and CLIMATE are well suited to production of apples, blueberries and strawberries. Winter temperatures often dip to -24°C; hence, peach and cherry growing are marginal.

**New Brunswick** Severe winter temperatures restrict production to the Saint John R valley. Only apples can withstand the severe winter temperatures (commonly -24°C, but reaching -34°C). Some blueberries and strawberries are also grown.

**Québec** Orchards are located mainly on light soils around the bases of old volcanic hills that rise above the dry loams of the plains, and in the foothills of the Appalachian Mts, near the US border. Low winter temperatures can cause extensive tree damage. For example, in the winter of 1917-18 temperatures of -37°C to -40°C resulted in losses estimated at 50%. In the 1980-81 winter, temperatures fell to -33°C and an unusual warm spell followed. The result was a reduction of production from an average of 5.3 to 2.4 million bushels (192 to 87 million L).

**Ontario** The moderating influence of lakes Huron, Erie and Ontario, coupled with suitable soils, allows the growing of a complete range of fruit crops in southwestern Ontario. The more tender fruits (eg, peach, cherry, grape, plum, pear) are limited to the Niagara Fruit Belt on the SW shore of Lk Ontario. Apples are grown over much of the southern part of the province, including the S shore of Georgian Bay.

**British Columbia** Strawberries, raspberries, loganberries and grapes are cultivated in the Lower Mainland area but the fruit-growing region is the OKANAGAN VALLEY. The valley is in the rain-shadow area of the interior; hence, fruit growing is dependent on irrigation. The complete range of fruit crops is grown, but the major crop, apples, accounts for two-thirds of the area. Most orchards are located on the top and sides of terraces along the sides of lakes. Deep, dividing gullies, running from the high slopes down to the water, provide necessary air drainage to prevent frost damage. Winter damage to trees is a recurring problem; eg, low temperatures in the 1949-50 winter caused an estimated loss of 20% of all trees.

J.T.A. PROCTOR

Reading: W.H. Upshall, ed, *History of Fruit Growing and Handling in the United States of America and Canada, 1860-1972* (1976).

**Fruits of the Earth**, novel by Frederick Philip GROVE, was published 1933 in Toronto. To dramatize the tragedy of the pioneer, Grove charts the life of Abe Spalding, a man imbued with an indomitable drive to impose his will on the prairie. Spalding leaves Ontario for Manitoba, where, through years of unrelenting work, he masters his land, builds a mansion and becomes a power in the community. But Spalding's triumphs are fleeting: in time he becomes alienated from his family, and the natural world begins to prove itself impervious to human designs. In the end, the pioneer's great dream — to conquer raw nature — does violence to his own human nature.

NEIL BESNER

**Frum, Barbara**, née Rosberg, radio and TV journalist (b at Niagara Falls, NY 8 Sept 1937). Educated at U of T, she wrote for numerous magazines, performed on TV and radio in the late 1960s, and did thoughtful, incisive and often acerbic interviews with international figures on CBC Radio's popular phone-out show "As It Happens," 1971-81. Probably Canada's most respected and best-known interviewer, she has won many journalism awards. In Jan 1982 she became the co-host of "The Journal," CBC TV's nightly current-affairs program.

ALLAN M. GOULD

**Fry, Frederick Ernest Joseph**, aquatic ecologist (b at Woking, Eng 17 Apr 1908). From 1936 to 1956, including 4 years (1941-45) with the RCAF doing research in aviation medicine, Fry was professor of zoology at U of T. Since 1974 he has been professor emeritus and an associate of the Institute for Environmental Studies. A brilliant writer and influential teacher, he is best known internationally for his work on aquatic physiology and demographic analysis. He was awarded an MBE in 1944 and elected to the RSC in 1948. He has been president of the American Soc of Limnology and Oceanography (1951), the American Fisheries Soc (1966), the Canadian Soc of Zoologists (1966) and the American Inst of Fishery Research Biologists (1972), and he received the Canada Centennial Medal in 1968. In 1974 the Canadian Soc of Zoologists established the Fry medal.

S.R. KERR

**Frye, Herman Northrop**, literary critic, university professor, editor (b at Sherbrooke, Qué 14 July 1912). A professor of English at Victoria Coll, U of Toronto, since 1939, Frye has achieved international recognition for his literary theories, expounded in his study of William Blake's prophecies, *Fearful Symmetry* (1947), his grammar of mythic form, *ANATOMY OF CRITICISM* (1957), and his study of the Bible's symbolism, *The Great Code* (1982). These works, particularly the often translated *Anatomy*, have made Frye one of this century's leading literary theorists. Although noted for clarity of style, his writing for the average reader is conceptually difficult and is best approached through *The Educated Imagination* (1963).

Northrop Frye, literary critic internationally recognized for his study of William Blake and his works on mythic form and biblical symbolism (photo by Roy Nicholls).

Raised in Moncton, Frye first came to Toronto to compete in a national typing contest in 1929, in which he won second place in the novice class. Soon after, he enrolled at Victoria Coll and, except for 2 years of study in the late 1930s at Merton Coll, Oxford, he has remained associated with the college, and became chancellor in 1978. While still a graduate student, Frye decided to write a definitive study of Blake's prophetic poems, then considered incoherent, even aberrant. In *Fearful Symmetry*, Frye showed that Blake deliberately used a regular pattern of symbolism based on earlier writers such as Milton and ultimately on the Bible. In *Anatomy of Criticism*, Frye expanded this notion by outlining a verbal universe of repeated archetypes and symbolism and rhetoric that binds all literature together. This universe consists of desired and abhorred worlds, the former expressed by comedy and romance, the latter by tragedy and irony. Frye's own evangelical Methodist upbringing influences his view that there is in human culture an inherent impulse towards affirming the sunnier vision and implementing it in the world. Ironically his own view of Canadian literature, which he has never much admired, is notoriously sunk in gloom. Frye contends that like the poetry of his own mentor, E.J. PRATT, it is the product of a "garrison mentality" of beleaguered settlers who huddled against the glowering, all-consuming nothingness of the wilderness. Its birth lay in a blighted winter, rather than vibrant spring, mentality.

Despite his insistence on the ultimate visionary process of literary studies, Frye has demanded the kind of discipline in study he experienced himself in music, which has an intensely integrated theory. He teaches that literature is not a grab bag of thousands of individual works but an integrated universe of recognizable forms. He has always seen a close association of a disciplined recognition of form with major literary talent, such as that of his own preferred subjects, Spenser, Shakespeare, Milton, Blake, Yeats and Eliot. He has spurned a predominantly evaluative approach to literature because evaluation tends to say more about the critic than the work studied. This has led him into endless international controversy, which has obscured his fundamental purpose in trying to establish an objective and universally accepted terminology for literature studies.

Frye's enormous influence peaked in the mid-1960s when a new generation of scholars, influenced by the ideas of the *Anatomy*, were attracted by his insistence that literary criticism was not a poor cousin of philosophy, psychology, linguistics or aesthetics but a symbolically co-ordinated discipline that outlines the shape of the human imagination itself. As such, it has its own authority, which can be useful in the study of other arts and social sciences.

JOHN AYRE

**Fuca, Juan de**, pilot, apocryphal explorer of the NORTHWEST COAST (b at Valeriano, Cephalonia I, Greece; d there c1602). Other than what Michael Lok, an English promoter of geographical discovery, reported in 1596, little is known about Fuca. According to his own story, he was a pilot in Spain's Pacific maritime service. He claimed to have led a 1592 voyage of discovery N from Mexico that encountered a passage leading to the "North Sea" (possibly the Arctic Ocean) between 47° and 48° lat. Fuca told Lok that he sailed through the broad passage before retracing his course to Mexico. The discovery much later of the strait now bearing Fuca's name at 48°30' lat gave credence to his story and suggested the possibility of a 16th-century Spanish voyage to the NW Coast. More likely, Fuca told Lok an exciting tale in order to obtain financial compensation. Spanish archival sources and published works offer no evidence of such an expedition.

CHRISTON I. ARCHER

**Fuel Cell**, device that directly converts the energy contained in chemical reactants (fuels), delivered from outside the cell, into direct current (DC) electrical power and, typically, heat and water as waste products. "Directly" means by a single-step process, ie, without first converting the energy of the chemical reactants to heat. This absence of a heat-production step distinguishes the fuel cell from conventional energy conversion devices that first burn fuel to produce heat, then convert a relatively small fraction of that heat to mechanical work (eg, by turning a steam turbine), which is subsequently used to turn an electric generator to produce electricity. Fuel cells remove large inefficiencies associated with these heat-to-work steps; thus, they can be significantly more efficient than conventional "heat" engines.

The concept of a fuel cell has been known for over a century; however, modern fuel-cell development dates back to the late 1930s when F.T. Bacon developed an alkaline fuel cell that operated on hydrogen and oxygen. Bacon's work formed the basis for the fuel cell that generated electrical power (and drinking water) for the US Apollo spacecraft. This same type of fuel cell is now used aboard the US space shuttle.

Several countries, including Canada, have active fuel-cell programs aimed at terrestrial applications. The US and Japan have concentrated their efforts on development of acid fuel-cell technology because they anticipate using impure hydrogen derived from fossil fuels (initially natural gas and eventually coal). In other programs, including a major thrust in Canada, the development has focused on the more efficient alkaline technology where the applications allow the use of pure hydrogen and are targeted at providing standby power for hospitals, telephone or computer systems, and mobile power plants for transportation vehicles such as ships, trains and fleet vans. Fuel-cell research in Canada is taking place mainly in government or university laboratories, eg, the NATIONAL RESEARCH COUNCIL and University of Toronto.

DAVID SCOTT

**Fulford, Robert Marshall Blount**, editor, essayist, critic (b at Ottawa 13 Feb 1932). Editor of *Saturday Night* magazine since 1968, Fulford has been a champion of liberalism in somewhat the same tradition as J.W. DAFOR and Frank UNDER-

**HILL.** Self-educated, he joined the *Toronto Globe and Mail* as a copyboy in 1949 and held reporter jobs until 1953. He was then an editor and writer on various magazines, notably *Maclean's*, but it was at the *Toronto Star*, which he joined in 1958, that he became an influential critic, first of books, art and jazz, and finally of ideas. Over his tenure at *Saturday Night* he has switched from continentalism to nationalism and in the 1980s has drifted towards the more conservative end of the liberal spectrum. His attitudes towards popular culture, which he once relished as a sort of democratic kaleidoscope, have also changed, though his books on the subject, including *This was Expo* (1968), *Marshall Delaney at the Movies* (1974) and *An Introduction to the Arts in Canada* (1977), remain valuable and enjoyable for their subtle, even style, informed wit and ability to deal lucidly with elusive notions.

DOUG FETHERLING

**Fuller, Thomas**, architect (b at Bath, Eng 8 Mar 1823; d at Ottawa 28 Sept 1898). In 1857 Fuller left England to set up practice in Toronto with Chilion Jones. The firm, with Fuller responsible for design, specialized in Anglican church architecture in a Gothic revival style and won 2 important competitions, the first for the PARLIAMENT BUILDINGS in Ottawa in 1859, and the second for the New York State Capitol in Albany in 1867. In 1881 Fuller was appointed Dominion chief architect and during his 15-year tenure supervised the design of over 140 buildings across the country. Perhaps more than any other architect, he was responsible for defining the character of federal architecture in Canada. His small post offices, executed in a blend of Gothic and Romanesque forms and characterized by their picturesque massing, and accented by stone gables and tall clock towers, provided immediately recognizable symbols of the federal government and established a design that endured into the 1930s.

JANET WRIGHT

**Fuller, William Albert**, ecologist, conservationist (b at Moosomin, Sask 10 May 1924). He is best known in academic circles for his long-term studies on population fluctuations of small mammals, especially in taiga. After 12 years with the CANADIAN WILDLIFE SERVICE (1947-59), when he studied larger mammals and surveyed several northern areas, he joined U of A's zoology department (1959). During his wildlife-service career, he was the first biologist to see the last remaining natural nesting grounds of the WHOOPIING CRANE. Fuller applies ecological principles to conservation problems; he has chaired a subcommittee of the International Biological Program and the National Research Council of Canada's Associate Committee on Ecological Reserves, and serves on the board of the International Union for the Conservation of Nature and Natural Resources.

MARTIN K. McNICHOIL

**Fullerton, Douglas H.**, economist, financial consultant (b at St John's 3 Sept 1917). As investment manager for the Canada Council (1957-68) he placed the council on a sound financial footing, and as chairman of the NATIONAL CAPITAL COMMISSION (1969-73) he led the government's program to redevelop the central area of HULL. He has advised governments on diverse matters, including pension reform, public transit systems, the coal and steel industries in Atlantic Canada, and the nationalization of Québec hydro companies and Saskatchewan potash mines. Fullerton is noted for his populist approach to urban planning, emphasizing that people come first, and he has written a newspaper column on urban affairs. He is author of *The Bond Market in Canada* (1962), *The Capital of Canada: How Should It Be Governed?* (1974) and *The Dangerous Delusion: Quebec's Independence Obsession* (1978). In 1979 he was appointed honorary professor of urbanism at U of Calgary.

WILLIAM T. PERKS

**Fulmar, Northern** (*Fulmarus glacialis*, family Procellariidae, order Procellariiformes), medium-sized, tube-nosed SEABIRD, about 50 cm long, related to the albatrosses. Birds from warmer parts of the Atlantic are usually white with greyish wings, while those from colder parts are brown all over; the opposite holds in the Pacific. Originally, the northern fulmar was an arctic bird, but around 1820 it began to spread southward into the eastern Atlantic, perhaps scavenging from the fisheries. It reached Atlantic Canada around 1970, and a few pairs now nest in Newfoundland. Most Canadian fulmars, about 400 000 pairs, breed in the eastern Arctic, above 67° N. Alaskan migrants visit BC waters; birds from Greenland and the eastern Atlantic winter off Newfoundland. Fulmars breed on steep cliffs, laying a single, whitish egg on bare ledges. They defend their nests by vomiting a stinking oil over any intruder.

R.G.B. BROWN

**Fulton, Edmund Davie**, lawyer, politician, judge (b at Kamloops, BC 10 Mar 1916). Son of an MP and grandson of a former BC premier, he distinguished himself as a Rhodes scholar, MP, Cabinet minister and judge. First elected to the House in 1945, he ran for the Progressive Conservative Party leadership in 1956; in June 1957 he was appointed minister of justice; he was highly regarded in that position. Fulton was involved with patriation of the CONSTITUTION (the Fulton-Favreau formula reflects his views on federal-provincial relations) and the COLUMBIA R TREATY negotiations during this period. In 1963 he was elected leader of the BC Tories, but in 1965 returned to federal politics. He was a justice of the BC Supreme Court from 1973 to 1981.

PATRICIA WILLIAMS

**Functionalism**, a concept of world order developed in the early 20th century by such writers as Leonard Woolf and David Mitrany, who argued that if nations joined in economic and social interdependence, and if national well-being depended upon the maintenance of peace, then war would be less likely. This theory influenced the founders of the UNITED NATIONS, with its specialized functional agencies and its particular organs for security and for economic and social questions. Canadians extended the concept into the theory of functional representation, where membership and influence in the various UN bodies would be accorded to those countries with special interests in, and contributions to make to, the specific subject for which the body was responsible.

JOHN W. HOLMES

**Fundy, Bay of**, and Gulf of Maine, with a total area of about  $1.8 \times 10^5$  km<sup>2</sup> and depths generally less than 200 m, are a part of the continental shelf off eastern Canada and New England. The area of the Bay of Fundy alone is about  $1.6 \times 10^5$  km<sup>2</sup>. Its name is likely a corruption of the French *fendu* ("split"). It was known for a time as La Baie Françoise.

Between about 15 000 and 10 000 years ago, as the glaciers retreated from the last ice age, parts of GEORGES BANK and other shallow areas were dry land; fragments of trees and mammoth teeth from this era are still found occasionally in fishing trawls. A rising sea level since then not only submerged these offshore banks, but also

led to the development of the present tidal regime. The tides of the Bay of Fundy are the world's largest, with a range from low to high tide that can exceed 15 m in MINAS BASIN at the head of the bay. At peak flood tide the flow of water across the edge of the continental shelf into the Gulf of Maine is  $25 \times 10^6$  m<sup>3</sup>/s, 2000 times the average discharge of the ST LAWRENCE R. The flow past Cape Split into Minas Basin is 40 times that of the St Lawrence.

The main reason for these large tides is that because of its shape, size and depth, the Bay of Fundy-Gulf of Maine system has a natural period of oscillation of about 13.3 hrs. As a result, its waters respond vigorously to the push they get every 12.4 hours from the N Atlantic tides — a phenomenon known technically as a near-resonant response. The Reversing Falls at SAINT JOHN, NB, and the tidal bores in rivers near the head of the bay are well-known natural phenomena associated with the tides. The large tides also have dramatic effects on oceanographic conditions throughout the region. Large areas, such as Georges Bank, much of the Bay of Fundy, and the area off SW Nova Scotia, are kept well mixed vertically by the strong tidal currents (with resulting cold surface waters and frequent fog), rather than developing the warm surface layer that occurs in less-well-mixed waters in summer. The tides also contribute to the average circulation patterns in the region.

These effects influence biological productivity, generally favourably, by returning nutrients to surface layers where they can be utilized. Thus the waters off southwestern NS form the summer feeding ground of the Nova Scotia herring, a major stock of several hundred thousand tonnes. Off BRIER and GRAND MANAN islands, where tidal currents interact with the sharp topographic relief, swarms of copepods and euphausiids (or krill) are often found at the surface. This condition attracts fin and humpback whales, along with large flocks of plankton-feeding birds, such as phalaropes, shearwaters and gulls. In the bay's upper reaches the strong tidal currents keep so much mud in suspension that light penetration, and hence biological productivity in the water, are greatly reduced. Most of the biological productivity occurs on the mud flats, which are important feeding grounds in late summer for vast flocks of migrating shorebirds, particularly semipalmated sandpipers.

The region's fisheries, particularly for scallops and groundfish on Georges Bank, for herring and lobster off southwestern NS and for herring in the Bay of Fundy, are of great importance to many small communities, and indeed to the general economy of NS, NB and Maine. New developments are largely centered around fisheries and energy. Considerable effort is being devoted to research and international diplomatic activity to permit sensible regulation of the fisheries. The problem is particularly acute on Georges Bank, where the US and Canada dispute the location of the international boundary and the setting and sharing of quotas for the various fisheries, and where exploratory drilling for oil and gas, with attendant risks to the fisheries, has commenced. A proposed superport and oil refinery at Eastport, Maine, has been strongly opposed by Canada, as the area's strong tidal currents and narrow channels make navigation hazardous and would make it very hard to prevent any oil spill from contaminating large sections of coastline.

One major possible development in the upper reaches of the Bay of Fundy is of tidal power. Schemes with a power output equal to that of several nuclear-power stations are technically feasible; a small pilot plant has been built in NS's Annapolis Basin (see TIDAL ENERGY). Surprisingly, these large schemes may lead to a slight increase in the tidal range over much of

the Bay of Fundy-Gulf of Maine outside the barrage. In the head pond behind the barrage the operation of the plant would lead to a substantial change in low-tide level and to a reduction of the tidal range, and hence of currents, by a factor of about 3. The possible effects of such a change on the extent and biological productivity of the mud flats, and hence on migrating shorebirds, are not yet fully understood.

CHRIS GARRETT AND TONY KOSLOW

**Fundy National Park** (est 1947), renowned for its high tides averaging 10 m, stretches for 17 km along the Bay of Fundy and extends inland to cover a 207 km<sup>2</sup> area of wooded hills cut by deep valleys and tumbling streams. The park's seaward edge features wave-pounded cliffs and cobble beaches. At low tide sea anemones, barnacles and a host of other marine invertebrates can be found sheltering in small tidal pools or among seaweed. In late summer, flocks of migrating shorebirds congregate on the tidal flats. Inland, the budworm-ravaged forests of spruce and fir are home for white-tailed deer, moose, red fox, black bear, bobcat and, possibly, the rare eastern cougar. Coyote are recent immigrants to the park. In presettlement days Micmac lived here. More recently, lumbering and shipbuilding were major activities of Irish and English settlers. The park has 5 serviced facilities for outdoor recreation.

LILLIAN STEWART

**Funeral Practices** consist of customary observances for the dead and arrangements made for disposition of the body. There is a network of social and legal requirements to be met that usually involve the services of various professionals (see DEATH AND DYING).

**Predeath Protocols** Many arrangements can be made prior to death, from wills to donation of body parts, but Canadian laws and customs restrict how a person's wishes are implemented after death. There is a growing tendency, supported by memorial societies and the medical fraternity, to donate body parts for transplant or for research, but an individual's wish to donate may be countermanded if the family has strong views about dismembering the deceased. Religious attitudes and traditions influence these decisions. A person may dictate the nature and type of funeral, the final disposition of the remains, and even arrange the newspaper announcement ahead of time. Prearranged funerals are much more common than they were 30 years ago. Memorial Societies are volunteer, nonprofit consumer-information organizations that are found in most major cities. Their function is to encourage preplanning and to ensure that simple, low-cost funeral options are available from the funeral industry.

For highly placed individuals, or for a member of the armed forces or the police, public protocols regarding funeral arrangements may take precedence over individual or family customs and wishes. In all arrangements, both group values and professional organizations play a significant role.

**Preburial Procedures** An individual may be pronounced dead if the vital signs are missing or if brain waves are no longer detected. If sudden death is involved or if there is no clear reason for death, the provincial coroner or medical examiner requires an autopsy to be performed. Since health care is a provincial responsibility, the legal requirements are specified in provincial legislation. In all cases, legal requirements take precedence over religious views. Unwritten codes are also observed in announcing a death. Immediate next of kin take precedence over relatives who may be nearer to the scene of death, and it is a breach of etiquette not to notify a close relative about a death. Since nothing can be done until the physician signs the death certificate, hospital protocol requires this step. With Orthodox Jews, there may be a delay in an-

nouncing a death (especially just before the beginning of the sabbath) and arrangements for interment have to wait until after the sabbath.

Deaths caused by highly infectious diseases are treated differently from others; for instance, if death is from hepatitis, the body must be sealed in a casket immediately and no embalming can take place. If a body is to be shipped out of the country, the local Board of Health must certify that the body is not the carrier of a communicable disease.

Funeral homes are a service industry in Canada. Some provinces, such as Ontario, require a funeral director, though in most provinces these services are optional. Most funerals in remote places take place in funeral homes. Provincial licensing is required for embalmers, and though embalming the body is not a legal requirement in Canada, it is an accepted practice. Provincial legislation requires embalming or sealing only for bodies that will not reach their place of burial within 72 hours of the death. Educational requirements for embalmers differ across Canada, the minimum being a 2-week vocational course, a correspondence course and on-the-job apprenticeship.

Some religious groups, such as Hindus and Sikhs, may require preparation of the body to be done by the eldest son or by a designated individual, but for the majority of Canadians the funeral director prepares the body: washes it, ejects blood from the veins and substitutes embalming fluid (thus removing the discoloration of the skin), cleans and disinfects the chest and abdominal cavity, applies makeup, fixes the hair and dresses the body in clothes provided by the next of kin. Restorative work, if the face has been damaged, may also be done. Muslims are an exception to this practice, since they traditionally bury the dead in a shroud.

Funeral directors have several options regarding cost and services. Some provide a casket and all essential services for a fixed price. This unit pricing system is popular with prearranged funerals and requires less time and decision making for the bereaved. Another option is the functional pricing system, in which the price of the chosen casket and the desired services are added to the basic price. Despite widespread criticism of the industry's costs, little has changed. Elaborate caskets may be purchased and expensive services chosen, sometimes from guilt on the part of survivors, sometimes for the public image of the family. Funeral costs can vary from region to region or from urban to rural areas.

The wake, a vigil held over the body prior to burial, commonly took place at the home of the family of the deceased. Although this custom still occurs, especially in families that have recently come from Europe, wakes are now usually replaced by viewing times at the funeral home, when members of the family will be present to respond to the condolences of visitors. For many years it was customary for close friends and relatives to buy flowers, the size of the floral spray varying according to closeness with the deceased. In recent years a marked trend to request gifts to charities in lieu of flowers has taken place.

Funeral services differ according to religious and cultural practices. For Roman Catholics, Anglicans and Eastern Christians of Orthodox persuasion, as well as for those who were closely connected to a church during their lives, the norm is to have the service at the church with the body present. For some of these faiths, the church is the only sanctified locale in which a mass may be held, but in many communities the church is regarded as the proper place for funerals, no matter what the denomination. In urban settings, the funeral chapel plays a much larger role. Fewer than 5% of the population have no funeral service at all.

A common scene in Canada is the funeral

procession, headed by cars containing the chief mourners and followed by the hearse and friends of the family. The lights on the motorcade were traditionally the signal for bystanders to pause in respect to the departed, a custom that has been eroded in contemporary Canada.

**Interment** Cremation (to reduce to ashes by burning) is becoming more common; in 1977 14.8% of bodies were cremated, in 1979, 17.8%. Western Canada leads with 26.2% in 1977. More recent statistics are not available. Even among Roman Catholics the trend toward cremation is growing, and in 1983 the Pope lifted any prohibition against it. Funeral directors suggest that the mode of disposal is defined culturally, not religiously. Lack of space available for burial use has also encouraged the trend to cremation.

**CEMETERIES** may be either private or public, though there are legislated restrictions on private cemeteries. A gravesite is regarded by the law as a piece of real estate and a deed is issued for the lot. The "deed" is frequently a form of rental and not a complete transfer of title. Most cemeteries have regulations regarding tombstones, markers and even flowers. Ethnic and sectarian cemeteries are common in Canada and have restrictions based on memberships. Cemeteries may impose time limits on the use of plots or may reuse a plot for a relative after a specified period of time. The trend away from ostentatious monuments continues, sometimes at cemetery insistence, but also because of high prices for marble. Some memorial parks with special theme areas or ethnic gardens have been established across the country, and costs for their plots include a percentage for perpetual care.

The graveside service with the committal to earth, usually with a symbolic toss of earth on the lowered casket, is the last act of the mourners. Closing the grave is left to the cemetery workers. Disposal of ashes from cremation is left to the family of the deceased, and since there are no laws requiring specific places of deposit, the ashes may be spread anywhere. Some people arrange for them to be placed in an urn, and some cemeteries sell niches in a vault for this purpose.

**Postburial Rites** No set period is allocated for the bereavement; traditional Jewish law specifies one week of mourning, after which reintegration with the community is enjoined. Widows in some traditions, such as Coptic Christian, are required to wear black clothing for a year, at the end of which a memorial service is held. Some Catholics adhere to the practice of holding a mass on the first anniversary of the death and some have masses said for the deceased, but Protestants have eschewed this remembrance of the dead. Mormons often initiate special rituals designed to elevate to a state of grace the souls of those who have died without being initiated into the faith. Various Orthodox believers have an annual day for remembering the dead, when the names of all the dead from the community are read, and prayers said, after which the family will have a picnic at the gravesite. For most Canadians, the funeral service is the last public occasion for relating to the dead. For those who leave a will, an executor will call the beneficiaries together for its reading, and the memory of the deceased lives on in the disposal of the inheritance. Private grave visitation may serve to bolster the memory but, except for those who follow ancestral traditions, there is little overt link with the dead.

EARLE WAUGH

**Fung, Donna Lori**, gymnast (b at Vancouver 21 Feb 1963). She was western Canadian all-around champion of rhythmic gymnastics in 1981 and finished sixteenth in rope in the world championships that year. She was Canadian national all-around champion 1982 and 1983 and first all-around in the pre-world championships at Lausanne, Switz, and ninth in the ribbon at the

Lori Fung in action at the 1984 Los Angeles Olympics, at which she won a gold medal in rhythmic gymnastics (courtesy Athlete Information Bureau/Service Information)

world championships at Strasbourg, France, in 1983. She won the first Olympic gold medal in all-around rhythmic gymnastics, at Los Angeles in 1984.

JAMES MARSH

**Fungus**, common name for any member of the kingdom Mycota. Fungi share some features with the lower PLANTS and share others with the simpler ANIMALS, but are independent of either group. Like plants and animals, they evolved from the protists. Vegetatively, fungi usually consist of slender filaments (hyphae) massed together in a mycelium which carries on the functions of metabolism and reproduction, but their fruit bodies are often complex. Since all fungi lack chlorophyll and cannot feed themselves through photosynthesis, they are heterotrophs and must use complex organic compounds of nitrogen and carbon for metabolism. Therefore, they commonly exist as parasites, drawing nutrients directly from a host plant or animal which they may injure; or as saprophytes, living on dead or decaying matter. Fungi were long treated as plants and, because of their intimate associations with plants, they continue to be studied chiefly in BOTANY and plant pathology institutions. Mycology, the study of fungi, began in Canada as a result of concern about plant diseases and timber decay. Its history is traced in works on plant pathology.

**Classification** Advances in BIOCHEMISTRY and electron microscopy have required changes in fungal classification. Acceptance of the kingdom Mycota (as distinct from the kingdom Plantae) entailed changes in rank. Changes are continuing, and the provisional system presented here omits several minor groups. Two divisions are recognized: Myxomycota, mainly slime molds, often considered protists; and Eumycota or typical fungi. Slime molds have an amoeboid, noncellular growth phase during which they engulf food particles. At the end of the nutritional period they develop varied and often beautiful fruiting structures which produce masses of dry spores that disperse the organisms. They lack true mycelium, but curious and often decorated threads frequently are found among the spores. They are generally studied by mycologists. Eumycota include 5 subdivisions.

**Occurrence** Fungi grow in almost all environments from tropic to high arctic: in soil, fresh water (including hot springs) and seawater, or in association with many animals and all plant groups. Species attacking man, eg, on the skin (dermatophytes) or in the lungs, are relatively few but are difficult to eradicate.

**Associations** Involving fungi are many and often very important. LICHENS have arisen repeatedly through association of various fungal genera with numerous algae. The importance of a fungal group in Canada does not always correlate with numbers of species, eg, some important pathogens (agents of disease) belong to small groups. Major groups in Canada include wood-rotting Aphyllophorales, more than 800 species; MUSHROOMS (Agaricales), more than 3000 species; ascomycetes and deuteromycetes, c.5000 species (estimates are doubtful because many have unknown life cycles); rusts (Uredinales),

450 species and well-marked varieties; smuts (Ustilaginales), 140 species; downy mildews (Peronosporales), 100 species. Among important fungal PLANT DISEASES are wheat stem rust (*Puccinia graminis*), which reduced the Canadian crop in 1916 and 1954 by 2.7 and 4 million tonnes; other cereal rusts (*Puccinia*), which take a continuing toll; white pine blister rust (*Cronartium ribicola*), which nearly eliminated the eastern white pine; cereal smuts (*Tilletia* and *Ustilago*); potato late blight (*Phytophthora infestans*); sunflower downy mildew (*Plasmopara halstedii*); onion downy mildew (*Peronospora destructor*); chestnut blight (*Endothia parasitica*), which virtually destroyed the American sweet chestnut; and apple scab (*Venturia inaequalis*), which often causes heavy loss. Another important aspect of fungal activity is the production of serious toxins in moldy grain.

However, many fungal associations do no appreciable harm to the plant and some are highly beneficial. About 95% of SEED PLANTS have mycorrhizae, associations with one or more fungi that assist plant nutrition in most situations. Work in progress at Zürich, Switzerland, shows that healthy tissues of many plants yield numerous fungi, occasionally over 100 from a single plant species. These fungi do no visible harm to the plant and the associations may be mutually beneficial. In nature symbioses with fungi seem to vary from mildly injurious to strongly beneficial to the plant. Even parasites such as rusts probably supply some nutritional aid to the plant, partly offsetting their damage. Only when large areas are planted to one, often genetically uniform, crop do devastating losses occur. In natural grasslands, several to many GRASS species usually occur in mixed stands. This variety buffers the association against violent change, and rusts, although present, do little harm. In natural FORESTS, decay occurs chiefly in overmature or wind-thrown trees, and fungi speed the recycling of wood and bark into usable nutrients; but when the forest is treated as a crop, decay can be very costly. Trees must be cut while relatively young to reduce loss from decay; slash may stimulate growth of decay fungi; and human activity may damage trees and provide sites for infection. With fungi that are adapted to all trees and various climates, the problem is complex. The breakdown of litter in forests, grasslands and other biomes is as important as tree decay, although less spectacular. In each habitat there is an elaborate sequence of fungi, bacteria and minute animals, which completely reduce tissues to plant nutrients. Fungi are especially important in severe climates (eg, arctic deserts) that have minimal bacterial activity.

**Dispersal** Most species have airborne spores, some are spread in water or by water splash, and a few are carried chiefly by insects. Spores of some host-limited ascomycetes stick to seeds, fruits or bulbils of the plant and are carried with them. Thus, they may occur at the extreme limit of the host's range. Some pathogens are carried within seeds. Airborne spores may be released passively or discharged forcibly by several methods.

**Fungi in Human Affairs** The fungi best known to city dwellers are conveniently, if incorrectly, termed MOLDs. They include the variously coloured growths that occur in damp environments on fruit, bread, cheese, leather and other organic substances, and involve members of several groups of fungi. Some optical glass is etched (and the part ruined) by fungal secretions. Mites carrying spores could enter poorly sealed instruments, die on a lens, and supply nutrient for a mold colony. Damage from fouling in Canadian-built field glasses and riflescopes was greatly reduced by improved packing and storage methods and by redesigning for perfect sealing. Although fouling is mainly a

problem of humid tropics, severe damage did occur in a damp depot in Ontario, and some fouling was recorded in a survey instrument on Baffin I.

Edible mushrooms are a popular food (see MUSHROOM CULTIVATION) and other fungi also have uses in the various food industries. Industrial mycology was long concerned mainly with the use of YEASTS and a few molds in baking, brewing and wine making, and in flavouring cheeses. Development of antibiotics stimulated the use of more molds and, recently, some bird's nest fungi have yielded a promising antibiotic. Much attention is now being paid to the use of fungi (including some mushrooms and bird's nest fungi) for breaking down wood, straw and other plant debris into alcohol or edible carbohydrates.

D.B.O. SAVILE

**Funk Island**, 25 ha, is a flat, 15 m high, wedge-shaped granite island, 800 m by 400 m, lying 60 km off Newfoundland's NE coast, E of FOGO ISLAND. The origin of the name is unknown, though it may have been inspired by the smell of the guano that covers much of the island. The W end is crowned by a 15 m cairn built by past visitors to this nearly barren spot. Jacques CARTIER visited the island, as countless other mariners did, for the abundant eggs and birds found there. Once a favourite hunting ground of coastal residents, both native and European, it was the last known breeding place of the great auk, *pinguinis impennis*, extinct from about 1840. Here "factories" were set up and the birds were boiled, their valuable feathers removed, and the bodies discarded. Consequently the island was the source of most of the great auk skeletons preserved in museums around the world. Today, still populated by thousands of murrelets, terns and puffins, the island is a seabird sanctuary protected by law.

ROBERT D. PITT

**Fur Farming** In Canada, the primary MAMMAL species raised for fur are the MINK (*Mustela vison*) and the FOX (genus *Vulpes*). A limited amount of chinchilla (*Chinchilla laniger*) is also raised. Before 1890, all fur in Canada was taken by trapping; now, however, 40% of Canadian furs come from farming operations.

**Mink**, a carnivore, has been raised for its fur since the beginning of the century. Mink farming began as an offshoot of fox farming. Canada produces only 6% of the world's pelts, but the "Majestic" mink is widely acclaimed. Today, about 600 Canadians are engaged in mink farming, primarily in Ont, BC, NS and Qué. They belong to the Canada Mink Breeders Assn. In 1982 Canada sold 1.2 million pelts, at an average price of \$34.24 and a net profit of \$5-10 per pelt.

Selective breeding has produced over 200 shades of fur (in the whites, blacks, browns and blues) among the mink types Standard, Jet Black, White, Pastel, Pearl, Lavender, Buff, Demi Buff, Aleutian, Silverblu, Sapphire, Violet, etc.

Mink are aggressive animals and must be handled with care. A typical mink farm has separate sheds for kits and for breeding adults; each shed holds several rows of individual cages. Establishing a fur farm requires an investment of about \$275 per breeding female. One worker can care for 500-600 breeding females but vaccination and pelt preparation require extra workers.

The mink is killed by injection, gas or electrocution, and then skinned. The pelt is fleshed and degreased and dried on boards, usually fur side out. Pelts are then sent to a fur centre for classification ("Majestic," "Canada," "Unlabelled") and sale by auction; most pelts are classified and sold by the HUDSON'S BAY CO.

**Fox**, a carnivorous member of the family Canidae, has been farmed since about 1890. In the past, fox breeding underwent great fluctuations but, in the last decade, market demand

and prices have improved. In 1981 international production was 3 million blue fox pelts and 200 000 silver fox pelts; Canada produced 11 000 silver fox pelts. In that year, the price of the Canadian fox averaged \$294 a pelt; production costs, about \$100. In 1980 there were 295 fox farmers in Canada, mostly in NS, PEI, NB and Ont. A typical farm has breeding and fur sheds and a service building, but some farmers keep their breeding foxes in outdoor cages. Establishing a fox farm requires about \$1100 per breeding female. A single worker can look after about 100 breeding females. Fox pelts are prepared in the same way as mink pelts; the skin is always dried fur side out. Classification and sale at auction take place at the same fur centres that handle mink.

RENÉ BELZILE

**Fur Industry** The Canadian fur industry consists of companies that buy raw furs from trappers, dealers or fur-marketing companies (eg, HUDSON'S BAY CO raw-fur auctions), send them to fur dressers and dyers in Toronto, match the skins and cut and sew them into garments. Most manufacturers make coats and most specialize in one or 2 types of fur. Before the coat can be finished, it must go through a fur-cleaning process and some companies do only this. Some cleaners also maintain cold fur-storage vaults to house furs during the summer, but many retail furriers also have their own vaults. Fur factories are generally small, the number of workers varying from 4 to 75; only 8 of the 299 operating factories employed over 100 people in 1981. In that year there were 2483 furriers in the MANUFACTURING work force, 1718 in Québec, 559 in Ontario and 125 in Manitoba. Almost all fur companies are Canadian owned; there is some foreign ownership, mainly American, in the retail sector.

Fur garments have been made using hand techniques for more than 100 years, although new technologies have been introduced in the last decade. Innovations include cutting machines, an attachment to guide fur through the wheels of the fur-sewing machine, and a German invention for finishing a coat, ie, installing the lining. Almost no research and development is done anywhere except in Germany, but innovation exists in Canada in dressing, dyeing and cutting.

Canada is known internationally as the producer of the world's finest furs. Jacques CARTIER was met in 1534 on the shores of the St Lawrence R by Indian chiefs wearing the robes of their rank, hand sewn from beaver and bear pelts. Western Europeans wintering in Canada found it essential to tan and sew pelts they had obtained by trapping or barter, although the resulting garments could hardly be called fur coats, since there was no styling. A modest custom-fur business sprang up to meet the demands of voyageurs and traders who wanted better garments. Exported pelts were used mainly for men's hats, but gradually fur fashions began to appeal to women in Europe and Canada (see FUR TRADE).

This demand created a market for custom furriers, who designed, made and maintained fur garments. The Hudson's Bay Co, formed in 1670 to collect pelts from Rupert's Land, slowly developed a garment business as well. From 1880 to 1920, many of the immigrants from Ukraine, Poland and Austria, as well as young men from England and Scotland, had had experience with the needle in Europe and went into Canadian fur stores and workrooms. The early custom furriers were Anglo-Saxon, but by 1930 Jewish immigrants had developed a wholesale manufacturing industry to serve the custom trade and the developing retail trade. In 1933, as the GREAT DEPRESSION created financial chaos, manufacturers formed the Fur Trade Credit Assn of Canada, later the Fur Trade Assn of Canada. Retailers

formed the Retail Furriers Guild of Canada. Each May the Fur Trade Assn sponsors great fur fairs and international shows in Toronto and Montréal, where retailers order coats for August fur sales. The 1950s and 1960s brought many trained furriers from Greece, almost all being from the small town of Kastoria which had been totally employed in manufacturing fur items for 2000 years. The Greek furriers congregated in Montréal, Toronto and New York, and they are becoming a major factor in Canadian fur manufacturing. They have developed their own trade association in Toronto.

Fur-production workers can be trained on the job or at Toronto's George Brown College to become cutters (who cut the pelts to fit the pattern, using a pointed razor-bladed knife), operators (who sew the pieces together), blockers (who tack or staple the sewn sheets of fur to the tracing of the pattern) and finishers (who close the coat and install the lining, buttons, etc). The fur industry consumes relatively little energy because so much of the work is done by hand. Synthetic fur uses much more energy and its manufacture creates chemical pollution.

The Canadian fur industry is a significant exporter of pelts and garments. The largest customers are the US, Western Europe and recently Japan, which is a rapidly growing market. According to Statistics Canada, the fur industry has grown from \$51 million in wholesale shipments in 1970 to \$170 million in 1978 (of which \$81 million was exported) and to \$234.5 million in 1980 (of which over \$100 million was exported). In 1919 there were 107 plants; the peak of 642 plants was reached in 1949, and by 1982 the number had dropped to 270. Between 1949 and 1982 the number of employees decreased from 6700 to 2483. The fur industry receives no tariff protection and raw-fur prices continue to be high.

SIDNEY S. SCHIPPER

**Fur Trade** in Canada began as an adjunct to the fishing industry. Early in the 16th century fishermen from NW Europe were taking rich catches of cod on the Grand Banks off Newfoundland and in the Gulf of St Lawrence (see FISHERIES HISTORY). Drying their fish onshore took several weeks, during which time good relations had to be maintained with the Indians who were eager to obtain metal and cloth goods from the Europeans: iron knives and axes, awls,

copper kettles, blankets and trinkets. All they had to offer in exchange were furs and fresh meat. The fishermen found an eager market in Europe for the furs and made high profits. When the wide-brimmed felt hat came into fashion later in the 16th century, the demand for BEAVER PELTS increased tremendously. The best material for hat felt was the soft underfur of the beaver, the strands of which had tiny barbs that made them mat together tightly.

Early in the 17th century French traders established permanent shore bases in ACADIA, a post at TADOUSSAC (Qué) and in 1608 a base at QUÉBEC to exploit the trade more effectively. The following year the Dutch began trading up the Hudson R (NY) and in 1614 established permanent trading posts at Manhattan and upriver at Orange [Albany]. This activity marked the beginning of intense rivalry between 2 incipient commercial empires. During these years the number of traders flooding into the St Lawrence region and cutthroat competition among them greatly reduced profits. In an attempt to impose order the French Crown granted monopolies of the trade to certain individuals. In return, the monopoly holders had to maintain French claims to the new lands and assist in the attempts of the Roman CATHOLIC Church to convert the Indians to Christianity.

In 1627 Cardinal Richelieu, first minister of Louis XIII, organized the COMPAGNIE DES CENT-ASSOCIÉS to put French territorial claims and the missionary drive on a firmer footing. Missionaries were sent out: in 1615, 4 Récollets, and in 1625 the first members of the powerful Society of Jesus (Jesuits) arrived at Québec. A mission base, STE MARIE AMONG THE HURONS, was established among the HURON near Georgian Bay, but the Huron were more interested in the trade goods of the French than in their religion. Yet it was fur-trade profits that sustained the missionaries and allowed the company to send hundreds of settlers to the colony. In 1642 VILLE-MARIE [Montréal] was founded as a mission centre. In 1645 the company ceded control of the fur trade and the colony's administration to the colonists (see COMMUNAUTÉ DES HABITANTS). Unfortunately, they proved to be inept administrators, and fur-trade returns fluctuated wildly as a result of an IROQUOIS blockade of the Ottawa R route to the West. Finally, after a desperate appeal by the colonial authorities to Louis XIV, in 1663 the Crown took over the colony.

The main staple of the trade was still BEAVER for the hat industry. The Ministry of Marine

(see MINISTÈRE DE LA MARINE), responsible for colonial affairs, leased the West Indies trade, the African slave trade and the marketing of Canadian beaver and moose hides to the newly formed COMPAGNIE DES INDES OCCIDENTALES, in reality a crown corporation. All permanent residents of the colony were permitted to trade for furs with the Indians but they had to sell the beaver and moose hides to the company at prices fixed by the Ministry of Marine. All other furs were traded on a free market; thus the trade was not a monopoly, but the law of supply and demand had been suspended for beaver and moose hides.

Jean-Baptiste Colbert, the French minister of marine, hoped to see the Canadian economy diversified to produce raw materials for French industry, particularly timber, and minerals and foodstuffs for the West Indies plantations. Thousands of emigrants were shipped to Canada at the Crown's expense to bring the land into production. Colbert discovered that a sizable proportion of the young men did not remain on the land but disappeared for years to trade with the Indians in their distant villages (see COUREURS DE BOIS). The main reasons for this phenomenon were the assured profits in the trade and the imbalance of the sexes, which was so great that until about 1710 only about one man in 7 could hope to find a wife — a necessity on a farm. In the interior, however, the traders quickly formed alliances with Indian women, whose economic skills facilitated adaptation by the French to wilderness life. By 1681 Colbert was forced to acknowledge the pull of the fur trade, and he inaugurated the *congé* system. Each year up to 25 *congés* (licences to trade) were to be issued by the governor and the intendant. Each *congé* allowed 3 men with one CANOE to trade in the West. It was fondly hoped that the Canadians would wait their turn for a *congé*, thus leaving the colony only 75 men short each year.

The new system did little to reduce the number of men away from the settlements (most of them illegally), and the amount of beaver pouring into Montréal continued to increase astronomically. By the 1690s the *Domaine de l'Occident* (Company of the Farm), which had been obliged to take over the beaver trade in 1674 from the defunct *Compagnie des Indes Occidentales*, was complaining of a huge glut. In 1696, in desperation, the minister of marine gave orders to suspend the beaver trade, to stop the issuing of *congés* and to abandon all the French posts in the West, except Saint-Louis-des-Illinois. This occurred while England and France were at war and the Canadians were engaged in a desperate struggle with the English colonies and their Iroquois allies. The governor (see GOUVERNEUR) and INTENDANT at Québec protested vigorously, declaring that to abandon the posts meant abandoning the Indian allies, who would then go over to the English. New France would be doomed. In addition, the English had been established since 1670 at posts on Hudson Bay (see HUDSON'S BAY COMPANY), and the western posts were essential to fend off that competition. The Canadian COMPAGNIE DU NORD had been founded in 1682 to challenge the HBC on its own ground, but it was a failure. The minister of marine was obliged to rescind his drastic orders and the beaver trade was resumed, for purely political reasons.

In 1700, on the eve of new hostilities, Louis XIV ordered the establishment of the new colony of Louisiana on the lower Mississippi R, settlements in the Illinois country and a garrisoned post at Detroit. The aim was to hem in the English colonies between the Allegheny Mts and the Atlantic. This imperialist policy depended on the support of the Indian nations; and the fur trade was used to maintain their alliance.

In 1715 it was discovered that rodents and insects had consumed the glut of beaver fur in French warehouses. The market immediately

revived. As an item on the balance sheet of French external trade, furs were minuscule, and their share was shrinking proportionately as trade in tropical produce and manufactured goods increased; but it was the backbone of the Canadian economy.

Unlike the HBC with its monolithic structure, staffed by paid servants, in New France down to the early years of the 18th century the trade was carried on by scores of small partnerships. As the 18th century wore on and costs rose with distance, the trade came to be controlled by a small number of BOURGEOIS, who hired hundreds of wage-earning VOYAGEURS. Most companies consisted of 3 or 4 men who obtained from the authorities the lease on the trade at a specific post for 3 years; all members shared profits or losses proportional to the capital subscribed. Trade goods were usually obtained on credit, at 30% interest, from a small number of Montréal merchants who also marketed the furs through their agents in France. The voyageurs' wages varied from 200 to 500 *livres* if they wintered in the West. For those who paddled the canoes westward in the spring and returned with the autumn convoy, the usual wage was 100-200 *livres* plus their keep (about double what a labourer or artisan would earn in the colony).

Between 1715 and the SEVEN YEARS' WAR (1756-63) the fur trade expanded greatly and served a variety of purposes — economic, political and scientific. Educated Frenchmen were keenly interested in scientific inquiry, and government members, eager to discover the extent of N America, wished a Frenchman to be the first to find an overland route to the western sea (see NORTHWEST PASSAGE). Commissions were granted to senior Canadian officers, such as Gaultier de LA VERENDRYE, to discover that route. They were given command of vast western regions (some of which overlapped territory claimed by the British), with sole right to the fur trade. Out of their profits they had to pay the expenses of maintaining their posts and sending exploration parties west along the Missouri and Saskatchewan rivers. The Crown thereby made the fur trade pay the costs of its pursuit of science, and also maintained control over its subjects in the wilderness and its alliances with the Indian nations to exclude the English. By 1756, when war with England put a stop to EXPLORATION, the French had reached the foothills of the Rocky Mts. Warfare between the BLACKFOOT and CREE prevented further advances.

Throughout this period there was keen competition between the Canadian traders and the HBC, with the Canadians taking the lion's share of the trade. They had many advantages: they controlled the main waterways throughout the West; they had a sure supply of the birch bark needed for canoes (something that the Anglo-Americans and the HBC men both lacked); many of their trade goods were preferred by the Indians; and they had good relations with the Indians, with whom they had developed extensive kinship ties. Attempts by the English of the Thirteen Colonies to obtain more land for settlement by any means angered the Indians. The French did not covet Indian lands, but were determined to deny them to the English.

HBC traders made no real attempt to push their trade inland. Instead, they waited in their posts for the Indians to come to them. The Indians were astute enough to play the English and French off against each other by trading with both. The French dared not try to prevent Indians from taking some furs to the bay, but made sure to obtain the choice furs, leaving only the bulky, poor-quality ones to their rivals. In the St Lawrence region, New York and Pennsylvania traders made little attempt to compete with the Canadians. Instead, they purchased furs clandestinely from the Montréal merchants. In this way the Canadians obtained a good supply of

strouds (coarse English woollen cloth), a favourite English trade item. The illicit trade between Montréal and Albany also removed any incentive the New York traders might have had to compete with the Canadians in the West.

When the Seven Years' War began, the fur trade continued out of Montréal. The Indian nations had to be kept supplied, but the volume of exported furs steadily declined. Within a year of the French capitulation at Montréal in Sept 1760, the trade began to revive, largely supported by British capital and Canadian labour.

W.J. ECCLES

#### Fur Trade After 1760

At the time of the CONQUEST, 1759-60, 2 systems dominated the commercial fur trade of the northern half of the continent: the St Lawrence-Great Lakes system, based at Montréal and extending to the upper reaches of the Mississippi R and its major northern tributaries, as well as to the prairies and the southern portion of the Canadian SHIELD; and the Rupert's Land system, which theoretically covered the whole region draining into Hudson and James bays. The St Lawrence-Great Lakes system, developed by the French, had come to be served by the *en dérive* (itinerant peddling) pattern of trade, ie, a pattern in which the trade, dominated by many small partnerships, was conducted by parties of a few men sent out to do business with the Indians in their own territory. The Rupert's Land trading system, by contrast, had not evolved in the same manner; in 1760 the HBC's employees still followed the practice of remaining in their coastal "factories" (major trading posts), awaiting the arrival of Indians to trade.

After the Conquest, Anglo-Americans (Yankees, or *Bastonnais*), English and Highland Scots merchants supplanted the Canadian bourgeois and the agents of French merchants at Montréal. The new "pedlars" forged a new commercial link with London. The upsurge in activity in Montréal disturbed the HBC's "sleep by the frozen sea": the success of its new rivals forced the company to alter its coast-factory trading policy, and in 1774 the HBC penetrated inland from the bay to found CUMBERLAND HOUSE, close to the Saskatchewan R. For their part, the pedlars learned that co-operation among themselves, rather than competition, was the road to commercial success. The resulting NORTH WEST COMPANY rose rapidly to a position of dominance in the trade by gaining a *de facto* monopoly of the trade in the fur-rich area around LK ATHABASCA. Staple fur (beaver) and fancy furs (mink, marten, fisher, etc), unsurpassed in quality and number, assured handsome profits in spite of the high costs of the necessarily labour-intensive transportation system, the canoe brigade. The annual dash of brigades from Fort Chipewyan to GRAND PORTAGE (later to FT WILLIAM) on Lk Superior created much of the romantic image of the fur trade. To maintain its Athabasca monopoly the NWC competed, at a loss if necessary, with its opponents on the Saskatchewan R, around Lk Winnipeg and N of the Great Lakes. On the N Saskatchewan R, the rival companies leapfrogged westward past each other's posts in an attempt to gain a commercial advantage with the Indians. In all regions, small trading parties travelled *en dérive* to waylay Indians travelling to rivals' posts and, when necessary, to force them to trade. In this competition the HBC appeared disadvantaged in spite of its having a major entrepôt, YORK FACTORY on Hudson Bay, much closer to the fur-gathering areas than was the NWC's transshipment point of Montréal. The HBC lacked personnel and equipment equal to the tasks of inland travel and trade. Not until the 1790s did the HBC evolve the YORK BOAT brigade as an answer to its rival's *canot de maître* and *canot du nord*. Even then, improved equipment and personnel were not sufficient to turn the commercial tide in the company's favour.

Oxford House, 1880. When the Indians came to trade, they camped close to the fur-trade post in an open area called the "plantation" (courtesy Public Archives of Canada).

Montréal agents such as Simon "The Marquis" MCTAVISH and his nephew and successor William MCGILLIVRAY shrewdly directed the NWC's affairs, but much of the company's success was due to the élan of its officers and employees (*engagés*). WINTERING PARTNERS participated in decision making and enjoyed the profits of the trade. Unlike the HBC, the NWC permitted all ranks to take Indian wives *à la façon du pays*, a policy that resulted in a certain stability and a sizable MÉTIS population by the early 19th century. In 1789 Alexander MACKENZIE carried the company's flag to the Arctic Ocean, and in 1793 he reached the Pacific Ocean overland. Later explorers such as Simon FRASER and David THOMPSON opened up the fur lands west of the Rocky Mts. The signing of JAY'S TREATY in 1794 ended the southwest trade, and a new rival, the XY COMPANY, appeared in 1798. But the NWC met its challenge and in 1804 absorbed the upstart.

It was the revitalization of the HBC, beginning in 1810, that ultimately defeated the NWC. That year, the earl of SELKIRK's decision to establish a settlement in HBC territory led him to purchase sufficient stock to place 4 friends (2 of them kinsmen) on the HBC's 7-man governing committee. These men, new to the company, emphasized efficiency in the trading process as the means to reduce costs and turn from loss to profit. Success in this endeavour led the company to attempt to invade the Athabasca country in 1815. Poor planning by the expedition's leader and the NWC's influence with the Indians in the region caused as many as 15 men to die of starvation. But the HBC, undaunted, returned a few months later and successfully challenged the NWC monopoly.

The governing committee gave Selkirk's RED RIVER COLONY assistance and co-operation, although officers in the region were unenthusiastic. The NWC saw the settlers as supporters of their newly revitalized commercial rival, and convinced the local MÉTIS, who had settled the region earlier, that their lands were threatened. Commercial conflict erupted in violence when the colony's governor and some 20 other settlers and HBC servants died in the SEVEN OAKS INCIDENT on 19 June 1816; the MÉTIS lost only one man. Such occurrences led the British government to demand that the competing fur companies resolve their differences. To this end the government passed legislation enabling it to offer an exclusive licence to trade for 21 years in those areas of British North America beyond settlement and outside Rupert's Land. In 1821 the 2 companies created the "Deed Poll," a document which outlined the terms of a coalition between

them, detailed the sharing of the profits of the trade between the shareholders and individual officers in the field, and explained their relationship in the management of the trade. It was in this manner as well as in the sharing of profits that elements of the NWC survived in the new HBC, although what was a coalition in name became absorption by the HBC in fact when, in 1824, the board of management was eliminated. A majority of officers in the HBC after 1821 were former Nor'Westers.

Commercial agreements between 2 separate companies and the support given by government legislation and proclamation could not hide the NWC's defeat. The victorious HBC once again sought to increase its efficiency. Under the direction of Gov George SIMPSON, the "Little Emperor," the HBC achieved undreamed-of profits. But such profits required a constant monitoring of costs and a constant search for savings, as well as a policy of sharp competition with rivals in border areas. Through the company's policies and the actions of its personnel, the inhabitants of the old North-West had their initial exposure to the influence of changes wrought in Britain by the Industrial Revolution.

In monitoring the costs of the trade, Simpson clearly saw the importance of providing support to hunting and trapping Indians. In times of adversity the company offered medical services and sufficient supplies and provisions for the trapper and his family to survive. Yet in systematizing these services Simpson's policies led the Indians into an increasingly dependent relationship with the HBC. The Plains Indians, while the BUFFALO HUNT was still possible, could be independent of the company's services, but for others the new reality was increasingly economic dependence. Simpson's reforms, however, allowed HBC expansion along the Pacific coast, northward to the Arctic and into the interior of previously largely ignored Labrador. Such a vast fur domain attracted rivals.

Simpson's fundamental strategy was to meet competition in the frontier areas to preserve the trade of the interior. On the Pacific coast he reached an agreement with the Russian Fur Company permitting the HBC to pursue the maritime trade and successfully challenge the pre-eminence of the Americans. South and east of the Columbia R he encouraged expeditions to trap the region clean in a "scorched-earth" policy that left no animals to attract American "mountain men" or trappers. In the Great Lakes area he licensed small traders to carry competition to the territory of the American Fur Company, eventually causing it to abandon the field for an annual payment of £300. Farther east, the opponents were more difficult to dislodge. The KING'S POSTS, a series of posts N of the St Lawrence

originally belonging to the French king, had been granted in 1822 to a Mr Goudie of Québec City, and along the Ottawa R lumbering provided bases for competition to arise. Yet the company vigorously pursued its competitors in all the frontier areas, sustaining its monopoly of the trade in Rupert's Land and in the licensed territories to the N and W. Even when, in the 1830s, silk replaced felt as the favoured raw material in the manufacture of hats and beaver lost its value as a staple fur, the company maintained a profitable trade emphasizing fancy fur Settlement, not commercial rivals, finally successfully challenged the company.

West of the Rocky Mts, American settlers succeeded where their predecessors, the mountain men and the ships' captains, had failed. As a result of the OREGON TREATY of 1846 the HBC retreated N of the 49th parallel of latitude. To the E, at Red River, the HBC met the challenge of free traders by charging Guillaume Sayer and 3 other MÉTIS in 1849 with violation of the HBC monopoly. Although the company won a legal victory in the courtroom, the community believed that the free traders had been exonerated. Henceforth the company would meet the free traders with the techniques of competition learned elsewhere in its domain to slow the assault on the fur resources to the W and N. In LOWER CANADA the company had acquired the lease for the King's Posts in 1832, but the northward march of lumbermen signalled the lessening importance of the fur trade in this region. Simpson countered brilliantly by making his company an important supplier of goods needed by the lumbermen.

When the geographical isolation of the West was breached in the 1840s, metropolitan institutions other than the fur interests became involved in opening the "Great Lone Land." Roman Catholic and Anglican missionaries who had appeared earlier now penetrated to the heart of the continent. They were followed by adventurers and government expeditions (eg, the PALLISER EXPEDITION) seeking resources other than fur. Simpson's death in 1860 and the sale in 1863 of the HBC to the International Financial Society, a British investment group that saw settlement as a source of profits, marked the beginning of the end of the historic fur trade. In 1870 the HBC's vast territory in the West was transferred to Canada, and what had been a trickle of settlers coming from Ontario became a flood. As settlement spread N and W, the HBC and rival free traders intensified the northward push of the trade, and eventually established enduring trading contacts with the Inuit.

In the face of competition and the presence of the Canadian government, the HBC reduced the support services that had been a part of its trading relationship with the Indians and had buffered the Indians against the swings of fur-market demands in western Europe. In the 20th century, fortunes in the fur trade came to reflect the swings of the market and the advent of FUR FARMING (see FUR INDUSTRY). Increasingly the Indians looked to the missions and even more to the government for support in times of adversity. This shift culminated in the granting of FAMILY ALLOWANCE, schooling and pensions after WWII, and marked the end of the historic fur trade. FUR TRAPPING continues as a cash crop in frontier areas, but as a way of life it is isolated to a few northern areas.

Historically, however, the fur trade played a formative role in the creation of Canada. It provided the motive for the exploration of much of the country and remained the economic foundation for western Canada until about 1870. The fur trade also determined the relatively peaceful patterns of Indian-white relations in Canada. A central social aspect of this economic enterprise was extensive intermarriage between traders and native women, which gave rise to an indig-

enous fur-trade society that blended Indian and European customs and attitudes. JOHN FOSTER Reading: W J. Eccles, *The Canadian Frontier 1524-1760* (rev ed, 1983) and *Canadian Society During the French Regime* (1968); D. Francis, *Battle for the West* (1982); C. **Fur Trade Routes** Throughout the period of the historical fur trade, water routes were the natural "highways," and canoes (later boats — principally York boats) the vehicles. The placement of trading posts depended on the presence of numbers of Indians willing and able to trade, and on the ease of transportation to and from them. In the Atlantic region, the absence of a dominant river system resulted in only a localized traffic in furs; but the French tapped a vastly greater potential via the St Lawrence R and its tributaries. At posts at Tadoussac, Québec and Montréal they received furs from the Montagnais, Algonquin, Huron and Ottawa, who travelled various rivers from the King's Domain, or came down the Ottawa R from Lk Timiskaming and beyond. But most important to the later trade was the route the French themselves developed to the west via the St Lawrence, Ottawa and French rivers; by the 1740s they had extended it to the head of Lk Superior and thence to the prairies. After the Conquest of 1759-60 this route was adopted by anglophone independent traders and then by the NWC. From Kaministiquia (later Ft William) the route inland began at GRAND PORTAGE and twisted N and W through a series of streams, rivers and lakes marked by over 50 tortuous portages. From Lk Winnipeg the traders headed W via the 2 branches of the Saskatchewan R; many went

NW via Methye Portage [PORTAGE LA LOCHE] to Lk Athabasca.

The other major route was that of the London-based HBC through Hudson Bay. When that company began to move inland in 1774, with the construction of CUMBERLAND HOUSE on the Saskatchewan, most of its traffic inland was by the Hayes R from York Factory. In the direct competition that ensued between the HBC and other traders, the rivals paced one another westward across the prairies. Eventually the routes proceeded via the Howse, Athabasca and Yellowhead passes through the Rocky Mts and down the Columbia R to the Pacific region. After 1814 HBC ships rounded Cape Horn to service Pacific posts by sea. As the more southerly trade declined, traders moved down the Mackenzie R into the western Arctic and from the East Main (E coast of Hudson Bay) inland. Access to Ft Chimo and to posts in Labrador was generally by sea. After the merger of the NWC and HBC in 1821, shipments through Montréal virtually ceased.

JAMES A. OGILVY

**Fur Trapping** The FUR INDUSTRY is the oldest land-based industry in Canada. The fur resource is renewable and, after centuries of harvesting, Canada has maintained the stability of (and, in some cases, increased) its furbearer populations, which include BADGER, BEAVER, BOBCAT, COUGAR, COYOTE, ERMINE, FISHER, FOX, LYNX, MARTEN, MINK, OTTER, RACCOON, SKUNK, SQUIRREL, WOLF and WOLVERINE. In addition, BEARS are considered game animals in most provinces and are taken by hunters. There are no endangered furbearers in Canada; however, furbearer populations are sensitive to alterations in their habitat. Extensive clear-cutting leaves no home for squirrels, which means that marten, next up the food chain, lose the mainstay of their diet. Filling in marshland destroys the habitat of beaver, MUSKRAT and other furbearers. Loss of aquatic life in lakes and streams through the effects of ACID RAIN eventually eliminates mink and otter populations.

The primary producer of the furbearer resource is the trapper. Provincial and territorial governments impose controls on trapping, which include establishing various categories of licence (registered, resident or private land, farmer, zoned fur block, helper, native band trapline), setting quotas, establishing seasons during which hunting is permitted and granting export permits. Not all agencies have identical systems, but all Canadian trappers are licensed and fur shipped from each province or territory requires an export permit.

Fur management by provincial governments provides a data base allowing scientific control of seasons and harvesting. Ontario is the largest fur-producing province, followed by Québec and Alberta. Because 92% of Ontario's land is provincially owned, the province has a highly developed fur-management program. It has 2850 registered traplines, each assigned to one trapper who, depending on the size and location of the line, may have one or several assistants who are also licensed to trap. Most furbearer species harvested on registered traplines are controlled by quotas based on estimated populations. Because habitats produce only enough food for limited populations, the registered crown land trapper is required to produce 75% of the quota or forfeit his licence to trap. Beaver, in particular, can devastate food resources so that it will be many years before an area can support a family of beaver again.

The fur industry is big business in Canada, providing an economic and social base in every province and territory. It employs people living in areas where jobs are scarce and provides relief to landowners troubled by damage caused by "nuisance" furbearers. Wild furbearer meat is estimated to be worth millions of dollars and its

nutritional value is considerable. Beaver, especially, is high in protein and low in cholesterol and is readily available to people without access to supermarkets. Muskrat, lynx and raccoon are also eaten.

The value of Canadian wild furbearer pelts sold in the 1980-81 season was over \$72 million. More than 500 000 beaver pelts accounted for nearly \$16.5 million of this total; over 2.1 million muskrat pelts contributed nearly \$14 million. Major export markets for Canadian furs are Western European countries, but Far Eastern markets are growing steadily.

During the 1970s and 1980s, trapping techniques and equipment have become more efficient and humane as a result of public concern. Several new devices have been tested in the laboratory and, to a limited degree, in the field. Most ideas for innovations come from active trappers. Education in fur harvesting and handling is mandatory in BC and Ontario before a first-time trapper can obtain a licence. Other provinces are also active in trapper education and Alberta, in particular, has an excellent program. Many veteran trappers take courses and workshops to upgrade their skills.

The location and positioning of a trap is called a set. There are 3 kinds: blind, bait and curiosity sets. A blind set uses a trap placed in an area which the animal frequents so that it will encounter the trap or snare during its usual travels. A bait set uses food to lure the animal; the bait might be a fresh poplar stick (for beaver) or beaver meat (for fisher). A curiosity set uses scent as an attractant. Beaver castor mixed with oil from the beaver's oil sac, used in open water, will bring a beaver of a different colony or family to investigate, intent on challenging the outsider and maintaining its territorial rights. Lures made of synthetic ingredients or natural parts or substances, eg, fox bladder, urine and foot pads, allowed to age, will attract other foxes.

Methods of harvest include use of foothold or body-gripping traps, foot or neck snares, deadfalls and box or live traps. Deadfalls, constructed on a set location not to be moved, were one of the first methods of trapping animals. The snare was another early tool of the trapper. Until the development of the foothold trap, much of the fur was taken by hunting. The invention of the foothold trap is credited to New York State trapper Sewell Newhouse in 1823. Since that time there have been thousands of variations in size, style and manufacture. The foothold trap is the only one that will successfully hold a large animal without damage to the fur. It is also versatile, being readily adaptable to humane sets for aquatic furbearers. While body-gripping traps (eg, the Conibear, invented by BC trapper Frank Conibear in the 1950s) have been very successful for some species, the foothold trap is still the only type consistently successful in capturing canids (ie, fox, wolf, coyote). Increasing sales of new traps, such as the Conibear (used for beaver, raccoon, marten, fisher, muskrat and mink) show that Canadian trappers are willing to improve skills and use humane equipment and methods.

Since 1911, when Russia, the US, England, Japan and Canada signed the Pelagic Treaty to control the slaughter of Alaska fur SEALS, fur trapping has been under government regulation. Every Canadian province and territory controls trapping seasons and the size of the catch to conserve fur and control disease. Royalties are collected provincially and a great deal of biological research has been done since 1927.

Today's trapper is a small businessman who must operate efficiently and profitably to stay in business. Not all the estimated 80 000 Canadian trappers are totally dependent on trapping income, but many are and they contribute to the Canadian economy both directly, through royalty payments on fur that is collected in many

provinces, and indirectly through a positive effect on Canada's balance of payments.

The majority of Canadian wild fur is sold at fur auctions, such as those held at the HUDSON'S BAY CO in Rexdale, Ont, and the Ontario Trappers Association Fur Sales Service in North Bay, Ont. Both sales offer fur from all areas of N America. In the sliding economy of 1981-82, some of the average and high prices attained at the OTA auctions were fisher (\$182.21, \$201), Ont/Qué beaver (\$23.76, \$91), western beaver (\$18.84, \$66), mink (\$27.28, \$77), marten (\$32.08, \$135), muskrat (\$4.90, \$12.30). Canada is recognized as the producer of the finest wild fur in the world, a fact attributable to our climate, habitat and the expertise of Canadian trappers. See FUR FARMING; SEALING; FUR TRADE.

ROGER BETZ

**Furniture, Country** In studies of antiques or material history, "country" (ie, traditional, provincial or folk) styles are contrasted with stylized or formal ones. What one individual calls country and admires perhaps for its decoration or painted finish, another may reject as crude and primitive. Although some may expect formal furniture to be constructed of finer hardwoods (eg, walnut, cherry, mahogany) and country furniture of softwood (eg, pine), an understanding of the difference between country and formal furniture goes beyond methods and mediums of construction, forcing consideration of other factors, including where and when the furniture was produced. Country furniture is probably best understood as material produced after or similar to the mainstream of influences or period styles (eg, Chippendale, Hepplewhite, Sheraton), using local woods and influenced by the limitations of the cabinetmaker's tool chest, imagination and level of workmanship. Country furniture includes all types found in formal furniture (eg, tables, chairs, cupboards, chests) as well as additional forms.

#### Maritime Provinces

Settlement in the Maritimes (comprising NS, NB and PEI) was essentially a rural experience. Although port cities, such as Halifax and Saint John, were important as political, social and economic centres, most people lived in small farming and fishing communities. Because of distances, lack of adequate roads and unreliable methods of transportation and communication, contact between the regions was limited and rural areas were isolated from urban centres and mainstays of fashion and taste.

After the expulsion of the ACADIANS (1755-63), the first influx of immigrants began with the arrival of the PLANTERS from New England, followed by the LOYALISTS in 1783-84 and a substantial Scottish migration in the early 19th century. Although many of these settlers brought or imported their domestic furnishings, the migration included cabinetmakers, carpenters and joiners whose arrival and settlement quickly led to the establishment and production of indigenous Maritime-Canadian furniture, based on English and American styles familiar to the craftsman. Because cabinetmaking was essentially a conservative craft, based on an established APPRENTICESHIP system, and because furniture styles have a tendency to persist over long periods of time, the country furniture produced in the Maritime provinces from about 1770 to 1850 reflected the continuation of earlier styles such as Chippendale. Only in cities, which were open to the influx of new fashions, would one expect furniture styles to attempt to keep pace with new developments and trends in taste. The rural character of Maritime society also influenced the choice of construction materials. Except in urban centres, particularly port cities, where exotic woods (eg, mahogany) were available to local craftsmen, most furniture was constructed of immediately available woods (eg,

pine, birch, maple). Figured hardwoods (eg, birch, maple) were commonly used in both formal and country furniture because of their decorative grain. Country furniture (particularly that produced in pine) was often painted to represent more formal furnishings in exotic wood. In some cases, these painted finishes, which are often very vibrant and colourful, are the most important distinguishing feature of country furniture.

French (Acadian), English, Irish, Scottish and German influences are evident in the country furniture styles of the Maritimes. All ethnic groups used similar types of domestic furnishings, including blanket boxes, chests of drawers, tables of various sizes with and without drawers, chairs with and without arms, and corner and flat-to-the-wall cupboards. Not all groups, however, are represented in all 3 provinces, and some groups lavished more attention and detail on certain types of furniture than on others.

**Prince Edward Island** The flat-to-the-wall kitchen cupboard, usually with an open top, seems to have been the focal point of furnishings of Scottish and Irish homes during the 19th century. Although most of these cupboards were made by unknown craftsmen, PEI is rich in examples of furniture signed or in some way identified by its makers. Such cabinet and chair makers include Benjamin Chappell, a wheelwright from London who arrived in 1774, and Samuel Bagnall, a Loyalist who arrived from Philadelphia in 1787. Both are well known for their chairs, examples of which exist in public and private collections.

**New Brunswick** is also rich in furniture by known makers, particularly in Saint John, which was the most important centre of cabinetmaking. Known cabinetmakers working before 1800 include Robert Chillas, who arrived from New York in 1783; Daniel Fowler, who settled in 1785; Nathan Oaks and Robert Blackwood, who took out Freeman papers in 1795 and 1796, respectively.

**Nova Scotia** Like Saint John, Halifax was an important centre of cabinetmaking. NS saw the largest immigration of "Foreign Protestants" in the Maritimes. Lunenburg was settled by German-speaking immigrants in 1753. Although the initial migration numbered only about 2000, the Germans gave LUNENBURG county a distinctive tradition and culture which still survives. One of the early Lunenburg town furniture makers, listed in 1794 as a turner and wheelwright, was Casper Jung, who later anglicized his name to Young. In Halifax many signed examples of Windsor chairs are known by such makers as James Cole (about 1817), who came to Halifax from the US; George Gammon (about 1838), who worked in Cole Harbour, Halifax County; and Joy Humeston (about 1805), who made Windsor-style bamboo chairs and settees in Halifax. The Sibley family of Colchester County made other types of furniture but their chair, with its distinctive, shaped back slats and mushroom finials, is best known. Beginning with Joseph Sibley (born 1790), who was known locally as the "chair maker," the Sibleys continued in operation until 1900.

Of the Maritime provinces, NB and NS saw the largest influx of French-Acadian immigrants, beginning with the establishment of PORT-ROYAL in 1604. Expulsion of these Acadians was accompanied by the confiscation or destruction of such of their belongings as they could not carry with them. Therefore, much of the furniture identified today as "Acadian" actually dates from the post-expulsion period when, beginning in 1764, the French-Acadians returned to the region.

By the middle of the 19th century the craft tradition of furniture manufacture was rapidly being replaced by mechanization and factory production. Although in certain rural areas,

such as parts of PEI, earlier furniture styles persisted well into the late 19th century, the cabinetmaking-apprenticeship tradition slowly disappeared as the Maritimes moved into the industrial age.

RICHARD HENNING FIELD

#### Newfoundland

No furniture is known from Newfoundland which can be dated earlier than 1810-20, when restrictions on land granting were lifted and local development encouraged. The first British-trained cabinetmakers, Mark Green and George Hancock, arrived in St John's in 1815 to serve its growing population. Samuel Creed came from Halifax about 1833 and his surviving work suggests a conservative approach to current furniture styles. The fact that W. Gammon produced Windsor chairs in both Halifax and St John's, and that similar comb-back Windsors are found both in NS and Newfoundland, suggests an early, strong craft connection in the Atlantic region.

Although some cabinetmakers worked in major outports such as Harbour Grace, most were in St John's, the economic and political capital. That city had 6 cabinetmakers in the 1840s, 10 in the 1870s. Matthew Pope's furniture factory, opened in 1859, was one of a number that produced household and institutional furniture. What is known of the work of these individuals and factories suggests that their work was not imaginative; they were content to copy pattern-book styles to the limit of their abilities and equipment. There were exceptions, for example, H.W. Winter's workshop at Clarke's Beach, Conception Bay.

Real imagination can be found in outport furniture, whether homemade or made by a local carpenter. In such pieces as washstands and benches the whole repertoire of decorative treatments, eg, chip carving, applied motifs, spindles, chamfers, mouldings and arches, was exploited in inventive combinations augmented by strong colours in the paintwork. Where a particular skill was required, eg, with chairs requiring joinery, conservatism crept in. Old styles survived and new ones were adapted to the limitations of the craftsman and his tools. A form of chair generally considered 17th century, the Carver chair, was made until the end of the 19th century. Sheraton chairs are not uncommon (Chippendale are rare) but never have the turned leg (which requires a lathe) associated with the style; rather, they have the square-tapered Hepplewhite leg, which was easier to make. Similarly, because of the difficulty of

producing them, no chairs with the Hepplewhite shield-back or Victorian balloon-back are found. This interaction of professionalism and conservatism can also be found in kitchen dressers of the 1810-20 period. These pieces were probably the work of housewrights, because they were generally part of the whole architectural treatment of the kitchen. Because the housewrights were not constructing for themselves, they could not indulge their imaginations and had to construct something which spoke of the owner's standing in the community, a situation which inspired conservatism.

At the end of the 19th century, the appearance of factory-made furniture, the availability of mail-order catalogues (the ordinary man's pattern book) and the more widespread use of woodworking equipment had their first effect on outport furniture. Chairs and settees in what must be called "Catalogue Style," with thin frames and applied decoration, replaced an earlier factory form, Eastlake, with machine-gauged decoration. Furniture imitating these forms is generally found outside St John's, where it was difficult to get "bought" furniture. It has an element of expediency, making use as it did of salvaged wood from packing cases or houses as well as of whole elements (eg, legs) from discarded furniture. Such curious combinations reflect an economy that neither encouraged nor allowed waste.

Because of Newfoundland's location on the periphery of N America and its marginal economy, the island's furniture, like many of its other crafts, never entered the mainstream of the other Atlantic nations. As a consequence, Newfoundland retained earlier forms and construction techniques but applied to those forms a range of decorative treatments that speak of a strong and vigorous visual imagination.

SHANE O'DEA

#### Ontario

The phrase "country furniture" aptly describes most surviving antique Ontario furniture, held privately and in museum collections. Settlement began after the American Revolution and intensified during the 19th century. In those first years, the pressures of pioneering life ensured that most families had little time or money for high-style furniture, let alone access to it. Ontario country furniture was fashioned of native woods (eg, walnut, maple, cherry, birch, oak, basswood, pine), by hand, usually with some skill. It can be divided into 3 categories: copies of high-style furniture of British and American derivation; furniture with form and decoration of French, German and other European ethnic origin; and sturdy utilitarian furniture that was

used almost universally in town and country and in the less important rooms of city homes. All of the Georgian, Empire and Victorian styles were reproduced, alone or in combination, with varying degrees of success. Ontario cherry and figured maple provided excellent substitutes for imported mahogany and satinwood. Stain and paint were employed to simulate costly woods, veneers, inlay and carving, when cost or lack of skill or tools forbade such embellishments. Especially during the early years, cabinetmakers were more likely to use hardware (ie, hinges, handles, etc) that was readily available rather than what matched the style of the furniture. Decorative motifs such as the German 6-sided star and French diamond-shaped panels sometimes were used on country furniture that was British or American in form and style. Relatively few tools were needed to construct utilitarian furniture so it could be undertaken by most carpenters as well as joiners and cabinetmakers. Dual-purpose, space-saving forms included a chair with a back that could be lowered to form a table top, and a bench with a seat that unfolded to produce a full bed.

Country chairs fall into 3 groups: slat-backs, Windsors and Fancy chairs. Slat-back chairs had 4 turned legs, the rear ones extended and joined by several slats at the top to form a ladder back. A variation, the banister-back, had 2 slats, pierced by several vertical spindles. Woven ash splints or elm bark formed the seats. The Windsor, a chair of English derivation, was constructed like a stool with a back attached to the seat. Such chairs were named according to either the style or the shape of the back, eg, Sheraton, loop- or bow-back, arrow-back, low-back or Captain's, comb-back, spindle-back, short spindle-back or chicken coop, and gunstock. Slat-backs and Windsors were made as side chairs, armchairs and rockers; most were painted. Fancy chairs were side chairs with back, seat and leg patterns derived, at least in part, from Georgian and Victorian styles. Decorative, figured wood often was used; the seats were made of cane or rush. Many Windsors and Fancy chairs also were produced in early Ontario furniture factories.

The high, heavy, four-post, rope-spring bedstead and its accompanying trundle bed were succeeded by a lower, lighter spool-turned bed with slats. Hired-man cots, with spool-turned ends, became country settees when spooled or solid backs were added. Tables and stands of all sizes and for all purposes had tops that tilted, lifted, pivoted or were detachable, and leaves that could be dropped, drawn out or detached. Country schoolmaster desks with slanted lift tops might be attached to or detachable from a long- or short-legged frame below and a postmaster cupboard with pigeonholes above. Drop-front desks were composed of a cupboard front that dropped to form a writing surface, supported by a table or a lower cupboard. Country cupboards of one or 2 pieces, with glazed, solid, or no doors, some having a pie shelf sandwiched between the upper and lower parts, were built into corners or walls or were free standing. They were made in many sizes and shapes for storage of food or dishes and as dry sinks. Linen presses and wardrobes were constructed with fixed parts or, for ease of relocation, detachable ones. Most cupboards were painted or stained dark. Lift-top box chests, the earliest and best made of 6 dovetailed boards, were numerous and were even incorporated into the top part of early chests of drawers.

ELIZABETH INGOLFSRUD

#### Manitoba — Red River

With the arrival of the SELKIRK settlers in 1812 and the subsequent construction of permanent establishments by the HUDSON'S BAY COMPANY (HBC) and NORTH WEST COMPANY (NWC), domestic

residences and a tradition of country furniture were introduced in the Red River Valley. From the outset, the geographic isolation of the RED RIVER COLONY and the logistic difficulties inherent in transport worked against the importation of furniture. Furniture sent out by the London-based HBC had to be transported by the annual ship to YORK FACTORY, transferred to the YORK BOAT brigades and carried the 1300 km inland to Red R. Aside from company officers, who imported fine furniture, employees were limited to the quantity of household goods they could transport in small wooden trunks or cassettes. The early settlers in Red R confronted these transportation difficulties by producing their own furniture on a modest scale. Settlers and company personnel who had the tools fashioned tables, chairs (eg, the Red River chair, a sturdy pine chair with a plank seat), storage chests and beds that put utility and structure ahead of ornament. Consequently, furnishings in even the centrally located fur-trade posts at Red R were characterized by simplicity, even austerity. Because the Red R community was primarily French, Scottish and English in cultural antecedents, no single, distinctive furniture tradition emerged.

Examples of surviving country furniture (chairs, chests, cradles, sofas, sideboards) are housed in private collections or museums and historic parks such as St-Boniface Museum or LOWER FORT GARRY. The principal woods used were oak, pine and ash, which were readily available in the area. After frames were carefully cut and fitted, joints were firmly fastened by wooden dowels, varying in diameter from 1/4" (about 0.5 cm) in the HBC "board room" chairs to 1/2" (about 1 cm) in beds and sofas. Generally, the furniture was left in its natural state until the 1870s, when many pieces were stained, waxed and ornamented with carvings of flowers or other designs. By the 1860s improvements in transportation through the St Paul route and the arrival of professional cabinetmakers spelled the decline of country-made furniture in the Red River Valley.

GREGORY THOMAS

#### Furniture, English, Scottish and American

It is a common misconception that early Canadian furniture consists only of pieces (eg, chairs, tables) roughly hewn from pine. In fact, much "fine" or formal furniture intended for the drawing room, parlor, dining room, etc, was made, following European models, by craftsmen well-versed in their craft. ENGLISH, Scottish (see SCOTS) and LOYALIST influences are apparent in much surviving Canadian-made furniture, in specific details and characteristics unique to particular areas.

#### Georgian Period

During the earliest period of English settlement in Canada (in NS from 1713 to 1783) domestic furnishings were either imported or homemade. A few cabinetmakers, notably Edward Draper, are recorded as working in Halifax after 1749. No known Canadian-made furniture survives from this period. The loyalists, who arrived in 1783-84, comprised the first substantial English-language population and were followed by an influx of Scottish settlers. Both groups included a great variety of specialized craftsmen, cabinetmakers among them.

The earliest known English Canadian formal or stylized furniture dates from about 1785 and follows then fashionable English styles. The so-called Chippendale style, in vogue in England until the 1780s, was followed by the Hepplewhite, Sheraton, classical-revival and regency forms into the early 19th century. While the cabinetmakers produced what their markets demanded, they were also products of their conservative training. As in most CRAFTS, training in cabinetmaking was through the APPRENTICESHIP system, so that cabinetmakers had a strong ten-

This style of chair, with a Sheraton-style back, Chippendale arms and tapered legs, was common in the Scottish settlements of eastern Ontario (courtesy National Museums of Canada/National Museum of Man).

dency to build furniture in the same styles and the same manner as had their teachers and masters. Changes in style and fashion most rapidly affected the larger cities. In outlying areas, particular styles in furniture, notably the Chippendale, were produced long after their periods of actual fashion had ended (see FURNITURE, COUNTRY). One notable craftsman, James Waddell of Truro, NS, made Chippendale chairs as late as 1825. Canadian furniture also includes examples of "throwback" pieces, ie, items produced from observation or memory in styles long out of fashion. Although derived from English forms, Canadian-made formal furniture was far simpler. It was also relatively unornamented, compared to its English or American colonial counterparts; inlay work and carving were rare.

The earliest centres of sophisticated cabinetmaking and production were Halifax and Montréal. Many examples of Chippendale furniture of the 1780s and 1790s survive from these centres. Montréal furniture of the late 18th and 19th centuries was, by all accounts, the finest produced. Some Montréal examples are well-veneer with exotic woods and include complex inlaid stringing and banding. Halifax furniture was far simpler. Although Québec was a smaller city than Montréal, specialized cabinetmakers were in operation there as early as the 1780s, producing very fine work. Most notable perhaps are clock cases by the Loyalist James Orkney. The Bellerose brothers, who operated in Trois-Rivières before 1800, are also known for fine clock cases. Cabinetmaking in NB developed somewhat later, in Saint John and the Saint John R valley. No NB furniture predating 1800 is known, nor has any NB Chippendale furniture been found; all pieces are in the later styles of the early 19th century. In UPPER CANADA in the first generation of settlement, furnishings also seem to have been imported or homemade. A few cabinetmakers are known to have operated before 1800, but again no formal furniture survives which can definitely be dated to before 1800.

While Canadian formal furniture can generally be identified as Canadian and often be ascribed to a particular region, it can rarely be attributed to a specific maker. Before the industrial period of the 1840s and 1850s, very few

American Empire sofa (courtesy Metropolitan Toronto and Region Conservation Authority/Black Creek Pioneer Village).

cabinetmakers marked or labelled their furniture. Before 1825 only 3 cabinetmakers are known to have used paper labels: the firm of Tullis, Pallister and McDonald of Halifax (1810-11); Daniel Green of Saint John, NB (before 1820); and Thomas Nisbet of Saint John (1813-48). Occasional pencil or ink markings are found but are often the signatures of owners rather than of makers.

Imported West Indian mahogany was the favoured cabinet wood, as in Britain and the US. Mahogany logs were relatively inexpensive to transport by sea, as ballast cargo. Mahogany was available, however, only to cabinetmakers in port cities: Halifax, Amherst, Saint John, Québec City, Trois Rivières and Montréal. Transporting the heavy wood overland was so impractical that cabinetmakers even slightly removed from the ports depended instead on native woods. In the Maritimes, birch, stained to a dark colour and known as "poor man's mahogany," was a widely used cabinet wood. In simple inlays, or segments such as drawer fronts, birch was often mixed with maple. In Québec butternut and maple were quite widely used in areas where mahogany was not available. Upper Canada, inaccessible to imports of mahogany until about 1830, depended for finer furniture on cherry, walnut and figured maple. The secondary or structural wood of virtually all Canadian furniture was pine, although exteriors were made of hardwoods. Mahogany was the only imported wood available before about 1810. Especially after the WAR OF 1812, satinwood and rosewood began to appear in Canadian furniture, usually in small segments and as veneers or inlays. Except for simple iron hinges, all hardware (ie, drawer pulls, casters and small knobs, typically of brass) was imported. As well as typically being of mixed woods, Canadian stylized furniture is often of mixed styles: characteristics of 2 or more design forms are often evident in a single piece of furniture.

With the coming of CANALS, steamships and finally RAILWAYS, the increasing mobility of people led to an increasing homogenization of style and design forms. Identifiable regional characteristics began to disappear slowly by 1830 and were entirely gone by 1860. New technologies also had an impact on the style and craft of cabinetmaking. The development of the circular saw after 1820, followed by the veneer mill in the 1830s, made veneers far less expensive to use than had been the case in the earlier period of hand carving. The screw-thread lathe led, in the 1820s, to a fashion for round, rope-turned legs on tables and case pieces. Again, these details

were inexpensive because of mechanical production. Elaborate carving machines followed, making possible the decorative excesses of the Victorian period.

Beginning in the 1830s, furniture styles were increasingly adapted for component manufacture by machinery. The growth of the factory system after the 1830s led to a complete homogenization of design throughout N America and, by the 1860s, to a decline in the craft of cabinetmaking. Although there were many changes of style and fashion in the mid-19th century, furniture itself more and more became the product of factories and mechanization, and less and less the product of individual skills. D.B. WEBSTER

#### Empire and Victorian Furniture

During the Empire and Victorian periods, furniture design largely abandoned the restrained geometry of Hepplewhite, Sheraton and Adam in favour of picturesque outlines and historical revivals more in keeping with the eclectic ARCHITECTURE of the time. In addition, factory production and new forms of woodworking machinery began to replace the traditional methods of the furniture craftsman.

**Empire** refers to styles which first gained popularity in France during the reign of the emperor Napoleon I, in the first 2 decades of the 19th century. This period corresponds roughly with the time of the English regency. Fashionable furniture of the time was inspired by ancient Roman, Greek and Egyptian designs, popularized through publications such as Thomas Hope's *Household Furniture and Interior Decoration* (1807). Classical styles continued to dominate through the 1830s and 1840s. In Canada, "Empire" sometimes is used to describe the later manifestations of this style, which tended to

Thomas Nisbet table, c 1830, from Saint John, NB (courtesy Royal Ontario Museum).

follow American precedents; "regency" is the preferred term for earlier work.

Chairs from this period often followed the Greek *klismos* form, with sabre-shaped legs and a broad crest rail (ie, horizontal member at the top of the back). Armchairs had scroll-curved arms left open below. Sofas also tended to have scrolled arms, upholstered and often fitted with cylindrical cushions where they met the seat. The scrolled arms of Empire sofas found their counterpart in the high, curved headboards and footboards of "French bedsteads" (now commonly called sleigh beds). Tables often were supported on heavy pedestals set on wide bases with scrolled feet. Case pieces (eg, chests of drawers, sideboards) often had overhanging top drawers with columnar supports. Mahogany veneer over pine was commonly used.

**Victorian** By the mid-19th century, a wide variety of styles was replacing the classically derived Empire. The Victorian period (1837-1901) first saw the development of the rococo-revival or "modern French" style, which brought a return to rounded curves and naturalistic carving. The balloon-back side chair with its rounded open back and cabriole (S-shaped) legs was popular. The introduction of coil springs and factory-made upholstery materials in plush and horsehair brought a new era of comfort. Almost all lines were rounded; frames and cases were ornamented with carving in the forms of fruit, leaves and flowers.

At the same time, Gothic-revival furniture was coming into vogue, making use of architectural elements such as pointed arches, finials (eg, decorative knobs) and tracery. It was deemed most suitable for the library or entrance hall, where Gothic-revival chairs and benches often were the only unupholstered seating furniture in the house. "Elizabethan" was another popular mid-century style, although its characteristic ball or spool turnings had little to do with what actually had been used during the reign of Elizabeth I. All of these styles and their variants could be found in such popular handbooks as A.J. Downing's *The Architecture of Country Houses* (1850) or Blackie and Son's *The Victorian Cabinet Maker's Assistant* (1855).

By the late 1860s, some began to question the widespread use of revival styles, applied ornament and the trend toward factory production. In 1868, the English designer C.L. Eastlake published *Hints on Household Taste in Furniture, Upholstery and Other Details*, which advocated what he believed to be a return to simple, sturdy craftsmanship. The furniture he illustrated was invariably solid and geometrical in outline, eschewing the rounded curves of the rococo revival. It was ornamented with incised decoration in geometrical patterns, simple turnings and pierced decoration. Details of construction often were made visible through exposed pegs and joints. Eastlake's ideas found their counterparts in the Arts and Crafts Movement and the development of "mission" furniture. Much to the chagrin of the reformers, however, factories began taking up the name "Eastlake" and applying it to mass-produced furniture of simple, squarish outline. The Victorian period saw the introduction of a wide range of woodworking machinery which, combined with the development of steam power, the growth of markets and improved transportation, brought an end to the small, independent craftsman's shop.

Among the largest Canadian furniture factories was that of Jacques and Hay in Toronto, which produced such large quantities of furniture (from school desks to parlour suites) that often all Canadian Victorian furniture is erroneously called "Jacques and Hay." Proximity to the US also influenced furniture making in Canada. From an early date, Canadians purchased furniture, at both wholesale and retail levels, from American suppliers.

Interest in revival styles continued to dominate the furniture trade. Among the most influential by the 1870s was the renaissance-revival style, characterized by the use of bold cornices, pediments and pilasters, high-relief carving, classical anthemion (ie, floral or foliated ornaments) and a multitude of finials and drops. Bedsteads, sideboards and dressing bureaus with attached plate glass mirrors grew to astonishing heights. Marble tops became increasingly popular. Chair and sofa frames took on an often spoked, attenuated look; legs often were tapered, with either turned or panelled decoration.

The last years of Victoria's reign saw revivals of nearly every preceding style. Reproductions might be faithful to the original form or creative revivals influenced by the sinuous curves and sometimes bizarre shapes of art nouveau. The use of upholstery reached its height, often covering the frame entirely with several types or colours of fabric and ended on a tasselled fringe. New materials became popular, particularly wicker, iron, brass and bentwood. Oak replaced black walnut as the preferred wood for most furniture. Mail-order houses such as T. EATON COMPANY offered to ship furniture anywhere by rail.

**Furniture, French** Canadian furniture of French derivation was made between 1650 and 1820. It is of the traditional or regional type, ie, made of solid, jointed wood. This furniture was distinct from the grand style that emanated from the French court but was influenced by it, borrowing technical and artistic features, while retaining a peasant flavour. Some furniture was made by unskilled hands for a family's own use; most was made by skilled carpenters, who had come from France to meet the demands for churches, dwellings and furniture for the agricultural society that had replaced that of the fur traders. These men were artisans trained in the rigorous traditions of French *menuisiers*, ie, joiners. They were not *ébénistes*, cabinetmakers, whose specialty was marquetry and veneer. In the towns and villages of NEW FRANCE, professional woodworkers had their own shops, but sometimes worked directly in churches and dwellings where a particular piece was to be installed. There were also itinerant woodworkers who roamed the countryside and often spent weeks at a time making an armoire for a family, a convent or a seigneur.

The design and details of this furniture reflect regional origins from many French provinces, mainly Normandy, Picardy, Île de France, Brittany, Poitou, Aunis and Saintonge. The carved decorations particular to these regions are distinguished by traditional folk motifs: stylized flowers, leaves, rosettes, trees, stars and crosses of every kind of the Haute Bretagne; chip-carved circles, discs, lozenges, shells and hearts of the Loire Atlantique; in fact, whatever might spring from a pair of compasses and ruler or be drawn freehand. With time, these motifs became less varied than in Europe, until they evolved into entirely indigenous designs.

As in the French provinces, styles evolved slowly and period influences showed in furniture made long after the historical eras for which they were named. Between 1650 and 1750, the predominant inspiration was the Henry IV and Louis XIII style, featuring rectilinear lines and geometrical ornamentation with broad surfaces, pediments, multiple panels, lozenges, high and low diamond points and wood turnings with chamfered (ie, beveled) cubes or in a spiral twist. The flowing lines, graceful shapes and often asymmetrical decoration of the *régence* and Louis XV styles appeared between 1740 and 1760 and became very popu-

Late 18th-century serpentine fronted Québec commode, made of butternut in the Louis XV rococo style (courtesy Royal Ontario Museum).

lar. In New France, as in the country districts of France, the heavily ornate Louis XIV styles had little impact. Whatever the period, there was no ormolu, marble or veneer, and little lacquer or marquetry; however, the furniture was liberally ornamented, particularly after 1785, both in the shaping of integral parts (eg, door panels, rails, aprons, legs, rungs) and with increasingly profuse and ebullient surface carving. The woodworkers were less inhibited than their counterparts in France; embellishment beyond the traditional motifs appeared earlier and sometimes included features never seen in France.

The *Rocaille* style, reminiscent of 18th-century gardens, flourished in the Louis XV period and was the last direct influence from France. Its principal motif was crosiered branches entwining leaves, flowers and shells. After the SEVEN YEARS' WAR, this style exerted a powerful influ-

Mid-18th-century diamond-point armoire from Notre-Dame-du-Bon-Conseil, Qué. This armoire was likely intended to hold a rich trousseau (courtesy National Museums of Canada/National Museum of Man).

ence on the traditional furniture of French Canada, which reached its peak of refinement in technique and design between 1785 and 1820. In this period, features of English and American designs began to appear in combination with the traditional French features, sometimes with harmonious effect, sometimes without.

The woods available or appropriate for furniture were unfamiliar to the early immigrant craftsmen. White pine, butternut and yellow birch, none of which was known in France, were the most widely used between 1650 and 1750. White and sugar maple were at first used as firewood and considered too difficult to work, but became popular at the end of the 18th century, particularly if the grain was wavy or curly. Ash and basswood were little used until the mid-19th century. Imported mahogany was introduced with English and American styles. Between 1650 and 1750, most furniture was stained a dark maroon, but after that period, almost all was painted, using powdered colours mixed with glue, linseed oil or skimmed milk, to seal the wood against dirt and grease. The colours were chiefly blue, green, pale or dark blue-green and white (tinted with yellow ochre or red ochre, very popular between 1785 and 1820). Iron and brass escutcheons, latches, handles, drawer pulls and fische hinges, often artistically designed, were made locally, usually on French patterns. The rattail or devil-tail hinge may have been adopted from England or New England, but was also current in Lorraine and Alsace.

**Chests**, the earliest and most basic form of storage, were of 2 types, flat topped (*coffres*) or dome topped (*bahuts*). They are simple, sturdy and generally made of pine, with corner posts and tongue-and-groove boards, the mortice-and-tenon joints secured with dowels. There may be panelling or geometric decoration. The lids are attached with strong hinges and close at the front with heavy locks, for everything was kept under lock and key.

**Armoires and Buffets** evolved naturally from the chest. Buffets, for storing food and dishes, were often 2 tiered, like 2 chests, one on top of the other, with doors instead of horizontal lids. Armoires, vertically extended buffets, are the most interesting of all rural furniture, for they lend themselves to the widest variety of style and decoration. They may have 1, 2 or 4 doors, most commonly 2 doors. Louis XIII designs (eg, lozenge panels) are typical in the early period. These motifs were followed but not entirely supplanted by Louis XV styles (eg, diamond

points). Between 1785 and 1820, shaped and carved decoration of *rocaille* and every other inspiration abounded. Such decoration was particularly exuberant in the Montréal region, where most of the prosperous merchants lived. Elements of English design, notably of Adam inspiration, were sometimes pleasingly blended with French designs. All armoires were assembled with mortice-and-tenon joints, without glue. Large pieces could therefore be dismantled for moving. Variations include dressers, glazed buffets and corner cupboards. Food lockers with ventilation to keep food fresh tend to be primitive, as are bucket benches and most dough boxes.

**Commodes** In Canada the commode, which also evolved from the chest, was rare in 1750 but rapidly gained popularity. It was found mostly in the homes of the rich but also in rural houses. The early models were sturdy pieces with 3 or 4 drawers. Later, there were more refined models with rounded corners and shaped fronts, the most popular being the *arbalète* (crossbow) style, a serpentine outline with a recessed, flat plane in the centre. The corner uprights of these commodes were cut from a single massive piece of wood; the drawer fronts, from immensely thick boards shaped only on the outside. The inside was left flat, contrary to the practice in France. The drawers were assembled with a huge dovetail on each side, as in France, and secured by a large, hand-forged nail. The feet are often of Louis XV cabriole style; however, after 1775, a popular design was the claw-and-ball foot of Chippendale inspiration. A very popular example of melded French and English design is the *arbalète* front combined with the claw-and-ball feet. Canadian commodes were always smaller than their French counterparts.

**Beds** in the early period were designed for privacy and protection from draughts. The *cabane* was a closed wooden box, lined with woolen cloth and with a straw mattress laid on planks. Four-poster beds with spiraled, turned or tapered columns were hung with curtains. In the early 19th century, as larger stoves were introduced, curtains were abandoned, the posts became shorter, and eventually spindle beds and sleigh beds appeared, as did folding and movable beds.

**Tables** usually have pine tops and hardwood legs and stretchers which, in fine pieces of the early period, are turned in the Louis XIII manner, often with finials (ie, decorative knobs). Many later pieces have cabriole legs. Aprons are often shaped and carved, and many have a drawer. Half-moon tables were common, but console tables were found only in churches and wealthy homes.

**Desks** were owned by the elite. The most common type was the slat-top *secrétaire*, although the earliest in existence is a knee-hole desk in the Louis XIII manner.

**Chairs** with backs were rare in the 17th- and 18th-century peasant homes in France, but were quite common in New France. The distinctive Île d'Orléans chair, jointed and usually with an open-frame back, was found in every house in the region of Île d'Orléans and Côte de Beupré and was inspired by the Lorraine chair in France. Chairs termed "à-la-capucine" were found everywhere. They have high backs, straight or turned legs and shaped, ladder-back rails, doweled firmly into the uprights. Armchairs appeared in the latter part of the 17th century in Louis XIII styles, often upholstered. With the popular "os-de-mouton" armchair of the 18th century, graceful curves succeeded the earlier straight lines. Many other armchairs demonstrate originality and inventiveness. Chair seats were made of twisted straw or marsh grass woven in a diamond-point pattern; plaited elm bark woven in a basket-weave pattern; or rawhide, popular in the Montréal region. Uphol-

Québec pine armoire, in Burgundian style, late 18th or early 19th century (courtesy Royal Ontario Museum).

stery was covered in serge, tapestry, needlepoint, painted linen or moquette (a woolen pile fabric); cushions were widely used on chairs, attached by ribbons. The rocking chair came to Canada in the 19th century through American chair-makers and won instant popularity. French Canadian woodworkers created an infinite variety and decorated them with motifs of every inspiration.

These were the last innovations to enrich Canadian furniture of French derivation. After the 1820s, furniture in French styles soon ceased to be made. The thread of tradition and aesthetics was lost with the last generation of woodworkers trained in the French tradition, and the heritage was forgotten. It was brought to light about 1925 by a few discerning collectors, but was not generally recognized until after WWII.

JEAN PALARDY

**Furniture, German** Furniture of Germanic derivation occurs in Canada as a result of immigration from Germany and from Pennsylvania (see GERMANS). Traditional German furniture in Europe evolved over several centuries to serve the needs of ordinary, primarily rural, people. The basic forms changed little through the years, although stylistic influences were adopted from fashionable furniture designs from time to time. The most important of these influences and, in fact, the dominant style of traditional German furniture in the 18th and 19th centuries was the baroque style, which inspired the complex intersecting curves in the design profiles and a profusion of decorative elements in surface treatment.

Traditional German furniture makers were excellent craftsmen, and even the most commonplace objects were carefully made, with well-fitted dovetail joints, crisp moldings, neat cutouts and pleasing proportions. The more ambitious and formal examples display excellent carving and inlay work. There were numerous centres of German settlement in early Canada, where skilled immigrant craftsmen made furniture in the traditional styles of the homeland. In NS, Germans arrived as early as 1750, and throughout the 19th century, thousands came to Ontario from the continent and from Pennsylvania. As the Prairie provinces developed, groups of MENNONITES and HUTTERITES found refuge there. The German settlements included

members with a wide range of traditional skills; thus, the old traditions survived in many centres with little influence from the outside. Germanic furniture made in Canada includes a range of traditional forms which reflect several centuries of style and many regional characteristics. These traditional elements may be seen in combination with ideas adopted from the English-speaking community, especially in Pennsylvania-German furniture made in Ontario. The Pennsylvania Germans brought a furniture tradition which had been substantially altered as a result of their American experience. In particular, they had adopted the English Chippendale style in more formal furniture forms such as writing desks, chests of drawers and tall case clocks. Continental styles were retained in tables, benches, storage chests, cradles and other utilitarian furnishings. Similarly, the traditional German styles occurred, with various modifying influences, in other Canadian centres until mass-produced furniture largely replaced that of the local craftsman in the early 20th century. The most common forms in the German tradition are storage chests, tables, benches, chairs, cradles, beds, dish dressers, cupboards and *schranks*.

**Storage Chests** are, typically, simple rectangular forms. They may be plain or enriched by panels, moldings or turned details arranged in a geometric design. The base is sometimes intricately shaped or the chest might sit on bulbous turned feet.

**Tables** The most common design in dining tables was the sawbuck type, which has X-shaped trestles and a central stretcher supporting the tabletop. Most German country tables have a shaped cleat under the tabletop at each end, through which wooden pins are inserted to secure the top to the base; the top can be easily removed for cleaning.

**Benches**, the traditional seating form at these tables, were of simple plank construction on shaped trestles. The most popular type of chair was also of plank construction, with a shaped, often carved, back. The seat is a solid plank; the simple legs, inserted into cleats under the seat, lack the stretchers (to strengthen the chair base) found in many country chair designs.

**Beds and Cradles** are often of panelled construction, or the profiles may be a complex arrangement of intersecting curves. Many Ger-

Dry sink, common in Pennsylvania German homes in Upper Canada during the early 19th century and until much later periods (courtesy Metropolitan Toronto and Region Conservation Authority/Black Creek Pioneer Village).

man cradles feature distinctive heart-shaped cutouts at the head and foot, decorative elements that also serve as handles.

**Dish Dressers** with open shelves above and drawers and doors below were popular in country kitchens; wall cupboards and corner cupboards with glazed doors were used in the better rooms, particularly in urban houses. The recurring baroque influence is often apparent in these pieces in the complex curves and arches in the design of cornices and door panels.

**Schrank**, a large storage cupboard or wardrobe, is the most important form in the German furniture tradition and provided the craftsman with an opportunity to display his finest skills in creating elaborate panels, moldings and various surface treatments. The traditional schrank had 2 large doors, possibly 2 or more drawers below and different interior arrangements of hangers, shelves or drawers for storing clothing, linens, utensils, food or other household items. Because of its great size, the schrank was usually made in sections which could be separated for moving. Those used in the kitchen for food (*milchschränk*) have open grillwork in the doors for ventilation.

An attractive aspect of German traditional furniture, and further evidence of the baroque influence, is the extensive use of surface decoration employing various motifs including flowers, leaves, birds, stars, whorls, hearts and geometric designs, as well as names and dates in a calligraphic style. Often, the decoration commemorates a family event such as a wedding, anniversary or birth. These decorations may be painted in different polychrome techniques, carved into the surface or inlaid in contrasting wood tones. Furniture with painted decoration was usually made of softwood (eg, pine); inlaid or carved pieces were fashioned in hardwoods and were likely to be more sophisticated in style and execution. See GERMANIC FRAKTUR.

HOWARD PAIN

**Furniture and Fixture Industry** Canadian furniture originated with the first settlers and consisted of simple, handmade, utilitarian products. Later, local carpenters made furniture for others. The first Canadian furniture company was established in Berlin (Kitchener), Ont, in 1830; the next, in Toronto in 1834. The industry developed considerably in the last half of the 19th century, mainly in Ontario. There were a few factories in Québec before 1900, but the industry, particularly in the medium to low price ranges, developed there primarily after WWII. Furniture is considered, in economic terms, an "elastic commodity," ie, very sensitive to economic changes. This sensitivity was obvious in the 1930s, when production fell by two-thirds between 1930 and 1933. In 1980 shipments totaled \$2.2 billion, of which 54% was produced in Ontario, 32% in Québec, 9% in the Prairie provinces, 4% in BC and 1% in the Atlantic provinces.

Today the Canadian furniture industry is divided into 3 subsectors: household furniture, office furniture and miscellaneous furniture (ie, for restaurants, churches, schools, etc, and box springs and mattresses). The industry operates at

3 levels (manufacturers, distributors, retailers). Manufacturers transform raw materials into finished products. Distributors are agents or sales representatives who sell the finished product to the retailer. Because few manufacturers have large enough sales volumes in a region to justify full-time sales staff, sales representatives are usually free-lance agents representing several product lines. Retailers sell furniture to consumers.

#### The Modern Industry

The Canadian furniture industry is 95% Canadian owned and consists mainly of small or medium-sized family-owned and -operated firms. Automation strongly affected the industry in the early 1970s and was partly responsible for the decline in employment at that time. A small percentage of the industry's production remains at the "craftsman" stage. The industry employs nearly 50 000 people, with a total payroll of more than \$650 million. Work-force numbers include nearly 40 000 production workers, 357 working owners and clerical and administrative employees. The average wage for production workers was about \$6.20 an hour in 1980. The industry is largely unionized, particularly in the case-goods (ie, wooden) subsector.

In 1980 there were 1461 furniture plants in Canada: 607 in Ontario, 568 in Québec, 141 in the Prairie provinces, 113 in BC and 32 in the Atlantic provinces. Nearly 50% of the major manufacturers are located in rural areas. In 1980 the industry consumed over \$1 billion in supplies and materials (ie, nearly 50% of the value of Canadian furniture sales) and some \$24 million in fuel and electricity. Raw materials included wood in all forms (over 30% of materials used in furniture manufacturing), furniture frames, rubber and plastics, textiles, plastified fabrics, steel and metal, paints, lacquers, sealers and varnishes, and miscellaneous materials (eg, mirrors, packaging, hardware).

In 1980 factory shipments of furniture and fixtures totaled \$2.2 billion: the household sector accounted for \$1.2 billion; office sector, \$394 million; miscellaneous furniture, \$611 million. The type of production varies among regions. Québec accounts for almost 50% of case-goods production; Ontario produces much upholstered and office furniture. Exports in 1980 totaled \$223 million, 25% more than in 1979; imports totaled \$282.4 million, 3.2% more than in 1979. Canada's furniture exports, which have increased greatly in the past decade, have almost reached the level of imports and may well surpass imports before the end of the decade. The household-furniture subsector accounts for about 75% of imports and 25% of exports. Canada's total furniture production in 1980 accounted for 0.74% of the Canadian GROSS NATIONAL PRODUCT.

The industry is affected by federal pollution-control legislation. Air pollution from paint and lacquer fumes is the most frequently cited environmental problem. Safety-related legislation has been passed on mattress flammability, light fixtures and children's furniture (eg, lead content in paint, sharp edges).

The industry has received federal and pro-

vincial aid (eg, for expansion programs, development of microprocessor data, industrial renewal, energy conservation, market development), but none of these measures are specific to the furniture industry. At present only Québec has a specific furniture program: between 1980 and 1983, some \$8 million was invested to encourage innovation.

The last GENERAL AGREEMENT ON TARIFFS AND TRADE called for a progressive reduction in tariffs on furniture imported from the US: from 20% in 1980 to 15% in 1987 for household furniture; from 17.5% to 12.5% for office and metal furniture.

The Canadian furniture industry often finds it difficult to compete with other countries. Labour costs are much higher than in most competing countries — particularly the US, the source of most furniture imports. Canadian companies also have high transportation costs: it has been estimated that in 1978 Canadian furniture transportation costs exceeded US costs by as much as 40%. Because of the decreasing value of the Canadian dollar, imports to Canada of certain raw materials (eg, textiles, exotic woods) have increased dramatically. Finally, Canada's mostly small- and medium-sized companies have difficulty competing with American firms that have a much larger production capacity and thus can achieve economies of scale.

Two colleges offer courses on furniture production: l'Ecole québécoise du meuble et du bois ouvré in Victoriaville, and Conestoga College in Ontario. Several colleges and universities offer courses or programs in INDUSTRIAL DESIGN and some in woodworking. There are 3 industry associations: the Québec Furniture Manufacturers' Assn Inc (Québec and the Maritimes); the Ontario Furniture Manufacturers' Assn Inc (Ont); Furniture West Inc (Prairie provinces and BC). These trade associations have formed the Canadian Council of Furniture Manufacturers to represent the interests of the industry nationally. There are 4 major Canadian furniture trade magazines: *Canada's Furniture Magazine* (Victor Publishing Co Ltd) and *Home Goods Retailing* (MACLEAN HUNTER LTD) for household furnishings; *Canada's Contract Magazine* (Victor Publishing Co Ltd) and *Canadian Interiors* (Maclean Hunter Ltd) for office and contract furnishings.

LISE BUISSON

**Fytche, Maria Amelia**, teacher, novelist (b at Saint John 1844; d there 1926). Fytche is one of several late 19th-century Canadian women novelists, such as Sara Jeannette DUNCAN and M. Marshall SAUNDERS, who dealt seriously with the women's question. In her novel *Kerchiefs to Hunt Souls* (1895) in which her heroine sells her successful Maritime school for girls to pursue romance in Europe, Fytche studies critically women's education, homes, work and emancipation. Although the novel subscribes to many of the tenets of contemporary popular romantic literature, it offers some convincingly realistic characters and scenes that compellingly portray the working woman. Fytche also wrote a historical romance, *The Rival Forts; or The Velvet Siege of Beauséjour* (1907) and contributed short fiction and drama to periodicals. CARRIE H. MACMILLAN

**Gaboury, Étienne-Joseph**, architect (b at Swan Lake, Man 24 Apr 1930). Gaboury's strong links to the prairie landscape and the Franco-Manitobain community of his youth are reflected in his architecture. He was educated at St Boniface Coll, U Man (B Arch, 1958) and the École des Beaux-Arts, Paris (where the late work of Le Corbusier influenced him strongly). After apprenticing in Manitoba, Gaboury formed a partnership with Denis Lussier and Frank Siggurdson, and from 1976 was principal of his own firm. An important early building was the 1967 Église du Précieux Sang, St Boniface, a strikingly mystical church notable for its double helix of glu-lam beams spiralling above the altar. Gaboury has worked in a variety of other idioms, including the high-tech Royal Canadian Mint near Winnipeg (1978) and the hybrid Canadian-Mexican regionalism of the Canadian Embassy in Mexico City (1982). Gaboury's designs are linked by a concern with landscape, texture and cultural identity, and the manipulation and celebration of sunlight. T. BODDY

**Gage, Thomas**, army officer (b in Eng 1719 or 1720; d at London, Eng 2 Apr 1787). He served during the SEVEN YEARS' WAR in N America from 1755 and was present during several of the operations preceding the CONQUEST in 1760. He was then installed as military governor of Montréal, where, like fellow governors James MURRAY and Ralph BURTON, he attempted to reconcile the Canadians to British rule by retaining existing customs as much as possible and by introducing useful innovations such as his use of captains of militia in the administration of justice. In 1763 Gage replaced Jeffery AMHERST as commander-in-chief at New York City, where he was primarily concerned with growing tensions in the Thirteen Colonies. In 1774 he also became governor of Massachusetts, but his initial optimism faded as he recognized the strength of opposition to British policies. His increasingly gloomy reports caused his recall soon after the outbreak of hostilities in 1775. STUART R.J. SUTHERLAND

**Gagetown, NB**, Village, pop 618 (1981c), is situated on Gagetown Creek, near its confluence with the SAINT JOHN R and Jemseg R. English settlement began soon after Robert Monckton's expedition cleared the French from the lower Saint John Valley in 1758. By the time the LOYALISTS arrived in 1783 Grimross, as it was then known, had a population of some 200. It was laid out in grid pattern as a possible site for the provincial capital, but Gov Carleton chose St Anne's [Fredericton] and Gagetown became the shiretown of Queens County. During the 19th century it was the most important centre between Fredericton and SAINT JOHN and a prosperous farming and lumbering community. The establishment of GAGETOWN CFB after WWII stripped the village of its hinterland, and the abolition of county government in the 1960s deprived it of its importance as the shiretown. Although the village now lacks an important industry, it remains a viable community. JAMES K. CHAPMAN

**Gagetown CFB** functions primarily as the combat-training centre for the Canadian Army and comprises 111 000 ha between Fredericton and Saint John, NB, west of the Saint John R. Named after a nearby town, it is roughly egg shaped, with the permanent campsite at the northern tip. About 3000 soldiers are posted at the base, but the number of additional, temporary postings for combined arms (infantry, armour, artillery, air support) combat training varies greatly. The base was constructed in the early 1950s when Canada's NATO commitments required a location large enough for training an entire division. The federal government chose this site partly to provide needed economic stimulus to central NB and because fewer than 3000 people would be displaced in expropriating the land. Militarily it offered nearness to an all-

weather Atlantic port and a varied terrain — including open lands similar to northern Europe, swamps and dense forest, and high hills at the southern end. American and British forces have also used the base. BILL SMITH

**Gagnon, André**, pianist, composer, conductor, arranger (b at St-Pacôme-de-Kamouraska, Qué 2 Aug 1939). Despite the eclecticism of his compositions and interpretations, Gagnon has created for himself an easily identifiable style, a mixture of light and classical music. He studied with Léon Destroismaisons (theory), Germaine Malépart (piano), Clermont PÉPIN (composition) and, in Paris, with Yvonne Loriod (piano). Early in his career, he worked as accompanist, conductor or arranger for such artists as Claude LÉVEILLÉE, Pauline JULIEN, Renée CLAUDE and Monique LEYRAC. After 1969 he concentrated on composition, arrangements and his career as a soloist. He won Juno awards for his records *Saga* (1974) and *Neiges* (1975) and as best instrumentalist (1977). In 1979 his record *Le Saint-Laurent* was chosen the best instrumental record of the year during the ADISQ gala. HÉLÈNE PLOUFFE

**Gagnon, Charles**, painter, photographer, filmmaker (b at Montréal 23 May 1934). He spent the years 1955-60 in New York studying, painting in an abstract expressionist style, and photographing neglected or abandoned parts of the city. He returned to Montréal in 1960. He made his first films in the mid-1960s and has continued to work in a range of media. He undertook a large commission for the Christian Pavilion at EXPO 67, as well as a mural for the Lester B. Pearson Building in Ottawa. The latter, titled *Screenspace*, is a text painting based on the late prime minister's writings. DAVID BURNETT  
Reading: Philip Fry, *Charles Gagnon* (1978).

**Gagnon, Clarence**, engraver, painter (b at Montréal 8 Nov. 1881; d there 5 Jan 1942). After studying at the École du Plateau in Montréal, he received his artistic training from the painter William BRYMNER at the Art Assn of Montréal 1897-1900. The generosity of art patron James Morgan allowed him to go to Paris and study in the studio of painter Jean-Paul Laurens. Gagnon distinguished himself early in his career by the quality of his engravings, and won a gold medal at the St Louis Exhibition in 1904 and an honourable mention the following year at the Salon des artistes français in Paris. Returning to Canada 1909, he divided his time between Montréal and Baie-St-Paul. He became a member of the Royal Soc of Canada, and later was elected associate of the Royal Canadian Academy of Arts and, in 1923, received the Trevor Prize of the Salmagundi Club of New York. He illustrated *Le Grand Silence blanc* 1929 and Louis Hémon's *Maria Chapdelaine* 1933. Upon his return from a second stay in France, 1922-36, U de Montréal awarded him an honorary doctorate.

Soon after his death the Musée du Québec, the Musée des beaux-arts in Montréal, the Art Gallery of Toronto and the National Gallery of Canada organized a major retrospective of his works. In 1974 Canada Post reproduced one of his works as a stamp. MICHEL CHAMPAGNE

**Gagnon, Ernest**, folklorist, organist (b Frédéric-Ernest-Amédée at Rivière-du-Loup [Louiseville], Qué 7 Nov 1834; d at Québec City 15 Sept 1915). Member of a prominent Québec City musical family, Gagnon is most noted for his work as a collector of French Canadian folk music. His song transcriptions, published 1865-67 as *Chansons populaires du Canada*, not only helped conserve a rich heritage, but alerted the musical world to the dignity and beauty of Québec's oral song tradition. Gagnon was also an expert plainsong accompanist and virtuoso organist at St-Jean-Baptiste Church 1853-64 and at the Québec Basilica 1864-76. BARCLAY McMILLAN

**Galaxy Stars** are not distributed uniformly throughout the universe but are usually found in giant aggregations, known as galaxies, that are classified, according to their shapes, as spiral, elliptical or irregular. Earth's own galaxy is a large and probably typical spiral. Its most obvious component is an immense, flat rotating system of stars estimated to be about 100 000 light-years (some  $10^{18}$  km) across.

Serious attempts to estimate the size of the Galaxy began in the 19th century. The early pioneers failed to appreciate its true immensity, partly because they did not recognize the existence of dust and gas between the stars, which absorb starlight on its way to Earth and prevent us from seeing the farthest reaches of our own galaxy. The application of photography to ASTRONOMY made it possible to accumulate data about apparent changes in the relative positions of stars (ie, proper motions) much more rapidly, and SPECTROSCOPY enabled astronomers to study velocities of stars along the line of sight (radial velocities). Thus, it became possible to study not only the structure of the Galaxy but also its dynamics.

A classic study was made by J.S. PLASKETT and J.A. PEARCE at the Dominion Astrophysical Observatory, Victoria. The results, published in 1935, gave the best available idea of the size, structure and rotation of the Galaxy until the advent of radio astronomy after WWII (see OBSERVATORY). The explosive development of astronomical knowledge in the last 2 decades inevitably led to revisions. This study also helped astronomer C.S. BEALS to develop greater understanding of interstellar matter.

There are estimated to be about 100 million galaxies in the observable universe. Many are powerful emitters of radio waves and study of their emissions has increased our knowledge of the universe. Most powerful and puzzling of all are the quasars, now generally believed to be very distant extragalactic objects, but the real nature of which is not yet understood.

**Galbraith, John Kenneth**, economist, writer (b at Iona Station, Ont, 15 Oct 1908). Having graduated from Ontario Agricultural Coll in 1931, Galbraith received a doctorate in agricultural economics at U of Calif, Berkeley. Most of his active life was spent in connection with Harvard, where postdoctoral work at Cambridge, Eng, had fitted him to replace Robert BRYCE as resident Keynesian. An activist liberal, Galbraith was personal adviser to every Democratic candidate for the US presidency from F.D. Roosevelt to L.B. Johnson and thus held a number of public positions including controller of prices in WWII and US ambassador to India (1961-63). He was active in Americans for Democratic Action, a group of eminent liberal intellectuals, particularly during its opposition to the Vietnam War.

John Kenneth Galbraith graduated from the Ontario Agricultural Coll in 1931 and went on to become one of the world's best-known economists. He wrote an entertaining account of his boyhood in southern Ontario (courtesy Canapress).

Galbraith's contribution to social science is an alternative concept of capitalism to that of established, neoclassical theory. In a number of books, including *American Capitalism* (1952), *The Affluent Society* (1958) and *The New Industrial State* (1967), he established a basis for liberal policy on the ideas of "countervailing power," "conventional wisdom," the "technostructure" and the institutional "convergence" of communist and capitalist systems. In 1956 he testified before the ROYAL COMMISSION ON CANADA'S ECONOMIC PROSPECTS and, at the request of CANADIAN PACIFIC, he watched over the production of R.E. Caves and R.H. Holton on *Canadian Economy: Prospect and Retrospect* (1959). *The Scotch*, Galbraith's entertaining account of his boyhood environment in southern Ontario, was published in 1964.

Reading: J.K. Galbraith, *A Life in Our Times* (1981).

**Galiano Island**, 5787 ha, pop 669 (1981c), is one of BC's GULF is. named for Spanish navy commander Dionisio Galiano, who explored the area 1792. It has the driest climate of the islands. Shell middens at Montague Harbour suggest that SALISH have used the island for several thousand years. Settled by immigrants during the 1858 BC gold rush, the island became known as "Little England" because British families sent sons there to learn farming. Most settled at the S end; much of its narrow length was set aside for timber production. The island is now best known for its colony of writers, craftsmen and artists.

PETER GRANT

**Gallagher, John Patrick**, "Jack", geologist, industrialist (b at Winnipeg 16 July 1916). After working as a student geologist in the NWT and graduating from University of Manitoba, he spent 11 years, starting 1938, as a petroleum geologist exploring for oil for Shell Oil, Standard Oil of New Jersey and Imperial Oil, in California, Egypt, S America and western Canada. In 1950 he established a firm that later became DOME PETROLEUM, with initial financing of \$250 000 in equity and \$7.7 million in loans, backed by Dome Mines and the endowment funds of several American universities. Dome made promising discoveries of oil at Drumheller and gas in the Provost field in Alberta, but Gallagher's real interest was in the Canadian Arctic, where, with its partners, Dome spent hundreds of millions of dollars drilling in the BEAUFORT

SEA, finding several deposits of oil and gas that would, however, require billions of dollars to be brought into production. In the late 1970s Dome began unprecedented expansion and, after accumulating debts of some \$7 billion, was forced to sell many of its assets. Gallagher resigned as chairman of the board and chief executive officer in 1983.

EARLE GRAY

**Gallant, Mavis Leslie**, née Young, writer (b at Montréal 11 Aug 1922). An only child of mismatched parents, Gallant was raised virtually as an orphan and educated at 17 different schools in Canada and the US. At the age of 10, her father mysteriously died (suicide seems a strong likelihood), but Gallant was not informed even of his death for several years. Her mother made a hasty remarriage; Gallant did not like her new stepfather, so she was sent to live in the US. Gallant's father was most likely an Anglo-Scots remittance man, talentless in his chosen vocation as an artist. The "Montreal Stories" provide, in an almost documentary style, a complete and accurate account of an urban remittance man's life in Canada. She worked briefly at the National Film Board before becoming a feature writer for the *Montreal Standard* in 1944. While a journalist, she married Winnipeg musician John Gallant, but they soon divorced. Gallant began writing fiction in Canada, publishing 2 short stories in *Preview* (1944), one in the *Standard Magazine* (1946) and one in *Northern Review* (1950). But in 1950, determined to write fiction full time, she departed for Europe, finally settling in Paris, where she still resides. She has written a large body of nonfiction reviews and essays on French culture and society, including an introduction to *The Affair of Gabrielle Russier* (1971); in 1972, she began work on a chronicle of the Dreyfus case. Since 1951, she has published over 100 short stories in *The New Yorker*; many have been collected along with several novellas into *The Other Paris* (1956), *My Heart Is Broken* (1964), *The Pegnitz Junction* (1973), *The End of the World and Other Stories* (1974) and *From the Fifteenth District* (1979). Gallant focuses on exiles and expatriates, displaced from their cultural milieus through choice or circumstance; lacking a clear sense of direction, they eke out miserable lives in run-down European hotels and pensions, adrift as permanently lost tourists. In her 2 novels, *Green Water, Green Sky* (1959) and *A Fairly Good Time* (1970), similar patterns are evoked, with characters perpetually in transit. This prodigious output has long been curiously neglected in Canada but Gallant is finally gaining recognition here. In 1981, she was appointed an officer of the Order of Canada, and in 1982 Toronto's Tarragon Theatre premiered her first play, *What Is to Be Done?* In the same year, *Home Truths: Selected Canadian Stories* received the Gov Gen's Award. The collection of stories about young Canadians at home and abroad concludes with 6 linked, semiautobiographical "Montreal Stories." In this personal remembrance, Gallant portrays herself as a young woman and depicts life in Montréal.

DONNA COATES

Reading: The entire issue of *Canadian Fiction Magazine* 28 (1978) is devoted to Gallant.

**Gallicanism**, primarily a theory about the proper relationship between church and state. In NEW FRANCE this relationship was governed by a web of traditions and usages that defined the status of the French church, both within the secular kingdom and within the universal church. Gallicanism's major characteristics included a certain defiance of the papacy, the defence of Gallic freedoms (which discounted the idea of absolute papal authority, in temporal or spiritual matters, over the French king and church), and the desire to ensure the Crown's full power even in the spiritual domain. After the CONQUEST, and especially in the 19th century, Gallicanism became a theory with 2 groups of supporters:

those who did not believe in papal infallibility or saw no need to accept it as dogma; and those who halfheartedly accepted a degree of state intervention in traditionally church-controlled domains such as education, marriage, the development of parishes and the keeping of registries (baptisms, marriages and burials).

Gallicanism flourished in New France after 1660, when Intendant Jean TALON and Gov FRONTENAC sought to reduce overwhelming religious influence and make the church obey the state. A *modus vivendi* was quickly reached, guaranteeing a certain autonomy to the church while permitting some state intervention, even in such purely religious questions as the life of religious communities. However, after 1760, having assured its survival and won for itself a degree of freedom, Canadian CATHOLICISM rethought the division of religious and civil power. Two tendencies appeared after 1840. On the one hand, ULTRAMONTANES supported the supremacy of the church and its prior right in education, the legislation of marriage, and all joint domains. On the other, those who modified these claims to any degree or defended the rights of the state were called Gallicans — a title that included groups such as the Sulpicians; lawyers such as George-Etienne CARTIER, Rodolphe Laflamme and Joseph DOUTRE; and Université Laval professors such as Jacques Crémazie and Charles-François Langelier. Soon, however, extreme ultramontanes threw the epithet "Gallican" at anyone who did not think the way they did; Gallicanism as such existed to some degree but merged with Catholic liberalism, which was similarly denounced until the end of the 19th century.

NIVE VOISINE

**Gallinule**, common name for some marsh-dwelling birds of the RAIL family (Rallidae), now also known as moorhens. Six genera, with around 14 species, occur worldwide. Several island-dwelling species are becoming rare. The common gallinule or common moorhen (*Gallinula chloropus*) breeds in a small area in south-eastern Ontario and nearby Québec and has occurred in Manitoba. It resembles the coot but has a bright red bill and forehead, green legs and lobeless toes. Like the coot, it pumps its head when swimming. Like coots, gallinules are often colonial; their nests are similar. The gallinule lays 9-12 buff eggs, spotted with dark brown. Common gallinules often betray their presence by loud, henlike cackling. The purple gallinule (*Porphyryla martinica*) breeds in south-eastern US southward; occurrence in eastern Canada is only casual.

E. KURT

**Galt**, Ont. City, inc 1915, located on the Grand R 90 km W of Toronto. It was established around 1817 by William Dickson, a lawyer and merchant from Niagara-on-the-Lake. He engaged Absalom Shade, a Pennsylvania Dutch carpenter, to build the townsite and mill and so it became known as Shade's Mill. In 1827 it was renamed Galt after John GALT, the Scottish novelist and colonizer who founded the CANADA CO. It was a centre of Scottish settlement in Upper Canada. The first macadamized road in UC linked it to Hamilton in 1837. The Grand R provided abundant water power and during the 19th century Galt was a significant manufacturing centre. In 1973 it formed part of the new city of CAMBRIDGE.

DANIEL FRANCIS

**Galt, Sir Alexander Tilloch**, politician, promoter (b at London, Eng 6 Sept 1817; d at Montréal 19 Sept 1893). Galt emigrated to Canada in 1835 to work for the BRITISH AMERICAN LAND CO, which was opening land for settlement in Québec's Eastern Townships. As he rose in the company, Galt saw the advantages for the area of a railway link to the ocean (see RAILWAY HISTORY), and he became president of the ST LAWRENCE AND ATLANTIC RAILROAD in 1849. Galt was no excep-

tion to the rule that railway promoters — in search of state subsidies and bond guarantees — often entered politics, and he represented Sherbrooke in the legislature of the PROVINCE OF CANADA (1849-50, 1853-67). A Liberal, Galt voted against the REBELLION LOSSES BILL and supported the demand for ANNEXATION to the US (1849). In 1858 he introduced a resolution calling for a federal union of all the British N American colonies; he joined the reconstructed Cartier-Macdonald ministry DOUBLE-SHUFFLE that year as finance minister after being promised support for his union proposal. His revenue tariff of 1859, which provided "incidental" protection to Canadian manufacturers, aroused protest from British manufacturers, but Galt argued that without the right to set its own tariffs, a colony did not enjoy self-government. Galt, a member of the GREAT COALITION Cabinet, attended the QUÉBEC CONFERENCE in 1864 and was a Canadian delegate to England in 1865 and 1866. He resigned from the Cabinet in 1866 when he failed to obtain the education guarantees he had promised to Québec Protestants. After CONFEDERATION he joined the first federal Cabinet as minister of finance, but was forced to resign in Nov 1867 over the failure of the Commercial Bank of Kingston. He retired from Parliament in 1872, having opposed the Conservatives but being unwilling to support the Liberals. Galt was knighted for his services on the commission to settle the question of American payment for access to Canadian fisheries, as arranged by the TREATY OF WASHINGTON. He was the first high commissioner of Canada in London 1880-83, appointed to promote interest in financing Canadian railways, buying Canadian products, and emigration to the Canadian North-West. While in London, Galt furthered his own plans to develop coal fields that his son Elliott had discovered in southern Alberta while serving as assistant Indian commissioner. With the backing of London businessmen and federal land grants, Galt incorporated the Northwestern Coal and Navigation co, and began operations near Lethbridge. The successful business was sold to the CANADIAN PACIFIC RAILWAY in 1910. Truly, "the life of Alexander Galt is a history of Canada in the 19th century." MARGARET E. MCCALLUM

**Galt, John**, novelist, colonial promoter (b at Irvine, Scot 2 May 1779; d at Greenock, Scot 11 Apr 1839). While struggling to survive as a man of letters, Galt became involved with Canadian affairs, first as agent for those claiming losses in the WAR OF 1812, and subsequently (1824) as secretary of the board of directors of the CANADA CO. He came to Upper Canada on several occasions, remaining 1826-29 as company superintendent and founding the town of GUELPH in 1827; the town of Galt (now CAMBRIDGE) was named after him. He had continual conflict with the directors over policy and administration, was eventually recalled and spent his last years in impoverished ill health. Galt's best-known fiction deals mainly with Scottish life, and his writings, except for his *Autobiography* (1833) and *Literary Life* (1834), show only a limited influence of his Canadian involvements. Two of his novels embody his idea of emigrants best suited to the US (*Lawrie Todd*, 1830) and Canada (*Bogle Corbet*, 1831). J.M. BUMSTED

**Gamache, Louis-Olivier**, an inhabitant of Ile d'ANTICOSTI who had a far-reaching reputation as a man who sold his soul to the devil and had supernatural powers. He was referred to as a pirate and, when pursued, caused his ship to turn into a ball of fire and escaped. NANCY SCHMITZ

**Gambling** is the betting of something of value on the outcome of a contingency or event, the result of which is uncertain and may be determined by chance, skill, a combination of chance and skill, or a contest. Long before John Cabot's

Interior of the remodelled Diamond Tooth Gertie's casino in Dawson, YT (courtesy National Film Board/Photothèque).

voyage to Canada in 1497, gambling was popular among native people. While many of the native games from the past are now recalled only as a part of cultural history, native people used gaming sticks for centuries before the arrival of the Europeans and the decks of playing cards they brought with them.

For the past century or so the most popular gambling games have been the card games of poker, stook and blackjack, and the dice games of craps and barbotte. During the KLONDIKE GOLD RUSH, the game of Faro, played with a regular deck of cards, was popular. The origins of Faro can be traced to the German game of "landsquenet," which was played as early as 1400. Faro was introduced by American gamblers in areas such as Dawson City in the Yukon, where fortunes were won and lost on the turn of a card. When the gold rush ended, so did the popularity of Faro in Canada, although its popularity has survived in the US. (The name has also survived in the name of the town of FARO, YT.)

Since its original enactment in 1892, the Canadian CRIMINAL CODE, following the English common law, has tolerated gambling under certain conditions. A 1910 amendment allowed pari-mutuel (from "Paris mutuel") betting. This form of betting, in which winners divide losers' stakes and a cut of the bet goes to the track, to the horsemen and the state, became the official and legal form of betting in France in 1894. The amendment also allowed occasional games of chance where profits were used for charitable or religious purposes. A few games were also permitted at agricultural fairs and exhibitions.

Gambling laws, although amended from time to time, remained relatively unchanged until 1970, when sweeping changes to the Criminal Code gave the provinces the authority to license and regulate gambling, with a few exceptions. Forms of gambling now licensed by the provinces include bingo, break-open pull tickets, raffles, and casino games consisting of blackjack, roulette and wheels of fortune. The revenues from the majority of licensed gaming activity in Canada must be used for charitable or religious purposes. The 1970 changes have resulted in the creation of a multi-billion-dollar gambling industry throughout Canada. The federal and provincial governments are now actively involved in operating LOTTERIES. A large number of charitable and religious groups have come to rely upon gaming revenues for annual

budgetary obligations. AGRICULTURAL EXHIBITIONS and fairs derive substantial profits from gambling activity during annual celebrations. Pari-mutuel racetrack betting has long been and still is a popular pastime. In 1983 Canadians bet \$1.67 billion at racetracks across Canada (see THOROUGHBRED RACING).

Sports betting, by far the most popular form of illegal gambling, generates large profits for the bookmakers, and is the largest source of gambling revenue of ORGANIZED CRIME. Illegal private gaming houses can be found in every major Canadian city. Swindlers, using a variety of cheating techniques, are common in gaming houses and are also active in legally operated private gambling establishments but almost never attract the attention of law enforcement. Illegal gambling is generally perceived as a "victimless crime" and is not one for which the police receive many complaints. Unlike other crimes, modern illegal gambling is tolerated, and there is no public pressure exerted to control it. Its existence and continual growth has seemingly had no effect on the legal gambling market. At the same time, liberalization of legal gambling activities since 1970 appears to have had no effect on illegal gambling.

During the past 80 years gambling in Canada has evolved from an activity socially tolerated only within narrow restraints to a broadly acceptable leisure-time activity. The social, legal and economic consequences of these activities have yet to be chronicled. R. RONALD SHEPPARD  
Reading: W. Fadington, ed, *Gambling and Society* (1976); R. Herman, *Gamblers and Gambling* (1976); A. Waller, *The Gamblers* (1976).

**Game Bird**, any BIRD that is hunted, excluding WATERFOWL; 25 species now occur in Canada. Game birds are hunted because they are good to eat and are challenging to the hunter. Most are shot by walking hunters, who sometimes use pointing or retrieving dogs. Sandhill CRANES, band-tailed PIGEONS and mourning doves may be shot from blinds. The wild turkey (family Meleagrididae) disappeared from Ont around 1902 but has been reintroduced locally in Ont, Man and Alta. Eight members of the grouse family are found in Canada: spruce grouse in coniferous forest everywhere except Nfld and PEI; blue grouse in coniferous forest and savannah in Alta, BC, YT and southwestern NWT; sage grouse in southern Alta and Sask and formerly BC on sagebrush range; ruffed grouse everywhere in deciduous forests, introduced into Nfld; sharp-tailed grouse in open and brushy

habitat in muskeg and grassland W of the James Bay region, Qué; white-tailed PTARMIGAN in alpine areas of the West; rock ptarmigan in tundra and alpine habitats in BC, YT, NWT, Qué and Nfld; willow ptarmigan in tundra, shrub-tundra and alpine habitats in BC, YT, NWT, Man, Ont, Qué, Nfld and, in winter, in northern Alta and Sask. The greater prairie chicken, formerly found on the prairies and in Ont, has almost disappeared.

The only native PHEASANT is northern bobwhite, found in bushy and agricultural land in Ont. It has been introduced successfully to BC and unsuccessfully to Man and Alta. California and mountain quail, introduced to southern BC from the US, occupy wooded and brushy range. From Europe and Asia came the ring-necked pheasant and the gray (Hungarian) partridge, now established on agricultural land locally in all provinces but Nfld, and the chukar, established in the dry interior of BC and in southern Alta. The sandhill crane breeds on tundra and muskeg from Baffin I and the James Bay area of Qué to Siberia and locally on prairie. It migrates through western Ont, the prairies and BC. Of the RAIL family, the American coot (west of NB) and the common moorhen (southern Ont and Qué) are most commonly hunted in marshes. The smaller king rail (southern Ont) and Virginia and sora rails (all provinces) are rarely taken. The only members of the SANDPIPER family now hunted are the American woodcock (from southern Man to Nfld) in woodland and the common snipe (throughout Canada) in marshland and wet pastures. Two members of the pigeon family are hunted: the band-tailed pigeon in forested western BC and the mourning dove, which occurs in agricultural land in all provinces except Nfld and PEI but is hunted only in certain provinces. Both species winter in the US. The once plentiful PASSENGER PIGEON is extinct.

The harvest of game birds is controlled by bag limits and by length and timing of seasons. Not all species are legally hunted wherever they occur. Provinces and territories have the authority to set hunting regulations for turkey, grouse, pheasant, partridges and quail. These are considered nonmigratory, although some grouse populations may migrate long distances. The migratory game birds, including sandhill crane, American coot, common moorhen (gallinule), rails, American woodcock, common snipe, band-tailed pigeon and mourning dove, are regulated by the federal government under the Migratory Birds Convention Act (1917). The annual Canadian harvest of these birds probably exceeds 2.8 million. H.G. LUMSDEN

**Gananoque**, Ont, Town, pop 4863 (1981c), inc 1890, located at the confluence of the St Lawrence and Gananoque rivers, 29 km E of Kingston. Its name derives from an Indian word said to mean "rocks rising out of the water." The site was known in French times but was not surveyed until 1784. LOYALISTS John Johnson and Joel Stone were granted land in the area, but they quarrelled over the site. A compromise in 1789 gave Johnson the best land E of the Gananoque R, but Stone remained a resident, built a sawmill and with the McDonald family developed the site. It was raided by American forces under Benjamin Forsyth, Sept 1812. From the 1830s metal industries have been important. Now, as "Gateway to the Thousand Islands," it is a major tourist centre. There is a bridge to the US at nearby Ivy Lea. K.L. MORRISON

Reading: H.W. Hawke, *Historic Gananoque* (1974).

**Gandalf Data Limited**, see ELECTRONICS INDUSTRY.

**Gander**, Nfld, Town, pop 10 404 (1981c), inc 1954, is located on Gander Lake in east-central Newfoundland. Both the town and lake are named after the GANDER R. This fog-free site was

selected by the British and Canadian governments in 1935 to accommodate such flights as the regular transatlantic air service that had developed in the 1930s. By 1938 construction of what was then one of the world's largest airports had been completed and the community of Gander begun. During WWII Gander was a strategic link in the N American chain of defence, and in the RAF Transport Command's vital Atlantic FERRY COMMAND. The RCAF established a base here in 1940, which was also used by the USAF. The civilian use and enlargement of facilities after the war attracted a population of about 3000 by 1951, and by 1954 construction of a planned townsite began. Although Gander's importance as a refueling point has diminished, it has continued to attract many international flights, particularly from eastern Europe, and thus records many of the defections from communist countries that occur in Canada. Air Traffic Control (ATC) at Gander, the only oceanic unit in Canada, has jurisdiction over international and domestic airspace from W of Nfld to the mid-Atlantic and N to Greenland. In recent years the town has also become a major service centre for central Newfoundland.

JANET E.M. PITT AND ROBERT D. PITT

**Gander River**, 175 km long, drainage basin 6400 km<sup>2</sup>, is the principal river of NE Newfoundland, emptying into Gander B. Named for its abundant geese, it rises in the central plateau and eventually falls 427 m to the Atlantic. The NW Gander flows 97 km into the W end of Gander Lk where it is joined by the 77 km long SW Gander R. The main river begins on the N side of the lake and twists NE 44 km to the sea. A waterway of the BEOTHUK, it has been fished for salmon by Europeans since 1725. It reaches into excellent stands of timber and has long been a route for lumbering. ROBERT D. PITT

**Gannet**, or northern gannet (*Morus bassanus*), large, long-winged SEABIRD, white except for conspicuous, black wing tips and yellowish tinged head. It weighs about 3100 g and is up to 100 cm long. Nine species of gannets and boobies comprise the predominantly tropical family Sulidae. All have a stout appearance, thick, sharply pointed bills, fairly short necks and legs, and wedge-shaped tails. They feed on fish

The northern gannet (*Morus bassanus*) is confined to the N Atlantic region, where it breeds in dense colonies on steep sea cliffs or cliff tops, mainly on islands (photo by Tim Fitzharris).

caught by plunge-diving, often from heights of 20-30 m. Northern gannets are confined to the N Atlantic. They breed in dense colonies (6 in Canada) on steep sea cliffs or cliff tops, mainly on islands. Gannets first breed when 5-6 years old. Each pair produces a single, whitish egg. Incubation takes about 44 days and the chick is fed by its parent for about 90 days. Adults and immatures are common inshore in autumn, moving offshore in winter. About 70% of the N American population of 32 700 breeding pairs nest at 3 sites in the Gulf of St Lawrence; the remainder on the southeastern coast of Newfoundland. The largest colony, at Bonaventure I, Qué, is a federal migratory bird sanctuary and a provincial park. D.N. NETTLESHIP

**Gar**, large, slender, thick-scaled, predatory FISH of family Lepisosteidae, order Semionotiformes, class Osteichthyes. Gars are found in fresh waters of eastern N America, Central America and Cuba, occasionally in brackish water and, rarely, in the sea. The 7 living species are divided into 2 genera (*Lepisosteus* and *Atractosteus*) by some ichthyologists; others consider them all as *Lepisosteus*. In Canada, 2 species, the rare spotted gar (*L. oculatus*) and the more familiar longnose gar (*L. osseus*), reach their northern limit in the Great Lakes drainage basin. Gars are characterized by diamond-shaped scales and a long snout with needlelike teeth. The gas-bladder, cellular and richly supplied with blood vessels, acts as a lung, enabling gars to breathe air in stagnant waters. Gars may reach 183 cm long and 22 years of age. They feed principally on other fishes, which they seize by a darting movement from cover of vegetation. A sideways swipe of the snout impales prey crosswise on their teeth. Gar flesh is edible but not attractive. The eggs are poisonous to mammals and birds. The importance of gars as predators of economically important fishes is uncertain, but large gars can destroy gear set for other fishes. BRIAN W. COAD

**Garant, Serge**, composer, conductor, pianist, teacher, critic (b at Québec City 22 Sept 1929). A daring and innovative musician, Garant is known for his promotion of 20th-century music, especially that of Canada. He studied in Montréal with Yvonne Hubert (piano) and Claude CHAMPAGNE (composition), and in Paris with Olivier Messiaen and Andrée Vaurabourg-Honegger. Returning to Montréal, he worked in counterpoint with Jocelyne Binet, and later took summer courses with Boulez in Switzerland. By combining recording tapes and instruments in *Nucléogame* (1955) and by using the aleatory technique in his *Trois Pièces* for string quartet (1958), Garant introduced 2 innovative procedures into Canadian music. However, it was *Anerca*, created in 1961 by Mauricio Kagel, that gained him recognition as a leading Canadian musician.

Garant has worked for CBC Radio as an arranger, accompanist, conductor and critic. He is also musical director of the Société de musique contemporaine du Québec, copresident of the national committee of the Société internationale pour la musique contemporaine and a professor at U de M. He was awarded the Canadian Music Council Medal (1971), the Harold Moon trophy from the Performing Rights Organization of Canada Ltd (1978) and the 1979 Prix de musique Calixa-Lavallée.

HÉLÈNE PLOUFFE

**Garapick, Nancy Ellen**, swimmer (b at Halifax, NS 24 Sept 1961). Although proficient in backstroke, butterfly, freestyle and individual medley, she enjoyed possibly her greatest success in the backstroke, setting a world record of 2:16.33 for the 200 m (1975) and a Canadian and Olympic mark of 1:03.28 for the 100 m (1976). Displaying her skills throughout the world with Canada's national aquatic team, Garapick collected an impressive array of honours and records. She represented Canada in the 1976 Montréal Olympics, claiming 2 bronze medals, and was named to the Canadian team for the boycotted 1980 Moscow Olympics. At age 14, in 1975, she was named Canada's female athlete of the year.

BOB FERGUSON

**Garbage**, see SOLID WASTE; WASTE DISPOSAL.

**Gardiner, Frederick Goldwin**, lawyer, politician (b at Toronto 21 Jan 1895; d there 22 Aug 1983). A law graduate of Osgoode Hall (1920), Gardiner began his political career in 1936 as deputy reeve of Forest Hill, a suburban village in N Toronto. An ardent proponent of municipal amalgamation, he was persuaded to become first chairman of Metropolitan Toronto in 1953. Nicknamed "Big Daddy," he dominated municipal politics during a period in which Toronto "shrank at the core and burst at the seams." He retired as chairman in 1961 and was appointed a Toronto Hydro commissioner in 1965, serving until 1979. A sharp debater and colourful speaker, he was also influential in the provincial and federal Conservative Party, and held several directorships of major corporations.

JAMES MARSH

**Gardiner, James Garfield**, "Jimmy," teacher, farmer, politician (b in Hibbert Township, Ont 30 Nov 1883; d at Lemberg, Sask 2 Jan 1962). Of Scots descent, Gardiner left Ontario for the North-West Territories and in 1905 witnessed the creation of Saskatchewan, where he remained to champion Prairie interests. As MLA (1914-35), Cabinet minister (1922-26), premier (1926-29, 1934-35), and leader of the Opposition (1929-34), he tirelessly pursued Liberal policies. In 1935 he became federal minister of agriculture and served until 1957, so single-minded in espousing western affairs that he frequently exasperated colleagues. His PRAIRIE FARM REHABILITATION ADMINISTRATION was designed to assist drought-stricken prairie farmers. He was also minister of national war services in 1940-41. He sought his party's national leadership unsuccessfully in 1948.

Gardiner's role as a western tribune was influenced by early poverty and a doctrinaire training in liberalism at Manitoba Coll. His faith in individual effort and in limited government as the servant of individuals never wavered, and he consistently applied his ideas to building his province and helping its citizens in turn through depression, war and reconstruction. Notably partisan, he held that a minister should be fully responsible and he believed frankly in patronage.

NORMAN WARD

**Gardiner Dam**, located 100 km S of SASKATOON is a 4 km long earth-fill structure towering 64 m above the S Saskatchewan riverbed. A dam near the "elbow" of the river (see ELBOW) had first been suggested in 1858 by Henry Hind, but construction did not begin until 1958 when a cost-shar-

ing agreement was signed by the Diefenbaker (federal) and Douglas (provincial) governments. The dam is named after J.G. GARDINER, former Saskatchewan premier, federal agricultural minister and champion of the PRAIRIE FARM REHABILITATION ADMINISTRATION. The body of water behind the dam is named Lk DIEFENBAKER after the man who, as prime minister, put the plan in motion (though Diefenbaker and Gardiner were arch-opponents). The dam was created to utilize better the water resources of the S Saskatchewan R for irrigation, recreation, urban water supply, electrical power and river control. It was officially opened in 1967.

DON HERPERGER

**Garibaldi Provincial Park** (est 1920), 1950 km<sup>2</sup> mountain wilderness located some 60 km N of Vancouver, normally reached by a short trail from Highway 99, N of Squamish. The mountains, which dominate the park and rise to 2678 m at Mt Garibaldi, are of recent volcanic origin. Lava from Price Mtn created a dam allowing 3000 m deep Lk Garibaldi to form. Subsequent erosion, especially by GLACIERS which still persist at higher altitudes, has sculpted the peaks, notably Black Tusk, and gouged the valleys, leaving a landscape of spectacular rugged beauty. Below 1500 m is a dense forest of Douglas fir, western red cedar and western hemlock; above, more scattered growth of mountain hemlock, yellow cedar, alpine fir and white bark pine. The alpine regions feature heather, numerous wildflowers and perpetual snow. Large mammals are scarce, although deer, mountain goats, grizzly and black bears are present. More noticeable are marmots, squirrels, ptarmigans, Canada jays and golden eagles.

Mt Garibaldi was named in 1860 by Royal Navy Captain George Richards after Italian revolutionary Giuseppe Garibaldi. Difficulties of access inhibited human exploitation of the area. Today, some 17 600 ha around Black Tusk are afforded special protection in a Nature Conservancy Area. Adjacent to the NW boundary is the Whistler Mtn resort, which provides some of the finest alpine and nordic ski facilities in N America.

JOHN S. MARSH

**Garneau, François-Xavier**, notary, civil servant, poet, historian (b at Québec City, 15 June 1809; d there 3 Feb 1866). The greatest writer of 19th-century French Canada and its most important historian, he had a major influence on the thinking and letters of his time.

The son of an unschooled, poor father, young François-Xavier was soon known for his keen intelligence. He excelled in primary school, but lack of money apparently barred his way to a classical education. His self-education and natural reserve explain the "proud independence" which impressed his contemporaries. Having decided in 1825 to become a notary, he spent 5 years clerking for Archibald Campbell. The latter had an outstanding library and encouraged Garneau to study both English and French history and letters. He also helped him make a trip to the US, where Garneau discovered American-style democracy and confirmed his sense of identity as a North American. In 1831 the young notary went to London for 2 years as secretary to Denis-Benjamin Viger, sent to defend the rights of French Canadians. Garneau learned much about British politics and society and visited Paris twice. Back in Québec in 1833, he half-heartedly exercised his profession, wrote poems, started a cultural magazine and eagerly followed the debates in the House of Assembly and the Legislative Council, dominated respectively by French Canadian nationalists and the Anglo-Canadian establishment.

Garneau began his work as a historian in the late 1830s. He worked, above all, on a vast synthesis of French Canadian history, the 3-volume *Histoire du Canada*, which appeared between 1845 and 1848. A supplement published

François-Xavier Garneau, the greatest writer of 19th-century French Canada and its most important historian (courtesy Public Archives of Canada/C-6721).

in 1852 brought the account up to 1840. Garneau presented the history of French Canadians as a struggle for survival — against the Indians and Anglo-Americans on the battlefield, and then against the English-Canadian oligarchy in the parliamentary arena. The work was hugely successful and caused Garneau, while still alive, to be hailed "national historian." For over a century, novelists, poets and political thinkers borrowed from his documentation and interpretations. His spirited and passionate style assured the *Histoire* lasting success. After 1845 the clergy began to show concern regarding certain Gallican and liberal aspects in the work, and Garneau then developed a more conservative nationalism in religious matters. For 100 years the historiographical interpretation of French Canada was a synthesis of Garneau's political interpretation and the religious one of Catholic historians like Abbé Ferland.

Garneau lived a quiet life first as a notary and, later, from 1844 to 1864 as City Clerk. He was peace loving, even timid, but held firmly to his opinions. His capacity for work was legendary. Though impassioned by politics, he never entered political life. In his view, the church should either be subordinate to the state or uninvolved in sociopolitical affairs, yet he viewed Catholicism as integral to the national identity of French Canadians. In his nationalist interpretation of history and love of his native land which pervaded his style, Garneau remains a major figure in French Canadian literature.

PIERRE SAVARD

**Garneau, Hector de Saint-Denis**, poet (b at Montréal 13 June 1912; d at Ste-Catherine-de-Fossambault, Qué 24 Oct 1943). Saint-Denis Garneau's writing marks a turning point in the history of Québec poetry. Great-grandson of the historian François-Xavier GARNEAU and grandson of the poet Alfred Garneau, Saint-Denis Garneau was the son of a comfortable middle-class family and cousin of the poet and novelist Anne HÉBERT. While taking his classical secondary course at the Jesuit colleges Sainte-Marie, Loyola and Jean de Brébeuf, he also attended art classes at the Ecole des beaux-arts in Montréal, but in 1934 his studies were interrupted by a rheumatic heart condition. Devoting himself to poetry, painting and music, he was associated for the next 3 years with the young Catholic intellectuals responsible for the magazine *La Relève*. During the 1930s also he kept his *Journal* (posthumously published in 1954 and translated into English by John Glassco in 1962) and composed the poems to appear in his only collection of verse, *Regards et jeux dans l'espace* (1937). Disillusioned by the volume's reception, Saint-Denis

Garneau withdrew to the seclusion of the family manor house at Ste-Catherine-de-Fossambault near Québec City, where he died in 1943, apparently of a heart attack while canoeing alone.

Radical in its form, with its unrhymed lines of various lengths, its lack of punctuation and its broken syntax, Saint-Denis Garneau's poetry was equally original in its themes (the spiritual adventure of the poet, the nature of artistic creation, the search for purity) and in its ironic distance. His hermetic poems, his cerebral correspondence and the restless searching of his diary make of Saint-Denis Garneau a unique figure in the intellectual history of Québec and its first truly modern poet.

DAVID M. HAYNE

**Garner, Hugh**, writer (b at Batley, Eng 22 Feb 1913; d at Toronto 30 June 1979). Garner's parents immigrated to Canada in 1919 and his father abandoned the family soon after. Garner spent his youth in the poorer neighbourhoods of downtown Toronto and entered the publishing world as a newspaper copyboy. He rode the rails during the Depression and fought in the Spanish Civil War and WWII. Garner's poor, urban and Protestant background was a rare one for a Canadian writer and pervades his work. His focus is working-class Ontario and his preferred genre, the realistic novel; the best-known example is *Cabbagetown* (1968). Frequently, his theme is the victimization of the worker in a class struggle, reflecting his early association with radical socialism.

The legend of Garner grew out of a hard-living life-style that fed his writing. To the end he smoked and drank, and was outspoken, abrasive and always unfashionable. His extensive literary output — 100 short stories, 17 books, hundreds of articles and radio and TV scripts — has been criticized for banality and flawed characterization, but he loved telling stories and was genuine in his talent and determination. In 1963 a collection of his short stories won the Gov Gen's Award.

MARLENE ALT

**Garratt, Phillip Clarke**, aviator (b at Toronto 13 July 1894; d there 16 Nov 1975). He served in WWI with the Royal Flying Corps, flew as a commercial pilot and joined de HAVILLAND AIRCRAFT in 1936 where he directed the development of aircraft to operate in the Canadian North. After WWII, he fostered development of the Chipmunk trainer and a series of successful STOL aircraft, including the BEAVER and OTTER. He was awarded the MCKEE TROPHY in 1951 and 1966.

JAMES MARSH

**Garrett, Christopher John Raymond**, physical oceanographer (b at Bude, Eng 30 July 1943). Educated at Cambridge, he joined the Department of Oceanography at Dalhousie in 1971. Known for his early work with W.H. Munk on the description of internal wave characteristics, he is also respected for his research on frontal processes, ocean mixing and shelf dynamics. He has been interested in numerous environmental issues, including the problem of radioactive waste disposal in the deep ocean. In 1982 he won the A.G. HUNTSMAN award in physical oceanography.

G.T. NEEDLER

**Garson**, Man, Village, pop 318 (1981c), inc 1915 as the village of Lyall, is located 37 km NE of Winnipeg. In 1927 it reverted to its original name — after William Garson, an early quarrier of the area's mottled Tyndall limestone, used in many prominent Canadian buildings. Mixed farming by Ukrainian, German, Polish and Anglo-Saxon settlers began in the region in the 1880s. Garson operated the first of 5 limestone quarries which attracted a cosmopolitan mix of skilled workers from the turn of the century onward. Only one quarry operation remains today. The village's residents primarily commute to nearby centres to work.

D.M. LYON

Six species of garter snake occur in Canada in a variety of habitats, from the NWT to urban environments of the south (artwork by Claire Tremblay).

**Garson, Stuart Sinclair**, lawyer, politician, premier of Manitoba (b at St Catharines, Ont 1 Dec 1898; d at Winnipeg 5 May 1977). After moving to Winnipeg as a child, he attended the Manitoba Law School, was called to the bar in 1919 and practised law at Ashern and Eriksdale, Man, until 1936. A Liberal-Progressive MLA for Fairford 1927-48, he held office as provincial treasurer 1936-48 and premier 1943-48. In 1937 he was instrumental in securing the appointment of the Royal Commission on DOMINION-PROVINCIAL RELATIONS, the greatest achievement of his premiership was the inauguration of an effective program of rapid rural electrification. From 1948 to 1957 he served as federal minister of justice and attorney general and as Liberal MP for Marquette. He then left politics to practise law until his retirement in 1965. He was named a companion of the Order of Canada in 1971.

DONALD SWAINSON

**Garter Snake**, common name for 30 species of harmless colubrid snakes of the genus *Thamnophis*, found from NWT to Costa Rica. Most have a prominent, longitudinal stripe down the back. Six species occur in Canada, including the common garter snake, which has the widest range of any N American snake. Garter snakes are often abundant and occupy a wide variety of habitats, including urban settings. Diets vary among species but include slugs, earthworms, fish and amphibians. Mammals are eaten occasionally, especially by the western terrestrial garter snake, which restrains such prey by a primitive coiling behaviour. All are live-bearing and normally produce 10-20 young by late summer to early fall.

PATRICK T. GREGORY

**Gascon, Jean**, actor, director (b at Montréal 21 Dec 1921). While studying at the Collège Sainte-Marie, he attracted attention for his performance in several plays with Jean-Louis Roux. In 1942 they both appeared in *L'Echange* directed by Ludmilla Pitoeff for the Compagnons de Saint-Laurent. Gascon enrolled in medicine but continued his acting career with the Compagnons. When Pitoeff returned to Montréal with her company in 1946, Gascon and Roux appeared with her in *Phèdre* and *Le Pain dur*, and the following year Gascon followed Roux to France to perfect his craft. Gascon remained there several years, working especially at Copeau's Ecole du vieux-colombier. When he returned to Canada, he, Roux, Éloi GRAMMONT and several others be-

gan the THÉÂTRE DU NOUVEAU MONDE, with Gascon serving as director. Early in 1952 they founded the Ecole du TNM, which was replaced in 1956 by the National Theatre School. Gascon managed the TNM until 1966, as well as taking roles in plays such as *L'Avare*, *Don Juan* and *Richard II* and directing productions including *La Tartuffe*, *Venise sauvée*, *L'Opera de quat'sous* and *Klondyke*. Under him the company took part in several international festivals and in 1958 undertook a major tour to Europe, the US and Canada. Gascon appeared in 1956 in *Henry V* at the STRATFORD FESTIVAL and returned there to direct *Othello* in 1959 and *The Comedy of Errors* in 1964. He succeeded Michael Langham as artistic director (1968-74) at Stratford. After leaving Stratford, he took charge of theatre at the NATIONAL ARTS CENTRE in Ottawa in 1977. Gascon's many honours include the Prix Victor-Morin and the MOLSON PRIZE; he is a companion of the Order of Canada.

ANDRÉ G. BOURASSA

**Gaspé**, Qué, City, pop 17 261 (1981c), inc 1874, is located on the bay bearing the same name, 650 km NE of Québec City. The name, whose origin and meaning are disputed, extends to an entire region, the GASPÉ PENINSULA. Following the amalgamation of 12 neighbouring localities between Anse-à-Valleau and Pointe-St-Pierre in 1970, Gaspé is now one of Québec's largest municipalities; the old town itself has only 3297 (1981c) inhabitants. Gaspé is one of the oldest settlements in N America: on 24 July 1534, Jacques CARTIER took possession of Canada on behalf of the king of France and placed a cross at this location, which very soon became a fishing port and supply centre for NEW FRANCE. Between 1628 and 1760, Gaspé was the scene of several incidents between the French and English. Sir William PHIPS's troops burned the village in 1690 and the English built a fort there just before the Conquest. After the American Revolution, many LOYALISTS settled in the area. Since then the population has been largely English speaking. Cod and salmon fishing dominated the economy for many years, but today other activities such as forestry, trade and tourism play a key role. A regional history and folklore museum opened in 1976, and Parks Canada has erected a monument nearby commemorating the arrival of Cartier.

ANTONIO LECHASSEUR

**Gaspé Peninsula**, a large peninsula in eastern Québec, comprises 5 counties (Bonaventure, Gaspé-Est, Gaspé-Ouest, Matane and Rimouski) with a population of 199 657 (1981c). Except for the copper-mining town of Murdochville, most of the population lives along the lengthy coast-

line within a few km of the St Lawrence R, the Gulf of St Lawrence and Chaleur Bay. Principal towns include RIMOUSKI, GASPÉ and Matane.

The name Gaspé probably derives from a MICMAC word meaning "land's end." When Jacques CARTIER landed in Gaspé Bay in 1534 to plant a cross and claim the land for the king of France, he found the area occupied by Iroquoian-speaking Indians. By the beginning of the 17th century, when Samuel de CHAMPLAIN sailed along its coasts, the peninsula was inhabited by Micmac. Although never probably numbering more than a few hundred, they have continued to live there since. They were Christianized by French missionaries in the 17th century. The rich supplies of codfish, found in great numbers only a few km from shore, have long been the focus of the Gaspé economy; every year, for centuries, hundreds of tonnes of fish have been shipped to Europe, S America and the US. The wide, stony beaches and reliable sun and winds of Gaspé were perfect for dry-curing the cod; until refrigeration arrived in the 20th century, this was the only means to ensure that the fish would endure the long voyages to market without spoiling.

In the French period only a few fishermen settled in Gaspé permanently. When James WOLFE and his forces arrived in 1758 they found about 400 permanent residents on the coast. He destroyed their homes and possessions and sent most of them back to France. Still, a few managed to hide in the woods, continuing to live in Gaspé after it became British territory in 1763. They were joined by several families of ACADIANS who had avoided the British deportation campaign in NS. In 1784 about 400 English-speaking LOYALISTS, refugees from the American Revolution, came to settle in Gaspé. Thereafter, few immigrants arrived, though the population grew vigorously by natural means.

It was a long time before the people of Gaspé escaped dependence on the fishing industry. A little mixed farming was practised in Bonaventure County, but it was not until the 20th century that the forest and mineral resources of the interior were seriously exploited. Construction of a railway connection only began in the 1890s. In recent years tourism has become an important source of employment, thousands of visitors come to see the famous PERCÉ ROCK, the great bird colonies of Île de Bonaventure, Gaspésie Provincial Park in the rugged interior and FORILLON NATIONAL PARK.

DAVID LEE

Reading: Jules Bélanger, Marc Desjardins & Yves Frenette, *Histoire de la Gaspésie* (1981).

**Gatineau, Qué.** City, pop 74 988 (1981c), inc 1975, is located at the junction of the R Gatineau and OTTAWA R, adjoining HULL, Qué. It was created through the merger of 7 municipalities situated E of the Gatineau R (Pointe-Gatineau, Touraine, East Templeton, East part of East Templeton, West Templeton, village of Templeton and Gatineau), and is the largest French-speaking municipality of the National Capital Region and seventh-largest city in Québec. It is named for Nicolas Gastineau who was active in the fur trade of the area in the 17th century. With only 35% of its urban core developed, Gatineau has experienced impressive growth in the last 10 years, with such developments as a new shopping centre (Les Promenades de l'Outaouais), a new hotel (l'Auberge des Gouverneurs), new hospital facilities, an airport coupled with a large industrial park, and a new superhighway. Spread over 263 km<sup>2</sup>, it is inhabited by a population younger than that of Hull's and whose mother tongue is 89% French and 9% English. A comparison of age groups is striking: Gatineau has twice as many in the "0-14" age group (20 270 compared to Hull's 10 120; 1981c) and almost half as many over age 65 (2685 to Hull's 4735).

PIERRE-LOUIS LAPOINTE

**Gaucher, Yves**, painter, printmaker (b at Montréal 3 Jan 1934). One of Montréal's most important abstract artists during the 1960s, he made his initial mark as a printmaker. His first purely abstract work is a suite of prints, *En Hommage à Webern* (1963), inspired by a Paris visit during which he realized that his artistic affinities were with New York, not Europe. Though his work developed parallel to American colour-field painting, he made formal choices closer to contemporary Montréal developments. His shapes and surfaces are anonymous and hard-edged, and he continues to be challenged by "relational" painting — balancing off structural components (since 1973 coloured planes of unequal weight and energy) to achieve a taut surface equilibrium. Gaucher sees formal problems as metaphors for existential ones, and reconfirms abstract painting's tradition of moral and spiritual enquiry.

ROALD NASGAARD

**Gaudard, Pierre**, photojournalist (b at Marvellise, France 6 Oct 1927). Gaudard moved to Montréal in 1952 and gained national recognition in the late 1960s with an extended photo-essay, about blue-collar workers, exhibited and published by the National Film Board. In 1972 he joined the short-lived Groupe d'action photographique (GAP), which recorded urban and rural Quebecers' lives. A commission from *Time* (Canada) to illustrate a cover story on the Canadian penal system in 1974 led to a Canada Council Senior Arts Award and a travelling exhibition in 1977 by the NFB. In 1980 Gaudard spent a year photographing in his native France. The resultant images, characterized by gentle humour and irony, were exhibited by the NFB in different parts of Canada.

LOUISE ABBOTT

**Gaudaur, Jacob Gill, Jr.**, "Jake," football player, executive, commissioner (b at Orillia, Ont 5 Oct 1920). An all-round athlete, he was a prominent oarsman and an accomplished lacrosse player in his youth. He joined the RCAF and played football with the Grey Cup champion RCAF Hurricanes (1942). He continued playing after WWII, finally joining the Hamilton Tigers in 1948. He was captain of the club from 1950 and centre on the 1953 Grey Cup championship team. From 1954 to 1968, he was president and general manager of the Tiger-Cats. He also played an unofficial role for the CANADIAN FOOTBALL LEAGUE, selling TV rights in Canada and the US and negotiating an agreement with the US National Football League to honour each league's contracts. In Apr 1968 he was appointed commissioner of the CFL, a position he held to 1984.

FRANK COSENTINO

**Gaudreault, Laure**, teacher, unionist, journalist (b at La Malbaie, Qué 25 Oct 1889; d at Clermont, Qué 19 Jan 1975). Gaudreault attended the Ecole normale Laval and then taught in Québec village grade schools. She wrote for various papers, analysing the position of women and, from 1930 on, tried to awaken her readers to the harsh working conditions of female rural school teachers. In 1936 she did the groundwork for the Association catholique des institutrices rurales and, in 1937, the Fédération catholique des institutrices rurales. She then organized female rural teachers to win improvements in salaries and pension programs; published *La Petite Feuille* and became a union organizer; was part of the 1946 fusion of various teachers' unions into the Corporation générale des instituteurs et des institutrices catholiques du Québec (CIC), precursor of today's Centrale de l'enseignement du Québec. Vice-president of the CIC, 1946-65, she participated in the major union battles of Québec teachers.

MICHELLE DUMONT

**Gauld, Bella Hall**, labour educator, political activist (b at Lindsay, Ont 31 Dec 1878; d at Montréal 21 Aug 1961). Raised on a farm in Manitoba, Gauld qualified as a teacher before studying piano in Germany. Back in Canada (1905), she worked with German immigrants near Brandon, and then joined J.S. WOODSWORTH's All People's Mission in Winnipeg (1911). On his recommendation, she was hired as first director of the Montréal University Settlement (1914). She studied at the Rand School of Social Science (1919), and returned to Montréal to establish the Labour College (1920). On its demise (1924), she worked for the Women's Labour League which sponsored camps for poor children. Gauld joined the COMMUNIST PARTY OF CANADA (1922), becoming president of the Montréal branch of the Friends of the Soviet Union (1926-39). In the 1930s she operated a soup kitchen and played piano at fund raisers for various ethnic communities. During WWII, she was a frequent soloist at Navy League concerts for servicemen. She remained active in the Communist Party until her death.

MARGARET E. McCALLUM

**Gault, Andrew Hamilton**, army officer (b in Eng 18 Aug 1882; d at Montréal 28 Nov 1958). Of Canadian parents, he attended McGill U. Commissioned in the 2nd Canadian Mounted Rifles, he served in the SOUTH AFRICAN WAR and joined the Canadian Militia on return to Canada. On the eve of WWI he offered the Canadian government \$100 000 to help raise and equip an infantry battalion for overseas duty, leading to the formation in 1914 of the Princess Patricia's Canadian Light Infantry regiment. Gault accompanied the regiment overseas as second-in-command, fighting until the loss of his left leg. On retirement (1920), he took up residence in England and was elected Conservative MP for Taunton (1924-35). Recalled to active duty in WWII, he served on staff with the Canadian Army in England (colonel, 1940; brigadier, 1942) and returned to Canada in 1945. Appointed honorary colonel (1948) and colonel (1958) of his regiment, he showed a keen interest in it until his death.

JEAN PARISEAU

**Gaultier, Jean-François**, king's physician, naturalist (b at La Croix-Avranchin, France 6 Oct 1708; d at Québec C 10 July 1756). Appointed king's physician of NEW FRANCE, he arrived in Québec in 1742. There he took over M. SARRAZIN's medical and scientific duties, and became a corresponding member of the Académie royale des sciences in 1745. In 1747, encouraged by LA GALISSONNIÈRE, he arranged for the post commandants to collect plant specimens for him. In 1749 Gaultier and Pehr KALM botanized around Québec C and E to Les Éboulements, and Kalm named for him the genus *Gaultheria*, or WINTERGREEN. Gaultier shipped plants to France each year. His 1749 manuscript lists 134 species, 61 first described by Sarrazin to which he added detail and 73 not mentioned by Sarrazin. Gaultier concentrated on the ligneous plants in his work and differentiated between 4 species of pines. He set up the first meteorological station in Canada and kept a log 1742-56, as well as sending minerals and preserved specimens of animals to France. But botany, including the medical properties of plants, was his great interest. His history of MAPLE SUGAR was published in the memoirs of the Académie.

BERNARD BOIVIN

**Gauvin, William Henry**, scientist, educator, SCIENCE POLICY planner (b at Paris, France 30 Mar 1913). A graduate of McGill (PhD, 1945), he has continued his association with that university (associate professor of chemical engineering, 1947-62; research associate, 1961). He has been a member of McGill's board of governors, the National Research Council (1964-70) and the Science Council of Canada (1966-70), and frequent

adviser for both the federal and Québec governments. A man of boundless energy and enthusiasm, Gauvreau was consultant and then head of the chemical engineering division, Pulp and Paper Research Inst of Canada (1951-61); and his research work with Noranda Research Centre (1961-83) was a source of inspiration to many. His publications include more than 150 papers on electrochemistry, high-temperature heat and mass transfer, fluid mechanics, and plasma technology. He is a companion of the Order of Canada.

LEO YAFFE

**Gauvreau, Claude**, writer, artist (b at Montréal 19 Aug 1925, d there 9 July 1971). Gauvreau studied at the Collège Sainte-Marie in Montréal but was expelled in his last months of study for having maintained publicly that the idea of hell was absurd. He later earned a BPL from U de M. During this period he published remarkable articles in several student and left-wing papers. Gauvreau was especially influenced by the painter Paul-Émile BORDUAS and from 1942 on followed the activities of the AUTOMATISTES. His main contribution to the group's activities was as a writer, first (by 1943) as a critic and then (by 1944) as a playwright and poet. The performance of *Bien-être* in May 1947 and the 1948 publication of this "dramatic object" in the collective REFUS GLOBAL were among the first signs of modernism in Québec theatre. His "amour fou" for certain great artists, especially actress Muriel Guilbault, is one of the principal themes of his work. Only one of his works was published in its entirety during his lifetime — a collection of poetry entitled *Brochures. Oeuvres créatrices complètes*, which he was preparing for publication, did not appear until 1977; little of his important critical writing and correspondence has appeared.

ANDRÉ G. BOURASSA

**Gauvreau, Pierre**, painter (b at Montréal 23 Aug 1922). In 1941, while a student at Montréal's École des beaux-arts, he discovered French modernism through magazine reproductions. His works made under this influence attracted Paul-Émile BORDUAS, who invited Gauvreau to join the radical young artists and intellectuals who met informally in his studio. Like them, Gauvreau and his poet brother (Claude GAUVREAU) became interested in the surrealist idea of automatism as a way of releasing creativity. In 1943 Gauvreau and others were invited to exhibit with the Contemporary Art Society, which fostered Québec's most adventurous art. Gauvreau remained associated with this circle, and became part of the group known as the AUTOMATISTES, who with others produced the 1948 manifesto REFUS GLOBAL. By the mid-1950s, Gauvreau was using looser, more gestural imagery in his work, and was also working for the new medium of TV, as a writer, director and producer. He stopped painting in the early 1960s and did not start again until 1975. His recent work continues his exploration of gesture and calligraphy.

KAREN WILKIN

**Gavazzi Riots** On 6 June 1853, Alessandro Gavazzi, a recently arrived Italian patriot, gave a speech in Québec City at the Free Presbyterian Church. A riot resulted, the principal participants being Irish Catholics who reacted violently to Gavazzi's anti-Catholic sentiments. Gavazzi attributed the failure of the Italian national movement of 1848-49 to the defection of Pope Pius IX from the cause, and therefore rejected Catholicism. On June 9 he repeated his diatribe at Montréal's Zion Church. In the following riot, the police lost control and Mayor Charles Wilson apparently called out a detachment from the local garrison. The soldiers opened fire, killing 10 and wounding 50. The riots caused by Gavazzi's incendiary preaching in Québec and Montréal illustrate the instances of religious fanaticism that occurred frequently

throughout the 19th century in Europe and America.

PHILIPPE SYLVAIN

Reading: Philippe Sylvain, *Clerc, garibaldien, prédicant des deux mondes* (2 vols, 1962).

**Gayford, Thomas**, equestrian (b at Toronto, Ont 21 Nov 1928). An outstanding international competitor, Gayford was a member of the Canadian jumping team from the late 1940s until the early 1970s; he then became team coach. He first represented Canada at the 1952 Helsinki Olympics in the 3-day event and in 1959 helped win the 3-day event Pan-American Games gold medal. With James DAY and James ELDER he formed the gold-medal show-jumping team at the 1968 Mexico City Olympics. This team went on to win several international events. Gayford also captained the 1971 champion Pan-American Games team. He was 3 times individual high-jumping champion at the NY National Horse Show and jumping champion at the National Horse Show (1972).

BARBARA SCHRODT

**Gélinas, Gratien**, man of the theatre (b at St-Tite, Qué 8 Dec 1909). The multiple activities of Gélinas — actor, director, producer, playwright — laid the base for contemporary Québec theatre. In 1937 Gélinas created the radio character Fridolin — a naïve, resourceful, softhearted but cynical young Montréalais. Fridolin became, in monologue form, the central character in annual theatrical revues, the *Fridolinons* or *Fridolinades* (1938-46), which were a spirited, popular and professional mixture of musical comedy, dance, mime and song, romantic sketches, satires and scenes of contemporary mores and trends. *Les Fridolinades* did not begin to appear in written form until 1980. Besides being a commentary on the social, political and cultural scene, they were a revue of theatrical styles and genres, from burlesque to melodrama, from the radio series to official speeches.

*Tit-Coq*, created in 1948, grew out of Fridolin. The drama of the bastard who did not want to leave bastards behind him, the unemployed conscript, the soldier sent to England who never really came home, contrasted in the play with vivid, moving tableaux of traditional family life. *Tit-Coq* triumphed in Canada (though it failed on Broadway) and inspired other playwrights. It dominated Gélinas's life for several years — revivals, tours, translations, films — but he worked briefly for TV, appeared in plays

Gratien Gélinas's puppet character Fridolin, a soft-hearted but cynical young Montréalais, was the central character in the annual revue *Fridolinons*; 1945 photo (courtesy Public Archives of Canada/PA-122724/NFB/Ronny Jacques).

at the STRATFORD FESTIVAL and in 1957 founded La Comédie canadienne, which he directed until 1972. Gélinas's second play, *Bousille et les justes* (1959), is stronger and tougher than *Tit-Coq*. Another orphan, Bousille, is servant and scapegoat to a hypocritical and evil family of entrepreneurs, typical representatives of the class that rose to prominence during the Maurice DUPLESSIS regime. *Hier, les enfants dansaient* (1966) is a more conventional study of family tensions arising from Québec/Ottawa political tensions. Gélinas was chairman of the CANADIAN FILM DEVELOPMENT CORPORATION 1969-78.

Translator-adaptor for George RYGA (*Rita Joe*, 1969), a remarkable film director of his own shows from the 1940s on, and a born writer for and about the theatre, Gélinas worked within a popular cultural tradition and transformed it.

LAURENT MAILHOT

**Gellman, Steven**, composer, pianist (b at Toronto 16 Sept 1947). After early studies with Samuel Dolin in Toronto, he attracted attention in 1964 as soloist in his piano concerto, with the CBC Symphony Orchestra, and as first Canadian recipient of a BMI Award for student composers. Further studies were with Berio, Persichetti and Sessions at the Juilliard School (1965-68), Milhaud at Aspen, Colo (1965-66), and Messiaen at the Conservatoire de Paris (1973-76). Since 1976 he has taught at the U of Ottawa. Gellman's music is one of evocative, colourful sonorities, sometimes in an oriental-inspired contemplative mood, "in praise of the transcendental." Among his works are commissions from the Stratford Music Festival (*Mythos II*, 1968), CBC (*Symphony in Two Movements*, 1971; *Symphony II*, 1972; *Chori*, 1974), Hamilton Philharmonic (*Odyssey*, 1971; *The Bride's Reception*, 1983), Besançon Festival (*Deux tapisseries*, 1978), McGill U (*Trikaya*, 1981) and Toronto Symphony (*Awakening*, 1982).

PATRICK CARDY

**Gellner, John**, author, journalist (b at Trieste, Italy 18 May 1907). Gellner graduated from Masaryk U in Brno, Czech, where he practised law until 1939. He served in the RCAF from 1940 until he retired with the rank of wing commander in 1958 to become a free-lance journalist. The bitter memory of WWII turned Gellner to the study of history and international power relationships and to the belief that only strength had ever preserved nations from war. He was an influential force behind Liberal defence policy in the early 1960s. Among his publications are *The Czechs and Slovaks in Canada* (1968), *Canada in NATO* (1970) and *Bayonets in the Streets* (1974), along with hundreds of articles on defence and international relations. He was a professor of political science at York, 1972-82 and editor of the *Canadian Defence Quarterly* from 1972.

NORMAN HILLMER

**Gemstone**, MINERAL, rock or organic material used for personal adornment or for decorative purposes. A gem is the cut and polished finished product. Most gemstones are minerals: about 100 of the nearly 3000 mineral species known have gem varieties, but only about 25 are commonly marketed. The essential attributes of gemstones are beauty, derived from colour, brilliance, pattern, texture or light-reflecting qualities; durability, ie, sufficient hardness to resist abrasion, breakage or decomposition; and rarity, a quality that enhances their desirability and value.

Canada's most important gemstone, nephrite jade, was used extensively in British Columbia's NORTHWEST COAST as early as 3000 years ago. The INUIT of Ellesmere I, 500-700 years ago, chipped, shaped and drilled nodules of amber to form round and oval beads. They selected the clearer, gem-grade material, believed to have weathered from Tertiary coal beds (2.5-65 million years old) along the shore of Hazen Lk, where amber

is still found today. They also fashioned ivory into beads and artifacts. Ivory was used for tools earlier (7500 years ago) by the Maritime Archaic peoples in coastal Labrador. The first gemstone exported from Canada is believed to be amethyst from NS. Crystals were presented to Henri IV of France by Sieur de MONTS when he was governor of Acadia, and one became part of the French crown jewels.

Modern use of Canada's gemstones began in the 19th century. As geological explorations disclosed gemstone occurrences, amateur lapidaries cut or carved and then polished the rough material, releasing its beauty and transforming it for gem or ornamental use. While lacking deposits of traditional gemstones (eg, diamond, ruby, emerald, sapphire), Canada can claim a varied assortment of lesser known but appealing gemstones. Their intrinsic value is relatively low but, in the hands of an expert artisan or creative designer-jeweller, their inherent beauty can be captured and their value enhanced.

Extraction of Canada's gemstones is both hobby oriented and a commercial enterprise. The amateur lapidary, individually or in lapidary club excursions, selects raw materials from outcropping rocks or from old pits and mines (see ROCK AND MINERAL COLLECTING). In some cases, as in the Cassiar asbestos mine in BC, the Jeffrey asbestos mine in Asbestos, Qué, and the Geco base-metal mine in Manitouwadge, Ont, interested miners or geologists rescued the gemstones (nephrite jade, hessonite garnet and iolite, respectively) from large-scale mining operations. From Yukon placer operations, the larger gold nuggets are set aside for use in JEWELLERY.

Commercial mining solely for gem material is small scale, often a one-person operation, and sporadic, responding to a fluctuating demand. The largest and most important commercial operations are for nephrite jade recovered from alluvial boulders and bedrock deposits. Production in recent years came from the Mt Sidney Williams, Mt Ogden, Cry Lk and Dease Lk areas of BC and from the Frances Lk area in the YT. Most of the jade was exported to cutting centres in the Far East. The 1981 total BC production was 59 208 kg valued at \$133 000, a drop from the 1978 all-time high of 489 000 kg valued at \$1.42 million, which reflects a depressed world demand. Canada is the world's leading producer of nephrite jade. Smaller commercial operations are conducted intermittently for amethyst near Thunder Bay; sodalite and rose quartz near Bancroft, Ont; labradorite on Tabor, Lab; amazonite (microcline) near Eganville, Ont, and Lac St-Jean, Qué; and rhodonite at Saltspring I, BC. The output is exported to suppliers in the US and to cutting centres in the Orient and Europe. A small proportion is distributed domestically to amateur lapidaries and to some of the 200-odd mineral/lapidary dealers in Canada. The exported material often returns to suppliers and retailers as unmounted cut stones and beads, jewellery or ornamental objects, their origin recognized only by geologists or connoisseurs of Canadian gemstones. One gemstone, ammolite, from Lethbridge, Alta, is an exception in that it is extracted and processed into jewellery-ready stones in an integrated operation. Canada's newest gemstone, it was introduced in the late 1970s and is derived from the iridescent shell of the Cretaceous (64-145-million-year-old) ammonite FOSSIL, *Cephalopoda ammonioidea*. The finished stone, an opallike mosaic of brilliant colours, is sold mainly to manufacturers and jewellers in Canada and the US. It is also known by the trade names "calcentine" and "korite."

Domestic use of commercial gemstone production is by hobbyists or custom lapidaries and designer-jewellers. Techniques used for cutting, shaping and polishing the rough material are essentially the same as those in use the world over for about 500 years. Transparent gemstones

Ammolite from Lethbridge, Alta; cabochon-cut stone and part of ammonite fossil (courtesy Geological Survey of Canada).

Two ammonite stones from Lethbridge, Alta, cut in free-form style (courtesy Geological Survey of Canada).

are faceted, ie, cut with flat faces (facets) as in a diamond; translucent and opaque material is cut in the cabochon style, with domed top and flat base. Nongem-grade material is carved into sculptures and ornaments (see INUIT ART).

Noncommercial extraction is by amateur lapidaries who process their own material. These gemstones are regarded as collectors' stones. The most common and popular are the quartz gemstones, agate and jasper, from localities in BC, Alta, Man, the Lk Superior region, Gaspé and the Bay of Fundy; amethyst from NS; and petrified wood from BC and Alta. Less common collectors' gemstones include Alberta amber, British Columbia idocrase, Ontario feldspars (perthite and the moonstonelike peristerite), Québec scapolite, Newfoundland xonolite and ivory, and soapstone and lapis lazuli from the territories. These collectors' stones are generally seen as unmounted cut stones, set in jewellery or as carvings at craft shows or gem and mineral shows staged annually by some of the 125 lapidary and mineral clubs in Canada. Jewellery and sculptures fashioned by native peoples are often sold through co-operatives. Canada's gemstone industry is modest in terms of production. It does, however, support domestic lapidary interests and a tourist industry, most of the deposits being open to visitors, both Canadian and foreign.

ANN P. SABINA

**Genealogy** is the study of family history, and usually involves the preparation of a pedigree (family "tree") and an accompanying narrative. Traditionally, genealogy and HERALDRY have been the preserve of the educated, the leisured and the high-born, but since the 1960s there has been a phenomenal expansion of the hobby. Many people believe that Alex Haley's popular book *Roots* (1976), which was made into a TV drama, sparked the explosion of interest; however, Canadian genealogical pioneers such as Cyprien Tanguay (1819-1902), Edward Marion Chadwick (1840-1921), Placide Gaudet (1850-1930), Pierre-Georges Roy (1870-1953), and Wil-

liam D. Reid (1905-69) were busy compiling studies of our forebears long before the pursuit became popular. Today, increasing numbers of Canadians have the spare time and the means to embark on this personal journey into the past.

A genealogical study begins with the researcher recording everything he knows about his immediate family. This information can be supplemented by oral tradition from elderly relatives. Family papers, such as letters, deeds and diaries, can help verify these recollections, as can old photographs. When such sources are exhausted, the researcher must turn to the public holdings of archives, libraries, government agencies and other institutions. These repositories contain a surprising wealth of data in church registers, newspapers, cemetery transcriptions, censuses, assessment rolls, wills, historical journals and monographs, passenger lists, petitions, maps and atlases, vital statistics, naturalization papers, Indian land claims, etc. Technological advances in the collection, preservation and reproduction of documents have made widely dispersed records increasingly accessible to the researcher.

Guidance for the novice is available in numerous genealogical handbooks, journals and newsletters. An excellent beginner's manual is *Tracing Your Ancestors in Canada* (8th ed, 1984), available free from the Public Archives of Canada. Each province has at least one genealogical society. These organizations offer publications, lectures, workshops and conferences on finding one's "roots." More specialized family, clan, ethnic and historical associations can also sometimes furnish useful information. For the reluctant researcher, there is always the option of commissioning a professional genealogist.

At some point the amateur genealogist may need to hire an expert in Canada or abroad, to overcome a particular difficulty (eg, a search of records in an unfamiliar language), but most family historians find it more satisfying to discover their lineage firsthand. Research need not involve costly commissions and extensive travel. Local public libraries can often borrow required books and microfilms from other libraries and archives. Additional resources can be found in university libraries and branch libraries of the Mormon Church; at the latter one can examine microfilmed records from the world's largest genealogical collection in Salt Lake City, Utah.

After the gathering of information, it is important to preserve the findings for posterity. Ideally a genealogy should include not only pedigree charts but also a documented, written history of the family. Some genealogists add illustrations and others even publish their work. However modest the findings or the format may be, it is worthwhile to distribute copies to relatives, libraries and archives, so that fellow researchers may benefit from the findings and reciprocate in kind.

Genealogy is an absorbing, lifelong pastime. Every search, every family has its own story. Although detective skills and patience are often tested, the curious and imaginative genealogist is seldom disappointed. Along the way each family historian acquires a personal link with the past and a greater sense of self-identity.

JOHN D. BLACKWELL AND LAURIE C.C. STANLEY

**General Motors of Canada Limited**, with headquarters in OSHAWA, Ont, is a major manufacturer and distributor of cars and trucks. It was formed in 1918 by the merger of the McLaughlin Motor Company, Ltd, and the Chevrolet Motor Company of Canada Ltd, and was incorporated as a wholly owned subsidiary of the American-owned General Motors Corporation. By 1921 the company was making Buicks, Oldsmobiles and Oaklands. Since then, GM has grown through various acquisitions and expansions. From 1942 until the end of WWII civilian automobile production was suspended so that the company could manufacture tanks, machine guns and other military equipment. In 1982, 77% of the company's vehicles sold in Canada were manufactured here, and there were 941 GM dealers across the country. GM had sales or operating revenue in 1983 of \$13.8 billion (ranking 1st in Canada), assets of \$3.0 billion (ranking 27th) and 43 410 employees. General Motors Corporation of Detroit holds 100% of the shares.

DEBORAH C. SAWYER

**Genereux, George Patrick**, trapshooter, physician (b at Saskatoon, Sask 1 Mar 1935). At 13 Genereux claimed Midwestern International handicap honours, followed by 3 successive Manitoba-Saskatchewan junior titles. He also won the N American junior crown at Vandalia, Ohio, and tied for 2nd in world championship competition at Oslo. This tall 17-year-old with cool nerves and a keen eye reached the pinnacle of his shooting career in Helsinki in 1952 when he emerged with an Olympic gold medal. He was recognized as Canada's male athlete of that year. In 1960 he received his medical degree from McGill.

BOB FERGUSON

**Genetic Diseases** are those resulting from chromosome abnormalities or mutant genes showing a specific pattern of inheritance. In addition, genetic factors are involved in susceptibility to some "nongenetic" DISEASES. As progress has been made in eliminating infectious diseases, genetic disease has come to represent an increasingly larger proportion of all disease. Genetic diseases among animals, particularly among domestic species, have sometimes provided useful information about human counterpart disorders. In Canada the earliest studies of human genetic disease were carried out by Norma Ford Walker (Toronto), Madge Macklin (London, Ont) and F. Clarke FRASER (Montréal). Recent advances in the study of DNA, the chemical basis of genes, will increase the possibility for understanding and controlling human genetic disease. A complete knowledge of disease at the gene level may make possible the replacement of faulty genes through GENETIC ENGINEERING.

**Genetic Engineering** is the introduction of new genetic material into cells to stimulate the synthesis of new proteins and hence altered cell characteristics. The foreign genetic material can range from a single gene, which produces only one new protein, to a whole cell nucleus, which can redirect the cell along an entirely new path of development. The development of genetic engineering techniques was made possible by an increasingly sophisticated understanding of the BIOCHEMISTRY and mode of transmission of genes, the basic units of heredity.

Startling discoveries in genetics are leading to radical revisions of theories about gene structure and function. Recent discoveries include "overlapping genes," which code for more than one protein; "jumping genes," which are not fixed at any specific point on the chromosome, and which inactivate any gene into which they "jump"; "pseudo genes," segments of DNA similar to functional genes, but which do not produce proteins; and "oncogenes," cancer genes. Studies of bladder cancer indicate that an "oncogene" differs from a naturally occurring gene

by the replacement of a single specific nucleotide in the DNA by another. The result is an alteration in protein produced in the cancer cell: in the bladder all the normal glycine is changed to a valine. The significance of this simple change is not yet clear.

One of the earliest applications of genetic engineering was the introduction into bacteria of genes coding for animal proteins such as INSULIN, growth hormone and interferon. When these genes contain regulatory signals recognized by the bacteria, the bacterial cells make large quantities of the foreign proteins. Genetically engineered human insulin can be used in diabetic patients who are allergic to the animal insulins normally used. The gene specifying human insulin has been synthesized by scientists at the NATIONAL RESEARCH COUNCIL OF CANADA and propagated in the bacterium *E. coli*. Animal growth hormones are ineffective in humans, and the supply of human hormone obtained from cadavers was insufficient to treat all patients with growth hormone deficiency; hence the availability of genetically engineered human growth hormone is very important. Interferon, a protein being tested for its antiviral and antitumour properties, is very expensive when isolated from animal cells grown in culture. Genetically engineered interferon will be much less expensive and will be available in large quantities.

In Canada, genetic engineering research is taking place in laboratories of universities, federal and provincial research organizations and industries. For example, in the industrial sector, RDT research for medical applications is occurring at Ayerst Laboratories, Montréal, CONAUGHT LABORATORIES, Toronto, and INSTITUT ARMAND-FRAPPIER, Laval-des-Rapides, Qué. Inco is applying RDT research to mining and metallurgy, and Labatt's Breweries is using recombinant techniques in yeast genetics experiments. The Veterinary Infectious Disease Organization, based at University of Saskatchewan, Saskatoon, is using genetic engineering technology for production of new vaccines for livestock diseases. See MICROBIOLOGY.

**Genetics** is that subdiscipline of BIOLOGY devoted to the study of heredity, the phenomenon by which organisms pass on their characteristics to their offspring. Although humankind has always shown an interest in heredity, the practice of the science is usually considered to have begun in 1865 with Gregor Mendel, an Austrian monk. Through a study of pea plants, Mendel worked out the simple patterns of inheritance that apply to most inheritable characteristics of living things (eg, height, shape, colour, hairiness, smell, behaviour, disease resistance). Mendel formulated the concept of the gene to define the fundamental units of heredity that determine such properties. Today the molecular structure and function of genes is quite well understood.

Modern genetics may be conveniently divided into 3 areas of study: transmission genetics, population genetics and molecular genetics. Transmission genetics is concerned with identifying genes affecting a particular characteristic and the patterns by which these genes are transmitted from generation to generation, within single organisms or cells. Population genetics analyses the pattern of distribution of such genes in populations of organisms. Molecular genetics focuses on the structure and function of the genetic units, ie, the chemical composition of genes and their expression in enzymes and proteins, the functional components of cells.

**Transmission Genetics** The total genetic complement of a cell or organism is defined as the genotype. Its physiological expression is called its phenotype. Genes can be identified only if some variation is visible in the phenotype. Phenotypic variation can be discontinuous (eg, yel-

low versus green seeds) or may occur as a range (eg, very short to very tall). Discontinuous variation can usually be explained by a simple (often single) gene difference. Continuous variation usually involves a larger number of interacting genes (polygenes); the greater the number of genes involved, the greater the possible range of variation. Mendel's classic experiments dealt with the inheritance of discontinuous traits.

**Molecular Genetics** Genes are organized into structures called chromosomes (humans have 2 sets of 23 chromosomes, each parent contributing a set, for a total of 46). Each chromosome is composed of a 50 mm length of a threadlike chemical called DNA (deoxyribonucleic acid); however, as each chromosome is less than 0.005 mm long, the DNA is very efficiently packed through coiling and supercoiling. A gene is simply a segment on the thread with a specific function. It embodies a coded message, in the form of a sequence of "building blocks" (nucleotides), that dictates the sequence of amino acids produced to make up a specific protein molecule. The proteins control chemical reactions taking place in cells, and are themselves important structural components of cells.

Prokaryotes, ie, organisms composed of a single cell that lacks a membrane-bound nucleus (eg, bacteria), carry a single chromosome that undergoes replication during one cycle of cell duplication. Both cell and chromosome divide (by binary fission) to yield 2 daughter cells, each of which carries a daughter chromosome. Eukaryotic organisms, ie, those composed of one or more cells having membrane-bound nuclei (all "higher" organisms), contain 2 kinds of cells with different genetic potential. Somatic (or body) cells carry 2 copies of each of their chromosomes and are called diploid cells. Gametes or germ cells (eg, sperm, egg) carry one copy only of the gene complement and are haploid. In eukaryotes, 2 haploid germ cells unite at fertilization. The resulting embryo goes on to grow, differentiate and produce the progeny cells or organism. Cells that derive from division of prokaryotic cells or somatic cells will be exact genetic copies of their parents. In contrast, the union of 2 haploid cells, deriving from 2 cells with different chromosomal complements, results in genetic diversity in progeny.

Living things can duplicate their genetic material exactly, an ability that results from the specificity of the DNA sequence. Infrequently, this DNA undergoes a change, termed a mutation, that alters both genotype and phenotype and results in genetic variation. Mutations without obvious cause are referred to as spontaneous mutations; induced mutations result from damage to genes caused by chemicals, radiation, viral infection and other environmental factors. Mutations are the material on which the environment acts to produce evolution; thus, a mutation that gives an organism an advantage may permit it to survive longer and produce more offspring which, in turn, contain the mutated gene. Over time, an entire population may change. Of particular concern to human populations is environmental mutagenesis, the development of mutations caused by environmental changes. Increasing levels of chemicals and radiation in the environment may cause mutations in germ cells that may, over time, result in genetic disease, or mutations in somatic cells resulting in CANCER.

#### Canadian Contributions

Genetics has had a major impact on medicine, AGRICULTURE and FORESTRY. It is now recognized that health and illness are strongly influenced by genetics; in fact, many diseases are known to be genetic in origin, resulting from a mutation. Well-known examples of such genetic diseases are hemophilia, sickle-cell anaemia and Down's syndrome.

Important work on genetic diseases has been

or is being done by F. Clarke FRASER (McGill University), who worked on the genetics of abnormal development in mammals; Howard NEWCOMBE (Atomic Energy of Canada, Chalk River, Ont), who studied bacterial population genetics, mutagenesis, radiation genetics and human population genetics; Charles SCRIVER (McGill) for contributions on human genetic diseases. The recent establishment of somatic cell genetics in Canada owes much to L. SIMONOVITCH (U of T).

Genetics has been applied to plant breeding and ANIMAL BREEDING. Canadian researchers have produced outstanding examples of improvement by genetic manipulation, the earliest being Marquis winter WHEAT, produced early in the 20th century by Charles E. SAUNDERS to withstand the severe prairie climate. More recently, Canadian geneticists have produced strains of wheat resistant to rusts (destructive parasitic FUNGI). Triticale, a new CEREAL CROP, was developed by Leonard H. Shebeski and Edward N. Larter at University of Manitoba. The development of CANOLA, ie, improved varieties of rape plants for production of a VEGETABLE OIL, was undertaken by research groups headed by R.K. DOWNEY (Agriculture Canada, Saskatoon) and Baldur STEFANSSON (University of Manitoba).

In 1944 Canadian biochemist Oswald Avery demonstrated that DNA is the hereditary material of the cell, a discovery that made possible the clarification of DNA structure by James Watson and Francis Crick in 1953. Other Canadian geneticists whose work has made major contributions to the international body of genetic knowledge include Howard FREDEEN (Agriculture Canada RESEARCH STATION, Lacombe, Alta), who developed the industrially important Lacombe hog; Leonard H. Butler (U of T), who studied tomato genetics; Clayton O. PERSON (University of British Columbia), for his work on the genetic basis for host-parasite relationships; R.C. Von Borstel (University of Alberta), for his work on the genetics of YEAST. David T. SUZUKI (UBC) achieved worldwide recognition for his work on the genetics of the fruit fly (*Drosophila melanogaster*).

The most recent revolution in biological science has come as a result of the evolution of recombinant DNA technology. These biochemical techniques permit genes to be removed from their original organism and spliced into the chromosomes of simple organisms (eg, bacteria, fungi); thus, they are far more amenable to study. Furthermore the cloned genes can be put to use to make their normal gene product in a new host that can be grown in large batches. Already such GENETIC ENGINEERING has been applied to development of new strains of bacteria with major importance in industry, agriculture and medicine (eg, useful in production of insulin and interferon for the treatment of viral-induced diseases, oil-eating bacteria and over-producers of protein for worldwide food distribution).

#### Education and Societies in Canada

Professional training for a career as a geneticist or medical geneticist can be obtained in universities, agricultural colleges or medical schools. At the undergraduate level students obtain a BSc degree in biology, genetics, BIOCHEMISTRY or MOLECULAR BIOLOGY. Graduate studies lead to MSc or PhD degrees. The MSc qualifies a student for work in a research facility and to teach in a subordinate position; the PhD permits work as an independent genetic researcher in a university department or other research institution. Physicians may take specialist genetics training through the Canadian College of Medical Geneticists (headquartered at the Alberta Children's Hospital, Calgary), the world's first such institution. A candidate desiring to pursue a career in clinical genetics (eg, genetic counselling) must pass the examination of the CCMG.

In Canada, research is proceeding in all areas of modern genetics. Most work is taking place at the universities and is funded mainly through federal grants. The federal government also sponsors research directly through its own administrative structure (eg, the many research branches of Agriculture Canada). Industry, especially companies producing agricultural or medical products, also do some genetics research. Medical genetics studies are undertaken at universities and hospitals. In this area, the BC Health Surveillance Registry has compiled a complete record of all birth defects in the province since 1952, a record almost unique in the world. These data permit calculation of risk estimates for various genetic conditions and of population trends in genetic disease.

Geneticists make a major contribution to Canadian life in a variety of professional situations, eg, as research scientists at university, government or industrial laboratories and as genetics counsellors in hospitals. The Genetics Society of Canada, headquartered in Ottawa, is the professional association of Canadian geneticists. It holds annual meetings and publishes a journal, the *Canadian Journal of Genetics and Cytology*, with international distribution.

A.J.F. GRIFFITHS

**Gentian**, common name for several PLANTS of family Gentianaceae, primarily in genus *Gentiana*. The genus contains about 400 species of herbaceous perennials, some weedy, others with large, attractive, trumpet-shaped, usually blue flowers. Found chiefly in northern temperate and arctic zones, the genus is best developed in the mountains of Europe and Asia, where many excellent garden plants originated. At least 16 species occur in Canada, primarily in damp soils. Most are found W of Ontario; some are arctic; none have been reported from PEI or NS. The root of European yellow gentian (*G. lutea*) was used extensively as a tonic to promote digestion and aid appetite; closed gentian (*G. andrewsii*), native to eastern Canada, is said to have identical properties. N American Indians and European settlers used any species for a bitter tonic that was prepared by pouring boiling water over leafy tops and roots. Settlers improved on the infusion by adding a generous quantity of brandy.

GILLIAN FORD

**Geochemistry** is the study of chemical processes in the planet Earth, including freshwater bodies, oceans and atmosphere. It is closely allied to cosmochemistry, which studies other planets, stars and extraterrestrial matter. Although the focus is on chemical processes, geochemists also examine the abundance and distribution of chemical elements and their isotopes. Geochemistry began in the late 18th and early 19th centuries with chemical studies of natural materials. The word was first used in 1838 by the Swiss chemist C.F. Schönbein. The early history of geochemistry, rooted in mineralogy and inorganic CHEMISTRY, consists largely of the discovery of the elements and the development of ideas culminating in the periodic table, which arranges elements according to their properties. Most research was based on studies of MINERALS, but knowledge was accumulating about the elemental composition of natural waters, ores, salt deposits, fumaroles, gases and living organisms. The first statements about the principles of distribution of the elements and about the Earth's chemical processes appear in the writings of Russian scientist V.I. Vernadsky, F.W. Clarke, an American, and Norwegian-born V.M. Goldschmidt.

In Canada, many early geologists wrote on chemical aspects of Canadian GEOLOGY, but T. Sterry HUNT of the GEOLOGICAL SURVEY OF CANADA (GSC) was probably the first whose interests were geochemical in the modern sense. Although primarily a petrologist, F.D. ADAMS was

important in the development of Canadian geochemistry. As early as 1921, H.V. Ellsworth carried out important work for the GSC on the distribution of rare earths and radioactive elements. More recently, H. Lundberg, H.V. Warren and A.R. Barringer have done much to develop applications of geochemical principles to mineral exploration. H.G. THODE has figured prominently in studies of stable-isotope chemistry in geochemical problems concerning ore and petroleum deposits and in cosmological research.

**Geoffrion, Joseph André Bernard**, "Boom Boom," hockey player (b at Montréal 16 Feb 1931). He joined MONTREAL CANADIENS in 1950, playing with them 14 years. His perseverance, thundering shot and spirited play made him one of the highest scorers in hockey history. He won the CALDER TROPHY (1951-52), ART ROSS TROPHY (1954-55, 1960-61) and the HART TROPHY (1960-61). In 1961 he became the second player (after Maurice RICHARD) to score 50 goals in a season. He retired briefly then joined New York Rangers 1966-68. He scored 393 goals, 429 assists in regular season play, and 58 goals, 60 assists in playoffs.

JAMES MARSH

**Geographical Information Systems (GIS)** are systems designed to store and manipulate data relating to locations on the Earth's surface. Common applications are land inventories, the census, urban planning, and so on, where the data banks contain locational references such as a county, or the actual boundaries of land parcels. Equivalent terms for such information are "spatial" and "geo-coded" data. Because of the need to manipulate extremely large quantities of data, most modern GIS now employ computer technology.

Canada has been a pioneer in the development of GIS. The Canada Geographic Information System (CGIS), initiated in 1963 by the Agriculture Rehabilitation and Development Agency, was the first operational land resource GIS. Now operating under Environment Canada, CGIS holds the world's largest land resource data bank. Another early system was the Geographically Referenced Data Retrieval System of Statistics Canada, started around 1965. Many of the concepts and methods developed for these systems are now routinely incorporated into new systems. Large GIS are still predominantly operated by federal and provincial agencies such as the CGIS and the Canada Soil Information System of Agriculture Canada, but there is growing application of GIS in urban planning, forest and petroleum industries, utilities, transportation systems, etc. It is expected that usage of the GIS will continued to expand.

THOMAS K. POIKER AND IAN K. CRAIN

**Geography** A core of geography deals with the description and analysis of physical environmental phenomena and their interrelationships, and with distribution patterns of human POPULATIONS and their activities as they affect the Earth. As history interprets temporal sequences, so geography interprets spatial associations. Geography is broken into subfields with varying emphases. PHYSICAL GEOGRAPHY is less directly concerned with people than is human geography. It describes and analyses the distribution and process relationships among elements in the physical environment, eg, landforms, CLIMATE, vegetation, SOILS and DRAINAGE. Some of its subfields are GEOMORPHOLOGY, CLIMATOLOGY, HYDROLOGY and BIOGEOGRAPHY. Human geography places more emphasis on people and is concerned with the reasons for the location of human activities. Some of its subfields are cultural, historical, economic, political and urban geography. Geography serves as a link between the physical and SOCIAL SCIENCES. The discipline is taught "topically," ie, as subfields (geomorphology, economic geography, etc) and "regionally,"

ie, by studying distribution patterns within defined areas.

Geography is one of the oldest studies, originating with Greek scholars 2000 years ago [*geo*, "earth"; *graphos*, "to write"]. The concepts of modern geography were developed in Germany in the last half of the 19th century, and the subject was well known in France and Britain early in the 20th century. Geography was mainly an academic discipline in most countries until about 1940. The application of knowledge about the world's physical environments and resources became significant during WWII, and applied geography became a career possibility after 1945. Much of the philosophy and methods of modern geography came to Canada through Canadians trained in geography departments in American universities during the 1950s and 1960s. Other geographers came from Britain and France.

In 1923 UBC became the first Canadian university to have a partial geography department, when a Dept of Geology and Geography was established. Courses were taught by professors trained in geology. The first academic geographers came from France in the mid-1920s and lectured at Université de Montréal. The first full Dept of Geography was established at University of Toronto in 1935, headed by T. Griffith TAYLOR, a British geographer who had lectured in Australia. Most large Canadian universities established geography departments during the 1950s; more than 40 had geography departments or programs in the early 1980s.

Although the term "geographer" was used by provincial and federal governments before 1940, it usually referred to a person engaged in map production (see CARTOGRAPHY) and often trained in drafting or SURVEYING. The federal government engaged its first professional geographer, J. Lewis Robinson, in 1943, and geographers were carrying on studies in RESOURCE USE and planning in most provincial governments by the 1950s. The Canadian Assn of Geographers was formed in 1951 when about 50 geographers, mainly from Ontario and Québec, met at McGill in Montréal. The first president was Donald PUTNAM of U of T. Members have an academic degree or professional experience in geography. The association publishes a quarterly periodical, *The Canadian Geographer*. Geographical societies which are not professional organizations but are open to the public operate in some parts of Canada. The oldest is the Québec Geographical Soc (founded 1877); the largest, the Royal Canadian Geographical Soc, which publishes the popular *Canadian Geographic*.

Geographers are employed in diverse occupations. Most students at the bachelor level do not become professional geographers. For many of these, geography is part of a general education which permits them to become involved in matters such as people's use of the natural environment and natural-resource analysis, or to study about people and their activities in cities or in large regions. Many students continue into fields such as planning (environmental, urban, etc), architecture, law, commerce, public administration and especially teaching. By the mid-1970s increasing numbers of geography students were finding employment in business and industry. Others work where their technical skills in the design, preparation and reading of maps are useful, and where knowledge of air and satellite photos, or statistical methods, are required.

During the 1970s Canadian universities granted about 200 master's degrees in geography each year. Most of these geographers became lecturers in community colleges; planners, research scientists and administrators in consulting firms or governments; or applied geographers in business and industry. During the 1970s doctoral degrees in geography were awarded each

year to 25-35 people, most of whom became university professors. J. LEWIS ROBINSON

**Geological Dating** For centuries people have argued about the age of the Earth; only recently has it been possible to come close to achieving reliable estimates. In the 19th century some geologists realized that the vast thicknesses of sedimentary rocks meant that the Earth must be at least hundreds of millions of years old. Charles Darwin reinforced this idea by pointing to the time that must have been required for the evolution of advanced life from primitive forms. On the other hand, the great physicist Lord Kelvin vehemently objected and suggested that the Earth might only be a few tens of millions of years old, based on his calculations of its cooling history. These discussions were rendered obsolete by the discovery of radioactivity in 1896 by the French physicist Henri Becquerel. The existence of radioactivities of various kinds in rocks has enabled earth scientists to determine the age of the Earth, the MOON, meteorites, MOUNTAIN chains and OCEAN basins, and to draw up a reasonably accurate time scale of evolution. It has even been possible to work out a time scale of the reversals of the Earth's magnetic field. This "radiometric" approach has superseded all other techniques for determining absolute ages.

**Radioactive Clock** The vast majority of atoms (each composed of a nucleus surrounded by electrons) are stable. Essentially, they will exist forever. A critical few, however, are unstable. Their nuclei tend to emit particles spontaneously, ie, they are radioactive. Because of this particle emission, the original radioactive parent atom changes its identity, becoming a different, stable daughter atom. This change takes place at a known rate determined by the half-life, ie, the time required for one half of the original number of radioactive atoms to convert to the stable daughter product. The remaining number of radioactive atoms is halved every half-life. Radioactive elements of use in geological dating have relatively long half-lives. A good example is rubidium-87 which changes to strontium-87 at a rate of one-half every 50 billion years. Therefore, a rock can be dated by measuring how much of its original rubidium content has changed into strontium. The other key dating techniques involve uranium-235 transforming to lead-207 at a rate of one-half every 713 million years, uranium-238 becoming lead-206 at one-half every 4.5 billion years, potassium changing to argon (and calcium) at one-half every 1.3 billion years and samarium-147 becoming neodymium-143 at one-half every 1.06 billion years. These radioactive processes present a set of natural clocks which reveal when the rock was formed, or when it was last heated severely. The well-known carbon-14 method involves the conversion of radioactive carbon-14 to stable nitrogen, at a rate of one-half about every 5700 years. It can only be used to date organic matter, and is accurate only for materials 35 000 years old or younger. It is, therefore, of limited use in geological dating (see ARCHAEOLOGY).

Since 1950, radiometric methods have been developed to a very sophisticated level in several countries, including Canada. It has been demonstrated that when rocks which have led an undisturbed history are analysed, all methods reveal the same age. This uniformity demonstrates that the principle is reliable. When disturbed rocks are studied, the different techniques may give different readings and much research has been carried out on how to interpret such results. It often proves possible to date even severely disturbed rocks.

**Age of the Earth** To date the time of formation of a planet 12 640 km in diameter and 72% covered by water is not easy. Only the tiniest fraction of the Earth, the crust, is accessible. Those

rocks available for analysis (ie, the oldest ones) have been heated and squeezed many times in their GEOLOGICAL HISTORY, because for billions of years continents have been drifting over the Earth's surface, colliding and producing mountains and new ocean floors. Two approaches have been developed to circumvent these problems. The first involves sampling as much of the Earth's crust as possible and dating these rocks. The Earth certainly must be older than the oldest terrestrial rocks found. Stephen Moorbath and his colleagues at Oxford have shown that rocks near Godthaab in SW Greenland either formed or were in existence approximately 3.8 billion years ago. These results have been confirmed and agreement has been found among the rubidium-strontium, uranium-lead and samarium-neodymium methods. Rocks of almost this age have also been identified in other localities, including Labrador, Minnesota, Africa and India. Therefore, it is clear that the Earth is over 3.8 billion years old. Many scientists are searching for rocks older than these, and in 1983 Australian scientists claimed to have discovered minute zircon crystals 4.2 billion years old.

The second approach, which is more indirect but gives an answer currently believed correct, involves a comparison of the Earth with meteorites. They have clearly fallen to Earth from outside, often gouging out huge craters such as that called New Québec (61°17' N, 73°41' W). Rubidium-strontium, potassium-argon, uranium-lead and samarium-neodymium dating all show that the meteorites formed about 4.6 billion years ago. But detailed studies of lead isotopes in meteorites and terrestrial rocks strongly indicate that the Earth and meteorites formed at the same time. Therefore, since the meteorites are very accurately dated at 4.6 billion years old, the Earth is also considered to be the same age. Dating of the lunar samples collected by the Apollo missions strongly indicates that the moon is of the same age. If the Earth, the moon and meteorites are all 4.6 billion years old, then so very probably is the whole solar system.

**Age of Canadian Shield** The most ancient rocks of Canada comprise the Canadian Shield (see GEOLOGICAL REGIONS). Many Canadian scientists, and others, have examined these rocks to work out the region's history. The Shield is made up of areas of rocks of distinctive ages. The oldest, found in Saglek Bay and near Hebron Fjord in Labrador, are about 3.6 billion years old. Other massive slabs are dated at 2.9-2.5 billion years, 1.8-1.7 billion years and 1.3-0.9 billion years. Some of these areas represent the roots of what were ancient mountain chains, the upper parts of which were long ago removed by EROSION. Others represent volcanic belts, many of which have never been very deeply buried. Scientists are studying whether these portions of different age and geological history were always close together or were far apart until gathered together by continental drifting and PLATE TECTONICS. Although the igneous rocks of the Shield are very ancient, the formation of igneous rocks has been a continuing process in Canada. The rocks formed by the Aiyansh lava flow in BC are thought to be 90 to 350 years old, confirming legends of the TSIMSHIAN people of Nass R describing volcanic activity.

**Time Scale of Biological Evolution** It seems probable that life has existed on the Earth for well over 3 billion years. FOSSIL bacteria have been tentatively identified in the Fig-Tree Sediments in South Africa. Volcanic rocks associated with these have been dated at 3.5 billion years by the samarium-neodymium method by scientists at Columbia and by the potassium-argon method at University of Toronto. Probably the oldest fossils in Canada (2.5 billion years old) are the stromatolite formations at Steep Rock Lk, Ont. An indisputably biogenic, highly diverse microfossil assemblage is present in the approx-

imately 1.9-billion-year-old Gunflint cherts of southern Ontario. However, the fossil record is well documented only for the last 570 million years, for only during that period did organisms exist with the hard phosphate or calcium-carbonate components which make for good fossil preservation. The final 570 million years of evolution have been divided by paleontologists into 3 eras: Paleozoic (ancient life), Mesozoic (middle life) and Cenozoic (present life). The eras are subdivided into periods. The numerical estimates of the time occupied by these periods were made mostly with the aid of potassium-argon and rubidium-strontium dating of rocks which could be correlated with the time scale. Humans are creatures of only the last few million years. Fossils of apelike, upright-walking, potential human ancestors were found in 1981 in Ethiopia by an international expedition led by Desmond Clark of University of California at Berkeley (see PREHISTORY). A volcanic ash associated with these fossils has been dated at U of T at about 4 million years old, showing that creatures even remotely resembling modern humans have been on the Earth for less than one-tenth of 1% of our planet's history. DEREK YORK *Reading: Derek York, Planet Earth (1976).*

**Geological History** Fundamental to all ordering of events of the Earth's history is the principle of the positional relationships of rock and MINERAL bodies. For example, in any stratified rock sequence, younger rocks overlie older ones. Similarly, stratified SEDIMENTARY ROCKS intruded by formerly molten IGNEOUS ROCKS are clearly older than the igneous rocks. Study of positional relationships allows the geologist to establish a relative sequence of events. Positional relationships underlie all attempts to decipher geological history, and they allowed the development in the 19th century of a relative time scale based on the sequences of fossil assemblages which also provided evidence for the theory of EVOLUTION.

At the end of the 18th century, James Hutton formulated another major contribution to the understanding of the rock record, the principle of uniformitarianism, which states that the same geological processes now operating also acted in the past, producing similar results. This principle underlies the use of modern geological processes, rates and products as guides in interpreting and explaining the rock record. On a broad scale, 3 geological phenomena exhibit systematic changes which are essential to the construction and continued refinement of the geological time scale: the evolution of life, the radioactive decay of unstable isotopes and the paleomagnetic signature of rock and mineral bodies.

Whereas earlier attempts to understand the Earth's history focused on specific kinds of rocks, with crystalline igneous rocks considered oldest and sedimentary rocks progressively younger, the recognition of distinctive FOSSILS within the younger part of the rock record led to rapid progress. Most major divisions of the Phanerozoic [Gk, "visible life"] part of the geological time scale, the last 570 million years, were established in the 19th century, based on their distinctive fossil content. Cambrian, Permian, Triassic and most other names of the Phanerozoic systems were in common use before 1900 to refer to the rocks and time periods in which particular organisms were abundant. Recognition of the geological periods and eras permitted relative dating of rocks to move from local divisions, based on positional relationships, to regional and international dating; however, the time scale remained relative.

Calibration of the 19th-century geological time scale had to await 2 major advances of 20th-century earth science: discovery of natural radioactivity and development of tools to mea-

sure this radioactivity accurately (see GEOLOGICAL DATING). Radiometric dating techniques have permitted calibration of the geological time scale and are essential to subdivision of the vast Precambrian part of the rock record which lacks hard-shelled fossils.

**Geological Eras** About five-sixths of geological time is assigned to the Precambrian, which ended about 570 million years ago. Less is known about it than about the Phanerozoic (the most recent 570 million years) because more of the Phanerozoic is preserved and exposed, and because it contains most of the fossil record. The concept of geological eras came from the Phanerozoic part of the rock record, and the names of its 3 eras — Paleozoic (ancient life), Mesozoic (middle life) and Cenozoic (modern life) — are based on how closely the fossils resemble living forms. Each era had its own most characteristic organisms, and these and others are used to identify Phanerozoic rocks around the world. The hard-shelled arthropods and CORALS of the Paleozoic oceans gave way to the REPTILES of the Mesozoic oceans and, in particular, to the land-dwelling DINOSAURS. These, in turn, were replaced by the more adaptable, warm-blooded MAMMALS of the Cenozoic. Canada has world-famous exposures of Lower and Middle Paleozoic sedimentary rocks in the Rocky Mts (see BURGESS SHALE); of classic, Upper Paleozoic rocks in the high arctic islands; and abundant, widespread Mesozoic and Cenozoic successions in the sedimentary basin of the prairies (see BADLANDS; DINOSAUR HUNTING IN WESTERN CANADA), in the northern arctic islands and on the Continental Shelf off the Atlantic provinces.

The great age of Precambrian rocks and the general lack of fossils precludes fine-scale subdivision of this part of the rock record. Nevertheless, there are major global changes in the nature of these rocks through time. Archean rocks, those older than about 2.4 billion years, commonly consist of belts of volcanic rocks (greenstone belts) surrounded by masses of granitic rock. The Superior Province of the Canadian SHIELD is the largest and among the best-known bodies of exposed Archean rocks in the world. Proterozoic rocks, also abundant in the Shield, are about 570 million to 2.4 billion years old. These rocks begin to have a modern look: large sequences of shallow marine and continental sedimentary rocks can be distinguished, as can mountain belts similar to modern, continental-margin, mountain belts. There is no agreement on whether plate-tectonic processes operated in Archean time, but there is reasonable evidence that some lithospheric plates were established by Proterozoic time. This evidence is provided largely by the strong similarity between the Proterozoic Wopmay Mountain Belt in the Slave Province of the Canadian Shield and modern mountain belts.

Since the 1960s, the advent and acceptance of plate-tectonic concepts has resulted in great interest in detailed reconstruction of the Earth's crust and surface in past geological times. Canadian earth scientists are leaders in this work because of the long emphasis on regional geological studies in Canada and because of the diversity and complexity of the country — with its enormous Precambrian-Shield core, its widespread interior-platform sediments, its continent-bounding mountain belts on east, west and north sides, and its well-developed, continental-margin sedimentary sequences. This work depends fundamentally on continued refinement of subdivisions and methods of dating the rock record, through paleontological studies, radiometric dating, magnetic reversal chronology and other methods. The selection of suitable field localities as standards or references, eg, geological systems (such as the Devonian), is a vital part of this work. Government earth scientists, especially those of the

GEOLOGICAL SURVEY OF CANADA, play a key role in regional geological studies, particularly in remote areas of northern Canada (see also GEOLOGICAL REGIONS; PLATE TECTONICS).

R.W. MACQUEEN

**Geological Regions** Canada consists of 6 geological regions. Five of them are of Phanerozoic age (under 570 million years old) and are arranged roughly concentrically around and partly on the sixth, the Canadian SHIELD (of Precambrian age, over 570 million years old). The Phanerozoic regions, which overlap in age, are the Innuitian Orogen, the Appalachian Orogen, the Interior Platform, the Canadian Cordillera and the continental shelves. Each region has a distinctive architecture and is composed of building blocks of characteristic types and sequences of rocks (tectonic assemblages) that record its development (see also PLATE TECTONICS). Probably the most important developmental events in geological history were the orogenies, periods during which compressive deformation, metamorphism, granitic intrusion and other processes formed MOUNTAIN RANGES (see GEOLOGICAL DATING).

#### Canadian Shield

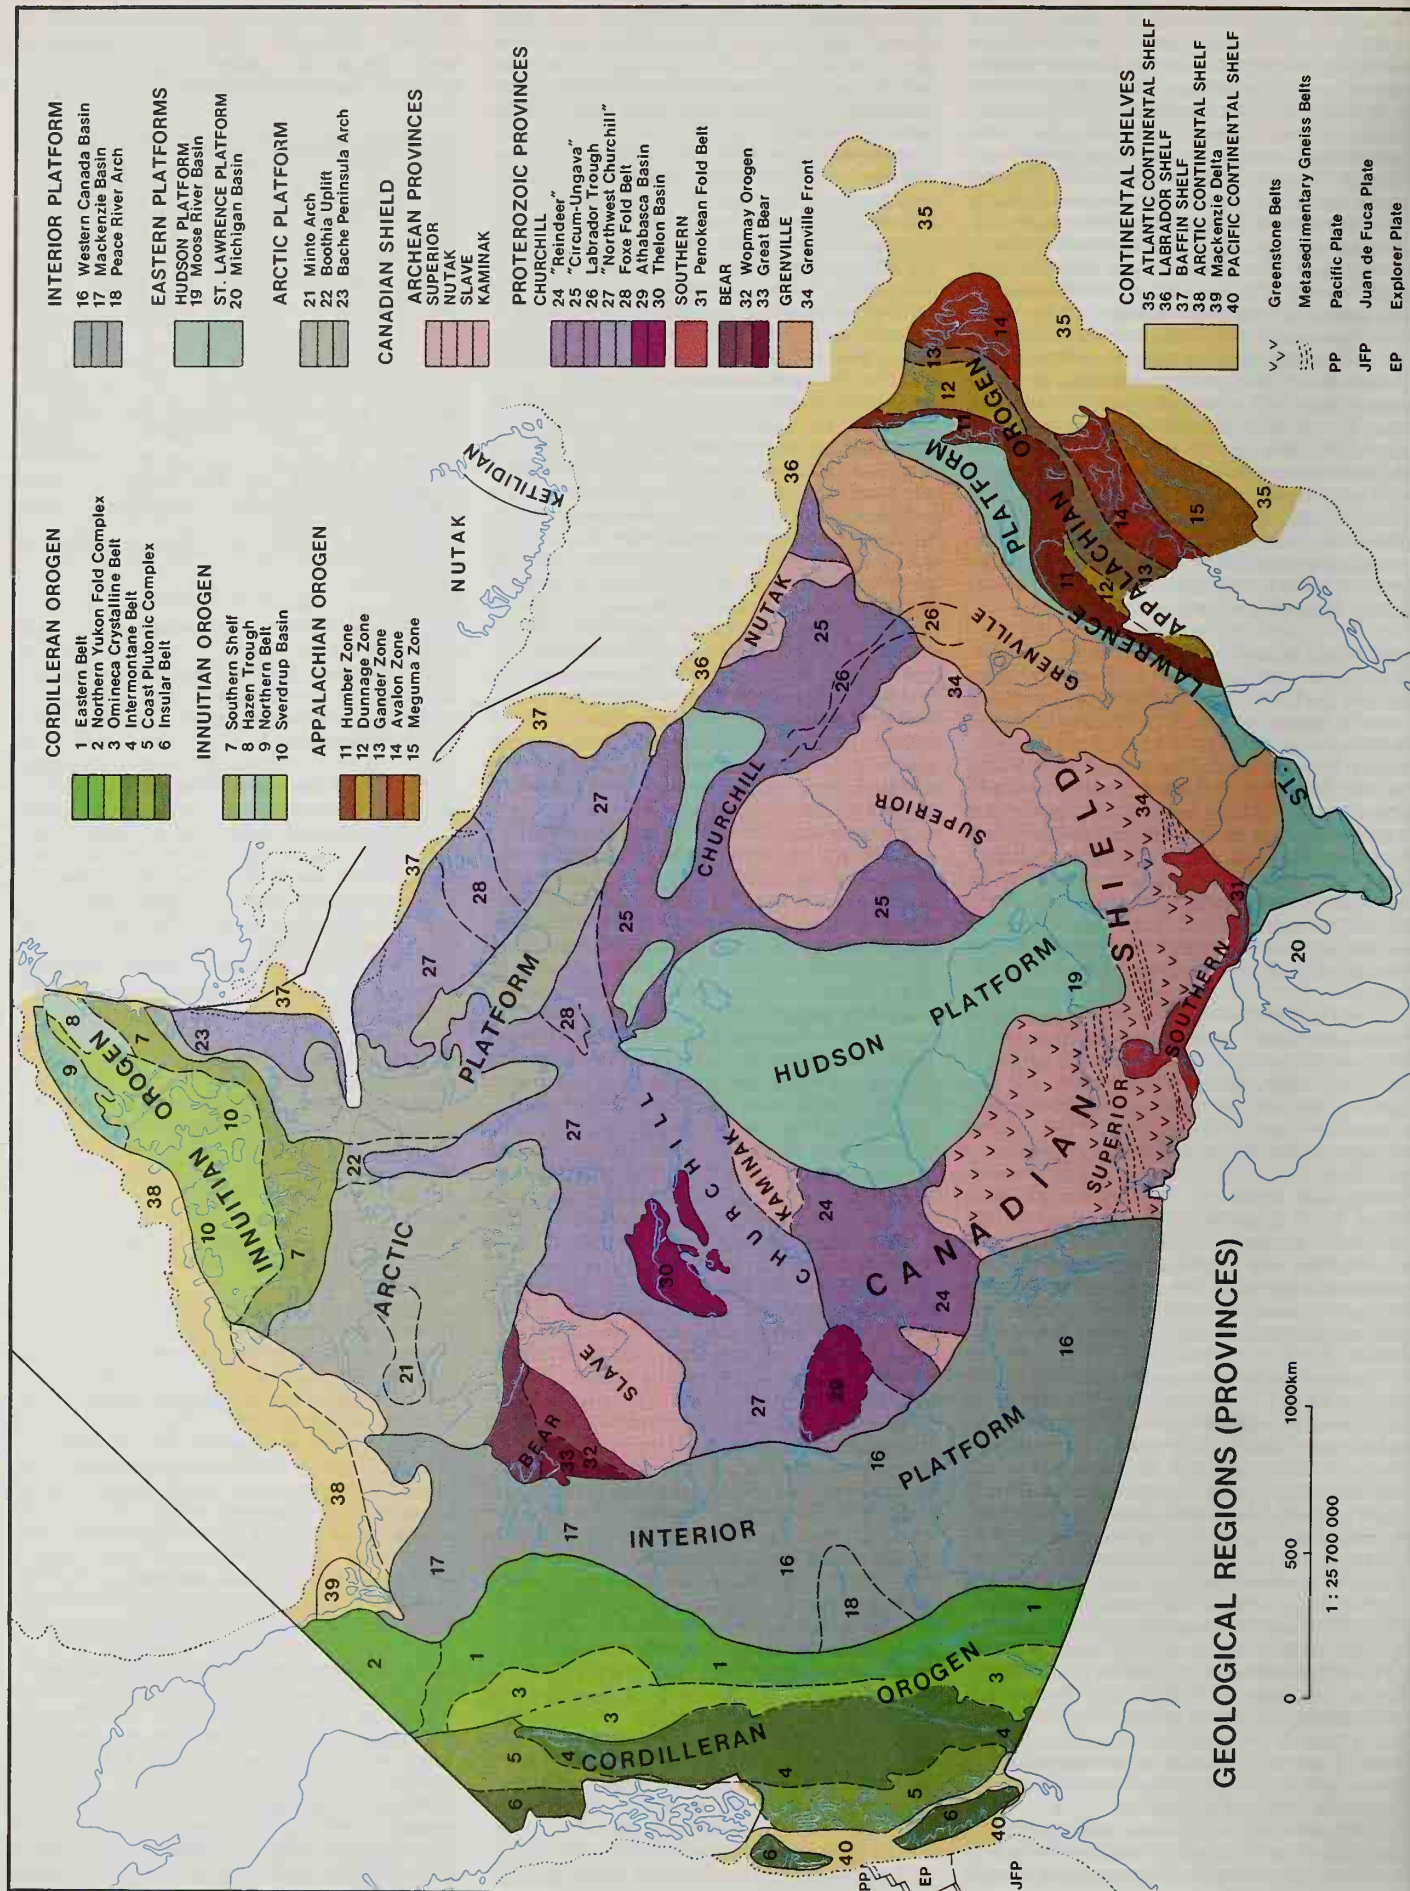

The Canadian Shield is a mosaic of geological provinces in which those of Archean age (more than 2.5 billion years old) are surrounded by a matrix of Proterozoic rocks (2.5-0.6 billion years old). The Archean provinces (Superior, Slave, Kaminak and Nutak) were cratons (ie, stable, low-lying continental parts of the Earth's crust) by the end of the Kenoran Orogeny (2.5 billion years ago); now they are mainly metamorphic and granitic rocks with irregular belts of turbidites and "greenstone" (metamorphic basic volcanics) 18 km in thickness. The Proterozoic provinces (Bear, Churchill, Labrador and Southern) are marked by orogenic trends developed during the Hudsonian Orogeny (1.9-1.8 billion years ago). The consolidated Shield was finally completed on the SE by the addition of Grenville Province about 1 billion years ago.

**Superior Province** is the largest Archean province. Its southern part comprises easterly trending belts, alternating between gneisses and greenstone. Some 3.8-billion-year-old gneisses occur in the extensions of Superior Province into Minnesota and of Nutak into Greenland. Slave and Kaminak cratons resemble Superior craton in overall aspect, age of contained rocks, and nature and timing of structural development. In Slave craton, however, weakly metamorphosed turbidites (ie, SEDIMENTARY ROCKS formed in water) predominate.

**Churchill Province**, the largest of the Lower Proterozoic provinces, includes the sinuous, intensely deformed, metamorphosed and intruded "Reindeer-Circum-Ungava" belt and the reworked fragments and edges of Archean cratons in "Northwest Churchill" domain. The southern margin of "Circum-Ungava" belt contains 6-10 km of Lower Proterozoic layered rocks overlying the Archean basement rocks of Superior Province. This rock succession, reflecting the separation of parts of Superior Province, comprises local clastic-volcanic rift assemblages, overlain by a clastic-carbonate shelf assemblage, succeeded by iron formation (see MINERAL RESOURCES). The shelf sediments pass outward into oceanic basalt with some ultramafic lava (ie, lava rich in iron and magnesium). Convergence and orogeny are manifested along the southern margin of the "Circum-Ungava" belt by folds and thrust faults. The northern margin of the belt is a rough mirror image of the southern margin.

"Reindeer" belt is a region of complexly deformed metamorphic rocks that includes the Flin Flon and Lynn Lk volcanic arcs separated by a turbidite basin. The NW margin contains metamorphosed remnants of shelf sediments

interfolded with Archean basement that extends into "Northwest Churchill" domain. Much of the latter was probably a semi-stable extension of Slave Craton that was variably affected by the Kenoran and Hudsonian orogenies. It contains remnants of a thin veneer of Lower Proterozoic rocks consisting of 1.5 km of quartz-rich clastics, deposited in restricted basins, succeeded by a more extensive, 3 km thick, platform assemblage of quartz-rich sandstone, carbonate, local clastics and volcanics. Much of the domain is characterized by the jostling of large blocks of Archean basement, brought together along major faults. In the Foxe Fold Belt, Archean basement and the overlying Proterozoic sediments are tightly folded together; elsewhere they are more broadly folded.

**Southern Province** contains a southeasterly thickening wedge of Lower Proterozoic, quartz-rich, shelf clastic sediments and subordinate mixed volcanics (7–11 km thick). The wedge accumulated along the southern edge of Superior Province. Its lowest part includes uranium-bearing conglomerate; its upper (NE) part contains sediments deposited during an ancient ice age. The SE part of the wedge was variably metamorphosed and deformed by folds and thrust faults, pushed N to form the Penokean Fold Belt. The intensity of metamorphism and deformation increases southward, reflecting the convergence of a 3.5-billion-year-old Archean cratonic block northward against Superior Craton (2.2–1.7 billion years ago). Sudbury Basin and its associated nickel-rich intrusion may have resulted from meteorite impact about 1.85 billion years ago (see METEOR).

**Bear Province** consists of the northerly trending Wopmay Orogen overlapped (in the N) by younger Proterozoic rocks. Westward from Slave Craton the orogen comprises 4 zones, all cut by northeast-trending strike-slip faults. The first zone is a thin veneer of platform carbonate and sandstone superimposed by the outer part of a westerly derived clastic wedge. An eastward thrust and folded assemblage (5 km thick) of shelf clastics and carbonate is overlain by the wedge. A clastic-volcanic rift assemblage (10 km thick) overlain by fine-grained off-shelf clastics, then by early clastic wedge rocks, was deformed, metamorphosed and intruded by 1.89-billion-year-old granites. Finally, in Great Bear Belt, 1.87-billion-year-old arc volcanics (8 km thick) were deposited on 1.92-billion-year-old basement and are overlapped by younger, more extensive arc volcanics. The orogen began its complex evolution 2.1 billion years ago with the splitting of Slave Craton along northerly and east-northeasterly trending rifts. This led to the deposition of a continental margin assemblage along the W edge of Slave Craton. The assemblage was deformed, metamorphosed and intruded by granites 1.9 billion years ago in response to the collision of a microcontinent from the west. Subsequently, east-sloping subduction led to arc volcanism which extended onto the continent. A second collision farther W generated northeast- and southeast-trending strike-slip faults across the entire orogen. The indentation of Churchill Province by the rigid Slave Craton cracked the Churchill crust and possibly gave rise to 1.8-billion-year-old alkaline volcanics in the Thelon Basin.

The middle and late Proterozoic record is fragmentary but nevertheless indicates stability of the Canadian Shield from 1.8–0.57 billion years ago. In Middle Proterozoic time, an extensive 1.5-billion-year-old continental and marine sandstone-carbonate assemblage (preserved in separate, partly fault-bounded basins, eg, Athabasca Basin) was deposited over much of the Shield, overlapping 1.8-billion-year-old alkaline volcanics. Concurrently, from Labrador SW into Grenville Province, huge masses of anorthosite (composed almost entirely of plagioclase

feldspar) and related granitic rocks were intruded. Concurrent and later widespread stretching across much of the Shield resulted in rifting, dike intrusion and volcanism. About 1.3 billion years ago, rifting, accompanied by basaltic volcanism and intrusion of alkaline rocks, began in Labrador parallel to Grenville Front. Enormous amounts of basalt were extruded in the Lake Superior region, accompanied by alkaline intrusions nearby, during the formation of a major continental rift that extended NE from central Kansas to Lk Superior and SE into Michigan (1–1.3 billion years ago). Depression of the crust from the weight of the volcanics created a basin in which clastic sediments were deposited until the end of Precambrian time. Concurrently, swarms of basic dikes, 1.2 billion years old, were intruded along northwesterly and north-easterly trends across much of the Shield; related basalts were extruded into parallel northwesterly trending sediment-filled rifts on Baffin I and as lava plateaus in northern Bear Province.

**Grenville Province** The convergence of Grenville Province against the adjacent provinces to the NW completed assembly of the Canadian Shield (0.9–1.2 billion years ago). Near Grenville Front this resulted in thickened crust and north-easterly trending structures pushed towards the NW. Subsequent uplift and erosion reveals widespread metamorphic rocks.

#### Interior and Related Platforms

At the end of Precambrian time (0.57 billion years ago), the Canadian Shield was a stable craton of low relief forming the foundation of the N American continent. In early Paleozoic time the Shield was depressed slightly, and much of it was gradually covered by warm, shallow seas. This inundation resulted in deposition of interrupted platform sequences (1–3 km thick), now preserved in the Interior, Arctic, Hudson and St Lawrence platforms. These sequences generally consist of quartz-rich sandstone, overlain by interbedded carbonate and shale. By mid-Paleozoic time, differential uplift and subsidence across the Shield had created a network of arches and intervening basins which led to interruptions in the depositional sequences. The uneven relief, together with the growth of carbonate reefs, produced enclosed basins in the central Interior Platform, in Hudson Platform and in Michigan Basin where evaporites (eg, salt, potash) accumulated.

Platform sequences of the Interior Platform, containing rocks from Cambrian to Jurassic age, are overlain by a foreland basin which migrated eastward and covered much of the platform ahead of advancing pulses of deformation and uplift in the Cordillera. Sandstone, conglomerate, shale and coal accumulated in 2 major clastic wedges of late Jurassic-early Cretaceous and late Cretaceous-Paleocene age, respectively. The lower wedge reflects several lesser, northward-migrating pulses. The 2 major wedges are separated by mid-Cretaceous marine shales deposited in a shallow sea that covered Interior Platform. A clastic wedge in Mackenzie Basin accumulated in pulses from early Cretaceous to Eocene time. Lower Cretaceous coal-bearing clastics were deposited in Moose River Basin on Hudson Platform.

#### Appalachian Orogen

The Appalachian Orogen records the latest Precambrian rifting of the ancestral Canadian Shield, the earliest Paleozoic opening of the Iapetus Ocean to the E, its mid-Ordovician closing and related deformation, and mid- and late-Paleozoic folding and faulting. The orogen consists of several zones of which only the innermost, Humber Zone, was deposited directly on ancestral N America. There, Grenville Province basement is overlain by Upper Proterozoic rift clastics and volcanics covered by a more extensive Cambrian-Ordovician sandstone-car-

bonate shelf assemblage. Succeeding clastics were derived from the SE, heralding the early Paleozoic arrival of a slice of off-shelf assemblage and higher slices of Ordovician oceanic crust thrust northwestward from Dunnage Zone and now stacked above the clastics.

Dunnage Zone consists of rock complexes which flooded the Iapetus Ocean: pieces of upper mantle-oceanic crustal sequences overlain by Lower Ordovician arc volcanics, related clastics and local masses of jumbled blocks of volcanics and clastic rocks surrounded by Ordovician shale. The ocean's eastern margin may be represented in Gander Zone by pre-Middle Ordovician clastics, associated with gneisses in Newfoundland and overlain by arc volcanics in NB. Zonal boundaries are straddled by overlying Upper Ordovician-Silurian marine and continental sediments and volcanics indicating that Dunnage and Gander zones were accreted to N America during the mid-Ordovician Taconian Orogeny.

Avalon Zone is a foreign fragment composed of Proterozoic partly glacial sediments and volcanics, overlain by Cambrian sediments containing fossils different from those in Humber Zone and St Lawrence Platform, and capped by Ordovician clastics with iron formation. Avalon Zone accreted to Gander Zone during mid-Paleozoic Acadian Orogeny, resulting in steeply inclined folds and faults and extensive granitic intrusion across the entire orogen, and disruption along steep faults in nearby platforms.

Meguma Zone is also foreign because it includes folded Cambrian-Ordovician turbidites, derived from an unknown source to the SE, and distinctive granites of Devonian age unlike those associated with Acadian Orogeny. Meguma Zone was accreted to Avalon Zone along steep faults with horizontal slip before both zones were partly covered by continental, coal-bearing Carboniferous clastics. The region contains evidence recording the final assembly of the supercontinent Pangea. The development of rifts in Triassic time (225–190 million years ago), the deposition in them of rift clastics and basalt and the intrusion of alkaline rocks in the Cretaceous are associated with the breakup of Pangea and the subsequent opening of the Atlantic Ocean in the Mesozoic.

#### Innuitian Orogen

The Innuitian Orogen began with earliest Paleozoic rifting of northern ancestral N America, followed by early Paleozoic deposition of shelf and off-shelf sediments, the latter in a deep trough bounded on the N by foreign continental fragments. A younger, overlapping clastic wedge was deformed in the mid-Paleozoic and, finally, the orogen was partly superimposed by a mainly Mesozoic clastic basin, which was itself deformed in latest Mesozoic and early Tertiary time.

The Arctic Platform merges northward into a Cambrian-Lower Devonian southern shelf assemblage of 5 km of carbonate, shale and evaporite. It is adjoined by Hazen Trough, containing Lower Cambrian rift clastics overlain by deep-water shale and 3 km of turbidites. Hazen Trough is bounded on the N by the Northern Belt which comprises continental fragments (largely volcanics and granites). Northerly derived turbidites indicate that the Northern Belt was uplifted, following the collision (along a zone marked by oceanic ultramafic rocks) of Proterozoic and Middle Ordovician fragments in mid-Ordovician time. This collision ended arc volcanism in the Northern Belt. It was followed by pulses of folding and uplift in Silurian and Devonian times and by granitic intrusion in the Devonian. Uplifts in northeastern and eastern parts of the orogen shed detritus to a southeastward advancing Middle and Upper Devonian clastic wedge. It was compressively folded during the Ellesmerian Orogeny (about

345 million years ago) which migrated from the Northern Belt to the Southern Shelf. Subsequently, stretching and subsidence led to the deposition of 12 km of sediments in Sverdrup Basin, mainly of Mesozoic rift clastics and basaltic lava and intrusion, and some Upper Paleozoic evaporites that were locally squeezed upward into overlying sediments. The latest Cretaceous uplift in the eastern Sverdrup Basin shed a clastic wedge across the basin to the continental margin. This was succeeded by the Eurekan Orogeny (about 65 million years ago) which created broad folds and thrust faults directed south and east. At the same time, more than 3 km of clastics accumulated in local basins on land and in narrow, marine fault-troughs. Late Cenozoic vertical faulting produced the present topography.

#### Canadian Cordillera

In the Canadian Cordillera rifting and continental shelf development took place from Proterozoic to mid-Mesozoic time in the Eastern Belt. Elsewhere, foreign fragments were accreted successively to western N America in mid- and late-Mesozoic time. Each accretion was followed by orogeny and deposition of a clastic wedge; related metamorphism and granitic intrusion were restricted mainly to zones straddling the boundaries of accreting blocks. Since the late Mesozoic, the Pacific Ocean Basin has slid under and horizontally past the Cordillera along north-west-trending transform faults.

A long-lived phase of continental margin sedimentation from Proterozoic to Jurassic time (1.5 billion–160 million years ago) is recorded in the Eastern Belt in at least 3 rift and shelf assemblages, totalling 25 km in thickness. The 2 Middle Proterozoic assemblages reflect continental rifting and separation 1.5 billion years ago, and deposition of 2 clastic-carbonate shelf sequences, the first of which was deformed 1.35 billion years ago. They were accompanied by development of connecting, easterly trending fault-troughs that protruded into the continent. The third assemblage comprises partly glacial Upper Proterozoic rift clastic overlain by Cambrian to Jurassic shelf sequences continuous with thinner sequences in Interior Platform but passing westward off the shelf to shale and turbidites. Northern Yukon underwent Devonian-Mississippian folding, granitic intrusion and uplift. This and other northern Cordilleran uplifted areas shed clastics SE across the continental margin.

An accretionary phase in late Jurassic to Cretaceous time resulted from the westward drift of N America and its collision with several northward-moving Pacific plates. Several foreign blocks were amalgamated into 2 large composite fragments (Intermontane and Insular belts) which, as a result of this collision, were then accreted successively to N America. The foreign blocks show fossil and other evidence of displacement through 30° or more of latitude.

The Intermontane Belt consists of 2 extensive Upper Triassic–Middle Jurassic volcanic arcs, each built largely on an Upper Paleozoic foundation. They are separated by an oceanic terrane which includes subduction complexes of repetitively stacked accretionary wedges and of jumbled blocks of basalt, ultramafic, chert and blueschist. The eastern arc is bounded on the E by a region of Upper Paleozoic oceanic crust, telescoped over a small Paleozoic terrane that was deformed before Mississippian time.

The Omineca Crystalline Belt embraces the region where the Intermontane composite fragment collided with and partly overrode the Eastern Belt. This mid-Jurassic collision gave rise to the Columbian Orogeny. Rocks of the outer part of the continental margin and the adjacent Intermontane fragment were compressed, metamorphosed and displaced into stacked sheets transported mainly eastward, but also

Big Muddy Valley (top); Baffin Island, NWT (centre); and Shield near Flin Flon, Man (photos by Richard Vroom/Miller Services Ltd.).

partly westward, from a central metamorphic core zone. From the resulting uplift, clastics were shed mainly eastward into a foredeep and partly westward into a backdeep. Eastward displacement over the Canadian Shield resulted, in effect, in a westward subduction of continental crust which, when partially melted, gave rise to mid-Cretaceous granites in eastern Intermontane and Eastern belts.

Insular Belt comprises 2 large terranes amalgamated in late Jurassic time. One is mainly of Paleozoic sediments and volcanics; the other a Triassic to mid-Jurassic sequence of basalt, carbonate and arc volcanics, overlying an Upper Paleozoic basement. The outer margins of the belt contain remnants of Upper Mesozoic and Cenozoic subduction complexes, suggesting prolonged east-sloping subduction of oceanic crust beneath the Insular Belt. In late Cretaceous time an Insular composite fragment collided with and accreted to the Intermontane Belt which was by then part of N America. This process created the Coast Plutonic Complex, a belt, uplifted in Cenozoic time, consisting of extensive granitic plutons and of medium-grade metamorphic rocks that straddle the boundary between these composite belts. Contemporaneously, arc volcanism and related intrusions of granitic plugs took place in the Intermontane Belt while in the Eastern Belt further thrust faulting and uplift during Laramide Orogeny completed the building of the Rocky Mountains. A related clastic wedge was deposited in a foredeep extending into the western Interior Platform. In the late Cenozoic, extensive crustal stretching resulted in extrusion of widespread sheets of fluid basalt over much of the Intermontane Belt and of local rift and arc volcanics in its western part.

#### Continental Shelves

The Canadian continental shelves are the youngest additions to Canada's landmass. The arctic and eastern shelves developed along continental margins adjacent to opening oceans; the Pacific Shelf formed along a continental margin that slides over or horizontally past oceanic crust. The shelves form submarine terraces, 5-700 km wide and up to 300 m deep. With the exception of the Pacific Shelf, they are underlain by relatively undeformed Mesozoic and Cenozoic prisms of sedimentary rocks (3-13 km thick), composed of materials eroded from the continent, draped over older rocks along its margin.

The Arctic Shelf evolved following opening of the Arctic Ocean basin, possibly from the counterclockwise rotation of Alaska 120 million years ago. Subsequently, 4 km of shelf sediments were superimposed by 9 km of Upper Cretaceous-Cenozoic clastics of the Mackenzie Delta which progressively expanded northward. The eastern shelves built outward as the Atlantic Ocean basin opened and as N America separated from Africa 165 million years ago, from Europe 100-90 million years ago, and from Greenland 70-60 million years ago. Eastern shelves comprise 2 or 3 tectonic assemblages: a lower rift assemblage in fault troughs containing clastics, evaporites and volcanics lying on Precambrian and Paleozoic rocks; an upper, more extensive clastic-carbonate shelf assemblage deposited during a continental drifting phase after the continents separated; and a final capping of Pleistocene glacial deposits. Continental crust is 35 km thick under the inner shelf, thinning to 15-20 km under the outer shelf.

The narrow Pacific Shelf lies along an active margin marked by numerous EARTHQUAKES. West of Vancouver I, the oceanic Juan de Fuca and Explorer plates are descending beneath the continent along a northeasterly sloping subduction zone. This has resulted in 2 modern assemblages: an active volcanic arc 300 km NE

of the foot of the Pacific Shelf, where the subduction zone emerges; and Upper Mesozoic and Cenozoic accretionary prisms of clastics and oceanic volcanics scraped off the descending plate and stacked in easterly tilted wedges beneath the narrow shelf. Northwest of Vancouver I, however, oceanic crust of the Pacific Plate is sliding horizontally NW past the continent along a transform fault.

J.O. WHEELER  
*Reading: R.J.W. Douglas, ed, Geology and Economic Minerals of Canada, 2 vols, (1970).*

**Geological Survey of Canada**, one of Canada's oldest scientific agencies, was founded in 1842 to assist in developing a viable MINERAL industry by establishing the general geological base on which the industry could plan further, detailed investigations. Originally limited to the PROVINCE OF CANADA, the GSC is now involved in earth-science studies throughout Canada, especially in the YT and the NWT. On 10 Sept 1841, £1500 was set aside to establish a geological survey, and the GSC began work in a warehouse in Montréal. The first director, geologist William Edmond LOGAN, was appointed in Apr 1842. His first project, a simple questionnaire sent to landowners, doctors, etc, from Niagara to Gaspé, provided the first overview of the GEOLOGY of the area. Logan's one assistant, Alexander Murray, was a topographer. Later, T.S. HUNT and Elkanah BILLINGS joined the GSC as mineralogist and paleontologist, respectively. In the next decade the GSC participated in several international exhibitions (eg, London, 1851; Paris, 1855) at which elegant displays advertised Canada's potential MINERAL RESOURCES. The first comprehensive report of the geology of the United Province, Logan's *Geology of Canada*, was published in 1863, and the first large-scale maps appeared in the same decade (see CARTOGRAPHY). Confederation increased tenfold the area for which the GSC was responsible. Emphasis was given to economic geology, especially to assist the government in making RAILWAY land grants. The value of the GSC to the economic growth of Canada became obvious during the mid-19th century. The organization, funded initially by two 5-year parliamentary grants, was a branch of the Dept of the Interior in 1877-90, moving to Ottawa in 1881. Between 1890 and 1907 it formed a separate department. Then began the change of titles reflecting the growth of parts of the original GSC: Mines (1907), Mines and Resources (1936), Mines and Technical Surveys (1950) and finally Energy, Mines and Resources (1966). The NATIONAL MUSEUMS OF CANADA, the Topographic Survey and the Canada Centre for Mining and Energy Technology (formerly the Mines Branch), all originated in the GSC.

Early geologists were also explorers, geographers, botanists, zoologists and anthropologists who played a large role in opening up the West and later the Arctic. Notable names include G.M. DAWSON, third director, who carried out extensive reconnaissance mapping in BC, prepared a comprehensive report on the HAIDA, and mapped in the YT a decade before the KLONDIKE GOLD RUSH; Robert BELL, who for 34 years explored the North and West, including the coasts of Hudson Str and Hudson Bay; A.P. LOW, whose work in central Labrador and Ungava included recognition of the potential of the region's vast iron resources and who, in 1903-04, commanded the government expedition to northern waters in the Neptune, in a voyage that was Canada's first clear exercise of authority over the ARCTIC ARCHIPELAGO; J.B. TYRRELL, whose epic trips across the Barrens in 1893 and 1894 filled large blanks on the map; and J. Mackintosh BELL, whose surveys from Lk Athabasca to Great Bear Lk in 1900 resulted in observations that 30 years later led Gilbert LABINE to the discovery of URANIUM deposits at Port Radium.

Studies having a strong economic focus were

emphasized during the 1930s and WWII, but by 1950 the need for the earth sciences to benefit from rapid advances in technology became apparent. The GSC again became research oriented and experienced a considerable expansion in staff and resources. To facilitate its coast-to-coast activities and provide closer liaison with its users, several small regional offices were expanded and a new headquarters was opened in Ottawa (1959).

To provide basic earth-science information, the GSC has always depended on field studies. The introduction of light-weight helicopters in the 1950s provided a tool that allowed the geologist to spend most of the working day making observations, instead of slogging through bush, climbing mountains or portaging a canoe. By 1973, all of Canada had been examined at a reconnaissance scale and more detailed studies had begun.

Technological developments in the field of airborne geophysics have made major programs possible, such as the GSC's national aeromagnetic survey. By 1982, more than 8 million line-kilometres had been flown, and 8000 aeromagnetic maps portraying data of great interest to the mining industry had been published. The GSC's expertise in the fields of airborne geophysics and GEOCHEMISTRY has also allowed significant contributions to be made to developing countries, especially in Africa, through the Canadian International Development Agency (CIDA).

The GSC's present role involves 3 main activities: ensuring the availability of basic, geo-scientific knowledge about the landmass and offshore areas; acquiring information on the nature, distribution and magnitude of ENERGY and mineral resources, and on related exploration technology; identifying and assessing geological hazards and processes that affect the environmental balance and may constrain use of Canada's landmass. In 1983-84 the GSC had a budget of \$51 million and a coast-to-coast staff of 760, organized into 8 divisions.

**Cordilleran Geology Division**, Vancouver and Patricia Bay, BC, conducts studies of the geology of BC and the YT, and the marine geology of the Pacific Continental Margin.

**Institute of Sedimentary and Petroleum Geology**, Calgary, provides geological data on the hydrocarbon-rich western and arctic sedimentary basins.

**Precambrian Geology Division**, Ottawa, conducts studies of the geology of the mineral-rich Canadian Shield, composed of some of the oldest rocks on the Earth.

**Atlantic Geoscience Centre**, Dartmouth, NS, responsible for geological and geophysical studies of the Atlantic and arctic offshore regions.

**Terrain Sciences Division**, Ottawa and Calgary, studies surficial materials, geomorphology and natural terrain hazards of the Canadian landmass, including the effects of human activity.

**Economic Geology Division**, Ottawa, conducts studies of the processes which lead to the formation of mineral deposits and determines the probable distribution and abundance of non-hydrocarbon minerals.

**Resource Geophysics and Geochemistry Division**, Ottawa, conducts aeromagnetic, radiometric and geochemical surveys and develops new methods for obtaining geophysical and geochemical data.

**Geological Information Division**, Ottawa, responsible for drafting, editing and publishing maps and reports and for maintaining Canada's largest earth-science library.

**Central Laboratories and Technical Services Division**, Ottawa, provides analytical services and carries out mineralogical studies.

R.G. BLACKADAR

*Reading: Morris Zaslow, Reading the Rocks (1975).*

**Geology** Every day of our lives we interact with the planet we live on. Normally, the interaction is quiet and unobtrusive and we take a stable ENVIRONMENT for granted. But, at times, we are reminded that this planet changes: a volcano erupts in a remote country and its dust reduces sunlight by 5% for a few years; an EARTHQUAKE leaves thousands dead or homeless. We have been forced to become aware of the limitations and fragility of the Earth, and of problems such as ACID RAIN and toxic-waste POLLUTION. Geology deals primarily with the study of the planet Earth. Significant questions involve the size, shape and chemical makeup of the Earth, now and throughout geological time. Of equal importance are questions about the origin and evolution of life, and about RESOURCES and the possible effects of resource limitations on human development and survival.

Earth is 70.8% covered by water but only with the development of SONAR techniques has it become possible to describe the solid earth below the oceans. With increasingly sophisticated satellite observations, relatively fine structural details (eg, areas of volcanic activity) can be seen. With modern techniques geologists can observe on almost all appropriate scales: we can "see" the entire planet on a scale of  $10^7$  m and, with electron microscopes, we can see atoms of  $1/10^{10}$  m diameter.

#### Geological Sciences in Canada

Canada has the second largest land area (after the USSR) and the largest coastline of any nation, as well as a vast area of continental shelf. Its population is small; the natural resources vast. Geology in Canada may have begun with Jacques CARTIER when, in the 1530s, he returned to France with a load of worthless crystals he thought were diamonds. Martin FROBISHER made the same error in the 1570s, mining quantities of useless ore on Baffin I. In the early 1800s, systematic geological mapping in Europe was becoming a science. The Industrial Revolution demanded coal, iron ore and other minerals, and early hit-and-miss PROSPECTING techniques were proving costly. Public interest in geology broadened as the study of rocks accelerated and, inevitably, as dogmas concerning time and life came under fire. In Canada, the systematic study of geology can be said to have begun in 1842 with the founding of the GEOLOGICAL SURVEY OF CANADA.

Early geologists in Canada went far beyond the massive task of describing the stratigraphy and producing accurate maps; they were true natural scientists who described every aspect of the natural and human environment. The great traditions established at that time have continued, and the present GSC remains a world leader. The mineral industry was slow in attaining worldwide importance. It was not until after 1945 that the steel, oil and gas industries began accelerated development; Canada first exported oil in 1949. The community of geologists grew with the mineral and oil boom. Canada became a leader in techniques for REMOTE SENSING, for geophysical techniques based on gravity, and for seismic, magnetic and electrical methods of mapping. As detailed maps improved, the most favourable rocks for particular resources became better understood. Canada perhaps still leads the world in modern prospecting technology, and Canadian geologists are sought in developing countries to assist in exploration programs. As the resource industries became increasingly important, the provinces began to build their own more specialized surveys, which have come to assist and amplify the task of the GSC. The membership patterns of the various specialized societies (involving government, university and industry representatives) illustrate the strength of the geological community.

Abbé Jean Holmes began geology instruction

in Canada early in the 19th century at the SEMINAIRE DE QUÉBEC (later Laval University). The first geology department was established at University of Toronto in 1853. To provide for the training of young geologists, William LOGAN endowed a professorship of geology and paleontology at McGill University. In 1855, J.W. DAWSON became principal of McGill and first incumbent of that chair. By the end of the 19th century there were 6 geology departments in Canadian universities. The most impressive growth occurred 1949-70, when the number increased from 15 to 30. Earth science instruction also takes place in departments of GEOGRAPHY, PHYSICS, MINERAL AND MINING ENGINEERING, CIVIL ENGINEERING (geotechnique) and SOIL SCIENCE. GEOCHEMISTRY and GEOMORPHOLOGY are also geological subjects.

#### Relation to Other Sciences and Society

To many, the most important justification for the study of geology is the necessity of providing raw materials. In Canada, the economic aspect of the science is large: minerals provide 26% of exports and, overall, almost 40% of Canada's economy involves the mineral industry. Today, the impact of earth sciences goes much further than mineral and energy production. Geochemists are skilled in the analysis of trace quantities of metals and hence are in demand for the study of environmental aspects of inorganic pollution (eg, heavy metals). Geologists are needed when dams, highways, airports, nuclear power plants, urban expansion or even agricultural developments are planned. Earth scientists are involved in any problem focusing on human impact on the environment.

The earth sciences have always had close links to other sciences. Thus, the solid-state physics of materials under extreme pressure and temperature is closely related to studies of the deep Earth and of objects in space. Views on nuclide synthesis in stars draw heavily on data from geochemistry. For BIOLOGY, studies of fossil organic matter in rocks make a vital contribution to an understanding of the origin of life and its tolerance to environmental change. Modern geologists require knowledge from many related sciences, for example, the paleontologist needs biology; the geophysicist, physics and applied mathematics; the structural geologist, a background in solids mechanics and fluid dynamics.

#### Canadian Institutions

Federal and provincial geological surveys still remain the key organizations for a continued understanding and improvement in knowledge of Canadian geology. From their work come essential geological and geophysical maps. University geologists have made large contributions to understanding the fundamental processes of geology. The main geological societies and their publications include Assn of Exploration Geologists, *Journal of Geochemical Exploration*; Canadian Assn of Geographers, *Canadian Geographer*; Canadian Exploration Geophysical Soc, *Canadian Geophysical Union*, *Canadian Geophysical Bulletin*; Canadian Geotechnical Soc, *Canadian Geotechnical Journal*; Canadian Institute of Mining and Metallurgy, *Canadian Mining and Metallurgical Bulletin*, *Journal of Canadian Petroleum Technology*, *Canadian Metallurgical Quarterly*; Canadian Soc of Exploration Geophysicists, *Journal of the Canadian Soc of Exploration Geophysicists*; Canadian Soc of Petroleum Geologists, *Bulletin of Canadian Petroleum Geology and Reservoir*; Canadian Soc of Soil Science, *Canadian Journal of Soil Science*; Canadian Well Logging Soc, *The CWLS Journal*; Geological Assn of Canada, *Geoscience Canada*, *Canadian Journal of Earth Sciences*; Mineralogical Assn of Canada, *Canadian Mineralogist*.

The Canadian Geoscience Council, Dept of Energy, Mines and Resources, co-ordinates information from all subdisciplines. It also publishes special studies (eg, a recent pamphlet on careers in geoscience). The GSC and the various

provincial surveys publish bulletins and maps and supply information of local and general geological significance. See also FOSSILS; GEOLOGICAL HISTORY; PALEONTOLOGY; PLATE TECTONICS; GEOLOGICAL REGIONS; MINING; MINERAL RESOURCES.

W.S. FYFE

Reading: R.J.W. Douglas, ed, *Geology and Economic Minerals of Canada* (1970); F. Press and R. Siever, *Earth* (1982).

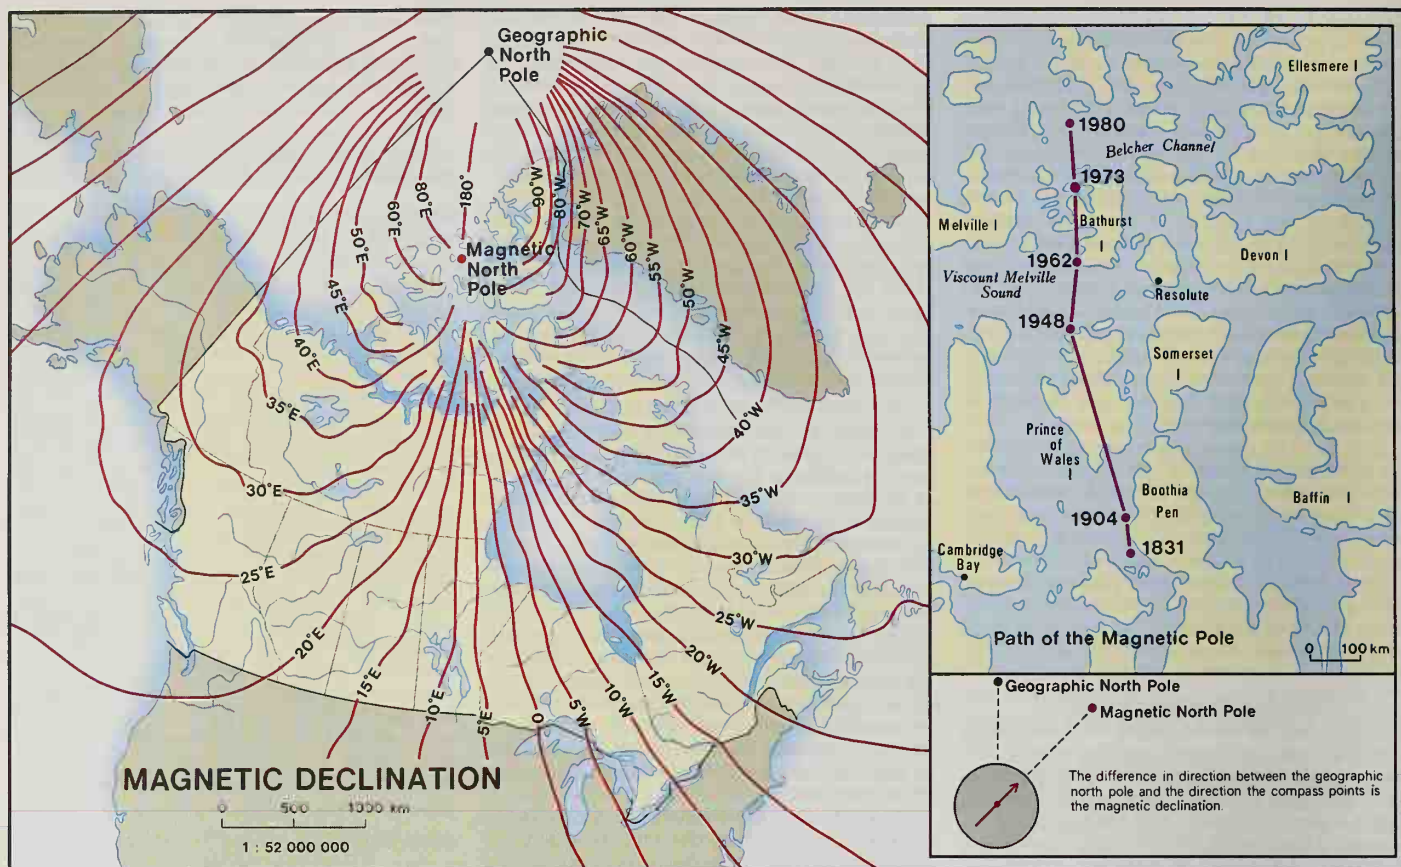

**Geomagnetic Pole** The Earth behaves like a magnetised sphere with its magnetic poles near, but not identical to, its poles of rotation. In 1831 James Clark Ross located the N magnetic pole on KING WILLIAM ISLAND in the Canadian Arctic where his compass dipped vertically downwards. This pole probably moves continuously and it is now over BATHURST ISLAND. Convection currents flowing in the white-hot liquid iron of the Earth's outer core are thought to generate the main magnetic field; secondary effects from the sun (eg, magnetic storms, solar winds) continuously agitate the field and its poles (see NORTHERN LIGHTS). An investigator in space would see that the field is distorted. The average of the whole field would have a pole (ie, north geomagnetic pole) over Baffin Bay near NW Greenland. The south magnetic pole is in Antarctica. Irregularities in the core's convection currents are believed to cause the magnetic poles to wander about the poles of rotation and to change in intensity so that the field dies away and returns with reversed polarity at intervals of thousands of years. This property is useful in archaeology, in dating magnetic rocks and in measuring the rates of seafloor spreading. See also NORTH POLE; map page 734. J. TUZO WILSON

**Geomorphology** studies the form of the Earth's surface. It includes the description, classification, internal structure and GEOLOGICAL HISTORY of surface features resulting from EROSION and deposition by RIVERS, GLACIERS, OCEAN WAVES, WIND, gravitational movement of material down slopes and weathering. Faulting of the Earth's crust and volcanism are also included. Most of Canada was covered by continental glaciers several times; therefore, glacial GEOLOGY receives most attention from Canadian geomorphologists. Arctic geomorphology and coastal geomorphology are also important. Most geomorphic processes result from the CLIMATE; hence, CLIMATE CHANGE is a uniting theme, especially in the closely related field of Quaternary geology, which deals with the last 2 million years.

Geomorphological accounts occur in most reports of exploration since the 1850s and surface deposits have been described by the GEOLOGICAL SURVEY OF CANADA (GSC) since its creation in 1842. Early discussions focused on whether erratic boulders were transported by floating ice or by continental glaciers. By about 1875 the glacial theory was widely accepted, except by J.W. DAWSON of McGill, author of *The Canadian Ice Age* (1894). His son, G.M. DAWSON explored much of western Canada and published the first comprehensive work on Canada's physiography (1884). Before 1850 most geomorphology reports were minor sections within reports on bedrock, but several geologists with the GSC made more definitive contributions: Robert Chalmers in southern Québec and NB; J.B. TYRRELL in northern Manitoba; W.A. Johnston in Ontario, the eastern prairies and BC; J.W. Goldthwait in the St Lawrence Valley and NS; and E.M. Kindle studying recent sedimentation processes. After WWI the GSC established a group of a dozen glacial geology specialists, which evolved into the Terrain Sciences Division, the largest single group of geomorphologists in Canada.

Early contributors outside the GSC were David Honeyman in NS (active 1862-88); J.W. Spencer, F.B. Taylor and G.M. Stanley, students of the glacial Great Lakes (1894-1945); and A.P. Coleman who worked across Canada and wrote on

Precambrian and Pleistocene GLACIATIONS, including his book *The Last Million Years* (1941). Glaciological observations were begun in Alberta and BC by George and William S. Vaux in 1899 and continued by A.O. Wheeler until 1931. Erosion surfaces of the Precambrian SHIELD were treated by A.W.G. Wilson in 1903 and by H.C. Cooke of the GSC in 1929-33.

Physiography took root in university GEOGRAPHY departments in the 1930s, promoted by Raoul Blanchard in Québec and Thomas Griffith TAYLOR at University of Toronto. The expansion of geography departments offering programs in PHYSICAL GEOGRAPHY (3 in 1947, 35 in 1979) brought an influx of European geographers. In 1979, 23 departments offered master's programs; 16 awarded doctoral degrees. Probably over half of these were in geomorphology. Similar growth increased the number of geology departments from 15 to 30, of which 23 gave graduate instruction in geomorphology and 14 offered advanced degrees in geomorphology or Quaternary geology. The Geographical Branch, a federal agency parallel to the GSC, was created in 1947 and emphasized arctic geomorphology. It was dissolved in 1967; its journal *Geographical Bulletin* ceased publication and most staff members joined other units. An explosive increase in the number of geomorphological publications took place between 1950 and 1970. Regional monographs appeared on the Canadian CORDILLERA by H.S. Bostock (1948), on southern Ontario by L.J. Chapman and D.F. PUTNAM (1951), on BC by S.S. Holland (1964), on the Arctic by J.B. Bird (1967) and on Canada as a whole by Bird (1972).

**Applications** Geomorphology is applied in soil research; in engineering geology and civil ENGINEERING projects such as route location, foundation problems, CONSTRUCTION materials, slope stability and geological hazards; and in environmental and GROUNDWATER studies. The tracing of transported indicators is an important technique in mineral PROSPECTING. REMOTE SENSING requires some knowledge of geomorpho-

logy. In Canada great effort is expended in mapping surficial geology, terrain characteristics and resources such as SAND AND GRAVEL (see CARTOGRAPHY). Much applied research is done, especially by geologists, geographers, civil engineers and foresters, on the behaviour of frozen ground and on slope stability (see LANDSLIDES). The federal and most provincial governments have geomorphologically oriented agencies. The GSC was responsible for about a third of the projects in Canada in 1979-81; Environment Canada, the Alberta Research Council and the Ontario Geological Survey had roughly 6% each. Among academic institutions, University of Alberta (Geology) leads with 10%.

**Societies and Journals** Canadian geological geomorphologists benefit from memberships in the Geological Soc of America and publish in its *Bulletin* and its monthly periodical, *Geology*. The Geological Assn of Canada with the *Canadian Jnl of Earth Sciences* is a major forum. The *Canadian Geographer* of the Canadian Assn of Geographers publishes some papers on geomorphology. The Canadian Quaternary Assn serves geomorphologists interested in Quaternary research. In Québec, l'Assn Québécoise pour l'étude du Quaternaire sponsors the journal *Géographie physique et Quaternaire*, and a few geomorphological papers appear in *Cahiers de Géographie du Québec*. Most Canadian areal studies requiring maps are government reports. J.A. ELSON

**Geopolitics**, a strategy for national identity and development based on a country's geographical characteristics and natural resources. From the development of a geopolitical strategy can flow industrial strategies, defence policies and a formula for permanent control over local branch plants of externally owned, multinational corporations. The study of the influence of geography on national and international politics began in the early 20th century. In 1919 an influential British geographer, Sir Halford J. Mackinder, theorized that the domination of the Euro-Asian "heartland" by one country, eg,

Germany, would upset the world's balance of power. German geographers used Mackinder's theories to provide a justification for Nazi territorial expansion. Geopolitics has also been used to explain the idea of "Manifest Destiny" espoused by the US in the 19th century.

Canada is an outstanding example of a "geostrategic region," identified by American political geographer Saul B. Cohen as a region "large enough to possess certain globe-influencing characteristics and functions." In 1937 French geographer André Siegfried noted that Canada's 2 basic assets were its vast natural resources and its geographic position. Nevertheless, geopolitical thinking has been absent in Canadian governmental and industrial planning, chiefly because policy planners have viewed it as deterministic and authoritarian. The long search for a national industrial strategy has failed partly because Canadians have not developed a prior and overall geopolitical view of Canada. Thus, for example, Canada approaches the social and economic development needs of its arctic regions piecemeal. With 3 long ocean coastlines Canada has never, since the work of the PERMANENT JOINT BOARD ON DEFENCE in the 1940s, attempted to develop a geopolitical strategy for defence. At the same time, such federal government programs as the 1961 National Oil Policy and the 1980 National Energy Policy could be defined as "geopolitical": both policies represented efforts towards the "Canadianization" of our strategically situated but largely foreign-owned oil and natural gas industries.

By comparison, other large nations including the US, USSR and Brazil, with great potential in their natural resources and dominant geographical positions in their regions, have defined themselves geopolitically. Their well-developed geopolitical positions have resulted in the growth and use of their military and commercial sea power, the control of their natural resources, and the direction of management and labour toward national goals.

JOHN D. HARBON

**George, Dan**, or Teswahno, actor, public speaker (b on Burrard Indian Reserve No 3, BC 24 July 1899; d at Vancouver 12 Sept 1981). By his film roles and personal appearances Dan George helped improve the popular image of Indian people, often represented as bad characters. Until age 60, he worked as longshoreman, logger and itinerant musician, and was chief of the Squamish Band of Burrard Inlet, BC, 1951-63. He was discovered in 1959 and acted a succession of roles as gentle Indian elder on Canadian television and stage, including CBC's "Cariboo Country" (1961) and the original production of George RYGA's *The Ecstasy of Rita Joe* (1967). He recited his much-publicized "Lament for Confederation" on Indian defeat and resurgence at Vancouver's Canadian Centennial celebrations in 1967. During his Hollywood career his roles included at least 8 feature films, among which are *Smith* (1969), *Little Big Man* (1970), *Harry and Tonto* (1974) and *The Outlaw Josey Wales* (1975). A non-activist, George refused to endorse Indian political causes but insisted on portraying only "good" native figures. He was author of *My Heart Soars* (1974) and *My Spirit Soars* (1982), both prose-poetry.

BENNETT MCCARDLE

*Reading:* Hilda Mortimer, *You Call Me Chief: Impressions of the Life of Dan George* (1981).

**George Cross** The aerial bombing of centres of civilian population in Britain early in WWII gave rise to numerous acts of the most conspicuous bravery. In response, King George VI instituted a major decoration in 1940 for which civilians and members of the armed forces are eligible. The George Cross ranks immediately after the VICTORIA CROSS in the scale of Commonwealth honours. Recipients have included 8 Canadians and one non-Canadian serving in a Canadian military unit. The decoration is in the form of a plain silver cross with, at its centre, a representation of St George slaying the dragon encircled by the words "For Gallantry." The ribbon is "garter" blue.

CARL LOCHNAN

The George Cross, established by King George VI in 1940 to honour acts of bravery, has been awarded to 8 Canadians and to one non-Canadian in a Canadian unit (courtesy National Museums of Canada/National Museum of Man/K71-96).

**George Rivière**, 560 km long, in northern Québec, drains N into the E side of UNGAVA BAY. Its southern and eastern divides, along with those of tributary rivers Ford and De Pas, extend along much of the Québec-Newfoundland and Labrador border. The river's 41 700 km<sup>2</sup> basin includes Lac de la Hutte-Sauvage (Indian House) and Lac aux Goélands (Whitegull) among many lakes that provide a mean discharge of 881 m<sup>3</sup>/s. Over granitic gneiss of the Churchill geological area, the vegetation is transitional — from boreal forest in the S and W to tundra in the E and N. The river has supported a salmon sport fishery and the basin makes up much of the range of the George River CARIBOU herd. Native occupation of the area is by MONTAGNAIS-NASKAPI Indian and LABRADOR INUIT. Moravian missionaries named the river for George III in 1811, but European exploration of the extent of the river was not made until John MCLEAN's attempt to establish a transportation route for the HBC from Fort-Chimo to Lk MELVILLE. McLean, preceded in 1834 by the clerk Erland Erlandson, first crossed the area in the winter of 1838; the following summer he set off upriver from the post of George River (also called Fort Siveright, Fort George River and now Port-Nouveau-Québec). Travelling by the George Rivière he crossed the southern divide on the exploratory journey on which he discovered CHURCHILL FALLS.

IAN MACCALLUM

**George Weston Limited**, with head offices in Toronto, is a Canadian food company incorporated in 1928 to acquire the business and assets of a predecessor of the same name, which was incorporated in 1910. The company grew between 1938 and 1980 by acquiring various assets in the food industry, including Loblaw Groceries Co Ltd and Donlands Dairy Ltd. Today, George Weston Limited is engaged in the wholesale and retail distribution of food and other products; it manufactures bakery, confectionery and dairy products and operates subsidiaries in Canada and the US. Its Loblaw Companies Limited division currently operates 292 supermarkets in Canada and 214 in the US. In 1983 it had annual sales or operating revenue of \$7.8 billion (ranking 6th in Canada), assets of \$2.2 billion (ranking 41st) and 60 000 employees. Wittington Investments (the Weston family) owns 57%.

DEBORAH C. SAWYER

**Sir George Williams University**, see CONCORDIA UNIVERSITY.

**Georges Bank** is a large submarine bank (250 km by 150 km) at the edge of the Atlantic continental shelf between Cape Cod and Nova Scotia. Typical water depths are 50-80 m, but in some areas the water shoals to 10 m and less. Georges Bank is within the Bay of FUNDY-Gulf of Maine tidal system, and strong oscillatory tidal currents, typically 80-100 cm/s (1.6-2.0 knots), pass across the top of the bank, keeping the water column there well mixed even in summer. The average currents follow the contours of the bank, however, forming a clockwise gyre, and water on top of the bank remains there on average for several months during the summer. Georges Bank is one of the most biologically productive regions in the world's oceans, largely owing to the tidal mixing, which brings to the surface a continuous supply of regenerated nutrients from the sediments. The combination of high primary productivity and prolonged residence of the water leads to the buildup of high concentrations of PLANKTON on the bank. As a result, Georges Bank sustains large stocks of fish, such as herring, haddock and cod, as well as scallops.

Georges Bank has traditionally been fished by Canadian and American fishermen. In recent decades it was severely overfished by distant water trawling fleets, primarily from the Soviet Union and Poland. The Georges Bank herring,

one of the world's largest herring stocks, with a biomass of approximately one million tonnes, virtually disappeared during this period. A boundary decision in Oct 1984 by the International Court at The Hague allocated five-sixths of the bank to the US. The easternmost sixth, awarded to Canada, is rich in groundfish and SCALLOPS. Properly managed, Georges Bank can sustain estimated annual fishery yields of about 420 000 tonnes. In recent years there has been exploratory drilling for gas and oil on the bank, but the size and value of the oil and gas reserves are not yet known, and the impact on the fisheries of exploiting these resources is not well understood.

CHRIS GARRETT AND TONY KOSLOW

**Georgetown**, PEI, Town, pop 737 (1981c), inc 1912, the capital of Kings County, is on the province's eastern coast, 50 km SE of Charlottetown. Named for King George III, it is the site of an excellent harbour, in proximity to both the Gulf of ST LAWRENCE and NORTHUMBERLAND STR. In the 19th century, Georgetown became a principal Island shipbuilding and commercial centre. However, the town's economy was debilitated by the late 19th-century collapse of the shipbuilding industry. When railway and then highway construction increased Georgetown's coastal isolation, the centrally located community of MONTAGUE became the commercial centre of southern Kings. In this century Georgetown's story has been one of further decline. In 1983 the incomes of over half the residents were derived from unemployment insurance and welfare payments. Georgetown Seafoods and the modern shipyard are the principal sources of employment.

W.S. KEIZER

**Georgia, Strait of**, body of water separating VANCOUVER I and mainland British Columbia S of QUADRA I. Part of a basin between 2 mountain ranges, the floor of the strait was deepened in the ice age by south-flowing glaciers. Coastal Salish have used sites on the strait for between 5000 and 10 000 years. In 1791, 2 Spanish navy ships under Francisco Eliza explored its coast. Capt George VANCOUVER followed in 1792, naming it the Gulf of Georgia, after George III, the British monarch. "Gulf" was changed to "strait" in 1865. Most of BC's population has clustered around the Strait of Georgia, especially in metropolitan Vancouver. It has year-round deep-sea shipping ports in Burrard Inlet, on the Fraser R estuary, at Roberts Bank, on Vancouver I's E coast, on Howe Sound and at Powell River. These are typically linked with railheads, and with forest-products mills or other manufacturing plants. The strait is also the main centre of the PACIFIC SALMON fishery, and its mild, rain-shadow climate makes it a popular marine recreation area in summer.

PETER GRANT

**Georgian Bay**, NE arm of Lake HURON in S-central Ontario. It is shielded from the lake by the limestone spine of the NIAGARA ESCARPMENT, which extends in a great arc NW up the BRUCE PENINSULA. The bay is fed from Lk Superior via the North Channel, between Manitoulin I and the N shore, and independently by the Mississagi, Spanish, French, Magnetawan, Muskoka, Severn and Nottawasaga rivers. The strait between the Bruce Peninsula and MANITOULIN I is called Main Channel (25 km wide). In contrast to the soft, white limestone cliffs of the W shore,

Georgian Bay's scenic islands, coasts and waters make it one of Ontario's favourite recreation areas (courtesy Parks Canada).

the E shore is cut into the hard edge of the Canadian SHIELD, fractured into myriad bays, inlets and sounds, with thousands of islands strewn along the coasts. On the inner, SW curve of Nottawasaga Bay are numerous sandy beaches, the longest of which is Wasaga. Located around the bay (from SW to NE) are OWEN SOUND, COLLINGWOOD, Wasaga Beach, MIDLAND, Pt McNicoll, Victoria Harbour and PARRY SOUND; in summer local residents are greatly outnumbered by tourists.

BRÛLÉ was the first European to see the bay (perhaps as early as 1610) and CHAMPLAIN came via the FRENCH R (1615) to visit the Huron, who lived on a small peninsula along the SE shore (see HURONIA). Jesuit missionaries came to the area in the 1620s and BRÉBEUF was entrusted with founding a permanent mission in the area in 1634 (STE MARIE AMONG THE HURONS). The bay

Eroded limestone islands, caves and "flowerpot" formations of Georgian Bay Islands National Park (courtesy Parks Canada).

also has a natural water connection, sometimes called the Toronto Passage, to Lk Ontario via Lk Simcoe and the Nottawasaga R. It was used by the Indians and later during the WAR OF 1812, when a military base was opened at Penetanguishene. Settlement followed the building of a railway from Barrie to Collingwood in 1855. Free land grants opened the area in 1868, but the soil is generally unfavourable to farming. The key industry of the late 19th century was logging; in 1890 Midland was second in production only to Ottawa. By 1900 most of the forests had disappeared; the lumber industry died, leaving behind slashed-over terrain and a few local mills. The fishing industry lasted longer. Immense quantities of whitefish, trout and pickerel were shipped out by rail until the 1950s. By 1960 the industry was virtually ruined by the LAMPREY. Today there is a variety of secondary industry around the bay — textiles, cameras, shipbuilding. But the once-profitable grain-handling business diminished rapidly after the ST LAWRENCE SEAWAY opened.

Tourism began in the 1850s with the arrival of the railway and is now the main industry. Summer homes were built along the N shore in

the 1880s, and thousands came after 1900 by train to Parry Sound and Midland, thence by boat to the islands to fish, sail and pitch tents — a pattern of vacationing repeated every year. The best-known areas are the N shore islands, the "Thirty Thousand Islands" on the E shore, Manitoulin I, the amusement-park atmosphere of Wasaga Beach, the yacht harbour at Tobermory and the Martyr's Shrine and reconstructions of Ste-Marie and a Huron village near Midland.

Called Lk Manitoulin by Capt William Fitzwilliam Owen, who charted the area 1815, the bay was later decreed part of Lk Huron and named for King George IV by Capt H.W. Bayfield's Admiralty Survey 1819-22. Nearly as large as Lk Ontario, it is one of the world's great bodies of fresh water.

JAMES MARSH

Reading: J. Barry, *Georgian Bay: The Sixth Great Lake* (1968).

**Georgian Bay Islands National Park** (est 1929) comprises 50 islands located off the SE coast of GEORGIAN BAY. Two other islands, Flowerpot and Cove, are situated farther W off the tip of the BRUCE PENINSULA. The Precambrian granite islands of the E, which inspired many GROUP OF SEVEN paintings, are a stark contrast to the eroded limestone islands to the W, with their caves, "flowerpot" formations and rich maple-beech forests. Although small (24.1 km<sup>2</sup>), the PARK protects several unusual species. Beausoleil I, the largest park island, is one of the last strongholds of the Massasauga rattlesnake, eastern Canada's only venomous snake. Other noteworthy species protected include the eastern fox snake, hognose snake, spotted turtle, calypso orchid and squawroot. The park has facilities for canoeing, hiking, cross-country skiing and swimming. Scuba diving is popular and the area has long been famous as a boating mecca.

LILLIAN STEWART

**Geothermal Energy** is the exploitable heat within the Earth. The interior of the planet is maintained at a high temperature by a vast store of heat, of which part remains from the formation of the Earth and part is continually generated by the decay of radioactive elements. Heat generated is roughly balanced by heat escaping through conduction to the surface, geysers and hot SPRINGS, and volcanic action. Some of this ENERGY becomes concentrated in deposits that can be tapped; research into geothermal energy seeks to discover new deposits of heat and to improve exploration and exploitation technology. Geothermal energy involves a relatively new technology compared to that developed for fuels such as oil or gas, but as these finite resources are used and become more expensive geothermal energy will grow in importance.

Most geothermal deposits involve a coincidence of water and heat. Surface water sinks into the ground, some of it penetrating deep into cracks or porous rocks where it may become trapped in large reservoirs for long periods. In stable, nonvolcanic parts of the Earth's crust, temperature increases in a downward direction at an average rate of about 25°C/km, and hot reservoirs are found only where porous rocks extend to depths that are hot under normal conditions. These are usually in large sedimentary basins, in the rocks that sometimes hold PETROLEUM deposits. In volcanic areas, water becomes intensely heated at shallow depth and some reservoirs become large deposits of exploitable energy. A few reservoirs, eg, Larderello in Italy, contain steam at about 235°C, but most contain water under high pressure at temperatures up to 400°C. When temperatures are higher than 200°C, reservoirs can be drilled for steam to drive turbines for production of electricity. Geothermal waters at lower temperatures can be used for many direct applications (eg, heating buildings, drying crops). Some hot rocks do not

have a convenient water stream to extract their heat and an artificial circulation system must be created. Such a system is being developed in the US at Los Alamos, where a pair of holes have been drilled, the rock between has been fractured to complete the circulation path, and electric power has been generated.

In Canada geothermal potential is found in the sedimentary rocks of the prairies and in a broad band bordering the oceans (see GEOLOGICAL REGIONS). The central area of the Canadian landmass, the Shield, is too old and cool to yield useful heat. The total potentially usable heat in hot water in the sediments of the prairies is equivalent to 3000 times Canada's total energy use in 1979, but only a small fraction of this heat is readily exploitable at current energy prices and with current technology. British Columbia's mountains contain about a dozen volcanic centres that may have geothermal deposits capable of producing ELECTRIC POWER. There are also hot dry-rock deposits, in volcanic centres and more widespread zones of intrusive rocks, and in small sedimentary basins that may be abnormally warm. One of the volcanic centres, Mt Meager, is being drilled by BC HYDRO for geothermal steam. Temperatures of about 250°C have been encountered, and the aim is a 50 MW pilot plant by the late 1980s. In the arctic islands, the Sverdrup Basin probably holds a large geothermal resource, but opportunities for using it are few. There is a deep sedimentary basin under PEI and the Gulf of St Lawrence, but little is known about its temperature and water content. The Atlantic margin of Canada also contains large granitic bodies, some with sufficient heat production from radioactivity to give high temperature at a depth of about 3 km.

The US, USSR, Italy, NZ and Iceland are already using geothermal energy for ELECTRIC-POWER GENERATION, residential and commercial heating, and agricultural and industrial processes. In volcanic areas, geothermal energy seems to be renewable, provided that extraction rates are carefully controlled. In sedimentary basins it is not renewable at a reasonable rate and parts of the reservoir can be cooled to a level from which it will recover only after a few hundred years. Hot water used for heating buildings or for other direct applications must be used near the source, as it cannot be transported economically more than 10-20 km. Much of the geothermal water contains dissolved chemicals, but it is easily reinjected into the ground after use, both for disposal and to keep up reservoir pressure. Harmful environmental effects are few — usually the result of failing to reinject cooled water. Surface disposal of water has been a problem at Cerro Prieto, Mexico, where large evaporation ponds are used. Subsidence (settling of the ground) has occurred at Wairakei, NZ, where water has been dumped into a river.

ALAN M. JESSOP

Reading: L. Rybach, *Geothermal Systems* (1981).

**Geranium**, annual, biennial or perennial PLANT of genus *Geranium*, family Geraniaceae [Gk geranos, "crane"], with opposite, palmate and often divided leaves. Flowers have all parts in fives: 5 green sepals; 5 pink or purple, rarely white, petals; 10 stamens, etc. Common name, "cranesbill," is derived from characteristic, beaked fruit, which explodes, when ripe, into 5 one-seeded parts which remain attached to a central column. About 275 species are known worldwide; in Canada, 7 species are native, 5 or 6 have been introduced. Bicknell's cranesbill (*G. bicknellii*), widespread across Canada in open woods and disturbed soils, is a dainty plant, 10-50 cm high, with small, paired, rose-coloured flowers. Spotted cranesbill (*G. maculatum*), a perennial plant, 20-60 cm tall, is found in woods, thickets and meadows in Ontario and Québec. It is quite showy with palmate leaves and large, rose-pur-

ple flowers. The underground stem (rhizome) is rich in tannin and gallic acid and produces an astringent, hence the common name alum root. Indians used the rhizome for diarrhea, dysentery, internal and external bleeding, mouth ulcers, sore throats. White geranium (*G. richardsonii*), distinguished by white flowers with purplish veins, grows to 40-80 cm and occupies moist open woods, thickets and alpine meadows from the YT to BC, east to Saskatchewan. Sticky purple geranium (*G. viscosissimum*), a showy, glandular plant with large, divided leaves and large, reddish purple flowers, grows up to 60 cm and is found in moist meadows in mountains and foothills and moist fescue prairie of BC, Alta and southern Sask. The familiar garden form is not a true geranium but belongs to genus *Pelargonium*, family Geraniaceae, and is native to South Africa.

BERYL HALLWORTH

**Gérin, Léon**, lawyer, farmer, federal civil servant, sociologist (b at Québec C 17 May 1863; d at Montréal 15 Jan 1951). The founder of empirical social sciences in French Canada, Gérin had an outstanding reputation because of his numerous well-documented studies of Québec's rural society. After graduation from law school at U de M (1885), Gérin went to Paris, where he registered at the Museum of Natural History. After meeting Edmond Demolins and the Reverend de Tourville, both disciples of Frédéric Le Play, Gérin left the museum and spent 6 months at the Ecole de science sociale. Returning to Canada in 1887, Gérin bought a farm and joined the Ottawa civil service. He soon became, through numerous and meticulous publications about rural Québec, a prestigious and prolific writer. He became a fellow of the RSC in 1898 and president of the French section in 1900. In 1933 he was elected RSC president and was awarded the Lorne Pierce Medal in 1941.

MARC-ADÉLARD TREMBLAY

**Gérin-Lajoie, Antoine**, journalist, lawyer (1848), public servant and writer (b at Yamachiche, LC 4 Aug 1824; d at Ottawa Aug 4 1882). As a student at Nicolet College, he wrote the poem "Un Canadien errant" (1842) and *Le Jeune Latour* (1844), the first Canadian tragedy. He was a founding member and president of the INSTITUT CANADIEN and one of its highly respected lecturers, a journalist for *La Minerve* (1845-47), the author of a very useful *Catéchisme politique* (1851), and a public servant. After being translator to the Assembly of the PROVINCE OF CANADA, he was assistant librarian at the Library of Parliament 1856-80 and chief compiler of its *Catalogue* (2 vols 1857-58). He helped found *Les Soirées canadiennes* and *Le Foyer canadien*, of which he was the leading figure (1862-65). His most famous work is a 2-part novel: *Jean Rivard, le défricheur* (1862) and *Jean Rivard, économiste* (1864), which extols the virtue of clearing uncultivated land in Québec as a means of ensuring survival of the French Canadian nation. Part of his *Mémoires* (1885) and an important historical work, *Dix ans au Canada, de 1840 à 1850* (1888-91), were published posthumously.

RENÉ DIONNE

**Gérin-Lajoie, Marie**, née Lacoste, author, educator, organizer (b at Montréal 19 Oct 1867; d there 1 Nov 1945). Gérin-Lajoie combined Catholicism and family life with reform work, developing a concern for women's rights after she discovered women's legal disabilities from reading her father's law books. A founder of the Fédération nationale St-Jean-Baptiste (1907), bringing together francophone women from charitable and professional associations, she directed its activities for the next 20 years, working closely with local branches of the National Council of Women of Canada. She was a lecturer

at U de Montréal and wrote *Traité de droit usuel* (1902) and *La Femme et le code civil* (1929). Although Gérin-Lajoie gave up her position as head of the francophone section of the Provincial Franchise Committee when the bishop of Montréal expressed disapproval of women voters (1922), she continued to agitate for women's rights. She testified before the Dorion Commission (1929) whose recommendations led to amendments to the Québec Civil Code.

MARGARET E. MCCALLUM

**Germain, Jean-Claude**, writer, theatre producer (b at Montréal 18 June 1939). While attending U de M (1957-59), he established the Théâtre Antonin-Artaud in 1958 and began work on a production of *Ubu roi* that had to be cancelled for lack of funds. He later wrote theatre reviews for the *Petit Journal* (1965-69), *Digest éclair* and *Dimensions* (1968-69), *l'Illettré* (1970-71) and *Maclean's* (1972-73).

Germain served as executive secretary of the Centre d'essai des auteurs dramatiques (1968-71) and in 1969 established the experimental Théâtre du même nom (TMN) where he clearly demonstrated his distance from the theories of the "Cartel" espoused by the THÉÂTRE DU NOUVEAU MONDE (TNM). The actors of Germain's company, known popularly as the Enfants de Chénier (1969-71) and later P'tits Enfants Liberté (1971-73), combined with André Brassard's group (Théâtre de Montréal) and Jean-Pierre Saulnier's company (Apprentis-Sorciers) to form the Centre du théâtre d'aujourd'hui, of which Germain was general manager 1972-82. Since 1969, Germain has produced some 15 collective creations, made 4 adaptations and, since 1973, produced 8 of his own texts (not including scripts written for TV and reviews for Radio-Canada). He has published poetry in *L'Action nationale* (1966-67), 3 outlines for collective plays, 2 adaptations and a dozen of his own plays. He has published short essays on theatre in *Pays théâtral* (1977-80) and, since 1973, has taught at the National Theatre School. In 1977 he won the Victor-Morin Award.

ANDRÉ G. BOURASSA

**German Writing** German Canadians, Canada's third-largest ethnic group, hail from a variety of national and cultural backgrounds: GERMAN, AUSTRIAN, SWISS, MENNONITE and others. Common to them are their language (High or Low German, or a variety of dialects), the experience of leaving the Old World and finding roots in the New World, and that of learning the new language(s) and adapting to new customs. Their literature reflects their experience. First-generation writers generally perceive and portray the new country from their perspective of the old, and in their native tongue; the next generation, having acquired both the new cultural traditions and at least one of the official languages, contributes to one of Canada's mainstream literatures, usually English Canadian.

Chronology and locations of developing literary activity are related to settlement. In 1750 the first Germans arrived in Nova Scotia and established LUNENBURG. At the time of the American Revolution the LOYALISTS — among them some of German origin — moved N. During the 1830s Mennonites from Pennsylvania settled in the Berlin (Kitchener, Ont) area. Large waves of German immigration came from Europe to Ontario, 1830-80, and to western Canada, 1880-1910. The most significant influxes followed the 2 world wars, and during the same periods many Mennonites came, mainly to Manitoba.

The pioneers had little time for literature, but newspapers and periodicals provided an early forum for creative writing. One of the earliest publications, *Der Neu-Schottländische Kalender* (1788-1801), featured anonymous poems and short prose. Among the numerous German-language newspapers, the *Berliner Journal* (Wa-

terloo) is of special interest for its humorous and entertaining dialect letters to the editor by John A. Rittinger. Spiritual leaders published religiously oriented didactic literature. The writings of Father Eugen Funcken (1831-88) and of Heinrich Rembe (1858-1927), for example, reflect strong influences of German classicism and romanticism, as does early Canadian Mennonite devotional didactic literature, which was written in Low German for a Mennonite audience. A significant departure in Mennonite literature is the recording of the experience of being uprooted from Russia, migrating to Canada and starting anew. Dietrich Neufeld's diary, *Ein Tagebuch aus dem Reiche des Totentanzes* (1921), and Hans Harder's *In Wologdas weissen Wäldern* (1934; tr *A Russian Dance of Death*, 1977, and *No Strangers in Exile*, 1979, respectively), and the novels of Gerhard Toews (pseudonym Georg de Brecht) deal with these chaotic times and events. Other important works are Arnold Dyck's educational, autobiographical novel *Verloren in der Steppe* (1944; tr *Lost in the Steppes*, 1974) and the vivid poetry of Gerhard Friesen (pseudonym Fritz Senn). Beginning in 1935, the periodical *Die Mennonitische Warte* encouraged literary activity. The anthologies *Harvest* (ed William de Fehr et al, 1974) and *Unter dem Nordlicht* (ed G.K. Epp, 1977) feature poetry and short prose in High and Low German and in English by more than 40 Mennonite contributors, along with introductory essays and bibliographies. Most significant in contemporary Mennonite literature is a new generation of writers born in Canada and writing in English, including Rudy Wiebe, Clint Toews, David Waltner-Toews, Menno Wiebe and Patrick Friesen.

Writers who had made their debut in German-speaking Europe continued to publish there. Else Seel (1894-1974) came from Berlin in 1927 to the BC wilderness, where she wrote poetry, short prose and a diary reminiscent of the work of Catharine Parr Traill and Susanna Moodie. Walter Bauer (1904-76), well known as an author in Germany, came to Canada in 1952. His books on Canadian themes reflect his European view of Canada. A small part of his work is available in English translation: *The Price of Morning* (1968) and *A Different Sun* (1976; both tr Henry Beissel) and *A Slight Trace of Ash* (1976, tr H. Milnes). Swiss-born Hermann Böschstein (1900-82), author of expressionist prose, wrote, besides scholarly publications on German literature, short stories and a novel dealing perceptively with the immigrant experience.

Some writers who were at home in both German and English made their mark in English Canadian literature: Felix Paul Greve, under his adopted name Frederick Philip Grove, became one of Canada's most important realists with his portraits of prairie life; his work is deeply rooted in the literary traditions of German naturalism and neo-romanticism.

Three writers came to Canada during WWII via internment in England: Carl Weiselberger (1900-70), already known in Vienna, served as the art and music critic of the *Ottawa Citizen* after his internment, and wrote short stories and newspaper articles reflecting a refreshing enthusiasm for his new homeland. Henry Kreisel, born in Vienna, Austria, became a professor of English and has written short stories and 2 novels, *The Rich Man* (1948) and *The Betrayal* (1964), with central themes concerning Europe and Canada. Charles Wassermann (1924-78), reporter, broadcaster and writer, became an important intermediary between the Old World and the New.

The writers who came to Canada at an early age were most successful in adopting English as their creative medium: Henry Beissel, born in 1929 in Cologne, Germany, came to Canada in 1951 via England. His work dealing with Indian and Inuit themes, his epic *Cantos North*

(1982) and his subjective *Kanada, Romantik und Wirklichkeit* (1981) are sensitive statements about the Canadian experience. Derk Wynand, born in 1944 in Bad Suderode, Germany, came to Canada in 1952 and became known as the translator of H.C. Artmann and as an author of modernist poetry and short prose in English. Andreas Schroeder, born in Hoheneggelsen, Germany, in 1946, was educated in Canada and is known as an editor and translator from German and an author of prose and poetry in English. Ulrich Schaffer, born in 1942 in Germany, came to Canada in 1953. Though he writes in both English and German, his audience is primarily in German-speaking western Europe. His writing, often inspired by the Canadian landscape, is sometimes reminiscent of Kafka. Those writers who continue to write in German well after their arrival in Canada invariably have to contend with the problems of both publication in a minority language and reaching an audience. Rolf Windthorst, born in 1909 in Dortmund, Germany, and living in Alberta since 1956, and Valentin Sawatsky, born in Ukraine in 1914 and living in Ontario since 1950 — to name but 2 of the more prolific writers — have not been able to find the readership their works may deserve.

The anthologies *Ahornblätter* (comp Heinz Kloss and A.B. Dyck, 1961) and *Nachrichten aus Ontario* (ed Hartmut Fröschle, 1981) feature samples of work by over 50 authors. The latter also contains a comprehensive introduction to German Canadian literature, a useful "Who's Who" and a selected bibliography. Critical attention to the writing of German Canadians is recent. The most important forums are the *German-Canadian Yearbook* (ed Hartmut Fröschle, 1973-), the proceedings of symposia on German Canadian studies and 2 series of critical editions and studies of German Canadiana. WALTER E. RIEDEL

Reading: K. Gürtler, ed, *Symposium* (4 vols to date, 1976-83); H. Loewen, ed, *Mennonite Images* (1980); W.E. Riedel, ed, *The Old World and the New* (1984).

**Germanic Fraktur and Calligraphy** Handwriting has served the needs of communication and recording in every literate culture and has been regarded as an essential tool of civilization. Frequently, however, lettering has been developed beyond the utilitarian level to an artistic form. The artistic calligraphy that flourished after the 17th century among the peoples of southern Germany, Alsace and Switzerland is known as *fraktur*. Related to the English word "fracture," the term suggests a lettering form

Drawing of bird and tulips from Lincoln County, artist unknown (private collection).

Anna Weber, *Birds and Checkered Sheep* (1875) (private collection).

with fractures or breaks in the script, which give an ornamental or decorative effect.

MENNONITES migrating from Pennsylvania to Ontario between the 1780s and 1830s brought along this art form. It flourished chiefly in 3 areas of early Ontario: the Niagara Pen (Lincoln and Welland counties), upper York County (especially Markham and Vaughan townships) and Waterloo County. Beautifully decorated fraktur songbooks, as well as drawings and exercises, were made by Samuel Moyer and other Mennonite teachers at Vineland in Lincoln County during the early 1800s. In the Markham area of York County one interesting artist, Christian L. Hoover, took up the activity during a year of severe illness, making hand-lettered and decorated birth records for relatives and friends. The largest output occurred from the 1820s to the 1890s in the sizable Mennonite community of Waterloo County, where several artists produced colourful fraktur drawings and texts. Anna Weber, one of the few women to practise the art, appears to have been a lonely individual, suffering from poor health, who made delightful drawings of birds, trees and animals for friends and visitors and for children of families who looked after her in her later years.

The art has revived somewhat in recent years with its reintroduction into some Old Order Mennonite schools in the Waterloo area of southern Ontario, and with a growing interest by the public at large in relearning lost artistic forms. During its high point, in 19th-century Ontario, fraktur was one of Canada's most exuberant folk-art traditions. MICHAEL S. BIRD

Reading: Michael S. Bird and Terry Kobayashi, *A Splendid Harvest: Germanic Folk and Decorative Arts in Canada* (1981).

**Germans** Few Canadians of German-speaking origin are *Reichsdeutsche* (from Germany); most are *Auslandsdeutsche* (from other lands), and may include Roman Catholics, Jews, Mennonites, Lutherans or others, who originate from Estonia in the N to the Black Sea in the S, from Alsace in the W to the Caspian Sea in the E.

There are about 1.1 million Germans in Canada, comprising 6.3% of the population. The majority reside in NS (33 145), Québec (33 770), Ontario (373 390), Manitoba (108 140), Saskatchewan (161 700), Alberta (233 175) and BC (187 630).

**Migration and Settlement** The Thirty Years War, 1618-48, upset the balance of the German population and caused the first wave of migrants to the New World. Later, a small number of settlers of German origin, including some

demobilized soldiers who had served under the French king at Port-Royal, Louisbourg and Québec, established themselves in NEW FRANCE; in 1664 Hans Bernard, the first recorded German settler, purchased land near Québec. Between 1664 and 1700 the migration of civilians was overshadowed by the settlement of soldiers from the garrisons of New France. Between 1749 and 1752 about 2000 German newcomers landed at Halifax. They were Protestants and represented the first organized attempt to settle Germans in Canada. They had been recruited by the British government from principalities suffering from severe economic problems, religious persecution or war. In 1763 some 1600 of the immigrants were moved to Merligash (renamed LUNENBURG) where they became fishermen and boat builders.

Between 1760 and 1770 Germans from Europe and Pennsylvania settled in Annapolis County (NS) and in several other areas that later became part of New Brunswick. During and after the American Revolution, among the thousands of United Empire LOYALISTS who journeyed to British N America, were many persons of German origin who had settled earlier in Pennsylvania, New York and even Georgia. Some formed part of the group who sailed from New York to Halifax in 1783, the others either moved up the Hudson River Valley by Lk Champlain and down to Sorel or made their way over the Niagara frontier. These groups included ordinary civilians as well as members of militia regiments and German regiments who had fought for the British Crown. Of some 1200 discharged German soldiers of Brunswick regiments recruited in German principalities and sent to Canada to defend it against American invasion, several hundred settled in Lower and Upper Canada, New Brunswick and Nova Scotia, where they founded the Hessian Line and Waldeck Line settlements.

In 1792, after John Graves SIMCOE became lieutenant-governor of Upper Canada, native Americans who still sympathized with Great Britain were invited to take up free land in the new province, and many settlers of German origin did so. Between 1792 and 1837 German settlers also arrived in Canada from New Jersey and Pennsylvania. They were not of Dutch origin but nevertheless were known as "Pennsylvania Dutch." The majority were MENNONITES who sought not only free land but religious freedom and exemption from military service. Americans regarded Mennonites and other "plain folks" Germans with great suspicion because they had been conscientious objectors and had not been involved in the war. For these migrants the "German Company" purchased land in the Grand River Valley of Ontario, and Waterloo county became the centre of German settlement. Berlin (now KITCHENER) was the principal community. Settlers of German LUTHERAN and Catholic origin also settled in this area and Mennonites founded communities in the Niagara district and in York County, at Whitchurch. Settlers travelled from the US in their Conestoga wagons, which were antecedents of the prairie schooners of the North American West.

After 1830 many German Catholics and Amish people arrived directly from Europe, settling in Perth, Huron, Bruce and Grey counties. Others, chiefly from Prussia, settled along the Ottawa R in Renfrew County and in Québec's Pontiac County. At Confederation, about 200 000 people of German origin had settled in Canada, mostly in Ontario. About 1500 lived in Québec (mainly Montréal) and 47 000 in the Maritimes, including 20 000 in Lunenburg County (NS). The immigration from Germany, which continued until the 1870s, changed drastically with the prosperity of the newly established German empire; it was replaced by large

numbers of German-speaking Mennonites from Ukraine who helped pioneer settlements on the prairies. After Canada acquired land from the Hudson's Bay Company the township system of settlement was adopted in 1871 and the Dominion Lands Act of 1872 facilitated homesteading. From 1872 onward, William Hespeler, an immigrant himself and a colonizer, contacted Mennonites and HUTTERITES who were intent upon leaving southern Ukraine because of changing Russian policies towards minorities. He persuaded a group of leaders to come and search for suitable land in Manitoba. The leaders received freedom from military service for their members, the right to educate their children and other concessions that led them to endorse migration to Canada. About 7000 Mennonites emigrated to Manitoba between 1874 and 1880, settling in the East Reserve — E of Ninerville, W of STEINBACH — and the West Reserve — E of Morden and W of Rosenfeld. Eastern Canadian settlers had doubted that the prairies could be settled, but the Mennonites confirmed that prairie soil was indeed fertile, and many of the colonizers prospered. From 1880 to 1900 thousands of settlers of German origin (many from Eastern and Southeastern Europe) settled in Manitoba, Saskatchewan and Alberta. Most settlements were along denominational lines. Mennonites lived in Swift Current and Rosthern, Lutherans in central Saskatchewan and Roman Catholics, after 1903, in the St Peters Colony, near Humboldt, and in the St Josephs Colony, near Tramping Lake. By 1914 about 35 000 Germans had settled in Manitoba, comprising 7.5% of the population; in Saskatchewan the number of immigrants with German origins jumped from under 5000 in 1901 to 100 000 in 1911, and German communities in Alberta, including the Josephsburg Colony (also called Medicine Hat) and those along the Calgary and Edmonton Railway had, by 1911, reached a population of about 41 000 people.

Although a small number of German settlers moved to BC under the auspices of the HBC, any sizable settlement dates from the Fraser River Valley gold rush of 1858 and a later one in the Cariboo Mts. Most of these Germans made comfortable livings as grocers, farmers, craftsmen, shopkeepers and brewers. By 1911 there were about 11 800 German-speaking persons in BC but a slump beginning in 1912 and WWI curbed German immigration.

WWI had a profound impact upon German Canadians. Until then, they were considered preferred immigrants, but with the outbreak of war the Canadian government restricted immigration. As a result of the war against Germany, Germans and other Europeans were vilified, arbitrarily interned, their properties confiscated and never accounted for and the use of their language restricted or banned altogether (see PREJUDICE AND DISCRIMINATION). Because Mennonites became one of the special targets of this new policy, about 6000 Old Colony Mennonites from Manitoba and Saskatchewan left Canada in the 1920s and settled in Chihuahua, Mexico, but retained their Canadian citizenship.

In 1918 a party of about 50 German-speaking Hutterites did immigrate to Canada from Dakota, settling in Manitoba and Alberta where their communal way of life often sparked conflict between their community and the government and local people. Germany did not acquire "favoured nation" status until 1927, but between 1919 and 1935 some 97 000 German-speaking immigrants arrived in Canada from Poland, Austria, Czechoslovakia and Germany. Some of the newcomers were artisans, shopkeepers and labourers; many were young men and unattached workers, who as nonpreferred migrants had to work on farms for an initial period of time. After a few years, these men drifted into the towns and cities in search of urban employ-

ment that would allow them to raise passage money to bring over their families. Some succeeded but the majority, because of the GREAT DEPRESSION, were unable to do so. Migration came to a virtual standstill during the 1930s and many migrants decided to go home. In the late 1930s there was a small flow of Sudeten Germans, who because of their Social Democratic political affiliation emigrated to escape Nazi persecution. Otherwise, Canada closed its doors to thousands of JEWS seeking refuge from Nazi rule (see also IMMIGRATION). After the British evacuation of Dunkirk, people of German or Austrian origin living in the UK were classified as "friendly aliens" and 6700 were sent to Canada for detention. By 1943 they had been released and 5200 remained in Canada.

The treatment of German Canadians during WWII was remarkably mild. While known Nazi sympathizers were interned for prolonged periods, other German Canadians were left alone. Only the property of German nationals was confiscated.

Between 1947 and 1950 immigration to Canada by Germans included many German-speaking refugees from Eastern Europe (ethnic Germans or *Volksdeutsche*), from Romania, Yugoslavia and the former Austria-Hungary. In 1950 a ban on immigration of German nationals was lifted. Between 1951 and 1960 some 250 000 German immigrants arrived in Canada, about 60% of whom remained in Canada permanently. In 1958 new immigration regulations, designed to maintain a lower level of immigration of any kind into Canada, were implemented. Since the 1970s the Old Colony Mennonites have slowly returned from Mexico and Latin America and an increased migration of German industrialists and investors has begun.

**Social and Cultural Life** The majority of German Canadians have acculturated in a selective fashion, retaining some of their ethnic traits but discarding others in favour of Canadian patterns. There is no unified German culture in Canada; instead there is religious and cultural pluralism. Most Canadians of German origin belong to the Protestant churches, but about 25% are Roman Catholic and 9% are Mennonites or Hutterites. The life of the early settlements revolved around the churches, which were responsible for language schools, care of the needy and recreational facilities.

The German Benevolent Society (est 1835 in Montréal) and the Germania Club (est 1864 in Hamilton) are the oldest surviving German Canadian clubs. After WWII new clubs were organized to help recently arrived immigrants or to promote cultural interests. One of the oldest Canadian musical societies, the Québec Harmonic Society (est 1820), was founded by the German Henri Glackemeyer, and many choir groups were formed before Confederation.

The national umbrella organization for German Canadians is the Trans-Canada Alliance of German Canadians, established 1951 in Kitchener to preserve the cultural heritage of German-speaking Canadians.

Festivals and celebrations are popular among Germans. The largest festival is Oktoberfest, now held in Kitchener. Christmas is also a major celebration. The custom of a lighted evergreen tree, which originated in Germany in the 16th century, was introduced into Canada in 1776 by Baroness von Riedesel.

The first German-language publication, *Hali-fax Zeitung*, appeared in the 1780s. Since 1951, 2 large newspaper chains, the Courier Northwestern and the Reprich chain, have been established. German-language broadcasting is conducted on privately operated radio stations.

Governors general, one former prime minister (JOHN Diefenbaker) and members of the federal and provincial governments have been German in origin, but considering the numbers of Ger-

man immigrants to Canada, Germans have not been proportionately represented in politics.

**Economic Life** Economically German Canadians are generally prosperous. They have retained the management of German-owned companies and are prominent in technical and professional occupations. Germans are also over-represented in skilled trades and machine-working occupations and farming. German farmers began grape growing in the Niagara Peninsula. Canadians of German origin are underrepresented in public service, however, where the German component is slightly over 3%.

R.A. HELLING

*Reading:* W.R. Bell, *The Foreign Protestants and the Settlement of Nova Scotia* (1961); F.H. Epp, *Mennonites in Canada, 1786-1920* (1974); O. Gingerich, *The Amish of Canada* (1972); G.E. Reaman, *The Trail of the Black Walnut* (1957); H. Troper and I. Abella, *None Is Too Many* (1982).

**Gerontology**, the scientific study of AGING and its consequences, eg, social and economic problems precipitated by growing numbers of elderly in a population; psychological aspects of aging; physiological bases of aging; and general biological aspects of aging in all animal species.

Systematic Canadian research began in 1944 with the founding of the Gerontologic Research Unit at McGill University. During the 1950s the Canadian Welfare Council formed the Committee on Aging, which began research in social gerontology that continues under its successor, the Canadian Council on Social Development. The Ontario Geriatrics Research Society became the Canadian Geriatrics Research Society in 1975. Research was stimulated by provincial conferences on aging held in several provinces beginning in 1957 and continued through the early 1960s. In 1966 the final report of the Senate's Special Committee on Aging was published, the first provincial office on aging, in Ontario, was created and the Canadian Conference on Aging was held.

Increasing participation of Canadian gerontologists in international gerontology associations led to the establishment of the Canadian Association on Gerontology/Association canadienne de g rontologie (CAG/ACG) in 1971. By 1984 it had grown to about 1200 members in 5 divisions, representing subspecialty interests in social sciences, psychology, biology, health sciences and social welfare. The CAG/ACG is the major forum for gerontological research in Canada through its annual conferences and its *Canadian Journal on Aging*, est 1982. In addition, all provinces have provincial associations, 8 of which are affiliated with the CAG/ACG. Qu bec has 2 nonaffiliated organizations. Several related organizations with gerontological activities exist in many provinces and some of these, such as the Ontario Psychogeriatric Association, are actively involved in research.

Since the late 1970s, extensive research support has been provided for social gerontology by the Social Sciences and Humanities Research Council of Canada through its Strategic Grants Program in Population Aging. Health-related research, both geriatric and social, has received increased funding support in Ontario by the Gerontology Research Council of Ontario, est 1980. Significant in-house or contractual research concerned with income security and health-provision issues associated with the aging of the population has been generated by federal and provincial task forces and committees and by the Economic Council of Canada.

The need for research in gerontology has been most evident in relation to the economic aspects of population aging, especially PENSIONS policy and because older people use health services more extensively than do the young. Because age is a major basis on which we establish rights and obligations as well as informal expectations for behaviour, population aging will necessitate

the adaptation of many social institutions, from the design of cities and transportation systems to reforms in FAMILY LAW. The expectation of a long life challenges the old and the young with whom they share familial and social relations. For these reasons, general interest in aging and research in gerontology has grown significantly over the past 50 years.

VICTOR W. MARSHALL

**Gesner, Abraham**, geologist, author, chemist, inventor (b near Cornwallis, NS 2 May 1797; d at Halifax 29 Apr 1864). Gesner invented kerosene oil and, because of his patents for distilling bituminous material, was a founder of the modern petroleum industry. He studied, described and mapped the distribution of rock formations in NS, NB and PEI. His father, Col Henry Gesner, was exiled from a large farm in NY state and moved to the Annapolis Valley. After elementary schooling in NS, Abraham enrolled as a medical student in London, Eng, in 1825, and graduated as a physician and surgeon. He returned to Parrsboro, NS, and began a medical practice and also continued to explore NS by boat, on horseback and on foot. He moved to Saint John, NB, 1838, and his 5 annual reports on the geology of NB (1839-43) established him as the first government geologist in a British colony. During this time he rediscovered the veins of solid bitumen in Albert County, which he used in experiments in distillation. He used his field collections to start the first natural history museum in Canada at the Mechanics' Institute, Saint John, NB, 1842, before returning to NS in 1843. Beginning about 1846 he developed experiments for distilling "coal oil" from solid hydrocarbons and coined the name kerosene for the lamp oil that he had perfected by 1853. He obtained patents in 1854 and a factory was set up under his guidance on Long Island, NY, to manufacture kerosene, which became standard lighting fuel in homes. In 1863 he sold his patents and returned to Halifax where he was appointed professor at Dalhousie.

Gesner wrote numerous scientific papers and reports and several books, the most important of which was *A Practical Treatise on Coal, Petroleum and Other Distilled Oils* (1861). His other inventions include one of the first effective wood preservatives, a process of asphalt paving for highways, briquettes made from compressed coal dust, and a machine for insulating electric wire.

Abraham Gesner, inventor who coined the name "kerosene" for the lamp oil he perfected (courtesy Geological Survey of Canada/100798).

Imperial Oil has provided a tribute at his grave in Halifax for he did "give the world a better light."

L.M. CUMMING

**Gibson, George**, "Mooney," baseball player (b at London, Ont 22 July 1880; d there 25 Jan 1967). Gibson signed a professional contract in 1903 and joined the Pittsburgh Pirates 2 years later. He had a strong throwing arm and led National League catchers in fielding percentage several times. He was a member of Pittsburgh's 1909 World Series champions and played in the majors until 1918. Known as a developer of young pitchers, Gibson later managed the Pirates (1920-22, 1932-34) and the Chicago Cubs (1925). He was named Canada's baseball player of the half century and in 1958 was the first baseball player elected to Canada's Sports Hall of Fame.

WILLIAM HUMBER

**Gibson, Graeme**, writer, cultural activist, teacher (b at London, Ont 9 Aug 1934). Although best known for his 3 novels, Gibson has also made national contributions through organizational initiatives. Educated at Western, in 1961 he began an 8-year career teaching English at Ryerson. He was instrumental in forming the WRITER'S UNION OF CANADA, which he chaired 1974-75. In 1973 he began work on a literary resources guide and was concurrently developing the Book and Periodical Development Council. The Writer's Development Trust was another group Gibson helped launch. His novels include *Five Legs* (1969), *Communism* (1971) and *Perpetual Motion* (1982). In 1971 he wrote a film script of Sinclair Ross's *As for Me and My House*. He has also written travel articles, a book of interviews entitled *Eleven Canadian Novelists* (1973), was awarded the Writers Exchange Fellowship to Scotland (1978) and has been writer-in-residence at U Waterloo.

MARLENE ALT

**Gibson, Sir John Morison**, businessman, lawyer, politician (b at Toronto 1 Jan 1842; d at Hamilton, Ont 3 June 1929). A Liberal provincial politician known for his reformist views, Gibson was responsible for the 1893 Act for the prevention of cruelty to children, which led to the creation of Children's Aid societies in Ontario. His Hamilton-centered business interests encompassed industrial promotion, real-estate development, the provision of urban services such as utilities and streetcars, and the organization and operation of interurban electric railways. In the early 20th century, companies in which he was a principal dominated the hydroelectricity supply system and radial railway network of the Hamilton-Niagara region. A renowned rifleman and militia supporter, Gibson served as first president of the Canadian Red Cross 1896-1910 and was lt-gov of Ontario 1908-14.

CAROLYN GRAY

**Gibson, Tom**, painter, photographer (b at Edinburgh, Scot 11 Dec 1930). He documents, in a highly personal way, what he sees in the streets, his images revealing both the amusing and the alienating sides of urban life. Gibson settled in Toronto in 1952, enrolled at the Ontario Coll of Art and became part of a circle of artists including Graham Coughtry, William Ronald and Michael Snow. By the mid-1960s he had left painting for photography. He moved to Montr al in the mid-1970s and began to teach photography at Concordia. Gibson's black-and-white photographs have been shown nationally and internationally and have appeared in magazines and books, including *Tom Gibson Signature 1* (National Film Board, 1975).

LOUISE ABBOTT

**Gibson, William Wallace**, aircraft inventor (b at Dalmellington, Scot 1876). After making a fortune in mining, Gibson built the first successful Canadian aircraft engine, and then the Twin-Plane aircraft, which first flew Sept 1910 near Victoria, BC, with a 60-hp gasoline engine. A second aircraft, the Multi-Plane (with 4 nar-

row sprucewood wings) is reported to have flown successfully the following year near Calgary before being wrecked in a crash. Broke, Gibson returned to mining and later moved to San Francisco.  
DONALD J.C. PHILLIPSON

**Giguère, Roland**, poet, painter, publisher (b at Montréal 4 May 1929). Recipient of the Paul-Émile Borduas Award in Visual Arts (1982) and a nominee for the coveted Prix David in literature that year, Giguère has, with the foundation of the Éditions Erta (1949), played a major role in the development of Québec's artistic life.

It was not until publication of his first collected volume of poems, *L'Âge de la parole* (1965), that he gained recognition, being awarded the Prix France-Québec and the Grand Prix littéraire de la ville de Montréal. For political reasons Giguère refused in 1974 the Gov Gen's Award for *La Main au feu* (1973). His most recent collection is *Forêt vierge folle* (1978). Influenced by the surrealists, Giguère has always refused to equate poetry and the written word. To him, poetry is a way of life, a perpetual revolt in which the exterior world is invaded by the artist's interior world.  
JEAN-MARCEL DUCIAUME

**Gilbert, Sir Humphrey**, explorer (b near Dartmouth, Eng c1537; d at sea 9 Sept 1583). Gilbert was an early publicist for the idea of a NORTH-WEST PASSAGE, publishing an influential *Discourse* (1576) on the subject, and his experience in colonizing Ireland suggested similar ventures farther afield. He received letters patent 11 June 1578 from Queen Elizabeth authorizing him to colonize the coast of N America. His first attempt, in 1578, was frustrated by poor organization, desertion and storms. Undaunted, he regrouped and set out again 11 June 1583 with 5 vessels (*Delight*, *Raleigh*, *Golden Hind*, *Swallow* and *Squirrel*); the queen tried to persuade Gilbert to stay behind, noting he was a man "of not good happ by sea." The *Raleigh* turned back, but the other 4 ships arrived off St John's Aug 3. Brandishing his letters patent, Gilbert entered the harbour Aug 5 and formally took possession of Newfoundland. He dispatched *Swallow* to England with the sick and malcontents and left St John's Aug 20, losing *Delight* in shoals off Sable I, and turned homeward in heavy seas. On the evening of Sept 9 Gilbert reportedly sat astern of *Squirrel* repeatedly calling out, "We are as neare to Heaven by sea as by land." Near midnight he and the *Squirrel* were "devoured and swallowed up of the Sea." The *Golden Hind* reached Dartmouth Sept 22.

Vain, tempestuous, even cruel, Gilbert was typical of the early adventurers who became obsessed with America. His own exploits were failures but his persuasive, if faulty, advocacy of a Northwest Passage spurred endless fascination, and although his seizure of Newfoundland seemed a formality, nobody seriously disputed it and the colony became the first English possession in the New World.  
JAMES MARSH

**Gilbert, Kenneth**, harpsichordist, organist, musicologist (b at Montréal 16 Dec 1931). After winning the Québec government's Prix d'Europe for organ in 1953, he moved to the forefront of virtuosity and scholarship. His new editions of early keyboard music (notably of Couperin's and Rameau's complete harpsichord works, and Scarlatti's sonatas) have won the admiration of musicologists worldwide. A strong advocate of classical organ design, he spearheaded the return to mechanical action in many new installations across Canada. Since 1965 Gilbert has performed almost exclusively on the harpsichord, appearing in N America and Europe as soloist, chamber musician and recitalist. International critics have praised highly his many records, among them the complete harpsichord works of Couperin (1970-71) and Rameau (1976).  
BARCLAY McMILLAN

**Gill, Charles**, painter, teacher (b at Sorel, Qué 21 Oct 1871; d at Montréal 16 Oct 1918). He began to study design in Nicolet with Abbé Thomas Maurault and continued his art studies in Montréal with William Raphael before enrolling in William BRYMNER's courses at the Art Gallery school. Encouraged by American painter George de Forest Brush, he began in 1889, at age 18, a long stay in Paris. He studied at the École des Beaux-Arts in Paris and frequented the literary circles of Montmartre and the Latin Quarter, making friends with Alphonse Allais and Paul Verlaine. In 1892 he came home to win the contract for a large canvas, *La Visitation*, intended for the Sacré-Coeur Chapel of Notre-Dame de Montréal. He became professor of design at the École Normale Jacques-Cartier, teaching concurrently at the Monument National and the École des Arts et Métiers. Around 1895 Gill helped found the École littéraire de Montréal, with Louvigny de Montigny, and soon became a brilliant writer, regularly publishing his stories, poems, and art critiques and commentaries in such periodicals as *Le Canada*, *La Presse* and *Le Nationaliste*. He died a victim of the 1918 INFLUENZA epidemic. His sister Marie published his poetry in 2 volumes — *Le Cap éternité* and *Les Étoiles filantes*.

MICHEL CHAMPAGNE

**Gill, Robert**, theatre director, teacher (b at Spokane, Wash 19 July 1911; d at Toronto 10 Aug 1974). He studied and later taught at Pittsburgh's Carnegie Tech and was active with Pittsburgh Playhouse and Opera Soc, and Woodstock (NY) Playhouse. He was Hart House Theatre director, U of T, from 1945 to 1965, and trained a generation of actors and directors that helped launch Canada's professional theatre, including William HUTT, Kate REID, Charmion King, Donald SUTHERLAND and Barbara Hamilton. He was instrumental in founding the Straw Hat Players in Muskoka (1947) and Toronto's Crest Theatre (1954). He also taught at the Royal Conservatory of Music, Toronto, the Banff School of Fine Arts, Banff, Alta, and at UBC.  
DAVID GARDNER

**Gilmour, Clyde**, broadcaster, critic (b at Calgary 8 June 1912). An influential film and record columnist who has written for a number of newspapers and magazines, Gilmour is best known as a radio personality. He was named a member of the Order of Canada in 1975 in recognition of the national appeal of "Gilmour's Albums," broadcast weekly on CBC Radio since 1956.  
BARCLAY McMILLAN

**Gimli**, Man, Town, pop 1550 (1981c), inc 1946, is located on the W shore of Lk WINNIPEG, 85 km N of Winnipeg. The mother colony of several N American Icelandic settlements, Gimli developed after a series of natural disasters forced ICELANDERS to leave their island 1874-76. Some 200 arrived near Gimli in 1875 to begin New Iceland, a tract of land outside the boundaries of Manitoba reserved for their use by the Dominion government. The settlers experienced extreme hardships — a smallpox epidemic, flooding, financial problems, religious differences — which led to out-migrations, but they also developed schools, a newspaper, a fishing industry and a self-governing colony with a sophisticated constitution. New Iceland came under Manitoba's jurisdiction 1881, and by the late 1890s the area was receiving Ukrainian, Polish, German and Hungarian immigrants. Farming, fishing and mink ranching shaped Gimli's early economy, but an air-force base established during WWII was a major boost. When the base closed in 1971 an industrial park was formed and the town's recreation resources were revitalized to offset the loss. Gimli has several cottage developments and summer camps nearby and hosts the annual Icelandic Festival of Manitoba. It is also a National Research Council base for

stratospheric studies. Gimli was named for "the great hall of heaven" in Norse mythology.

D.M. LYON

**Ginger Group**, an independent group of members of Parliament who in 1924 split from the PROGRESSIVE PARTY because they did not support a party structure that inhibited an MP's ability to act solely as the representative of his constituents. The group, named after the Tory MPs who in 1917 opposed the MILITARY SERVICE ACT, was initially composed of UNITED FARMERS OF ALBERTA representatives G.C. Coote, Robert Gardiner, E.J. Garland, D.M. Kennedy and Henry Spencer, and UNITED FARMERS OF ONTARIO representative Agnes MACPHAIL. Later, working with Labour MPs J.S. WOODSWORTH, William IRVINE, A.A. HEAPS and Angus MacInnis, it included Ontario MPs W.C. GOOD and Preston Elliott, Alberta Independent Joseph Shaw, Milton Campbell from Saskatchewan and W.J. Ward from Manitoba. The Ginger Group declined along with the Progressive Party; some members later helped found the CO-OPERATIVE COMMONWEALTH FEDERATION.

**Ginseng**, herbaceous perennial PLANT of genus *Panax*, ginseng family (Araliaceae). Six species are known, 2 from N America, 4 from E Asia. Plants grow to 30 cm and have a large, fleshy, often forked root. Although there seems to be no scientific evidence of medicinal value, ginseng has a long history of medical use, continuing today. The Chinese, in particular, considered its dried root immensely valuable in prolonging life, vitality and sexual potency. American ginseng (*P. quinquefolius*) occurs in woods of central and eastern N America; however, local demand has resulted in its becoming very rare in the wild. It was once exported to China, but the Chinese found it inferior to their own product. Dwarf ginseng (*P. trifolius*) grows in moist woods from Ontario to the Maritimes. Ginseng (*P. pseudo ginseng*), native to Korea and Manchuria, is now cultivated quite extensively in eastern Canada.

GILLIAN FORD

**Girard, Alice M.**, nursing teacher (b at Waterbury, Conn 11 Nov 1907). After arriving in Canada as a young girl, she completed her schooling in Montréal and began a career as a public-health nurse. Later a nursing educator, she eventually was appointed dean of the Faculty of Nursing at the Université de Montréal. The first woman dean at a French-language university in Canada, she held the position until her retirement in 1973. A member of the Hall Royal Commission on Health Services, she served as president of the Canadian Nurses' Assn 1958-60 and in 1965 was the first Canadian president of the International Council of Nurses.  
D FRANCIS

**Girard, Marc-Amable**, notary, politician, premier of Manitoba (b at Varennes, Lower Canada 25 Apr 1822; d at St-Boniface, Man 12 Sept 1892). A Conservative and disciple of George-Étienne CARTIER, Girard came to Manitoba 1870 to uphold French language, religious and political rights as guaranteed by the Manitoba Act. He served on the Executive Council 1870-72 and in the Assembly 1870-83. In 1871 he was appointed to the Canadian Senate. Girard became premier of Manitoba June 1874, the first French Canadian to hold that post, but resigned later that year. He served in John NORQUAY's Cabinet 1879-83. Girard was a man of compromise, but he lacked the leadership necessary to promote French Canadian political interests during a critical transition.

DIANE PAYMENT

**Girl Guides** Official operation in Canada dates from Jan 1910 when the 1st St Catharines Co was registered by the Girl Guide Organization founded in GB in 1909 by Lord Baden-Powell. Canadian headquarters were established in Toronto in 1912; 5 years later a Canadian Council

was federally incorporated and in 1961 the organization became known as Girl Guides of Canada/Guides du Canada. In 1983, 234 763 girls across Canada between the ages of 6 and 17 were enrolled in Guides' various branches under the direction of 40 857 volunteer leaders.

The philosophy of the organization is expressed in the promise that Guides have made since 1909 to do their duty to God, monarch and country, to help others at all times and to obey the Guide law. This 10-point law and the motto "Be Prepared" reflect the organization's aim of training girls to fulfil their roles as responsible citizens and family members. The guiding program requires girls at different levels to pass a series of tests and to earn badges in a wide variety of fields. Camping and nature activities have always been an important element of guiding.

Membership is open to all girls who accept the principles of the Guide promise and law. Canada's involvement in the World Assn of Girl Guides and Girl Scouts brings Canadian Guides into contact with girls throughout the world and opens up avenues of international exchange. National headquarters and archives are located in Toronto.

PATRICIA G. DIRKS

*Reading: Girl Guides of Canada/Guides du Canada Annual Report for 1982; Policy, Organization and Rules, Girl Guides of Canada/Guides du Canada (1981).*

**Girouard, Sir Édouard Percy Cranwill**, railway builder, governor (b at Montréal 26 Jan 1867; d at London, Eng 26 Sept 1932). In 1888 he was commissioned in the Royal Engineers and was in charge of the Sudan railways 1896-98. His construction of a line bypassing the Nile cataracts in the Sudan made possible Kitchener's victory at Omdurman. He then ran railways in South Africa, 1899-1904. Girouard served as high commissioner and then governor of northern Nigeria, 1907-09, and governor of the British East Africa Protectorate (Kenya), 1909-12. In Nigeria, the effects of his policies created a major impediment to Nigerian unity. In Kenya, his views on land alienation conflicted with those of the British government, and he resigned under a cloud. From 1913 to 1932, except for a brief period of munitions procurement and railway organization in Belgium during the war, he was a director of the armaments firm Armstrong Whitworth.

RICHARD STUART

**Girty, Simon**, frontiersman, LOYALIST, Indian agent (b near Harrisburg, Pa 1741; d at Malden, UC 18 Feb 1818). The legendary "white savage" of American frontier lore, he was an early Loyalist settler in Upper Canada. Girty lived several years in Indian captivity as a boy, and later became a scout and interpreter. During the AMERICAN REVOLUTION he joined the British Indian Department at Detroit and accompanied Indian raiding parties south. He was greatly feared by American pioneers but stories of his cruelty are exaggerated. In 1784 Girty settled on a farm at Malden. He continued to support Indian resistance against American expansion in the Ohio Valley until 1796 when the US took possession of Detroit. He is portrayed as a villain in romantic American novels and in Stephen Vincent Benét's "The Devil and Daniel Webster" (1937). He was the model for Sampson Gattree in John RICHARDSON'S novel *The Canadian Brothers* (1840).

EDWARD BUTTS

**Gisborne, Frederick Newton**, telegraph engineer (b at Broughton, Eng 8 Mar 1824; d at Ottawa 30 Aug 1892). At the age of 32, Gisborne completed the first submarine telegraph line in N America, joining Newfoundland across the Cabot Str with the mainland. Gisborne immigrated to Canada in 1845, became a telegraph operator and soon manager of the NS Telegraph Co. He created a company to link St John's with NB. Though nearly ruined in 1853 by the cost of building a land line across 640 km of New-

foundland wilderness, he was refinanced by Cyrus Field, the American industrialist. Together they completed the Nfld telegraph, from Cape Ray to Cape Breton, in 1856. Field went on to tackle the N Atlantic, succeeding in 1866 after 3 earlier cables broke. Gisborne became superintendent of the Canadian government telegraph service in 1879. He was a charter member of the RSC in 1882 and held many patents for his own inventions.

DONALD J.C. PHILLIPSON

**Gjoa Haven**, NWT, UP, pop 523 (1981c), is located on the SE coast of KING WILLIAM I, off the mainland Arctic coast, 1062 air km NE of YELLOWKNIFE. The area is the traditional territory of the NETSILIK INUIT. It derived its name from Roald AMUNDSEN, the first person to navigate the NORTHWEST PASSAGE. He wintered there and called the site after his ship, *Gjoa*. Trapping, hunting and carving are the sources of livelihood of the mostly Inuit population. The community is noted for its production of distinctive Inuit wall hangings. Channels and bays in the area are icebound for most of the year.

ANNELIES POOL

**Glance Bay**, NS, Town, pop 21 466 (1981c), inc 1901, is located on the E coast of CAPE BRETON I. Facing into the sun and the Atlantic Ocean, the location was known to the Micmac as *Wasokusegwom* ("bright home") and to the French, who mined coal for LOUISBOURG from the cliffs, as "Baie de Glace," a reference to annual drift ice from the Gulf of St Lawrence. The Dominion Coal Co (1893) made Glance Bay a boom town, and the municipality emerged from the smaller 19th-century colliery settlements. Immigrant workers came from Britain and Europe, but most of the population was drawn from rural Cape Breton, the Maritimes and Newfoundland. To exploit the rich bituminous coal seams underlying the district and dipping under the ocean floor, Dominion Coal operated 11 collieries within the town, including some of the largest and most productive coal mines in N America. Although the coal company dominated the local economy, by the 1920s Glance Bay was a union stronghold: the coal miners had a powerful influence on community life, and "company town" gave way to "labour town." The declining economic importance of coal led to Dominion Coal's withdrawal in 1967; the publicly owned Cape Breton Development Corp operated the town's one remaining colliery until 1984. Despite high unemployment and out-migration, and costly disappointments such as the heavy-water plant constructed in the 1970s, Glance Bay stands fast, proud of past achievements and hopeful of a change in its fortunes. The Miners' Memorial Museum is a tribute to the people of Glance Bay and the surrounding coal towns.

DAVID FRANK

**Glaciation** is defined as the formation, movement and recession of GLACIERS. At present glaciers cover about 10% of the world's land area (14.9 million km<sup>2</sup>). Most of this area is under the Antarctic and Greenland ice sheets; only about 700 000 km<sup>2</sup> is covered by the thousands of glaciers in the remainder of the world. Glaciation has been much more extensive in the past than it is today, occurring mostly as large, continental ice sheets. During expansion and recession of glaciers, the processes of EROSION and deposition may occur. Erosion by glaciers takes place mainly by abrasion and quarrying. Abrasion occurs when fine particles and fragments held in the ice, at or near the base of a glacier, move across the underlying material, commonly bedrock. This process can striate and polish fragments in the ice and the underlying bedrock. In addition, abrasion may form elongated, gutterlike channels (flutings) in the bedrock. Quarrying, the removal of blocks of bedrock by overriding ice, usually occurs where the bedrock is easily fractured, or where planes of weakness,

such as joints, are present. *Roches moutonnées*, large, knoblike bedrock features with streamlined sides tapering up-glacier, and steep, abruptly broken sides down-glacier, result from abrasion and quarrying. Relatively more erosion and removal of material takes place in valley glaciers, where the ice is confined by topography, than in the less constrained ICE CAPS and ice sheets. U-shaped valleys, such as the Bow Valley in the Rocky Mts, are formed where glacial erosion has deepened and widened preexisting river valleys.

As erosion takes place in one area, deposition may occur in another. Forms such as DRUMLINS (streamlined, oval mounds commonly 15-25 m high and about 1500 m long) and certain kinds of ground MORAIINE (low-relief, undulating terrain commonly up to 6 m high) can form under moving ice. However, most glacier deposition takes place near the terminus (boundary) during retreat of the ice. Features which can occur include hummocky moraine, high-relief forms up to about 10 m high, consisting of mounds, ridges and doughnut-shaped knobs; series of arcuate (bow-shaped) ridges of varying heights and lengths, named (according to their form, origin and position) cross-valley, ribbed, washboard, De Geer, push, ice-thrusted and recessional moraines; single, prominent ridges marking the limit of a glacial advance, called end or terminal moraines; and ground moraine. Most of these features contain a high percentage of glacial till. Till, in the strictest sense, is unstratified, unsorted material deposited directly from a glacier. It usually consists of a heterogeneous mixture of clay, silt, sand, pebbles, cobbles and boulders, with most constituents closely reflecting the composition of local bedrock. Commonly, larger particles are angular to well-rounded, striated, and show a preferred orientation. Till can be subdivided into several types depending on its location in the ice and how it was deposited.

Glaciers are also directly or indirectly responsible for various other deposits. Meltwater, originating on the surface, inside a glacier, or at its base, may form braided streams beyond the glacier margin. These streams display an interconnecting network of shallow channels which carry and deposit gravel and sand. Gravel is an important industrial resource in Canada, and some of the largest deposits have resulted from glacier-derived braided streams. An outstanding modern example is the Donjek R, YT, fed from the Donjek Glacier in the St Elias Range. KAMES and ESKERS (knoblike features and sinuous ridges, respectively) result from the deposition of SAND AND GRAVEL by glacial streams. Glacially associated lake deposits form large plains that cover wide areas of Canada. The lakes were formed by direct damming by the glacier or by impedances to preexisting drainage. Manitoba's glacial Lake AGASSIZ is an outstanding example of a glacially dammed lake. Most sediments deposited in glacial lakes consist of silt and clay, which commonly form varves, ie, pairs of coarse and fine layers deposited in one year. Beach ridges composed of gravel and sand occur along the margins of some former glacial lakes. The absence of vegetation in recently deglaciated areas and the exposure of unconsolidated sand and silt (such as occurs in interchannel areas of braided RIVERS and former lake beds) allow wind to form sand dunes and deposit loess. Dunes are formed by the shifting of sand by saltation and traction; loess deposits, consisting of fine sand and silt, originate from suspended material that may have been carried hundreds of kilometres (see AEOLIAN LANDFORM).

The areal extent and succession of glacial deposits indicate how far and how often glaciers expanded in the past. Most is known about glacial activity of the past 2-3 million years, although evidence indicates that glaciation took

place several times during GEOLOGICAL HISTORY. During the Pleistocene ICE AGE, as much as 30% of the Earth was covered by glaciers. Glaciers formed and expanded in mountainous regions throughout the world. In northern latitudes (eg, Canada and northern Europe) ice caps developed, expanding to ice sheets. About 97% of Canada was covered; hence, this country contains more glaciated terrain than any other.

The number of major glaciations that occurred during the Ice Age is open to question. Traditionally, 4 glaciations were recognized, each lasting approximately 100 000 years, separated by long, warmer periods. From oldest to youngest, these are known in N America as Nebraskan, Kansan, Illinoian and Wisconsinian. Within these major glaciations, minor glacier retreats and advances are recognized. New evidence and reinterpretation of old data suggest that ice did expand and retreat many times, but the complexity of the data is such that it is not even possible to say with certainty that there actually

were 4 major glaciations. Much is known about the Wisconsinian, less about previous glaciations. Since the Wisconsinian was the latest glaciation, evidence (eg, moraines) is relatively well preserved. In addition, the time of the Wisconsinian glaciation can be estimated, mainly through radiocarbon dating of organic matter from below, within and above Wisconsinian glacial deposits (see GEOLOGICAL DATING). Although radiocarbon dating is by far the most important method for determining when glaciers expanded, it is useful only for material less than about 70 000 years old.

As can be seen from a map, the farthest limits of glaciation in Canada took place before the late Wisconsinian. It is not known whether this was during an early portion of the Wisconsinian or represented an earlier major glaciation such as the Illinoian. It is evident, however, that during the Pleistocene, ice never flowed far beyond these limits and, in general, conformed roughly with the configuration of the latest glaciation. Glaciers never extended into the northern YT and parts of the western NWT. In addition, the highest peaks of western Canada and the higher hills on the prairies (eg, the CYPRESS HILLS) have

never been glaciated (see NUNATAK). Although the climate was severe enough to support glaciers, there was not enough moisture to nourish their expansion.

Enough information is available from glacial and associated deposits and from radiocarbon-dated organic samples to give a reasonable account of the Wisconsinian glacier complex in Canada. Sometime after about 100 000 years ago, ice caps formed and expanded in several parts of Canada. Major areas of accumulation included the Keewatin Sector, Labradorian Sector and the Foxe-Baffin Sector. Minor ice caps formed in the Atlantic provinces and the arctic islands. In time, these ice caps coalesced forming the Laurentide Ice Sheet. Apparently, at about the same time, valley glaciers expanded in the western mountains and, in time, formed the Cordilleran Ice Sheet. There is conflicting evidence about how far the ice sheets expanded initially. At least one retreat occurred before the final onslaught which probably began about 25 000 years ago and reached the areas illustrated on the map. The maximum limit reached by the late Wisconsinian ice sheets is under debate. In addition, there is evidence that the time of maximum expansion of the ice sheets varied from region to region. The Laurentide Ice Sheet probably had a maximum ice thickness close to 4000 m; that of the Cordilleran Ice Sheet may have been close to 2000 m.

As recession of the ice sheets took place, most of the glacial landforms seen today across Canada were formed. There were minor readvances during the overall retreat, but in general the retreat was relatively rapid, with ice withdrawn from most of Canada by 10 000 years ago. Since that time, glacial and other landforms have been modified by various agents such as WATER and WIND. However, these changes have been minor, and the preservation of the present glacial landscape is ensured for thousands of years to come.

N.W. RUTTER

**Glacier** Large mass of ice, formed at least in part on land, which shows evidence of present or former movement. It is formed by the compaction and recrystallization of snow into ice crystals and commonly contains air, water and rock debris as well. Movement is downslope or outward in all directions because of stress caused by the weight of the ice. Internal deformation and basal slippage of ice is common. Glaciers may end on land, in the ocean (as an ice shelf) or in a lake (see ICE CAP; GLACIATION).

N.W. RUTTER

**Glacier National Park** (est 1886, 1350 km<sup>2</sup>) was carved from the rugged Selkirk and Purcell mountains of BC by more than 400 GLACIERS. Its sheer valley walls have been scarred by countless AVALANCHES caused by heavy snowfalls. Underground rivers have created unique CAVE systems. Half of the PARK is alpine TUNDRA, where meadows burst into flower only for a few short weeks each year. Below the meadows, stands of Engelmann spruce and alpine fir descend to the interior rain forest of western red cedar and western hemlock. High mountains, deep snow and long winters make a harsh environment for wildlife. Some species, eg, mountain goat, are able to withstand the rigorous conditions year-round. Others, eg, hoary marmot, hibernate in winter. Glacier is famous for its black and grizzly bears, which find abundant forage on the park's slopes. The rugged Selkirk Mts were a barrier to travellers until the discovery of ROGERS PASS in 1881. Development of the pass as a link in the building of the first transcontinental railway and, in later years, the Trans-Canada Highway has played a major role in the park's history. The mountains offer a dramatic backdrop for campers and a challenge for hikers and climbers.

LILLIAN STEWART

**Gladstone**, Man, Town, pop 964 (1981c), inc 1882, is located on the Whitemud R, 138 km NW of Winnipeg and 30 km W of the southern tip of Lake Manitoba. Ontario farmers seeking new land settled in 1871 at the Third Crossing where the North Saskatchewan Trail crossed the Whitemud for the third time. The community — known first as Palestine and later as Gladstone after the noted British PM — was on the fringe of prairie settlement, and became a take-off point for pioneers travelling farther W. A population and land boom occurred, sparked by construction of a railway link with Portage la Prairie, but soon collapsed, leaving the town in debt. Today, Gladstone serves the surrounding mixed farming district and has an important cattle-auction mart.

D.M. LYON

**Gladstone, James**, or Akay-na-muka, meaning "Many guns," Canada's first native senator (b at Mountain Hill, North-West Territories 21 May 1887; d at Fernie, BC 4 Sept 1971). Gladstone, a member of the BLOOD tribe, devoted most of his life to the betterment of Canadian Indians. He was president of the Indian Assn of Alta (IAA) and 3 times was a delegate to Ottawa to discuss proposed changes in the INDIAN ACT. He played a prominent part in the fight for better education, greater respect for treaty rights, and participation of Indians in their own administration. On 1 Feb 1958 he was appointed to the Senate of Canada and in his maiden speech he spoke in Blackfoot "to place in the official debates a few words in the language of my people, the Blackfoot Indians, as a recognition of the first Canadians." In the Senate, Gladstone spoke strongly on issues that affected natives; he sat on the 1959 joint committee to investigate Indian affairs.

JAMES DEMPSEY

**Glass** The first, known Canadian glass factory or glasshouse, the Mallorytown Glass Works, began operation in 1839 and closed in 1840. Glassmaking involved a large investment in raw materials, equipment and salaries. The smallest glasshouses employed 15-20 men producing glass from a 5-pot furnace; additional workers were needed to perform ancillary functions (eg, cutting firewood, unpacking raw materials, packing finished products). Thus, it is not surprising that the early period of glassmaking in Canada (1839-80) was one of changing partnerships and of firms going into and out of business. Throughout the 19th century imported glass set the fashion and competitive standard. Between 1840 and 1860, 5 Canadian glass factories manufactured the most useful glass products — common green window glass and bottles. They marketed to a population of 2.5 million people.

**Manufactured and Pattern Glass** The Canada Glass Works at St Jean, Canada East (now Québec), 1845-51, and the Ottawa Glass Works at Como, 1847-57, were window-glass factories located on water routes leading to Montréal. From this distribution centre, sales were advertised as far away as Hamilton. Window glass was made by blowing an elongated, hollow tube. Both ends were cut off and the tube was slit lengthwise and opened out into a flat sheet which was cut into various pane sizes. The largest window-pane available measured about 30 by 48 inches (76 by 102 cm).

Bottles might be free blown but, more often, were mold blown, using iron molds. A general line of bottles, made after 1851 by the Como factory and the Foster Brothers Glass Works, St Jean (about 1855-58), would include aquamarine medicine bottles, soda or mineral water-bottles, whisky flasks, ale and wine bottles, square, tapered case bottles to fit travelling cases, and large demijohns for storing liquids, made in black (really a very dark green) glass.

The 4 major companies operating between

Soda water bottle (left) and fruit jar (right) from the Hamilton Glass Works, 1865-96 (courtesy Royal Ontario Museum).

1860 and 1880 made bottles, jars and lamp chimneys as staple products. All were located near shipping facilities or the railway lines laid down in the 1850s. The Canada Glass Works, Hudson, Qué, 1864-72, and the Hamilton Glass Co, Hamilton, Ont, 1865-96, were "green" glasshouses. Green glass, used for window glass and bottles, ranges in colour from aquamarine through green, olive green and amber. The colour results from iron impurities in the sand, the major raw ingredient used in glassmaking. The St Lawrence Glass Co, Montréal, 1867-73, and the Burlington Glass Co, Hamilton, Ont, 1874-98, were flint houses. "Flint" or colourless glass, used for finer glass lamps and tablewares, is made by adding a decolorizing agent that masks out the natural green colour. After 1864, an improved formula for a good-quality colourless glass reduced the costs of raw materials by one-third. This development opened the druggists' bottle trade to flint glasshouses. It also greatly expanded the market for cheaper, pressed flint-glass lamps and tablewares.

Druggists' bottles were mold blown in green, amber and flint glass in sizes ranging from indi-

vidual doses of 1 or 2 ounces (28 or 56 mL) to a 16-ounce (about 450 mL) size. By the mid-1870s all N American druggists'-ware manufacturers were making round, oval, square and rectangular mold shapes. On special orders, bottle molds would be lettered with the name of the retail druggist or the patent medicine. A cheaper method used a letter plate that could be inserted into a standard mold shape.

At first, soda-water bottles were egg shaped, a style introduced in England as early as 1814. In 1870 a modified version with a flat bottom was patented and, beginning in the early 1870s, a cylindrical bottle was also made with rounded shoulders and base or with a small flattened base, allowing the bottle to stand upright. These bottles were used by the growing number of late-19th-century bottlers of sweetened soft drinks and ginger beer. Whisky flasks and bottles were made up for distilleries. The BREWING INDUSTRY required cylindrical, mold-blown black or amber bottles for its ale, beer and porter. Although some custom-lettered molds were made up for Canadian breweries, most used plain bottles identified with paper labels bearing trademarked designs and names.

A mold-blown glass preserve jar was first patented by John Mason in the US in 1858. It had a wide mouth with spiral threading blown into the glass at the neck that created a tight seal with a metal screw-cap lid. This improvement over pottery jars and the advantage of visible contents encouraged home canning. The 2 Hamilton factories and the one at Hudson, Qué, all marketed one or 2 jar styles; the Hamilton ones were identified by the glass-company name blown into the glass.

The 2 flint factories (St Lawrence Glass Co and Burlington Glass Co) made lamps and lamp chimneys, as did the Hudson factory. The fragility of the chimneys, which required a daily washing, created a high-volume trade. The St Lawrence Co also made pressed flint-glass tablewares. The molten glass was pressed into patterned molds by a plunger that forced the glass into all parts of the mold. This process produced identical pieces very quickly and cheaply. By the 1860s heavy geometric designs, imitating cut glass, were in favour. Tableware sets included covered compotes and bowls, nappies, sugar and cream sets, spoon holders, tumblers, goblets, water pitchers, salt cellars and casters.

During the period 1880-1900, bottles, jars and chimneys continued to be staple products of the green and flint Hamilton factories, of several smaller firms established in the 1890s and of the 3 major new factories: the green and flint glassworks of the North American Glass Co (later Diamond, Diamond Flint, Dominion, Domglas), Montréal, 1880 to the present; the flint factory of the Nova Scotia Glass Co, New Glasgow, NS, 1881-92; and the Sydenham Glass Co, Wallaceburg, Ont, 1894-1913.

In druggists' bottles, some Canadian shapes were probably introduced in the 1890s. They were named for the city in which the factory was located or for the glass company. Jars were lettered with the glass-company name or with a trademarked name suggesting quality, eg, "Crown" or "Best." By the 1880s the number of pieces offered in a tableware set had expanded and commonly included several sizes of plate, bread plate, footed cake plate or salver, butter dish, mug, celery vase, relish dish, and quart and half-gallon jugs. The new designs of the 1880s were delicately molded flowers, birds, berries, leaves, crests, scrolls, commemorative events and fine, shallow-pressed geometric patterns made by the flint factories. By the 1890s patterns were more deeply pressed, imitating the current fashions in cut glass, or with bolder patterns of leaf or fruit. Panelled patterns were also popular. After the mid-1890s, pressed emerald green glass and white and blue (pale turquoise)

Cut-glass rose bowl from the Gundy-Clapperton Co Ltd, Toronto, c1905-20 (courtesy Royal Ontario Museum).

opal pressed glass became popular. By 1900 Canadian firms supplied half of the Canadian market of 5.5 million people with bottles, lamps and tablewares.

From 1900 to 1932 pressed glass patterns continued to imitate the pinwheels, stars and floral designs of cut glass. They were made by the Diamond Flint/Dominion Glass Co, Montréal, and by that company's tableware and illuminating plant in Toronto, the Jefferson Glass Co, from 1913-25. By the mid-1920s imitation cut patterns were becoming less popular, as new, delicately molded floral designs in pale pink, green, yellow and blue glass replaced them. By 1932, the Dominion Glass Co phased out production of most of its earlier tablewares, concentrating on hotel wares and on several simple, geometric patterns in the new pastel shades. As in the 19th century, bottles and jars were a staple and, after 1932, became the major production line of both the Dominion Glass Co and the Consumers Glass Co, Montréal, from 1917 to the present. After 1907 large orders were produced by the newly introduced automatic bottle-blowing machinery.

**Cut Glass** Between 1867 and 1900, the 5 Canadian flint-glass manufacturers concentrated on making the cheaper grades of glass bottles, lamp chimneys and pressed tablewares. All of them employed cutters to decorate their wares. From surviving examples, this earliest cut glass was engraved. The engraver used fine copper wheels and abrasives to cut minute, shallow lines in the glass. Usually, no final polishing was done and the designs appear with the opaque, greyish surface made by the engraving wheel. This technique was used for adding monograms to goblets and special presentation pitchers, or decoration to tableware sets, lamp chimneys and door lights. Fern fronds, wreaths of leaves, and sometimes grape vines and flowers, all reduced to a stylized simple form, were the most common decorative motifs.

The making of the more expensive and more deeply cut glass tablewares began in Canada about 1895. Between 1900 and 1930, 4 major firms made cut glass: George Phillips, Montréal, 1904-71; Gowans, Kent, Toronto, about 1900-18; Gundy-Clapperton, 1904-20, later Clapperton, 1920-72; and Roden Bros, Toronto, about 1907-54. One of the largest, the Gundy-Clapperton firm, employed 50 cutters in 1912. In addition, some 15 other glass-cutting firms were in operation during the period. They were concentrated in Toronto and Montréal, or located in Ontario centres (eg, Ottawa, Lakefield, Wallaceburg, Waterford) and in Winnipeg, Calgary and Vancouver. Some of these operations were one- or 2-man cutting shops. Many of the highly skilled glass cutters, including George Phillips and Harry Clapperton, came from the US.

High-quality lead-glass blanks, ie, the undecorated pieces for cutting, were imported from the Val St Lambert factory in Belgium; the Baccarat firm in France; Libbey Glass Co, Toledo, Ohio; O.C. Dorflinger & Sons, White Mills, Pa; and Mt Washington Glass Co, New Bedford, Mass.

In the larger cutting shops, cut glass was usually produced by a team of cutters, each with his specialty. The "rougher," using a stone wheel and fine abrasive, followed the designer's marks that outlined the decoration and made the first deep cuts in the glass. At this stage, there was always the danger of cutting too deeply and ruining the piece. The work was then passed on to a "smoother," who also used a stone wheel to smooth the first deep cuts and added the shallower lines of the design. Cutting gave the cut areas a dull, opaque surface. By the time the Canadian firms were in operation, the final polishing was no longer done with a wooden wheel and fine pumice. Instead, the glass was dipped in a bath of sulphuric and hydrofluoric

acid, which returned a clear, sparkling finish to the cut areas. The process had been invented in the 1890s and helped cut production costs. In smaller shops, the whole cutting process would be carried out by one man.

The Canadian firms used the hob stars, pinwheels and stars that became popular in the American industry in the late 1880s and 1890s, and the more recent stylized flower and leaf patterns. They created many of their own designs of a brilliant beauty, with such names as Primrose, Oak, Tulip (Gundy-Clapperton); Cornflower, Poppy and Sunflower (Roden Bros); Maple Leaf (Gowans, Kent); as well as many geometric patterns. The Toronto firms marked many of their pieces permanently with an acid-etched trademark: Gundy-Clapperton with "GCCO" in the leaves of a cloverleaf; Clapperton with a "C" in a cloverleaf; Roden Bros with an Old English "R" flanked by lions; and Gowans, Kent with the word "ELITE" in a maple leaf in a circle.

By about 1930 the smaller glass-cutting shops in Canada had vanished. They faced stiff competition from the larger firms, and their disappearance coincided with a decline in the demand for elaborately cut glass. A new style of lighter blown glass with highly polished, shallow-cut delicate floral and leaf patterns found favour in the market. From 1930 to 1972 firms such as Phillips and Clapperton followed much simpler geometric designs in cutting. One firm, W.J. Hughes, Toronto, specialized in cutting one pattern, Cornflower, which they first made in 1914 and still produce. Other new firms, such as the Mayfair Glass Co, Montréal, and the Crystal Glass Co and Monogram Glass Co, both of Toronto, produced the new light cut wares in patterns such as Carnation, Laurel and Grapes, Marguerite and Comet. JANET HOLMES

**Glass, Stained** Despite a number of technical developments, Canadian 20th-century stained-glass craftspeople have continued largely with the traditional technique of hand-made glass set and soldered in a matrix of lead strips (cames). However, *dalle-de-verre*, or cast slab glass, silicon adhesives and epoxy resins, sandblasting devices and a range of new tools and machinery have reduced fabrication time and extended the range of technical and aesthetic possibilities. Stained glass in Canada is of 4 major types. The

Stained glass window, "The Good Shepherd" (1935), in St Paul's Anglican Cathedral, London, Ont. It is one of a series and the only one signed by Louis C. Tiffany (photo © Hartill Art Associates).

oldest type, dating from the 1850s in this country, involves production of memorial windows in the Gothic-revival style by companies belonging to the religious art industry. A second type, also influenced by historical styles, is the work of studios devoted to recreating or restoring art nouveau, Edwardian or art deco windows for period houses, restaurants or bars. More recent directions (from the early 1970s) include the development of the stained-glass hobbyist and the emergence of the artist-craftsman of the studio-glass movement.

Of particular benefit to the hobbyist has been the development of a comprehensive Canada-wide distribution network for stained-glass tools and supplies. Courses, mostly at the elementary level, have become widely available through schools, colleges, youth organizations and studios. Accordingly, stained glass has become an inexpensive, accessible part-time leisure activity for thousands of Canadians.

Influenced by postwar developments in stained-glass design in Germany and England, and encouraged by the energy of the stained-glass renaissance in the US in the late 1960s, a number of Canadian artists have turned to stained glass as a medium for contemporary artistic expression. Although primarily concerned with architectural applications, many of these artist-craftsmen (so-called because they both design and fabricate) also began to produce autonomous works that could be exhibited independent of an architectural setting. Thus, exhibitions of stained glass, once a rarity in Canada, now occur frequently. In 1976, Canada's first association of stained-glass artists and craftsmen was founded in Toronto. Supported by members from all parts of the country, Artists In Stained Glass encourages the development of stained glass as a contemporary ART form. ROBERT JEKYLL

**Glassco, John**, poet, translator (b at Montréal 19 Dec 1909; d there 29 Jan 1981). Glassco will be remembered for his brilliant autobiography, his elegant, classical poems and for his translations. He came from a respectable Montréal family but escaped at 20 to Paris, where he lived for 3 wild, exhilarating years. This period is recalled in *Memoirs of Montparnasse*, mostly written after his return to Canada in 1932 with a near-fatal illness, but not published until 1970. It is a dazzling book: elegant, witty, precocious, outrageous, combining a supreme evocation of Paris in the 1920s with a profound examination of the author's own fascinating character. Glassco's later years were spent mostly in Montréal and rural Québec. He wrote poetry (his *Selected Poems* won the Gov Gen's Award in 1971) and some fiction, collected in *The Fatal Woman* (1974). He also wrote, with customary elegance and wit, what he himself called "aphrodisiac works . . . as an article of commerce." His translations of French Canadian poetry are, along with F.R. Scott's, the finest yet to appear — his greatest achievement being the *Complete Poems of Saint-Denis-Garneau* (1975). STEPHEN SCOBIE

**Glassco, William Grant**, director, producer (b at Québec City 30 Aug 1935). As artistic director of TARRAGON THEATRE in Toronto (1971-81), Bill Glassco contributed to the development of Canadian theatre and drama by producing the works of numerous Canadian playwrights. Besides premiering plays by established writers such as James REANEY (*Donnelly Trilogy*), Glassco worked closely with emerging playwrights to develop their dramatic texts and employed leading Canadian actors to premiere new scripts. The works of playwrights such as David Freeman and David French were first staged at Tarragon. Glassco also introduced the works of leading Québec playwrights, particularly Michel TREMBLAY, at the Tarragon. ANTON WAGNER

**Glenbow Museum**, founded in Calgary in 1954, is one of Canada's foremost museums of art and western history. It was created by oilman and philanthropist Eric L. HARVIE as an outgrowth of his personal interest in collecting memorabilia. In 1966 its assets were donated to the people of Alberta and the Glenbow-Alberta Institute was formed to administer the huge collections of artifacts, paintings, books and documents. In 1976 the government of Alberta constructed a large 8-storey structure in downtown Calgary, providing 8361 m<sup>2</sup> of exhibition space. This has permitted the displaying of world-class exhibitions as well as its own unique collections dealing with western Canadian history, native peoples and other related topics.

The Glenbow's holdings are among the largest in Canada. It has some 22 000 works of art, the largest nongovernment collection of western Canadiana books and manuscripts in existence, and major holdings of pioneer, ethnic, military, and Indian artifacts. Included in its art collections are works by such well known figures as Paul KANE, Carl Rungius, Belmore Browne, W.J. PHILLIPS, F.A. VERNER, Albert Bierstadt and A.F. Kenderdine.

With its reputation as a lively and active institution, the Glenbow has carried out an extensive publishing program producing many books and catalogues on subjects of western Canadian art and history.

DONNA LIVINGSTONE

**Glengarry School Days: A Story of the Early Days in Glengarry**, by Ralph Connor (Charles William Gordon), was published in Toronto, New York and London, 1902. Connor's sketches of school life in Glengarry County are imbued with a deeply felt religious attitude and with his reverence for the eastern Ontario landscape. His schoolboys come under the influence, first, of the universally loved and respected Archie Munro, and then of John Craven, who, through his contact with the minister's wife, is transformed from a talented but disreputable young teacher into a man filled with faith and bound for the ministry. *Glengarry School Days* sets out, with energy and good will, a clear design of moral and religious imperatives for the formation of good character; Connor's stories celebrate his Scots figures' hardy self-reliance, their deep respect for what they understand as God's law, and the ordered vigour of the lives they make in the light of their faith.

NEIL BESNER

**Glenie, James**, army officer, politician (b at Fife, Scot 1750; d at London, Eng 23 Nov 1817). After service in Québec during the AMERICAN REVOLUTION Glenie resigned his army commission and settled in New Brunswick (1787). Already he had a reputation as an opinionated and prickly officer blessed with intellectual ability and engineering talent. His involvement in the masting trade and frustration over several land schemes brought him into conflict with Lt-Gov Thomas CARLETON and the LOYALIST élite. First elected to the NB Assembly in 1789, Glenie, part of the Assembly rights faction, became an outspoken critic of the governor and Council, and contributed substantially to the political deadlock of 1795-99. While Glenie's attacks did make the Loyalist political culture more accommodating, his abrasive and relentless opposition alienated friends as well as foes. By the early 1800s moderate assemblymen had come to terms with Carleton and the Council, but Glenie's criticisms continued, although now frequently lacking majority support in the Assembly. By 1805 Glenie withdrew to England to eke out a living through appointments and by employing his considerable talents as a mathematician, but he died in poverty.

WILLIAM G. GODFREY

**Globe and Mail**, Toronto, was founded in 1936 when George McCullagh united 2 influential

and historically important dailies, the *Globe* and the *Mail and Empire*. From the beginning, the new newspaper took on the character of the old *Globe*.

George BROWN launched the *Globe* in 1844 with the support of a group of Reformers. Although at first a party journal, the *Globe* quickly became required reading for the educated and business community in Toronto and the surrounding countryside through a shrewd mixture of news, features, forceful editorials and technological innovation. By 1853 the 4-page paper had become a daily, with a weekly edition for out-of-town subscribers; in 1876 Brown commissioned early morning trains to Hamilton and later London, and absorbed mailing costs for the daily *Globe*. As new presses and cheap paper enabled the journal to expand in size, the first women's section was added in 1882 and, within a decade, drawings and photoengravings. By 1900 the *Globe* was established as a quality paper attractive to advertisers, and with a combined circulation for all editions of 69 545. Just after the turn of the century it added the words "Canada's National Newspaper" to its masthead and began its pursuit of readers in all parts of the country. Meanwhile, the *Mail* had been established as a Conservative party organ in 1872 and, in 1895, absorbed another Tory paper, the *Empire*. In 1900 the *Mail and Empire* boasted a circulation of 61 720.

The *Globe and Mail* became the flagship of FP Publications' chain of NEWSPAPERS in 1965 and, in 1980, was bought by the THOMSON GROUP. It has become a journal of record as well as of the business, political and cultural communities. As a "writer's newspaper," the *Globe and Mail* has given skilled journalists such as Jeffery Simpson and John Fraser the opportunity to practise their craft. In 1984 circulation stood at 330 000, and the national edition, including the influential Report on Business, was beamed by Anik satellite to printing facilities in Moncton, Ottawa, Brandon, Calgary and Vancouver. Staff reporters were based in 8 Canadian cities and abroad in London, Washington, Peking and Harare.

RICHARD J. DOYLE

**Globe Theatre**, Regina, was founded by Ken and Sue Kramer in Aug 1966 with assistance from the CANADA COUNCIL and various provincial boards. Canada's first professional children's theatre, it travelled to schools across the province presenting a variety of programs that appealed to different age groups. Parental response to the plays was so enthusiastic that in 1967 the Kramers established an adult theatre in Regina. After many moves, in 1980 the *Globe* acquired a 400-seat facility in a renovated downtown historic building. Unique among Canadian theatrical companies, the *Globe* has a writer-in-residence, Rex Deverell, whose plays such as *Black Powder* and *Medicare* deal with regional political issues and history. Plays by George RYGA, James REANEY, Rick Salutin and W.O. MITCHELL have also been performed. In 1983-84 the *Globe*, still under the artistic directorship of Ken Kramer, presented a season that included Shakespeare, Shaw, Alan Ayckbourn, Molière and *Mandarin Oranges* by Deverell. In 1982-83 over 30 000 patrons attended performances across the province.

CHARLOTTE STEVENSON

**Glooscap**, the culture hero, transformer of the Eastern Woodlands Indians. Huge in size and powers, Glooscap is said to have created natural features such as the Annapolis Valley, in the process often having to overcome his evil twin brother who wanted rivers to be crooked and mountains impassable. Glooscap slept across NS, using as his pillow PEI, known to the natives as Abegweit, meaning "Cradled on the Waves."

CAROLE H. CARPENTER

**Glyde, Henry George**, painter, art educator (b at Luton, Eng 18 June 1906). Glyde was trained at the Royal Coll of Art, London (1926-30). In 1935 he became head of the art department at Calgary's Institute of Technology and Art, beginning 30 years as a force in post-secondary art education in Alberta. In 1937 he began instructing at the BANFF CENTRE SCHOOL OF FINE ARTS and in 1946 he established the fine-art department at U of A, which he directed until 1966. Glyde's most significant works are oils and murals depicting a type of social realism. These works are a valuable documentary of urban and rural prairie life. His murals are classical, the colours sombre, and the figure groupings mythological and symbolic in mood and content. The emphasis on structural realities has carried over to his interpretation of the Alberta landscape and to his portrayal of the BC coast.

KATHLEEN LAVERTY

**Gnatcatcher, Blue-Gray** (*Polioptila caerulea*, family Muscicapidae, subfamily Sylviinae), tiny, migratory, insectivorous songbird, the sole representative in Canada of the tropical New World tribe, Polioptilini (13 species). It is slender-bodied, blue-grey above, whitish below, with a long, black tail. It is rare in Canada, breeding only in southern Ontario in open, broad-leaved deciduous woodland with brushy undergrowth. Nesting occurs late May to mid July. Clutch includes 4-5 eggs. Song is high-pitched and squeaky; more commonly heard is a buzzy call note.

J.C. BARLOW

**Goat Farming** Goats (family Bovidae, genus *Capra*), ruminant MAMMALS with backwardly arching hollow horns, short tail and usually straight hair, are related to SHEEP but are of slighter build. Goats were domesticated as early as 7000 BC and have provided humans with food (milk, cheese, butter), leather and mohair. They were probably introduced with sheep by early settlers in NEW FRANCE. Goats are now raised in every province except Newfoundland, but are most popular in Ontario (about 50% of the goats registered in 1983 were in that province), BC (21%) and Québec (11%).

There are 4 kinds of breeding operations: for industrial milk production (milk is sold to processing plants for cheese making), for farm cheese production (sold by the producer), for meat production (meat is a by-product for milk producers but some breeders specialize in the production of slaughter goats) and for mohair wool production. Goats fall into 3 categories: nonregistered (grade) goat, the pedigree is either unknown or unregistered, or its parents are not registered; registered goat (Canadian), the mother's pedigree is unknown or unregistered but the father's pedigree is registered; registered goat, the pedigree can be traced back to the first goats imported to Canada. Five milk breeds are important in Canada: Alpine (of the 54 132 goats registered in Canada to 31 Dec 1983, 1764 were Alpine), Nubian or Anglo-Nubian (1618), Saanen (1028), Toggenburg (1003) and La Mancha (106). Two breeds, Angora and Cashmere, are raised mainly for wool. In goat breeding, each animal is identified and a register is kept of its birth date, breed and sex, identification number, breeding, kidding and weaning dates, vaccinations, antivermin treatments and milk-control reports.

The doe matures at 3 months but must not be bred before it is 7-9 months old; it reproduces once a year. Artificial insemination enables a large number of females to be impregnated with the sperm of a highly bred buck. The average gestation period is 5 months (153 days). The doe has 2 mammary glands. Diet, lactation stage, number of lactations, health and herd management are the major factors influencing milk production. Genetic improvement of the goat population is essential. Selection involves eliminating imperfect animals and keeping well-

formed ones (body, hooves, pelvis, limbs, udders). A table for classifying the physical conformation of goats has been developed by the Canadian Goat Society, Durham, Ont. Genetic selection also includes breeding characteristics (eating habits, fertility, prolificness) and milk-production characteristics, both quantitative and qualitative. Quantitatively, production increases 200 kg between the first and third lactations; this level is maintained between the third and seventh lactations and then declines. Qualitative aspects involve the levels of nitrogen and bytyrin in the milk.

Goats are fed twice daily; fodder makes up 72% of the daily intake of dry feed. Goats are very selective and like leaves and young sprouts. They prefer rolled cereals or concentrated nutrients in tablet form over finely ground grains. Like other ruminants they can digest foods rich in cellulose and then metabolize the volatile fatty acids. Goats are gregarious animals and prefer to live in groups. **JEAN-PAUL LEMAY**

**Godbout, Jacques**, novelist, essayist, filmmaker, poet (b at Montréal 27 Nov 1933). One of the most important writers of his generation, Godbout strongly influenced post-1960 Québec intellectual life. After studies at Coll Brébeuf and Université de Montréal, he taught French in Ethiopia. He joined the NATIONAL FILM BOARD (1958) as producer and scriptwriter. Co-founder of *Liberté* (1959), the Mouvement laïque de la langue française (1962) and the Union des écrivains québécois (1977), Godbout was active in the QUIET REVOLUTION, constantly analysing society through contributions to various periodicals. His most important essays, demonstrating his penetrating mind and concern for democratic values, were collected in *Le Réformiste* (1975). Godbout's films include 4 full-length features (*Yul 871*, *Kid Sentiment*, *Ixe 13*, *La Gammik*) and more than 15 documentaries. He has written 6 novels: *L'Aquarium* (1962), *Le Couteau sur la table* (1965; trans *Knife on the Table*, 1968), *Salut Galarneau!* (1967; trans *Hail Galarneau!*, 1970), *L'amour*, P.Q. (1972), *L'Isle au dragon* (1976) and *Les Têtes à Papineau* (1981). **ANDRÉ SMITH**

**Godbout, Joseph-Adélard**, agronomist, professor, premier of Québec (b at St-Eloi, Qué 24 Sept 1892; d at Montréal 18 Sept 1956). He was educated at Ste-Anne-de-la-Pocatière and the Massachusetts Agricultural Coll and taught agriculture at Ste-Anne-de-la-Pocatière 1918-30. Elected Liberal MNA for L'Islet in 1929, he was minister of agriculture in the L.A. TASCHEREAU administration 1930-36. He became premier in Aug 1936 upon the unexpected resignation of Taschereau under the violent attacks of the new Union Nationale leader Maurice DUPLESSIS. His party was defeated in the 1936 elections, but despite his own defeat he remained Liberal Party leader thanks to the assistance of federal Liberal minister Ernest LAPOINTE. Heavy support from the federal Liberal Party enabled him to regain power in the 1939 elections. Because of his close ties with the federal party, Godbout did not strongly oppose the military CONSCRIPTION imposed in 1944 following a Canada-wide referendum. He also accepted the federal government's appropriation of various revenue sources that until then had belonged to the provinces. Despite some socially progressive bills, including one granting women the right to vote (1941), Godbout's party was defeated in 1944; he lost his own seat in 1948. The next year he was made senator for Montarville. **DANIEL LATOUCHE**

**Goderich**, Ont, Town, pop 7322 (1981c), seat of Huron County, inc 1850, located on a bluff above Lk Huron at the mouth of the Maitland R, 130 km NE of SARNIA. The site, with its small natural harbour, was discovered 1827 by the CANADA CO's William "Tiger" DUNLOP. It was named for Lord Goderich, British PM 1827-28.

Goderich, Ont. The townsite, laid out in 1829, has wide, tree-lined streets radiating from a central octagonal square (photo by John deVisser/Masterfile).

A trail chopped 97 km through the bush provided access in 1828. The townsite was laid out 1829 with the idea that Goderich would become the entrepôt for the Canada Co's 400 000 ha Huron Tract. The town had wide, tree-lined streets which radiate from a central octagonal square like the spokes of a wheel. Development fell short of expectations, and while the town became the terminus of a railway from Buffalo in 1858, it commanded only local trade. In 1866 the discovery of salt by a company drilling for oil gave Goderich a major industry. Since the 1870s it has remained stable, growing slightly with the development of the resort industry. The massive stones of the historic HURON COUNTY JAIL (1839) contrast with its graceful design; the exercise yards are enclosed by an octagonal wall. **HUGH JOHNSTON**

**Godfrey, Dave**, writer, publisher, academic (b at Winnipeg 9 Aug 1938). Godfrey's books include *The New Ancestors* (Gov Gen's Award 1971), a powerful and complex novel set in Africa, where the author served with CUSO, and several collections of highly stylized short stories. An activist in Canadian cultural politics beginning in the late 1960s, he was co-founder of both the House of Anansi and New Press, and at present runs Press Porcépéc with his wife, writer Ellen Godfrey. He studied at U of T, Iowa and Stanford, and currently teaches creative writing and publishing at U of Victoria. **JOHN MOSS**

**Goforth, Jonathan**, Presbyterian missionary (b at Thorndale, Canada W 10 Feb 1859; d at Wallaceburg, Ont 8 Oct 1936). Inspired by G.L. Mackay's work in Formosa (Taiwan), Goforth left farming to study at Knox College, U of T, graduating in 1886. The following year he was sent to Honan Province, China. Thanks to his policy of identifying with Chinese culture, friendly officials helped the 14 Canadian missionaries and dependents in Honan escape during the Boxer Rebellion. After the uprising the mission grew rapidly. Goforth refused to join the UNITED CHURCH OF CANADA in 1925 and started a mission in Manchuria. **JOHN S. MOIR**

**Golab, Anthony Charles**, Tony, "Golden Boy," football player (b at Windsor, Ont 17 Jan 1919). Golab was a hard-charging, versatile player with the Ottawa Rough Riders. He joined the Sarnia Imperials (ORFU) in 1938 and the Ottawa Rough Riders in 1939, where he won the Jeff Russell Trophy as most valuable player in 1941. As an RCAF flight lieutenant and pilot during WWII he was shot down and wounded. He returned to Ottawa to play until 1949, his spirited style making him a fan favourite. Golab, who played offence and defence, appeared in 4 GREY CUP games. **FRANK COSENTINO**

**Gold** (Au), heavy, rare, very malleable and ductile metal which melts at 1063°C. Native gold ordinarily contains up to 16% silver. Electrum is

gold containing unusually high percentages of silver (20-40%). Pyrite or fool's gold, an iron MINERAL distinguishable from gold by its brittleness and hardness, is frequently mistaken for gold because of its colour. Although a rare element, gold occurs in nature widely distributed in small amounts. The chief source is the so-called hypothermal gold-quartz veins where gold, pyrite and other sulphides were deposited from ascending, mineral-bearing solutions (see IGNEOUS ROCK). The gold is mechanically, not chemically, mixed with the sulphides; therefore, when the sulphides are oxidized, the gold is freed. It is recovered by amalgamation with MERCURY or by treatment in a cyanide solution to form a soluble cyanide (see METALLURGY). When gold-bearing veins are weathered, gold may be washed into neighbouring streams where, because of its high specific gravity, it separates from lighter sands and gravels and concentrates to form placer deposits.

Gold was one of the first metals used by humans. In prehistoric times it was widely valued for artistic and ornamental purposes, and magical powers were attributed to it. It later acquired the status of currency (see MINTING; COINAGE), and although no longer commonly used as currency, it is interchangeable with any currency and most countries maintain some portion of their international reserves as gold (see GOLD STANDARD). Gold has several industrial uses. Being chemically inert, it has long been popular in dentistry for crowns and caps. Resistance to corrosion and good electrical conductivity make it useful in precision electronic equipment (see ELECTRONICS INDUSTRY). When applied as a thin film, it improves the thermal properties of window glass; the Royal Bank building in Toronto is an example of a large-scale use for this purpose. The major industrial use remains in JEWELLERY fabrication. Because it is soft, gold is commonly alloyed with other metals, eg, copper and silver, and it is combined with platinum to form white gold. The karat number indicates the amount of gold in the alloy: 24 karat is pure gold; 18 karat is 18 parts gold, 6 parts other metals.

Early exploration of what is now Canada was partly motivated by the hopes of France and England that they would discover hoards of gold, like those seized by the Spaniards in Mexico and Peru. Several adventurers, such as Martin FROBISHER in 1577 and 1578, returned to Europe expectantly with loads of worthless ore. The first gold found in Canada was in small placer deposits in the Eastern Townships of Québec and in central NS. Beginning with the Fraser River GOLD RUSH (1858), a series of discoveries in interior BC transformed that colony's history. The famous KLONDIKE GOLD RUSH (1897-99) attracted prospectors to the YT from all over the world. An enormous "dome" of gold was discovered near Porcupine Lk, northern Ontario, in 1909. At KIRKLAND LAKE, Ont, HARRY OAKES developed the deepest gold mine in N America, and certainly the richest ever controlled by one man — it yielded over \$265 million. WWII stimulated a boom in gold mining, and for a time gold was Canada's leading mineral product. By about 1970, costs of production from Canadian mines had increased until most mines had to close and gold production declined to 25% of peak levels. However, in recent years a dramatic increase in gold prices, combined with the discovery of large new gold deposits, particularly in the Hemlo district of northwestern Ontario (the largest discovery since Timmins in 1905) and Val d'Or, Qué, has led to increased production and a renewed importance of gold to the Canadian economy. In 1983 Canada was the world's 3rd-largest gold producer, far behind the Republic of South Africa and the USSR. Canadian production was 70 746 kg valued at \$1.2 billion. **S.A. HAMILTON**

**Gold Rushes** in British North America began in the Queen Charlotte Is (BC) in 1852. Britain responded to the threat of encroachment by American gold seekers by placing the islands under the jurisdiction of Gov James DOUGLAS of the colony of Vancouver's I. In Aug 1857 gold was found on the Fraser R, and Douglas, anticipating a rush, assumed jurisdiction of the mainland in Dec. Approximately 25 000 individuals, most of them American, took part in the Fraser gold rush of 1858; by July the population of Victoria (the seat of government and a supply centre) had grown from several hundred to about 6000. The influx of men transformed the fur-trade territory into a mining frontier and altered the native Indians' position: once regarded as partners in the FUR TRADE, they became obstacles to prospectors and settlement. The rush led to the creation of the colony of BRITISH COLUMBIA on 19 Nov 1858 with Douglas as governor, and was followed by the establishment of commercial activities, transport companies and routes, places of entertainment and a postal service.

As the gold supply dwindled on the lower Fraser, prospectors travelled farther inland in search of shallow diggings. In 1860 gold was found near Cariboo Lk. The finds on the Cariboo creeks, such as those of William Dietz ("Dutch Bill") on Williams Creek, led to the Cariboo gold rush of 1862. Unlike the predominantly Californian rush of 1858, this one saw gold seekers from Britain, the Canadas, Europe and other parts of the US. Two men associated with the Cariboo were Billy Barker the pioneer of deep diggings, and John "Cariboo" Cameron, who had acquired more than \$150 000 by Oct 1863. This rush led to the building of an arterial highway for BC (see CARIBOO ROAD) and to the population's becoming less American. The mainland population desired its own governor and government, and obtained both in 1864.

Gold was found on the Stikine and Peace rivers in 1861 and 1862, but the resulting small rushes were overshadowed by that of the Cariboo. The search for gold led to rushes to Wild Horse Creek in the Kootenays in 1864 and to Big Bend in 1865-66. The depression resulting from the gold industry's falling revenue gave rise to a demand for retrenchment and to an exodus of population, and resulted in the 1866 union of the colonies of Vancouver I and BC. Joining CONFEDERATION in 1871 was the political solution for a population seeking to escape heavy taxation to pay the colony's debt and the costs of an over-staffed government. The economic growth of BC after the end of the mining boom was based on links forged by the CPR.

In 1869 the Omineca R and its tributaries drew miners northward in search of individual wealth (mining in the older areas had become more technical, and capital and labour intensive, and companies were formed to meet higher operational costs) and the rush to this region reached its height in 1871. The Cassiar district in the Liard R basin in northern BC was productive 1872-80 and the operations there were a link between the gold rushes of BC and those of the Yukon and Alaska.

The Yukon R basin, which the Alaska-Canada boundary divided, was the principal gold-bearing district in the North, and the American system of miners' meetings was used to regulate mining and maintain law and order. The Canadian government sent Insp Constantine of the NORTH-WEST MOUNTED POLICE to Canadian territory in 1894, and the following year he became agent at FORTY MILE with wide powers and 20 policemen to assist him. In 1896 gold was found on Bonanza Creek and news of its discovery led to the KLONDIKE GOLD RUSH. The influx of people prompted the Canadian government to establish the Yukon Territory (1898).

The Klondike rush was the last major gold rush, for by the end of the century the era of in-

The Neversweat Company tunnel, Williams Creek in the Cariboo country, 1868 (courtesy Public Archives of Canada/C-173/F. Dally).

dividuals participating in the independent extraction of gold had largely passed. Gold had been found near Madoc, Canada East, in the late 1840s and along the Nova Scotia coast in 1862. The construction of the CPR, ONTARIO NORTHLAND and other lines within the Canadian SHIELD resulted in the sometimes accidental discovery of several large, valuable mineral deposits in Québec, Ontario and Manitoba, and the associated discovery of gold. Prospecting for silver-cobalt in 1906 led to the discovery of gold at Larder Lake, Ont. But these discoveries were quickly taken over by companies with the ability to mine and transport minerals on a large scale. See MINING.

JERRY SHELEST  
Reading: R.J.W. Douglas, ed, *Geology and Economic Minerals of Canada* (1976); W.P. Morrell, *The Gold Rushes* (1968).

**Gold Standard**, monetary system in which a currency unit (the Canadian dollar, for example) is defined in relation to a certain quantity of gold, and in which the monetary authority (central bank) agrees to buy and sell gold freely at this price. International gold flows are unrestricted and international payments are balanced by gold movements. Canada was officially on the gold standard after 1851, but followed most other nations in abandoning it in 1914. A version of the standard was re-established in 1926 but permanently abandoned in 1931. The gold standard restrained governments from expanding credit, keeping international creditors happy, but it also meant that economic instability in one country was transmitted to others by gold movements. Modern nations have been loath to subjugate their domestic economies to the vagaries of world economic conditions, although a return to the gold standard has been advocated in the US and elsewhere as a means of disciplining monetary authorities

JAMES MELVIN

**Goldbloom, Alton**, pediatrician, educator, author (b at Montréal 23 Sept 1890; d there 3 Feb 1968). A 1916 McGill medical graduate, Goldbloom pioneered modern pediatrics in Québec and eastern Canada. Following internships, including 2 years in New York, he began to practise in Montréal (1920). He played a leading role in developing the Montréal Children's Hospital and the Dept of Pediatrics at McGill. His book, *The Care of the Child* (1928), was translated into

French and Dutch. In 1959 *Small Patients: The Autobiography of a Children's Doctor* was published. Goldbloom's wit and encyclopedic knowledge made him a popular lecturer. HAROLD SEGALL

**Golden, BC, Town**, pop 3476 (1982e), inc 1957, is located on the COLUMBIA R and Trans-Canada Hwy, 260 km W of Calgary, Alta. It is situated between the Selkirk Mtn Range and Glacier National Park on the W and between the Rocky Mtns and Yoho National Park on the E. In the 19th century the area was known as the Cache, or Kicking Horse Flats, but in 1883, during construction of the CPR, the community was named Golden City as a counterpart to Silver City (Castle Mtn, Alta). The town owes its start to the railway, still its principal employer. The region around Golden also supports several sawmills and plywood plants and some mining. Before construction of the Rogers Pass section of the Trans-Canada Hwy in the early 1960s, Golden was the eastern end of the Big Bend Hwy which followed the big bend of the Columbia between Revelstoke and Golden. Tourist traffic on the Trans-Canada Hwy, especially in the summer season, is also important to the economy.

JOHN R. STEWART

**Golden Dog** (*le chien d'or*), stone bas-relief bearing the figure of a dog gnawing a bone, with the inscription: "Je suis un chien qui ronge lo [l'os]/En le rongeant je prend mon repos/Un tems viendra qui nest pas venu/Que je morderay qui maura mordu" ("I am a dog that gnaws a bone/In gnawing it I take my rest/A time will come which is not yet/When I shall bite him who has bitten me"). The stone was built into a house erected by Timothée Roussel in Québec City in 1688. It may have been set there by Roussel or by Nicholas Philibert, who bought the house in 1734 and may have used the image to protest the corrupt practices of Intendant François BIGOT. In 1871 the house was destroyed to make way for a post office, and the stone was moved to the new building's portico. The many legends connected with the Golden Dog all turn on revenge and end in tragedy. One version was the basis for William Kirby's *Golden Dog*.

**Golden Dog (Le Chien d'Or), A Legend of Quebec, The**, by William Kirby, appeared in New York and Montréal, 1877. The first edition contained many errors, and the supposedly "authorized" edition, *The Golden Dog (Le Chien d'Or), A Romance of the Days of Louis Quinze in Quebec* (Boston, 1897), was, according to Kirby, "a poor mutilated thing." The many other editions and

abridgements are also textually unreliable. The novel's action takes place just before the fall of New France, when the supporters of the popular Chien d'Or trading house, headed by the bourgeois Philibert, struggle against the decadent and corrupt Grand Company of the Intendant Bigot. Two ill-fated romances are interwoven: that of Amélie de Repentigny with Philibert's son, Pierre; and that of Le Gardeur (Amélie's brother) with the self-seeking Angélique des Meloises, who eventually persuades him to kill Philibert. This action precipitates the collapse of the colony. The novel mixes Gothic and historical romance with Québécois history and legend; it also provides insight into 19th-century English Canadian perceptions of French Canada's past. *The Golden Dog* was translated into French by Léon-Pamphile LeMay as *Le Chien d'Or: légende canadienne* (Montréal, 1884; rev 1926).

NEIL BESNER

**Golden Hinde**, elev 2200 m, is the highest mountain on VANCOUVER I., located near the Island's centre in Strathcona Pk. The peak was known as Rooster's Comb until R.P. Bishop submitted to the Geographic Board of Canada (confirmed 1939) the present name (after the ship of Sir Francis DRAKE, who may have reached this latitude and sighted the mountain). It was possibly discovered in July 1896 during the Bolton-Laing survey of the Island. GLEN BOLES

**Goldenrod**, genus *Solidago*, showy, perennial, herbaceous PLANT of the Compositae or Asteraceae family. Nearly 100 species have been described, chiefly from N America. Thirty-two species occur in Canada, 6 of which are distributed transcontinentally. Eastern Canada (Ontario to NS) has 11 species, with an additional 6 species found only in southern Ontario (the richest part of Canada for varieties of goldenrod). Goldenrods grow in dry, sterile to moist, rich soils, in prairie and wooded locations, and from the brackish seashore to high mountain elevations. The stems are usually simple, bearing distinctly toothed or lobed leaves. The flower cluster is usually a large, loose plume of several hundred heads, each a small "daisy" — a central mass of small, tubular florets surrounded by radiating, strap-shaped florets. The flowers are yellow and bloom in mid-to-late summer and autumn. The calyx tube, firmly attached to the ovary of individual florets, is crowned by fine hairs that form a parachute at the top of the tiny, dry, ripened fruit and aid in wind dispersal. Goldenrod is wrongly blamed for hay fever caused by RAGWEED pollen.

**Goldhamer, Charles**, painter (b at Philadelphia, Penn 21 Aug 1903; d at Toronto 27 Jan 1985). He was commissioned as one of Canada's official war artists, and his candidly observed charcoal drawings of burned Canadian airmen in an English hospital are some of the most horrific images of WWII. After the war, for a time, he was married to British comedienne Anna Russell. For 42 years he was in the art department of Toronto's Central Technical School (he retired as chairman 1969). His use of demonstrations and working directly are a style of teaching he learned from Arthur LISMER, his own teacher at the Ontario College of Art (1922-26). Like other painters in the 1930s, especially his friend Fritz BRANDTNER, Goldhamer found a base in Baie St Paul, painting habitants in Charlevoix County. His work in Québec, often in water-colour, was the start of his reputation. Fresh and sparkling, it recorded the area's rolling terrain. Sometimes his watercolours — like those of Carl SCHAEFER and Charles COMFORT — recall the work of American artists Charles Burchfield and Charles Sheeler. JOAN MURRAY

**Goldsmith, Oliver**, poet, civil servant (b at St Andrews, NB 6 July 1794; d at Liverpool, Eng 23 June 1861). The son of Loyalists and

grandnephew of Irish poet Oliver Goldsmith, he was employed for most of his life in the commissariat of the British army at Halifax. His long poem, *The Rising Village*, originally published in England (1825) and later revised in Canada (1834), was the first book-length poem published by an English Canadian. In heroic couplets, Goldsmith depicts the progress of settlement and civilization in a Maritime community, but subtly cautions that the settlers must remain vigilant and loyal to Britain — lest the wilderness reassert its chaos and the lawless youth rebel in a (perhaps) American revolutionary spirit. Of interest is *The Autobiography of Oliver Goldsmith* discovered by W.E. Myatt and published with his notes in 1943. GERALD LYNCH

**Golf** is an outdoor game played with a small hard ball and a set of clubs with iron or wooden heads. The object of the game is to make one's way round a specially laid out course in as few strokes as possible, hitting the ball from certain starting points, or tees, to specific targets, which are holes set in the ground. Most golf courses have 18 holes. The name "golf" probably derives from the German *kolbe*, meaning "club." The game's ancestry is obscure, but golf as we know it was first played in Scotland in the last half of the 15th century, although the Scottish Parliament by 1491 had passed 3 edicts ordering that it be banned, reasoning that interest in it kept people from more practical pursuits and interfered with military activities. Golf spread, nonetheless, and when native Scots emigrated to Canada, they took what came to be known as the "Royal and Ancient Game" with them.

The first golf club in Canada was the Montreal Golf Club, founded in Nov 1873 by Scotsman Alexander Dennistoun; he was also the first president and the captain of the club. He was joined in his efforts by John G. and David D. Sidey, Scottish brothers who had immigrated to Canada. The first course for the Montréal club was over property called Fletcher's Field, owned by the city of Montréal. In 1884, Queen Victoria, through the Earl of Derby, bestowed upon the club the "Royal" prefix. The Quebec Golf Club (now Royal Quebec Golf Club) was founded in 1874. Play was over Cove Field between the Citadel and the Plains of Abraham. Canada's third course belonged to the Toronto Golf Club, founded in 1876. The fourth was the Brantford (Ont) Golf Club, begun in 1879. One of its mem-

bers, Ralph H. Reville, began Canada's first golf magazine, *Canadian Golfer*, in 1915. The magazine continued under Reville's direction through 1932 and became the primary source for early Canadian golf history. Canada's first 18-hole course was the Victoria Golf Club, started in 1893; until then golfers had played over 9 holes. In 1894 the Winnipeg Golf Club was founded, followed by the Halifax Golf Club and the Edmonton Country Club in 1896, the Calgary Golf and Country Club in 1897 and the Vancouver Golf Club in 1898. By the turn of the century, golf was firmly established in Canada. The first municipally owned and operated golf course was conducted by the city of Edmonton in 1912, and within a short time there was hardly a town in Canada that did not have a golf course. Today, Canada has numerous outstanding courses, with the National Golf Club in Woodbridge, Ont, and Glen Abbey Golf Club in Oakville, Ont, generally considered the best championship courses.

Seeking competition and camaraderie, club members began to play against one another. The first interclub match was held on Cove Field in Québec City in 1876 and the host team defeated Montréal by 12 holes. The first interprovincial match was played at the Ottawa Country Club in 1893 between teams from Ontario and Québec. The Canadian Golf Assn, later to become the Royal Canadian Golf Assn (RCGA), was formed in 1894, spurred on by the efforts of A. Simpson, secretary to the Royal Ottawa (formerly Ottawa) Golf Club. The RCGA aimed to promote and develop golf in Canada, to protect the mutual interests of its members, establish consistency in the handicapping, or rating, of golfers, and to conduct national championships. In 1895 it conducted the first Canadian amateur championship, at the Royal Ottawa course. The winner was T.H. Harley, a Scotsman who had moved to Kingston, Ont.

At first, the RCGA conducted national championships for men and women. The first Canadian Ladies' Open amateur was held in 1901 at Royal Montreal and was won by member Lily Young. In 1913, Florence Harvey, a member of the Hamilton (Ont) Golf Club founded the Canadian Ladies' Golf Union. She had recently competed in England and, observing the good work of the Ladies' Golf Union there, saw no reason why a similar organization could not exist in Canada. By 1924 the CLGU, now the Canadian Ladies' Golf Assn, was ready to take over its own championship and the RCGA relinquished

Kananaskis Golf Club, one of Canada's newest and most spectacular courses (courtesy Kananaskis Country).

control. The CLGA adopted similar objectives in women's golf to those of the RCGA in men's.

As more novice golfers joined clubs across Canada, the need for instructors was met by the many Scots who had been working at Canadian clubs and were adept at golf. They brought a knowledge of the game's principles and transmitted them to their members. By 1911 there were so many club professionals that they formed the Canadian Professional Golfers' Assn. Their inaugural championship was held in 1912 at the Mississauga Golf Club, near Toronto. Earlier the first Canadian Open had been conducted by the RCGA in 1904. It was won by J.H. Oke, an Englishman who had spent some time in Canada, but 7 of the next 10 Opens were taken by professionals firmly ensconced at Canadian clubs. George Cumming, professional to the Toronto Golf Club 1900-50, brothers Charles and Albert Murray of the Royal Montreal and Outremont (Qué) clubs, and Karl Keffer of Royal Ottawa starred in that decade of tournaments. It became obvious that professionals could both teach and play golf. Eventually these roles were divided, as memberships swelled and competition became so fierce that anybody who wanted to play for a living had to be devoted to practice and competition.

At the same time, Canadian amateurs were also busily engaged in their sport. George S. LYON, a former cricketer who played golf at the Rosedale and Lambton clubs in Toronto, won the Canadian amateur title 8 times between 1898 and 1914, as well as the 1904 Olympic golf event. C. Ross (Sandy) Somerville of the London Hunt Club won it 6 times 1926-37; and Ada MACKENZIE, founder of the Ladies' Golf and Tennis Club in Thornhill, Ont, won the Canadian ladies' amateur title 5 times 1919-35. They were later joined as top amateurs by Marlene Stewart STREIT, 11-time ladies' amateur champion, ladies' British Open amateur champion (1953) and US women's amateur champion (1956); and Gary Cowan of Kitchener, Ont, winner of the US men's amateur in 1966 and 1971. During Somerville's tenure as Canada's top amateur (he also won the US men's amateur in 1932), the inter-provincial team matches for the Willingdon Cup had been inaugurated in conjunction with the Canadian amateur. The matches began in 1927 when Governor General Viscount Willingdon presented the cup to the RCGA. Four-man teams have competed annually for the trophy after emerging from provincial playdowns. As the top golfers edged into middle age, senior championships arose to fill the need for competition and Lyon himself took the first 6 events held by the Canadian Senior Golf Assn from 1918 to 1923.

On the professional side, the Canadian Open became one of the most sought-after titles in golf as players from Canada, the US and around the world competed for prizes that rose to \$425 000 in the early 1980s. Until 1936 the Open was played for the Rivermead Cup; from 1936 to 1970 the Seagram Gold Cup was at stake; and after 1971 competition was for the Peter Jackson Trophy. On the US men's pro tour, Canadian Stan LEONARD won 3 events 1957-60, while George KNUDSON had won 8 by the time he turned to teaching in the late 1970s; he had also won the 1968 World Cup with Al Balding. On the women's tour, Sandra POST of Oakville, Ont, won the Ladies Professional Golf Assn championship on her first year on the tour and won more money than any Canadian professional, male or female. In 1980 Dan Halldorson and Jim Nelford won the World Cup of professional golf for Canada; that same year Halldorson won on the US tour and in 1981 Dave Barr of Kelowna, BC, did the same. In 1984 Nelford, Halldorson and Barr were all among the top 100 money winners on the US tour.

More than 1000 clubs belonged to the RCGA

by the early 1980s. Junior golf had been strong since the first Canadian junior was held in 1938. The best junior women golfers had competed for the Canadian junior girls' championship since 1955. Stimulated by the prize money available in golf around the world and encouraged by the RCGA, the CLGA, and provincial golf associations, junior golfers began to look to golf as a career and to attend college on golf scholarships. In 1979 the Canadian Golf Foundation, an arm of the RCGA, was founded to act as a clearing house for Canadian golf information. In 1982 the foundation offered scholarships for eligible Canadians to attend college.

The long tradition of golf as a participant sport, the pleasant environment in which it is played, and the long life of the sport for individuals ensure that it will remain a popular hobby. There is something in golf that keeps people interested — perhaps the personal test of ability — and despite severely increasing land costs, escalating fees for play, and the reputation of the game as a sport exclusive to the leisured and moneyed class, golf has endured for centuries.

LORNE RUBENSTEIN

**Good, William Charles**, farmer, co-operative and agrarian leader (b near Brantford, Ont 24 Feb 1876; d at Paris, Ont 16 Nov 1967). A student of social and religious issues and a member of a family long involved in farm organizations, Good was on the executive of the Farmers' Assn in 1904. In 1907 he helped amalgamate the association with the Dominion Grange and became president of the new organization in 1912. A proponent of the need for farmer unity, Good, with E.A. PARTRIDGE and E.C. DRURY, drafted the constitution of the Canadian Council of Agriculture in 1909. In 1914 he helped organize the United Farmers of Ontario and the United Farmers Co-operative. Good was a leader of the PROGRESSIVE PARTY and sat as an Independent-Progressive in the Commons 1921-25, where he advocated electoral reform, banking reform, temperance and tariff reform. Elected president of the Co-operative Union of Canada in 1921, he held that post until 1945. Philosophically committed to a co-operative world view, he encouraged all forms of co-operative organizations (see CO-OPERATIVE MOVEMENT).

IAN MACPHERSON

**Goodeve, Sir Charles Frederick**, scientist, research director (b at Neepawa, Man 21 Feb 1904; d at London, Eng 7 Apr 1980). After beginning research in electrochemistry at U of Man, Goodeve won a scholarship to University Coll, London, Eng. He joined its staff in 1930 and was elected a fellow of the Royal Soc of London in 1940. He had joined the RCN Volunteer Reserve at Manitoba, transferred to the RNVF (being promoted to lt-cdr in 1936) and tried to convince university colleagues to get personal experience of military problems. In 1940 he invented the method of degaussing ships to render them immune to magnetic mines, and subsequently commanded a special Royal Navy research unit. He was knighted and granted £7500 in 1946 for his wartime inventions. From 1945 to 1969 he was director of the British Iron and Steel Research Assn and introduced operational research methods into industry. While making his career in England, Goodeve sought to promote Anglo-Canadian co-operation in science by exchanges of personnel with the Defence Research Board and NATIONAL RESEARCH COUNCIL.

DONALD J.C. PHILLIPSON

**Goodridge, Augustus Frederick**, businessman, politician (b at Paignton, Eng 1839; d at St John's 16 Feb 1920). He became prime minister of Newfoundland in Apr 1894 when William WHITEWAY's sizable majority resigned after charges of corrupt election practices were brought against it. Goodridge was first elected as a Conservative in 1880, became leader of the Opposition in 1884 and was made a Cabinet minis-

ter before his brief and chaotic term as prime minister. His resignation on 12 Dec 1894 followed upon the financial collapse of 2 principal Newfoundland banks.

ROBERT D. PITT

**Goodwin, Betty Roodish**, artist (b at Montréal 19 Mar 1923). Her career has been characterized by a quest for atmosphere and effect, but the medium she uses divides it into 2 periods. Initially her training at Sir George Williams followed by a trip to Europe in 1958-59, placed her among modern artists who seek to combine crowd scenes and geometrization. After she worked with painter-engraver Yves GAUCHER in 1968-69, her attitude towards her medium changed and she began to try to evoke the essence of the material world's imaginative force. In her series working with vests from 1969 and after 1972 with tarpaulins, she uses transparency, thickness and texture to capture the power of her worn and battered objects. As the scale of objects changed during these years, her attention focused on light, movement and on time as an element of communication. In a subsequent series of installations, *P.S. One*, New York (1977-79), *rue Mentana*, Montréal (1977-79), in the Pluralities exhibition, National Gallery of Canada (1980), and, as part of the OKanada exhibition in Berlin (1983), structured space, uneven planes, light and coloured pigment play a fundamental role.

LAURIER LACROIX

**Goose**, member of a widespread group of WATERFOWL ranging in size from the giant Canada goose (*Branta canadensis maximus*) to the diminutive cackling goose (*B. c. minima*). The term goose is applied to many species of waterfowl in the Southern Hemisphere, but the only true geese are found in N America, Europe and Asia. Geese belong to 2 main groups, true geese (genus *Anser*) and Brant geese (*Branta*). Some taxonomists subdivide geese into additional groups, eg, Hawaiian goose or nene (*Nesochen*), emperor goose (*Philacte*) of Alaska, bar-headed goose (*Eulabia*) of Tibet and India, or snow goose (*Chen*). Their taxonomy at the specific and subspecific level is very complicated, especially in the races of the Canada goose and bean goose (*Anser fabilis*). There are 7 species of geese in N America, most of which breed in the boreal forest and TUNDRA. The Canada goose may have as many as 50 distinct races and variations, ranging in size from the cackling goose of Alaska (1 kg) to the Canada goose of Manitoba (10 kg); all have the same general pattern of black neck and head with a white throat patch. Brant geese (*B. bernicla*) are divided into 4 populations: those from the eastern QUEEN ELIZABETH is winter in Ireland; those from the western Queen Elizabeth is in Puget Sound and the lower BC mainland; those on the coastal tundra of the NWT in Baja, California; and those from FOXE BASIN off the coast of New Jersey. The lesser and greater white-fronted geese (*Anser erythropus* and *A. albifrons*, respectively) are circumpolar, breeding in the arctic tundra. Snow geese (*Chen caerulescens*) breed in the High Arctic and Ross's geese (*C. rossii*) in the Low Arctic. Geese in Canada are intermediate in size between swans and ducks. Males are called ganders; juveniles, goslings. Geese are believed to mate for life. Members of various species may nest singly or in colonies. Usually 3-6 eggs are laid (range 2-9) in a nest of plant debris, moss, etc, lined with down. Both parents care for young.

F.G. COOCH

**Gordon, Andrew Robertson**, physical chemist, educator (b at Toronto June 26 1896; d there 29 July 1967). He was an officer in the Canadian Field Artillery in WWI and was appointed to the faculty of the Department of Chemistry of U of T in 1925. He was widely recognized for his pioneering research on the calculation of chemical properties by quantum statistical mechanics and in 1946 received an OBE for research and

advice during WWII. He made significant contributions to the theory of electrolytic solutions. Head of the Department of Chemistry 1946-60, he was a founding member of the Defence Research Board and founding director of ATOMIC ENERGY OF CANADA LTD. He greatly improved the stature of graduate studies as dean of graduate studies, U of T, 1953-64. D.J. LE ROY

**Gordon, Sir Charles Blair**, banker, manufacturer (b at Montréal 22 Nov 1867; d there 30 July 1939). Five years after beginning work in a dry-goods store, Gordon formed the Standard Shirt Co and in 1904 oversaw the organization of Dominion Textiles. He became company president 1909 and was a founder and president of Dominion Glass. Recognized as a consummate organizer and a shrewd financier, Gordon's career paralleled the consolidation of Canadian business and the rise of Montréal as Canada's banking centre. His long-standing association with the BANK OF MONTREAL was marked by his appointment as a director 1913 and president 1927. During WWI, Gordon served on the IMPERIAL MUNITIONS BOARD in Ottawa and with the British War Mission in Washington. He received a knighthood for his contributions. P.E. RIDER

**Gordon, Charles William**, pen name Ralph Connor, clergyman, novelist (b in Glengarry Cy, Canada W 13 Sept 1860; d at Winnipeg 31 Oct 1937). The most successful Canadian novelist in the early 20th century, Gordon used literature as a pulpit to preach his energetic branch of "red-blooded Christianity." Educated at U of T and Edinburgh, he was ordained a Presbyterian minister in 1890 and undertook mission work for 4 years in the Banff, Alta, area before becoming a pastor in Winnipeg. In 1897, as a fund-raising effort, he published some short stories about mission work in the West, and with their success he began producing best-selling western novels such as *The Sky Pilot* (1899) and *The Prospector* (1904) as well as several novels set in Glengarry Cy. His early novels are fast-paced, sentimental melodramas, with stereotyped characters dramatizing the conflict between good and evil in frontier settings presided over by exemplary churchmen. The greatest influence on Gordon after his mother was Dr James ROBERTSON, the Presbyterian superintendent of missions in the West, whose biography Gordon wrote in 1908.

During WWI, after serving in France as chaplain to the Canadian forces, Major Gordon toured the US speaking in favour of American participation in the war. His novels then and afterwards were broader in scope and setting, more bluntly didactic in applying theology to modern society, and less popular than his westerns. Returning to Winnipeg, he chaired the Manitoba Council of Industry for 4 years after the 1919 WINNIPEG GENERAL STRIKE and negotiated in numerous labour disputes. In 1921 he became moderator of the Presbyterian Church in Canada and helped form the UNITED CHURCH in 1925. His autobiography, *Postscript to Adventure*, was published posthumously in 1938. TERENCE CRAIG  
Reading: Ralph Connor, *The Man from Glengarry* (2nd ed, 1960) and *Glengarry School Days* (2nd ed, 1975).

**Gordon, Crawford**, business executive, public servant (b at Winnipeg 26 Dec 1914; d at New York City, NY 26 Jan 1967). Educated at private schools and McGill, Gordon worked in the Dept of Munitions and Supply during WWII. At the end of the war he became C.D. HOWE's director of industrial reconversion. After a stint in private industry Gordon returned to government service in 1951 as co-ordinator of production for the Dept of Defence. Sent to the A.V. Roe aircraft plant at Malton, Ont, to improve production of the AVRO CF-100 fighter, Gordon was president and general manager of the company 1951-59.

He presided over the development of the CF-105 (AVRO ARROW), cancelled by the government in 1959. ROBERT BOTHWELL

**Gordon, Donald**, banker, business executive (b at Old Meldrum, Scot 11 Dec 1901; d at Montréal 2 May 1969). Gordon left Scotland when young and joined the Bank of Nova Scotia, working up through the ranks while attending night school. He was rewarded with promotions to head office and eventually to the Toronto branch. In 1935 he was recruited as secretary of the new Bank of Canada and in 1938 became deputy governor. When war broke out Gordon was assigned to the Foreign Exchange Control Board and in 1941 was made chairman of the Wartime Prices and Trade Board, a job at which he was highly successful. In 1947 he returned to the Bank of Canada, leaving again in 1950 to become president and chairman of the CNR. Gordon presided over a difficult period of labour troubles, a declining share of passenger traffic, the expense of modernization and demands to appoint more French Canadians to senior management. He claimed that he had done all that he could with what was available and in response was burned in effigy in Montréal. Gordon retired in 1967 to become president of Brinco and chairman of the CHURCHILL FALLS power project. ROBERT BOTHWELL

**Gordon, John King** (b at Winnipeg 6 Dec 1900), son of Charles GORDON (pen name Ralph Connor). After studying at U of Manitoba, Oxford and Union Theological Seminary, Gordon taught at United Church Theological College in Montréal and was active in the Fellowship for a Christian Social Order, the LEAGUE FOR SOCIAL RECONSTRUCTION and the CO-OPERATIVE COMMONWEALTH FEDERATION. In New York C he was managing editor of *The Nation* (1944-47) and joined the staff of the UN, serving it in critical times in Korea, the Middle East and the Congo. After 1962 he taught international relations at the universities of Alberta and Ottawa, was chairman of the Canadian University Service Overseas (CUSO), president of the United Nations Assn and an adviser to the International Development Research Centre. JOHN W. HOLMES

**Gordon, Walter Lockhart**, public servant, politician, author (b at Toronto 27 Jan 1906). Gordon was educated at Upper Canada College and RMC, becoming a partner in the accounting firm Clarkson, Gordon and Co in 1935. During WWII he served in the Bank of Canada and the Ministry of Finance; in 1946 he chaired the Royal Commission on Administrative Classifications in the Public Service, and in 1955-57 the Royal Commission on CANADA'S ECONOMIC PROSPECTS. Gordon's concern for Canadian economic independence led him into the Liberal Party after L.B. PEARSON became leader in 1958; in May 1963 Gordon became minister of finance in the Pearson government. His 1963 budget proposal for a tax on takeovers of Canadian firms was withdrawn under pressure, and his influence in Cabinet waned until his resignation following the general election of Nov 1965. He returned to Cabinet as president of the privy council in 1967 to oversee the Watkins Task Force on the Structure of Canadian Industry, and resigned after completion of the report in Mar 1968. In the 1970s he inspired the COMMITTEE FOR AN INDEPENDENT CANADA; in the 1980s he gave leadership to the movement for nuclear arms control and disarmament. DENIS SMITH

Reading: Walter Gordon, *A Political Memoir* (1977); Denis Smith, *Gentle Patriot* (1973).

**Gore, Francis**, colonial administrator (b at Blackheath [London], Eng 1769; d at Brighton, Eng 3 Nov 1852). The third Lt-gov of Upper Canada, he came to the colony after a brief career in the army and as Lt-gov of Bermuda. His first term (1806-11) was marred by bitter quarrels

with Judge Robert Thorpe and Surveyor General Charles B. Wyatt, which ended in their suspension from office. He was absent on leave during the WAR OF 1812. His second term (1815-17) closed with his prorogation of the Assembly, which had objected to his ban on the issuing of land patents to American immigrants, was impatient with delays in obtaining compensation for wartime damage to private property and was dissatisfied with his slow administration. Before that, he had got on well with the Assembly and had secured bills to build roads, reorganize the militia and found schools. He returned to England to become a deputy teller of the Exchequer. S.R. MEALING

**Gorman, Charles**, speed skater (b at Saint John, NB 6 July 1897; d at St Martins, NB 11 Feb 1940). Despite suffering a shrapnel wound in one leg during WWI, Charlie Gorman's international success earned him the title of "the man with the million dollar legs." Developing a long, sweeping stride, he won the 1924 US amateur title and the world championship 2 weeks later. He lost both in 1925 but defeated Clas Thunberg, the 1924 Olympic champion, to reclaim his world title the next year. On his retirement in 1928 he held 7 world records. J. THOMAS WEST

**Gosford, Archibald Acheson, 2nd Earl of**, colonial administrator (b in Ire 1 Aug 1776; d at Markethill, Ire 27 Mar 1849). Scion of a prominent Anglo-Irish family, he was an outspoken opponent of the ORANGE ORDER and strongly supported a policy of conciliation in Ireland. After a parliamentary career he was appointed governor of British N America in 1835 and placed in charge of a commission of inquiry into the crisis in LOWER CANADA. A number of its recommendations were embodied in the Russell Resolutions in 1837. From 1835 to 1837 Gosford vainly sought to satisfy the Assembly of LC without alienating the colony's anglophone minority, but his efforts at conciliation did divide the PATRIOTE party and helped limit the support given the REBELLIONS of 1837. He resigned after violence began and returned to England. His tragedy was that he had been sent to govern Lower Canada at a time when a peaceful solution to the crisis there was no longer possible. P.A. BUCKNER  
Reading: F. Ouellet, *Lower Canada* (1980).

**Gosling, William Gilbert**, merchant, politician, author (b at Paget, Bermuda 8 Sept 1863; d there 5 Nov 1930). Gosling came to Newfoundland in 1881 as a clerk with a fish-exporting firm. Known for his literary interests, Gosling organized an urban-reform movement in St John's in 1913. As a result the city's elective council was replaced by a 12-man commission which drafted a new municipal charter under Gosling's chairmanship. Although the legislature initially refused to pass the charter, Gosling was elected mayor in June 1916. During his tenure he promoted public housing, tax reforms and the formation of the Child Welfare Assn. He finally got the legislature to pass the charter in 1921 — the basis of present municipal government in St John's — and withdrew from public life. He wrote *A History of Labrador* (1910) and a biography of Sir Humphrey GILBERT (1911). His extensive collection of books formed the basis of the city's first public library. MELVIN BAKER

**Goss, William Arthur Scott**, civic employee and photographer (b at London, Ont 4 Mar 1881; d at Toronto 1 June 1940). As official photographer for Toronto 1911-40, he produced over 30 000 photographs documenting a period of dramatic expansion in the city's history. These photographs are characterized by their realism and technical brilliance. An exponent of "pictorialism," in which photography was employed for artistic ends, Goss came into contact with many Canadian artists, including the GROUP OF

SEVEN. His pictorialist, soft-lens portraits and landscapes received critical acclaim both in Canada and abroad.

VICTOR RUSSELL

**Gosse, Philip Henry**, naturalist, religious writer (b at Worcester, Eng 6 Apr 1810; d at St Mary Church, near Torquay, Eng 23 Aug 1888). The foremost popularizer of natural history in mid-Victorian England and leader of a Brethren community in Devonshire, he made his decision to devote his life to the study of nature and the practice of evangelical Christianity during years spent in Canada. Gosse left Poole, Eng, in 1827 to work for 8 years as a clerk in a merchant's countinghouse at Carbonear, Nfld. Then in 1835 he attempted to farm just N of Compton in Lower Canada. The experiment proved a failure and he left Canada in 1838. Although Gosse's sojourn did not influence significantly his achievements, he has a place in the history of Canadian science. He was the first person to investigate systematically and record the entomology of Newfoundland. *The Canadian Naturalist* (1840; repr 1971) was Gosse's popular book on the flora and fauna of the Eastern Townships. Characteristically accurate and original in its ecological descriptions, though weak in taxonomy, the work provided first lessons for later generations of Canadian naturalists.

DOUGLAS WERTHEIMER

**Gotlieb, Allan Ezra**, public servant (b at Winnipeg 28 Feb 1928). A Rhodes scholar and international lawyer with a reputation for intellectual toughness, Gotlieb joined the Department of External Affairs in 1957, and was assistant undersecretary and legal adviser 1967-68. He was deputy minister of the new Dept of Communications 1968-73 and of Manpower and Immigration 1973-76. A member of P.E. TRUDEAU's inner circle, he returned to External Affairs as undersecretary 1977-81 and was then appointed ambassador to Washington. He is the author of *Disarmament and International Law* (1965) and *Canadian Treaty-Making* (1968).

ANNE HILLMER and NORMAN HILLMER

**Gotlieb, Calvin Carl**, "Kelly," professor of COMPUTER SCIENCE (b at Toronto 27 Mar 1921). A pioneer in the computer industry, Gotlieb received a PhD in physics from U of T in 1947 and was hired by the university as a researcher and lecturer. A founding member of the university's computation centre in 1948, he began teaching computer science in 1951 through the physics department. In time his interest shifted from hardware to computer applications and software and eventually to the socioeconomic implications of computer technology. He was instrumental in founding the Computing and Data Processing Assn of Canada (now the Canadian Information Processing Soc) in 1958 and the Co-operative on Information Technology between U of T and Waterloo in 1982. An expert in mathematical, business and scientific applications, he has been consulted on social issues, timetables, graph theory, international development, and seaway calculations since 1950.

J. KNELMAN

**Gotlieb, Phyllis Fay**, née Bloom, writer (b at Toronto 25 May 1926). She has published 4 vols of poetry, 5 verse plays (commissioned by the CBC), several science-fiction stories and 4 science-fiction novels. Her first novel, *Sunburst* (1964), has been translated into Dutch, French, Norwegian and German; the second, *O Master Caliban*, into German and Japanese. In 1980 she began an epic science-fiction trilogy about cat aliens. Her poetry blends fantasy and metaphysics and many of her poems, particularly the early ones, evoke her Jewish roots. She is the author of "Hasidic influences in the work of A.M. Klein," an in-depth analysis of one aspect of Klein's writing.

SHARON DRACHE

**Gotlieb, Sondra**, author (b at Winnipeg 30 Dec 1936). Educated in Winnipeg, she has published 2 novels: *True Confections* (1978), subtitled *Or How My family Arranged My Marriage*, which won the Stephen Leacock Medal for Humour, and *First Lady, Last Lady* (1981), a lively tale of diplomatic life. Gotlieb also writes nonfiction: *The Gourmet's Canada* (1972), *Cross Canada Cooking* (1976), and has written articles for *Saturday Night*, *Maclean's*, *Chatelaine* and the *New York Times*.

SHARON DRACHE

**Goudge, Thomas Anderson**, philosopher (b at Halifax 19 Jan 1910). A student of G.S. BRETT at Toronto (PhD 1937), he spent a year at Harvard during a time of intense interest in mathematical logic and philosophy of science. Appointed to U of T (1938), he introduced these subjects into a curriculum focused on the history of philosophy. While chairman, expanding enrolment allowed him to appoint people to work in these and other areas of contemporary interest. His publications include a study of *The Thought of C.S. Peirce* (1950), a logician, philosopher of science and early pragmatist, and *The Ascent of Life* (1961), which maintains that evolutionary biology explains the world in a manner unlike, for example, that of physics.

THOMAS MATHIEN

**Gouin, Sir Jean-Lomer**, lawyer, politician, premier of Québec (b at Grondines, Canada E 19 Mar 1861; d at Québec City 28 Mar 1929), was the father of Paul GOUIN, founder and leader of the Action libérale nationale. Of modest origins but well connected following his marriage to the daughter of Prem Honoré MERCIER, Gouin began his career in Montréal civic politics, joining the provincial Cabinet in 1900. He became premier in 1905, continuing and defending his predecessor S.N. PARENT's policy of industrial development against a concerted attack by Henri BOURASSA. Although welcoming foreign investment to develop Québec's resources, Gouin was anxious that French Canadians should share the benefits of industrialization. He became a committed educational reformer, eventually serving as president of Université de Montréal and chairman of 2 enquiries into public education in the 1920s.

Like other Québec Liberals, Gouin felt betrayed when the federal government imposed

Glenn Gould in rehearsal, Toronto, Ont, 1974 (courtesy Public Archives of Canada/PA-137052/Walter Curtin).

CONSCRIPTION in WWI but reaffirmed his commitment to Confederation in the "Francoeur Debate" of 1918 and ran for Parliament in 1921. Minister of justice 1921-24 in Mackenzie KING's Cabinet, he functioned primarily as spokesman for tariff-protected industries, contributing to an impression that he had become a tool of powerful financial interests. Disillusioned, the author of Québec's dramatic emergence as an industrialized province soon retired from politics. He became lt-gov of Québec in 1929.

BERNARD L. VIGOD

**Gouin, Paul**, lawyer, politician (b at Montréal 20 May 1898; d there 4 Dec 1976), son of Lomer GOUIN and grandson of Honoré MERCIER, both former prime ministers of Québec. In 1934 Gouin established the ACTION LIBÉRALE NATIONALE which attracted reform-minded Liberals and nationalists opposed to the policies of the TASCHEREAU administration. Prior to the 1935 elections, Gouin formed an alliance with Conservative party leader Maurice DUPLESSIS; he soon became disenchanted with Duplessis, however, and left the coalition before the 1936 elections which Duplessis's Union nationale won handily. Most of Gouin's followers abandoned him to follow Duplessis. After the demise of the ALN, Gouin contributed to the foundation of the BLOC POPULAIRE CANADIEN in 1942.

RICHARD JONES

**Gouin, Réservoir**, 1570 km<sup>2</sup>, elev 404 m, max length 102 km, average depth 5 m, third-largest "lake" (really a collection of hundreds of small lakes containing innumerable islands) in Québec, is located in S-central Québec, equidistant from Ottawa, Montréal and Québec City. It was created in 1918 at the upper reaches of Rivière ST-MAURICE by the Québec Streams Commission. The dammed area, fed by numerous small lakes and streams, allows power developments on the St-Maurice by controlling the flow of water. The reservoir was named after Sir Jean-Lomer GOUIN, premier of Québec 1905-20, who created the Québec Streams Commission.

DAVID EVANS

**Gould, Glenn Herbert**, pianist, writer, broadcast and recording artist (b at Toronto 25 Sept 1932; d there 4 Oct 1982). Dissatisfied with the concert medium, he abandoned a thriving international concert career for performances using recorded-sound technology. His work had a unique importance in music and communications.

Gould received his musical education at the ROYAL CONSERVATORY OF MUSIC, Toronto, where his piano teacher was Alberto Guerrero. He was concerto soloist with the Toronto Symphony at age 14. Solo concerts, appearances with many Canadian orchestras, and CBC network broadcasts, as well as his championing of non-standard piano fare (Bach, the 16th-century English keyboardists, moderns such as Hindemith and Schoenberg) placed him among Canada's leading musical performers when still in his early twenties. Debuts in Washington, DC, and in New York C in Jan 1955, and his first US recording later that year (Bach's *Goldberg Variations*), brought immediate international attention. Concerts and orchestral engagements in the US, England, Austria, Germany, Israel and the USSR (where he was one of the first Canadians to tour) followed, along with regular recordings. He was summer music co-director at the STRATFORD FESTIVAL 1961-64.

Then in 1964 Gould retired from the concert stage, preferring the possibilities inherent in recording technology over "live" performance with what he called its "non-take-two" limitations and frequent sports-arena atmosphere. It was an unprecedented — and rigidly kept — resolve, but not a surprising one for this exceptional and unorthodox figure. Gould's pianism was marked by uncanny linear detail and strong drive. His classical realizations were often provocative, and occasionally eccentric, in tempo and articulation. The music's contrapuntal fabric held for him far more importance than its sensuous appeal. His recorded repertoire includes virtually all the Bach and Beethoven keyboard works, much Mozart, much early-to-middle 20th-century music, but few 19th-century piano staples.

His later personal appearances in public were rare, but his career expanded into TV and radio documentaries (on both musical subjects — eg, the conductor Stokowski, one of his idols — and nonmusical ones — eg, *The Idea of North*, prompted by a train trip to Churchill, Man). His literary flair, already familiar from radio scripts and record sleeve notes, broadened in significant articles and reviews (*Globe and Mail*, *New York Times Magazine*, *High Fidelity*, *Piano Quarterly*) on everything from concert life and technology to admired popular stars (Barbra Streisand, Petula Clark). He also created backgrounds for several US and Canadian films. He received the Harriet Cohen Bach Medal (1959) and the Molson Prize (1968). Geoffrey Payzant's *Glenn Gould: Music and Mind* (1978) is an in-depth account of Gould's singular views on musical aesthetics.

In 1981 Gould recorded the Bach "Goldbergs" a second time, announcing this as his farewell to piano-solo recordings. He began experimental taping sessions as conductor with small ensembles, intending to make this his new concentration. The day after his 50th birthday he suffered a severe stroke from which he never recovered.

JOHN BECKWITH

**Goulden, Cyril Harold**, geneticist (b at Bridgend, Wales 2 June 1897; d at Ottawa 4 Feb 1981). Son of a homesteader, Goulden took the course for farmers at U of Sask and went on to a PhD in plant breeding before becoming chief cereal breeder at the Dominion Rust Laboratory, Winnipeg, in 1925 (see J.H. CRAIGIE). He succeeded L.H. NEWMAN as Dominion Cerealists in 1948 and later became assistant deputy minister for research in the Dept of Agriculture. Contrary to early genetic theory, wheat resistance to rust diseases was controlled not by a single gene but by the interaction of several — which made both plant genetics and its application to farming much more difficult. A natural mathematician, Goulden took up the new speciality of biostatistics (and wrote the first N American textbook on the subject in 1937 for the students

he taught at U of Man). As head of cereal breeding at Winnipeg for 23 years, Goulden was responsible for the creation of Renown, Regent and Redman wheats, suitable for the Canadian climate and possessing various rust-resistant qualities.

DONALD J.C. PHILLIPSON

**Goulding, George Henry**, track and field athlete (b at Hull, Eng Nov 1885; d at Toronto 3 Feb 1966). Originally attracted to marathon racing with the Toronto Central YMCA, he began "heel-and-toe" (walk) racing on a whim, first appearing internationally at the 1908 London Olympics; he placed 4th in the 3500 m walk. At the 1912 Stockholm Olympics he won gold in the 10 000 m walk. Turning to invitational track meets in Canada, Britain and the US, he won 300 races at distances from 1 to 40 miles. He competed in many stunt races, winning against a man driving a horse and buggy and against a 4-man US relay team, and attracted thousands of spectators wherever he competed. TED BARRIS

**Goulet, Robert Gerard**, baritone, actor (b at Lawrence, Mass 26 Nov 1933). His rich voice and expert showmanship have gained him critical acclaim and popularity in Canada and the US. After training in Edmonton and Toronto, Goulet sang minor roles in the CANADIAN OPERA CO and made his CBC-TV debut in 1954. Appearances with CBC, "Theatre Under The Stars," and STRATFORD FESTIVAL followed. Goulet's realization of the role of Sir Lancelot in Lerner and Loewe's *Camelot* (Toronto and New York, 1960) was an immediate triumph and led to a successful career in the US in the 1970s, mostly as nightclub entertainer.

ANN SCHAU

**Gourlay, Robert Fleming**, polemicist, reformer (b at Craigrothie, Scot 24 Mar 1778; d at Edinburgh, Scot 1 Aug 1863). A successful farmer and writer who fell into financial difficulties, he came to UPPER CANADA in 1817 to take up land he owned in Dereham Township and to write an immigrant's guide. The questionnaire and township meetings that he arranged to get information being thought radical, he was refused the grant of land on which he had planned to settle families from Scotland. He attacked the FAMILY COMPACT and became its most celebrated victim. Twice acquitted of libel, he was banished for sedition in 1819 after a trial in which it became clear that his mental health had failed. He published more than 80 titles, most of them vituperative defences of his own conduct. His 2-vol *Statistical Account of Upper Canada* (1822) is the most systematic contemporary survey of the province. In the introduction he condemned the government of Upper Canada, especially JOHN STRACHAN. He thought that general ownership of land was the only sound basis for society and proposed a land tax to fund immigrants. His later advocacy of a union of British N America was written from an asylum in England. In the US in 1837 he condemned W.L. MACKENZIE's rebellions. He believed in petitioning and withholding supply as constitutional methods of achieving reform. His banishment was rescinded in 1839, and he returned to Upper Canada in 1856. After failing to be elected in 1858, he went back to Scotland. S.R. MEALING

Reading: R.F. Gourlay, *Statistical Account of Upper Canada*, ed S.R. Mealing (1974); L.D. Milani, *Robert Gourlay. Gadfly* (1971).

**Gouverneur** (governor), the French monarch's official representative in NEW FRANCE. The office, created before a complete system of government had been established, was always granted to a member of the nobility by royal commission, and the appointment could be withdrawn at any time. The governor had to account for his administration annually to the minister of marine (see MINISTÈRE DE LA MARINE), who was responsible for the colonies. The governor had far-reaching powers, most importantly external

affairs (relations with the native nations and with the British colonies) and military matters. As commander in chief of the army, he determined peace or war. He and the INTENDANT jointly supervised the colony's development, handled SEIGNEURIAL land grants and controlled the FUR TRADE. Through his prestige, power and advice, the governor played a major political and social role. Samuel de CHAMPLAIN has often been considered New France's first governor; the most celebrated ones of later years were FRONTE-NAC, Philippe de Rigaud de VAUDREUIL, and his son Pierre de Rigaud de VAUDREUIL. See GOVERNOR GENERAL.

JACQUES MATHIEU

Igor Gouzenko was a cipher clerk at the Soviet embassy in Ottawa. He defected in 1945 and provided information confirming the operation of a Soviet spy ring in Canada (courtesy Public Archives of Canada/PA-129625/ *Montreal Star*).

**Gouzenko, Igor Sergeievich**, intelligence officer, author (b at Rogachov, USSR 13 Jan 1919; d near Toronto late June 1982). At the beginning of WWII Gouzenko took intelligence training and in 1943 was appointed cipher clerk at the Soviet legation in Ottawa, where he learned that Soviet intelligence operated several spy networks in Canada. Disenchanted with Soviet life and politics, he decided to defect when he learned in 1945 that he and his family were to be sent home. On 5 Sept Gouzenko left the embassy with documents illustrating Soviet espionage activities. Initially, no one in Ottawa took him seriously; only on 7 Sept, following an abortive Soviet attempt to recapture him, were he and his family given protective custody. When it became evident that a widespread espionage network was operating, Mackenzie KING's government authorized the arrest of 12 suspects. After interrogation, they were brought before a royal commission. Gouzenko's testimony and documents impressed the commissioners, who confirmed in July 1946 that a spy ring had been operating in Canada, aimed at, among other things, the secrets of the atomic bomb. A number of suspects were subsequently convicted and imprisoned.

Gouzenko was given a new identity and for the rest of his life he and his family had police protection. He produced a memoir, *This Was My Choice* (1948), and a novel, *Fall of a Titan*, which received the Gov Gen's Award (1954). From time to time he emerged from the shadows, always wearing a protective mask, which for most Canadians became his trademark. Even his death, apparently from natural causes, was surrounded in secrecy.

ROBERT BOTHWELL

**Government** in its narrow sense may refer to the group of ministers comprising the CABINET, as in "the Mulroney government" or "the Loughheed government." It may mean the whole STATE apparatus including the Cabinet, the legislature, the courts, the civil service, the armed forces and so on, as in "Why doesn't the government do something about it?" or "Too much government in our lives." A third meaning has to do with the achievement and exercise of power. A government is different from other organizations in society because of its ability to make rules for the whole society. This results from its control of the police and the army, but also from a recognition by the citizens of the government's legitimacy.

**Organization of Government** In Canada the government's legitimacy derives from the CONSTITUTION. Powers of government are divided among its branches — legislature, executive and JUDICIARY. In the legislature elected representatives adopt laws and vote on taxes and other revenues. The executive proposes legislation, presents budgets to the legislature and implements laws. The judiciary is the final interpreter of the laws.

In a democracy it is not sufficient that the legislature members be elected (excepting the SENATE); in the parliamentary tradition inherited from Great Britain the ministers of the executive must resign when they fail to retain the confidence of the majority of the members of the legislature. The courts must be free to interpret the laws without interference from Cabinet ministers or members of the legislature. In recent decades this balance has been threatened by the growth of the executive, partly the result of the complexities of expanding state power. Federally and provincially the executive has 3 separate parts. The head of state is the Queen's representative: federally, the GOVERNOR GENERAL; provincially, the LIEUTENANT-GOVERNORS. He or she must approve laws and important executive decisions before they come into effect. However, by convention, if the Cabinet has the support of a majority of the legislature the head of state's role is purely formal. The second part of the executive is the Cabinet, comprising the prime minister (leader of the majority party) and ministers chosen by him from among the leading members of his party in the legislature. Most ministers will be appointed to head a government department, but some will be given coordinating posts and others will have special duties, eg, government leader in the legislature. The third and largest part of the executive is the administration — the government departments, armed forces and various autonomous bodies. While departments are the basic organs of administration, answering through their minister to the legislature, the autonomous bodies, eg, CROWN CORPORATIONS and regulatory commissions, have more limited roles. Other boards run government insurance and loan schemes; ADMINISTRATIVE TRIBUNALS are used in areas such as income tax, immigration and social services.

**Levels of Government, Centralization and Decentralization** Although national, provincial and municipal levels of government exist in Canada, only the first 2 have clear powers which other levels cannot usurp (see DISTRIBUTION OF POWERS). MUNICIPAL GOVERNMENTS have only those powers that are granted to them by their provincial governments; one of the important changes in Canadian government since 1867 has been the assumption by the national and provincial governments of functions once belonging to municipalities. (Centralization is the concentration of decision-making authority in a national or higher-level government, while DECENTRALIZATION, on the other hand, is the distribution of such authority to regional or local governments.)

**Changing Role of Government** In 1867 the BRITISH NORTH AMERICA ACT assigned to the federal

government authority or jurisdiction over defence and external affairs, criminal law, money and banking, trade, transportation, citizenship and Indian affairs. The provinces were to be responsible for education, civil law (including property and civil rights), health and welfare, natural resources and local government. The 2 levels of government were assigned joint jurisdiction over agriculture and immigration and, as it evolved, over most revenue sources. Changing social and economic conditions and ideas about the proper role of government have brought one level and then the other into prominence. In the 19th century, although the predominant philosophy was laissez-faire or non-intervention by government in economic life, the federal government used its control of the tariff to encourage industry in the East and used a combination of land and money grants to private companies to build railways, first the Intercolonial to the Maritimes, then the Canadian Pacific to the West. The provinces also plunged into support for railway building, but they were engaged in an almost constant struggle with the federal government to establish their claim to adequate powers and revenues. From 1900 to 1930 (excepting WWI), the provinces dominated as prosperity brought rising revenues to their governments. They built dams and highways and extended school and health services. The new urban, industrial and commercial life led to government regulation of health and safety, trade practices, highway traffic, etc — all provincial responsibilities. War and depression, however, brought the federal government again to the fore. In both world wars it not only directed the defence effort but used the powers given to the Cabinet by the War Measures Act to direct the economy. It took the leading part in organizing relief measures during the GREAT DEPRESSION. Various joint federal-provincial programs were created for public works and "back to the land" projects, as well as for the provision of direct relief.

Following the royal commission on DOMINION-PROVINCIAL RELATIONS (1940) the federal government proposed that it assume direct responsibility for regulating the economy and for the most important social insurance programs in exchange for the lion's share of government revenues. The provinces rejected this proposal at a conference in 1941, but many of the ideas were introduced piecemeal. By constitutional amendment, with the consent of the provinces, the federal government was given responsibility for unemployment insurance in 1941 and old-age pensions in 1950. Also with provincial consent, family allowances were created by federal law in 1944 and the CANADA PENSION PLAN in 1966. Conditional financial grants (or shared-cost programs) were used increasingly in the postwar period by the federal government to prod the provinces to action in fields such as highway construction (the Trans-Canada Highway), post-secondary and university education, unemployment assistance, hospital insurance and health insurance.

Because of these initiatives and because of international tension after WWII, the provinces did not achieve until the 1960s the kind of primacy they enjoyed in the 1920s. While many foreign observers find Canada a very decentralized state with many powers vested in the provinces, the latter continue to feel that the federal government interferes in the discharge of their responsibilities. For its part, as costs soared in the late 1970s, the federal government tried to find ways to limit its expenses, especially in health and higher education programs.

**Controlling the Administrative State** With the growth of the WELFARE STATE and increasing government management of the economy, the administrations of all levels of government

have expanded and become increasingly difficult to control. The number of people working directly or indirectly for one level of government or another represents about 25% of the labour force. The size and complexity of government departments have challenged the principle of ministerial responsibility. Members of Parliament have a full-time job trying to oversee the activities of the government and the administration. The role of the courts is being taken over in many cases by administrative tribunals.

Since the mid-1960s different solutions to these difficulties have been suggested. Cabinets have created their own planning and coordinating staffs, usually grouped around the prime minister or the Treasury Board. The Cabinet has often developed a specialized committee structure to do the detailed work, leaving only broad questions of policy for plenary sessions. The legislatures have also created committees whose members specialize in the affairs of one or 2 departments. They have streamlined their procedures and introduced small research budgets to allow Opposition parties to conduct their own studies. The measures taken to control government power include the establishment of OMBUDSMEN, FREEDOM OF INFORMATION laws have made some government information open to public scrutiny, and the CANADIAN CHARTER OF RIGHTS AND FREEDOMS will enable the courts to invalidate laws or administrative actions infringing on basic personal freedoms or rights.

J.I. GOW

*Reading:* Audrey D. Doerr, *The Machinery of Government in Canada* (1981); J. McMenemy, *The Language of Canadian Politics* (1980); J.R. Mallory, *The Structure of Canadian Government* (1971).

**Government Building** Government has always been the most important patron of ARCHITECTURE in Canada, and this role has increased rapidly over the past few decades. As its duties and responsibilities expand, so do its building needs. Today all levels of government contribute to all aspects of our built environment. Courthouses, schools, hospitals, military buildings, firehalls, market halls, factories, theatres, museums, police stations, recreational buildings and housing are required for the varied functions of government. The buildings most readily identified with government are those housing the central legislative and administrative portions of the political system. On the municipal level, government is identified with city hall and on the provincial level with buildings housing the legislature. The federal government is identified by the federal buildings in Ottawa and by hundreds of post offices, customs houses and office buildings in all parts of the country.

Design of government buildings varies according to the changing institutions and functions of the state as well as the changing architectural tastes. Despite this diversity, common themes or characteristics can be identified regardless of the date of construction. Government buildings tend to be constructed of enduring materials, commonly stone or brick, which impart a sense of weight, permanence and stability. Scale varies according to function, but generally government buildings are designed to dominate their surroundings, thereby visually establishing their central role in the community. Only in Québec was this position of dominance challenged by the church. In style, government buildings conform to current tastes in design, but government architecture has traditionally incorporated symmetrical elevations and balanced compositions. These aesthetic qualities reinforce values of order, reason and balance considered appropriate to the state. More significantly, government buildings are not generally noted for their architectural daring. As a symbol of the established state and its political traditions, governments prefer archi-

Early government buildings, such as Government House, Fredericton, NB, drew upon 18th-century Palladian traditions, a classical mode of building. These impressive buildings reinforced the presence of British rule (courtesy Public Archives of Canada/C-3558).

ture that is contemporary but also reflects accepted standards.

The earliest government buildings in Canada were erected in the early 17th century for the French settlements in NEW FRANCE and ACADIA. A legislative council building, called the *Senéchaussée*, was built in Québec in the mid-17th century, but the most important government building was the *Château Saint-Louis*, the residence of the governor. Typical of the initial phases of settlement, the first *Château Saint-Louis* was a simple, unpretentious structure. Located within the military compound on top of Cap Diamond, it differed little in design from the surrounding military buildings. Only its larger scale and prominent setting overlooking the cliffs visually distinguished it from its immediate surroundings.

In 1663 New France was named a province of France, and the local government became directly responsible to the Crown. This new status marked the colony's transition from a rough military and commercial outpost of empire into a permanent centre of French culture and society. This growing maturity was soon reflected in its major government buildings. In 1692 plans were drawn up for a new *Château Saint-Louis*. Built of stone, 2 storeys in height with a steeply pitched roof, symmetrical plan and impressive central frontispiece, it resembled French palaces of the 17th century. The palatial quality of key government buildings in New France was equally evident in the 1715 design of the palace of the *INTENDANT*. Like the *Château Saint-Louis* it was a 2-storey, dressed-stone building with a mansard roof, a U-shaped plan with a projecting frontispiece and 2 end pavilions. The palace contained a large assembly room for the meetings of the legislative council as well as numerous private apartments, a chapel, stables and beautifully landscaped gardens.

After the fall of New France the influx of United Empire LOYALISTS following the American Revolution greatly consolidated the British presence. At the end of the 18th century centres of colonial government had been established in St John's, Halifax, Fredericton, Charlottetown, Québec City and York (Toronto). The major government buildings were the residence of the governor, and the legislative buildings which housed both the legislative council and the legislative assembly.

The first 4 decades of the 19th century were a period of growth and stabilization for these British settlements. In the Atlantic colonies this

change was reflected in the construction of a number of imposing public edifices, including new governor's residences in Halifax (1800-05), Fredericton (1826-28) and St John's (1827-31), and a series of legislative buildings or province houses in Halifax (1811-19), Charlottetown (1839-48) and St John's (1847-50). These buildings have much in common. All were designed by architects or builders trained in Britain either as civilians or as officers of the Royal Engineers. They drew upon the well-established, 18th-century, British Palladian tradition, a classically inspired mode of building which featured a symmetrical plan, often with flanking wings or projecting pavilions, and a large central portico set upon a rusticated or arcaded base. The imposing visual impact of these dignified classical buildings was greatly enhanced by their use of finely dressed stone. Their weight and mass set them apart from the surrounding buildings, which were predominantly of wood, and reinforced the idea of these buildings as the keystones of British rule.

During the same period Upper and Lower Canada were reluctant to spend large sums on lavish architecture, although several plans had been submitted for public buildings. Because the Canadas were so vulnerable to attack from the US, budgetary priority was given to military works in the form of canal systems and fortifications. The government institutions of Upper Canada were first housed in a long range of military buildings on the lakefront, and later in a slightly more refined but still fairly modest one-storey brick structure (1831) situated on Front Street in York. In Lower Canada, the legislature met in the old episcopal palace of the French regime (Québec) which had been refurbished in a more anglicized style in 1831. The construction of permanent government buildings was further delayed by the Union of the Canadas in 1841 and by the failure of the new government to choose a permanent site as the capital.

In 1857 Ottawa was selected as the seat of government for the United Canadas and work then began on the construction of an appropriate home for the colonial parliament. A fanciful Gothic design for a Parliament Building and 2 departmental blocks in the same style was selected in 1859. The picturesque design with its irregular skyline, rich textures, polychromatic stonework and intricate medieval detailing differed substantially from the cold, reserved classicism of the earlier legislature buildings in the Atlantic colonies; but in many respects the Ottawa buildings share a common visual language consistent with other government architecture in Canada. The use of stone and the grand scale visually dominated and overpowered the town which surrounded it. Despite

the fanciful quality of the detail, the architects consciously avoided the usual asymmetry of the Gothic style and imposed a formal, symmetrical composition on the overall plan and elevation. Like the earlier legislature buildings, the design of the Ottawa PARLIAMENT BUILDINGS was self-consciously British. Inspired by the example of the new Parliament Buildings in London, begun in 1836, and by the prevailing perception of the Gothic style as being the only truly British style, a Gothic design for the Ottawa buildings reconfirmed the cultural and political bonds with Britain that set Canada apart from the American republic.

The establishment of a federal government in 1867 created a demand for public buildings across the country. Although many existing post offices and customs houses had been inherited from the old colonial institutions, the new government recognized the need to project a fresh and dynamic image by constructing substantial public buildings. This initial federal building program was dominated by the Second Empire style, characterized by a high mansard roof and by ornately carved classical ornamentation. It was a rich style, evocative of wealth, confidence and a sense of grandeur. This style was applied to some 24 post offices and customs houses erected under the direction of the Dept of Public Works in the 15 years following Confederation, thereby imposing a unified architectural theme on federal buildings across the country.

From Confederation to the end of WWI the appearance of federal architecture changed with changing architectural fashions. In the early 1880s the now outdated Second Empire style gave way to a late Victorian Romanesque vocabulary with its heavy stonework, round arches and massive, off-centre clock towers. This general profile of public building became so strongly associated with the federal government that it persisted into the 1920s and even into the early 1930s. Gradually, however, this type was replaced by the Beaux-Arts style of the 1910s and 1920s. But despite these changes in style, federal buildings continued to be visually consistent. Their solid stone or brick construction and their prominent setting established an imposing presence in the community and the repetition of related design types across the country created recognizable symbols of the federal government.

The 1930s marked a transitional phase in federal architecture. Stylistically this era was characterized by an aesthetic compromise between traditional classicism and the modern movement. Federal buildings retained the formal,

Post office, Galt [Cambridge], Ont. Early post offices formed the visual core of many towns across Canada (courtesy Public Archives of Canada/PA31834).

symmetrical composition and the sense of mass and weight; but in place of the traditional decorative vocabulary a modernistic language was used featuring austere stylized forms, clean crisp lines and sculptural motifs based on contemporary iconography. In the 1930s a new type of federal building was introduced. Whereas previously the regional departments of the federal government consisted primarily of the post office, customs house and perhaps the Inland Revenue Department, during the Depression the regional activities of the federal government expanded. In large urban centres such as Halifax, Toronto, Winnipeg and Regina, the government constructed a number of "Dominion" or "Federal" buildings which were large, multistoried buildings housing a variety of federal offices under one roof. This architecture reflected the new corporate structure of government.

Confederation had also created the secondary, provincial level of government, but the provinces were slower to express themselves architecturally. In the established eastern provinces most legislatures continued to use existing colonial buildings, and the provinces of NS and PEI continue to do so today. In the late 1870s Québec and NB were the first to construct new legislature buildings, both of which imitated the federal example by employing the mansard Second Empire style. The newly founded province of Manitoba also received a fairly substantial legislature building, built by the federal government as part of the Confederation agreement. It was later replaced by a legislature building of the province's own design.

At Confederation the western regions were still relatively undeveloped. This was evident in their unassuming government architecture. Only BC, whose origins as a colony dated from the mid-19th century, had a sizable legislature building. This curious structure, known locally as the "Birdcage," was built 1859-64. It consisted of a series of separate structures grouped in an ordered symmetrical composition which imposed the sense of visual formality characteristic of government architecture; but its light, rather exotic design with an intricate pattern of half-timbering, ornate eave brackets and bellcast roof lacked dignity and decorum. "The Birdcage" was replaced in 1898 and destroyed by fire in 1957.

The second phase of provincial architecture dates from the turn of the 20th century when both the provinces of Ontario and BC constructed their own lavish legislature buildings which reflected the eclectic tastes of the late Victorian era. The picturesque synthesis of Romanesque, medieval and classical motifs of the BC Legislature Buildings represents the extravagant example of this period. The Prairie provinces adopted a very different style of building. Constructed during the height of the Beaux-Arts fashion, all 3 legislature buildings (Edmonton 1908-12, Regina 1908-12, Winnipeg 1913-29) were designed in the grand classical manner, with monumental porticos, crisp stonework

The Saskatchewan Legislative Building, Regina, like all legislature buildings of the 3 Prairie provinces, was designed in the grand classical manner, at the height of the beaux-arts fashion (photo by Jim Merrithew).

and massive central domes. The strong association between provincial architecture and an austere classicism continued well into the post-WWII period. In 1959 Newfoundland constructed a new provincial legislature building. Although modernistic in its absence of historical details and its vertical strip windows, its symmetrical plan recalls the classical formalism of the earlier provincial buildings.

After WWII conventional architecture gave way to the modern age and a new language of bold geometric masses formed of steel, concrete and glass. Since that time there have been no new legislature buildings, with the exception of Newfoundland, but governments have been actively building. The expansion of government activities led to the need for a range of building types more specialized in function. Often these buildings have a lower profile than previous government architecture. For example, over the past 30 years the federal post office has gradually moved out of its old buildings, which had formed the visual core of so many towns, into small, open structures that quietly merge into the streetscape rather than control it. In the provincial and federal capitals the public service has grown at a rapid pace creating a vast demand for new office accommodation. The buildings constructed to meet this need often lack the sense of monumentality and grandeur that sets them apart from surrounding structures. Governments now occupy glass and concrete office towers that are indistinguishable from those of any other large corporation, as the new federal office buildings in Hull exemplify.

High-profile architecture represents the smallest but most prominent category of government building: monumental architecture whose scale, materials and setting distinguish it from its surroundings. The recently built courthouse in Vancouver, designed by Arthur ERICKSON, with the daring and dramatic slope of its glass wall, or the 1961 Confederation Centre in Charlottetown, featuring a monolithic, almost primitive form of stone slab construction, are both high profile. Though the language of architecture has changed substantially from the early 19th century, these modern buildings still serve as visual anchors to the community and as symbols of provincial and national pride. JANET WRIGHT

**Government Organization, Royal Commission on** (Glassco Commission), was appointed in 1960 under J. Grant Glassco, a prominent businessman and chartered accountant, to inquire into the organization and methods of the departments and agencies of the federal government. It investigated 23 departments, the armed forces, 21 statutory boards and 42 corporations. The commissioners also visited the UK and the US. Taking testimony from the former US president, Herbert Hoover, the commissioners earned themselves the sobriquet "the Canadian Hoover commission," after the aggressive inquiries conducted by Hoover into the American administrative structure. The 5-volume commission report (released 1962-63) recommended that government should "let the managers manage"; that departments should be free of inappropriate central control and should be allowed to devise management methods suited to their needs; that TREASURY BOARD should be reorganized to control and harmonize government operations; and that senior officials should rotate from department to department. A special Bureau of Government Organization was created to implement the recommendations, many of which were put into practice through the Transfer of Duties Act and later consolidated in the Government Organization Act (1966). Most observers acknowledge that the Glassco reforms did not work, particularly regarding the role of Treasury Board; that the commission did not address the operations of the executive and Parliament; and that the result was a growth of CENTRAL AGENCIES lacking effective control and unity. S.L. SUTHERLAND

**Governor General** Without interruption since the beginning of European settlement in Canada, a governor or governor general has been at the head of the country as the resident representative of the crown. Although the modern office is usually regarded as descended from the British institution, the present governor general, the Rt Hon Jeanne Sauvé, is in fact the 60th successor to Champlain, who became governor in 1627; she is the 23rd since Lord Monck was sworn in at CONFEDERATION on 1 July 1867; and she is the first woman to be appointed to the office. The office has developed with Canada's evolution from colony to nation. At first, governors general represented imperial governments and were responsible to various colonial ministers. After Confederation they were em-

The monumental portico and crisp stonework of the Manitoba Legislative Building, Winnipeg (photo by Bill Brooks/Masterfile).

powered to govern according to the wishes of the Canadian PRIME MINISTER in all internal issues, but until WWI they were still obliged to acknowledge British policy in EXTERNAL RELATIONS. After the STATUTE OF WESTMINSTER of 1931, they became the SOVEREIGN's personal representatives. Finally, on 1 Oct 1947, George VI formally delegated to the governor general all the sovereign's authority in Canada. In 1952 Vincent Massey became the first Canadian to be appointed governor general. Since then, a tradition of alternating anglophone and francophone governors general has emerged.

In Canada, as in many constitutional monarchies, there is a clear division between the

head of state and the head of government. The latter is the prime minister, an elected political leader. The former is the governor general, who is not involved in politics. Appointed by the sovereign on the prime minister's recommendation, the governor general usually holds office for at least 5 years. Whereas the prime minister speaks for the political majority, the governor general represents the whole country.

On taking office (at a ceremony usually held in the Senate Chamber), a governor general is accorded the title "Right Honourable" for life and "His Excellency" or "Her Excellency" for the period in office. Two official residences are provided: RIDEAU HALL, which forms part of a 36 ha estate on the Ottawa R, and the Governor's Wing at the QUÉBEC CITADEL. The salary was fixed in s105 of the BRITISH NORTH AMERICA ACT at £10 000, an amount corresponding to the 10 000 *livres* set as the salary of the governor of New France in the 1660s. In 1970 this was converted as \$48 666.63. The governor general's personal standard flies wherever he or she is in residence and takes precedence over all other flags in Canada except the monarch's. It is dark blue with, at the centre, the gold Canadian crest: a crowned lion carrying a red, stylized maple leaf in his right paw.

The governor general is one of 3 elements of PARLIAMENT, the others being the SENATE and the HOUSE OF COMMONS. The governor general summons, prorogues and dissolves Parliament, authorizes treaties, receives and sends ambassadors, commissions officers in the armed forces and gives royal assent to bills that have passed both the House of Commons and the Senate, thereby giving them the force of law. By constitutional convention, the governor general exercises these prerogatives only in accordance with ministerial advice. But by the same conventions, he or she retains special personal authority in times of emergency or in exceptional circumstances; in such cases, he or she may appoint or dismiss a prime minister and may dissolve Parliament. On at least 2 occasions since Confederation (1891, 1893) governors general (Lords Stanley and Aberdeen) had to designate a prime minister, but they never had to dismiss one. At least once (1926) a governor general (Lord Byng) refused a prime minister's advice to dissolve Parliament (see KING-BYNG AFFAIR).

The governor general also holds the constitutional rights of the head of state: "the right to

be consulted, the right to encourage, the right to warn." These are usually exercised by the receipt of Cabinet minutes and through regular visits from the prime minister and government officials. The governor general is the executive power of the governor-in-council, receiving advice from the Canadian PRIVY COUNCIL (the most important part of which is the CABINET) and signing ORDERS-IN-COUNCIL.

The governor general is designated by law as commander in chief of the Armed Forces, is charged with swearing in Cabinet ministers and commissioning high officials of state. He or she is chancellor of the Order of Canada and the Order of Military Merit, and is responsible for the administration of the whole Canadian system of HONOURS. The governor general is official host to visiting heads of state and can represent Canada abroad.

Extensive hospitality and travel within Canada make the governor general more familiar with the country, the people and the issues than most others can be. The office of governor general is also charged with symbolizing national community and continuity. It is a subtle presence above divisions and differences, affirming community, an acceptance of inherited loyalties and permanent ideals. See GOUVERNEUR.

JACQUES MONET, SJ

Reading: Jacques Monet s.j., *The Canadian Crown* (1979).

**Governor General's Literary Awards** were first presented in 1936 by the Canadian Authors Assn. The CAA did the judging itself until 1944, when an independent Awards Board was established. In 1959 the CANADA COUNCIL undertook to administer the awards and to provide at least 6 prizes of \$1000 each for fiction, nonfiction, and drama or poetry in English and French (previous awards had been for works in English only). That year the category of juvenile literature, which had been established in 1948, was dropped. In 1971 the council assumed responsibility for appointing two 9-member juries — one anglophone and one francophone — drawn from among experienced writers, academics and literary critics. The cash award was raised to \$5000 in 1975, and the separate category of drama was added in 1981. Winners in the new drama category are as follows: S. Pollock, *Blood Relations and Other Plays* and M. Laberge, *C'était avant la guerre à l'Anse à Gilles* in 1981; J. Gray, *Billy Bishop Goes to War* and R. Ducharme, *HA ha!* in 1982; and A. Chislett, *Quiet in the Land*, and R. Gingras, *Syncopé*, in 1983. Winners in other categories are listed in the table.

Like any prize, the Gov Gen's Awards are controversial from time to time; contemporary judgements do not always stand the test of time. There is a general complaint that writers have not always won for their best work, and there are specific criticisms (eg, the failure of Northrop FRYE's *The Great Code* to win an award in 1983). Some winners have refused to accept the award for political reasons. Nevertheless the Gov Gen's Awards are the pre-eminent LITERARY PRIZE offered for single works in Canada, and they serve to reward Canadian writers, as well as to publicize Canadian writing through the ceremonies held in various centres across the country.

**Gowan, Sir James Robert**, lawyer, jurist, senator (b at Cahore, County Wexford, Ire 22 Dec 1815; d at Barrie, Ont 18 Mar 1909). At 27 Gowan was the youngest judge appointed in Canada West, and he sat on the bench longer (1843-83) than any judge in the British Empire. He organized the judicial system in the newly created district of Simcoe, the largest jurisdiction in the colony. Gowan also served as Sir John A. MACDONALD's unofficial legal draftsman and sat on several royal commissions. These included every committee struck to revise the statute law of Canada West, Ontario and post-1867 Canada,

			T.H. Raddall, <i>The Path of Destiny</i>

and the commission that investigated the PACIFIC SCANDAL in 1873. Gowan also chaired several academic boards and, in 1855, founded the first legal periodical in Canada *W, The Upper Canadian Law Journal*, which survives in the *Canadian Bar Review*. In 1885 he was appointed to the Senate.  
D.H. BROWN

**Grace, Nathaniel Hew**, chemist (b at Allahabad, India 10 Nov 1902; d at Rochester, Alta 13 Nov 1961). The son of a missionary, Grace attended schools in California and Saskatchewan. He graduated from U of Sask (1925) and completed his PhD in physical chemistry at McGill (1931). He spent the next 20 years with the NATIONAL RESEARCH COUNCIL in Ottawa, where his diverse contributions included pioneering work on plant growth regulators. He was awarded an MBE in 1946 for research related to wartime shortages of raw materials. In 1951 Grace joined what is now called the ALBERTA RESEARCH COUNCIL as its first full-time director of research. Under his guidance, the council initiated important new areas of activity, notably groundwater and hailstorm research. Grace's dedication to research of social significance and high scientific quality laid the foundation for the research council's important role in the development of Alberta.  
E.J. WIGGINS

**Grackle**, see BLACKBIRD.

**Gradus, Lawrence**, choreographer (b at Brooklyn, NY 30 Oct 1936). Trained in New York C, he first performed with the American Ballet Theatre in 1951, rising from corps member to soloist. He joined LES GRANDS BALLETS CANADIENS in 1968 and cofounded with Ludmilla CHIRIAEFF Les Compagnons de la danse, an educational touring group. Gradus formed his own company, Entre-six (1974), and the following year received the Jean A. Chalmers Award for choreography. He moved to Ottawa as artistic director of the THEATRE BALLET OF CANADA in 1980. The company performs primarily his creative work in which ballet and modern dance flow easily together.  
JILLIAN M. OFFICER

**Graham, Andrew**, fur trader (b probably near Edinburgh, Scot c1733; d at Prestonpans, Scot 8 Sept 1815). Graham worked for the HUDSON'S BAY COMPANY at Churchill, YORK FACTORY and Ft Severn (1749-75). One fish and 4 birds sent by him from Ft Severn in 1771 were immortalized as "type specimens" when given Latin names by Johann Reinhold Forster in England. At York Factory in 1771-72, closely associated with surgeon Thomas Hutchins, Graham wrote important accounts of the native peoples, birds and mammals of HUDSON BAY, including the first description of the "plunge-holes" made by the great gray owl, in catching mice beneath deep snow. Graham described 111 bird species and Hutchins added another 12. The contributions of the 2 men were sorted out nearly 200 years later by Glyndwr Williams and published in 1979 as *Andrew Graham's Observations on Hudson Bay, 1767-1791*.  
C. STUART HOUSTON

**Graham, Howard Douglas**, lawyer, army officer (b at Buffalo, NY 15 July 1898). A WWI veteran, having enlisted at age 17, Graham rose to become chief of the general staff 1955-58. He practised law in Trenton, Ont, 1922-39, and was mayor in 1933. He was a militia officer between the wars and went overseas as second-in-command of the Hastings and Prince Edward Regiment in late 1939 and commanded the regiment 1940-42. As commander of 1st Canadian Infantry Brigade 1943-44, he distinguished himself under fire in Sicily and Italy. He remained in the army after WWII, becoming the only army chief who had not devoted the bulk of his career to professional soldiering. After retirement he was president of the Toronto Stock Exchange 1961-66.

NORMAN HILLMER AND WILLIAM JOHNSTON

**Graham, Hugh, Baron Atholstan**, newspaper publisher (b at Atholstan, Canada E 18 July 1848; d at Montréal 28 Jan 1938). In 1863 Graham went to work on the Montréal *Daily Telegraph* and by 1869 became a partner in the new evening paper, the *Star*. He transformed the *Star* into Canada's largest and most profitable daily, partly through technical innovations such as its overseas cable service but especially through its loyalty to the British imperialist ideal. Partly owing to the *Star's* pressure, the LAURIER government decided to commit Canadian troops to the SOUTH AFRICAN WAR. For his crusades during WWI (when his home was dynamited by anticonscriptionists), Graham was elevated to the peerage in 1917 as Baron Atholstan of Huntingdon, Qué., and Edinburgh, Scot.

DOUG FETHERLING

**Graham, Stuart**, aviator (b at Boston, Mass 2 Sept 1896). Raised and educated in NS, he served in the Royal Naval Air Service, patrolling shipping lanes in flying boats. He was Canada's first professional peacetime pilot and his forestry patrol near Grand Mère is regarded as the beginning of BUSH FLYING in Canada. He was decorated by Emperor Haile Selassie for organizing civil aviation in Ethiopia.

JAMES MARSH

**Grain Elevators** provide for the storage, cleaning and weighing of grain and its loading from elevator bins into railway cars, trucks or from port elevators into ships. The name is derived from its essential mechanical feature — the elevator proper or "leg" — an endless belt carrying a succession of buckets which lift the grain from a low level pit into which it is delivered to the top of chutes leading to the storage or cleaning bins.

Both concrete and timber elevators are familiar Canadian landmarks, the latter perhaps the most distinctive architectural symbol of the Prairies. They spread with the CANADIAN PACIFIC RY across the Canadian West in the 1880s; after 1900 a second wave of construction followed the building of the CANADIAN NORTHERN RAILWAY. By the 1930s there were nearly 6000, though the number has declined as farming and transportation have grown more efficient. Because elevators are essential to the movement and marketing of grain, their history is intertwined with economics and politics, especially the development of the CO-OPERATIVE MOVEMENT and the wheat pools.

The familiar rectangular, pitched-roof country elevators appeared from 1881 when the first was built by the Ogilvie Milling Co in Gretna, Man (a circular wooden elevator was built at Niverville, Man, in 1879). Many more were quickly built at railway sidings across the Prairies, within easy reach of the farms. From them, grain moved by rail to much larger terminal elevators at port cities where it was loaded for shipping to the east and overseas. The first Canadian terminal elevator was built by the CPR at Port Arthur [THUNDER BAY] (completed 1884), and others rapidly followed. A third type, transfer elevators, were built at such inland centres as Calgary, Edmonton, Saskatoon and Moose Jaw, Sask for the collection and distribution of grain to regional markets.

Country elevators and the earliest terminal elevators were built of timber, though frequently covered with sheet metal. The construction of walls and bins was of "crib": 2 x 6 or 2 x 4 inch timbers laid one above another on the flat and spiked together, with the ends alternately overlapping at the corners. A typical elevator might be 9-10.5 m on side in plan and rise 23 m or more above massive concrete foundations to the ridge of the narrower top section or cupola. Such an elevator held 35 000 to 40 000 bushels of grain. While wood has remained the most economical material for country elevators, from the 1900s slip-formed cylindrical concrete bins

\* Special Award

became the standard for the larger transfer and terminal elevators. The first was built at Minneapolis, Minn, in 1901, using recent European innovations in the reinforcing and forming of concrete silos. Canadian examples followed, and reinforced concrete was used at Port Arthur around 1903. Port of Montréal Elevator No 2 (completed 1912; demolished 1978) was one of the earliest all-concrete structures, "at the time probably the largest and highest concrete building in existence" according to its designers, the John S. Metcalf Co. Founded by John S. Metcalf of Sherbrooke, Qué, in Chicago, Ill, in 1887, the company built huge elevator complexes across the US and Canada, in Europe, S Africa, Argentina and Australia from its offices in Montréal, Vancouver, Chicago and London, Eng. Another major grain-elevator engineering firm, respon-

sible for the SASKATCHEWAN WHEAT POOL's North Vancouver Terminal (1966-81), was founded by the former federal Cabinet minister C.D. HOWE. These structures were not only impressive engineering feats, but were an inspiration to pioneering European architects. Photographs of elevators at Calgary and Montréal were given by Walter Gropius to Le Corbusier and published in his *Vers une Architecture* (1923).

Recent innovations include the sloped-bin concrete "Buffalo" elevators designed for the Alberta Wheat Pool by K.U. Driedger of A.B.L. Engineering Ltd. The first country elevator was built at McGrath, Alta, in 1980 and by 1984, 5 had been completed. Though more expensive than timber elevators, the new designs are fire-proof, more efficient and more durable.

MICHAEL McMORDIE

**Grain Growers' Associations**, a group of farm organizations formed on the Prairies in the early 20th century. They developed in the wake of the Manitoba Grain Act (July 1900), which regulated railways and grain elevators in the interests of grain growers. This Act, the result of considerable agitation in rural areas since the late 1880s, was regarded by farmers as a major victory. But dissatisfaction with the handling of the 1901 bumper crop led farmers at Indian Head (in present-day Saskatchewan) to convene a meeting in Dec 1901, at which the Territorial Grain Growers' Assn was formed. The Manitoba Grain Growers' Assn, established 1903 at Virden, followed. In 1906 the Territorial Grain Growers' Assn was divided into the Saskatchewan Grain Growers' Assn and the Alberta Farmers' Assn. The latter joined with the Canadian Society of Equity to create the UNITED FARMERS OF ALBERTA in 1909. In 1919 the Manitoba Grain Growers' Assn was reorganized as the UNITED FARMERS OF MANITOBA in an attempt to gain the support of all farmers and to proclaim an intention to enter politics. The Saskatchewan Grain Growers' Assn amalgamated with the Farmers' Union of Canada in 1926 to create the militant UNITED FARMERS OF CANADA (Saskatchewan Section).

Grain growers' associations were powerful spokesmen for the Prairies and Canadian agriculture generally. They lobbied provincial and federal governments for reform of the grain-marketing system and improvement of rural life. They sponsored the development of 3 large farmer-owned grain-marketing organizations, the Grain Growers' Grain Co (1906), the Saskatchewan Co-operative Elevator Co (1911) and the Alberta Farmers Co-operative Elevator Co (1913). They published the GRAIN GROWERS' GUIDE, the main voice of western agriculture between 1908 and the mid-1920s. The associations agitated for better roads, schools and medical care for the countryside. Particularly responsive to the plight of rural women, they embraced WOMEN'S SUFFRAGE and helped to win the vote for women on the Prairies during WWI. Technically, the associations were politically neutral, but some early leaders, such as Liberals C.A. DUNNING, M.A. MOTHERWELL and T.A. CRERAR, achieved national political prominence. Politics, however, was a vexing issue for the associations and was one of the reasons they disappeared after farmers began to assert themselves and demand a more direct voice in the political process.

IAN MACPHERSON

Reading: W. Irvine, *The Farmers in Politics* (1920).

**Grain Growers' Guide**, journal published 1908-28 for Prairie grain growers' associations. In 1928 it became the *Country Guide*, which is still published by the United Grain Growers in Winnipeg. Editors included E.A. PARTRIDGE, Roderick McKenzie and (1911-35) George Chipman. The *Guide* advocated educational reform to make rural schools more responsive to change, and it supported the TEMPERANCE MOVEMENT, the CO-OPERATIVE MOVEMENT and the SOCIAL GOSPEL. Its commentators included Nellie MCLLUN, Irene PARLBY and Violet MACNAUGHTON, prominent leaders of the women's movement. Its commitment to reform made the *Guide* a major spokesman for the PROGRESSIVE PARTY. During the early 1920s, as the Progressive movement declined, the *Guide's* commitment to reform waned, and by 1928 it was devoted to rural life, advising farmers on technical problems and providing amusement for rural families. In its day the *Guide* articulated a western rural view with vigour, style and effectiveness.

IAN MACPHERSON

**Grain Handling and Marketing** There are approximately 145 000 grain-producing farms in Canada's Prairie region. Yearly production varies substantially, depending on climatic conditions. In 1982-83 approximately 36 million t

of grain were marketed, wheat accounting for over 69% of this total. Harvested in the late summer and early fall, grain is trucked from the combine to storage bins located on the farm. Storage time on the farm varies, depending upon delivery opportunities at primary grain elevators as determined by the CANADIAN WHEAT BOARD (CWB). Some grain does not enter the commercial grain-handling system, but is retained as seed or consumed locally as livestock feed.

The CWB is the agricultural marketing BOARD responsible for the marketing of western Canadian grains (WHEAT, OATS, BARLEY) intended for human consumption or export. Feed grains may be sold to the CWB at the farmer's discretion; however, sale of OILSEEDS and most feed and industrial grains is privately controlled. In addition to marketing as much grain as possible at the best possible prices, the CWB aims to provide price stability and ensure that each producer gets a fair market share each CROP year. The CWB periodically issues delivery quotas, which tell farmers that the board is willing to accept a certain volume of a specified grain from each farmer at primary elevators in a defined geographic region. Quotas, based on the board's sales commitments and stocks on hand in the elevator system, are issued so as to maintain a relatively even flow of grain from farms through the primary elevator system. Before making export commitments, the board is required to ensure that the domestic market is adequately supplied for both feed and industrial uses. The board may sell directly to foreign government buying agencies (eg, the USSR, the People's Republic of China), to commercial interests in foreign countries (eg, Peru, the Philippines) or to private trading companies, which then resell to foreign buyers.

As delivery opportunities arise, the grain is moved off the farm by the farmer's own truck or that of a hired commercial trucker. Farm trucks vary in carrying capacity from 3 to 20 t, the average being about 8 t. Grain may be trucked up to 125 km, but the average distance is about 20 km. Most grain is delivered to primary or country elevators but some is taken directly to feed mills or processing plants.

The primary elevator accumulates small lots of grain (sorted by species and grade) from individual farmers until there is enough to fill rail cars. The primary elevator system consists of about 2900 elevators located at 1200 railway shipping points, with a total storage capacity of 8.1 million t. During the past decade the number of primary elevators has decreased by almost 40%; the decrease in storage capacity has been over 25%. Primary elevators, each employing a manager, are operated by grain companies, either farmer-owned co-operatives or privately owned companies. Six companies now own over 95% of all primary elevators. The largest grain-handling company is the SASKATCHEWAN WHEAT POOL, a farmer-owned co-operative with approximately one-third of the primary elevators on the prairies.

When grain is delivered to the elevator, the manager weighs and samples it, assigns a grade and issues a negotiable cash ticket to the farmer. If the wheat, oats or barley is destined for export, it becomes the property of the CWB and the primary elevator company acts as an agent of the board. In the case of flaxseed and CANOLA the primary elevator company assumes ownership; feed grains destined for domestic use may be sold either to the CWB or to the primary elevator company. Grain companies recover their elevator costs from the farmer through handling and storage charges. Maximum allowable charges are specified by the Canadian Grain Commission, and grain companies establish their charges within these limits.

The Canadian Grain Commission, answerable

Workers loading barley into the holds of a grain ship at Thunder Bay, Ont (courtesy National Film Board/Photothèque).

to the minister of agriculture under the Canada Grain Act, is responsible for establishing and maintaining standards of quality for Canadian grain and regulating grain handling in Canada to ensure a dependable commodity for domestic and export markets. Specific responsibilities include establishing grain grades and standards; official inspection of grain for export; licensing all types of grain elevators; supervision of treatment or fumigation of grain; setting of maximum fees chargeable by elevators for services (eg, receiving, cleaning, drying, shipping); inspection of elevators for compliance with operating procedures as detailed by the Canada Grain Act; and operation of the Grain Research Laboratory, which conducts research on the quality of cereal grains and oilseeds.

Grain is moved from the primary elevator system to port and other terminals by rail, using approximately 11 000 boxcars and 14 700 hopper cars. The capacity of a standard boxcar is about 54 t; of an average hopper car about 91 t. During peak movements, about 500 trains per week place empty cars at primary elevator points and take loaded cars to their destinations. The primary elevators are located at some 1200 points along approximately 30 000 km of rail lines, about 85% of which are branch lines with various carrying capacities. The average distance from a primary elevator to a port-terminal elevator is 1400 km; the average round-trip time is slightly under 3 weeks.

Grain moves from primary elevators to port terminals on Canada's West Coast (VANCOUVER and PRINCE RUPERT), on the Great Lakes (THUNDER BAY) and on the shores of Hudson Bay (CHURCHILL). The port-terminal elevators receive, store, process and ship grain. Processing includes cleaning of grain to export standards, drying, destoning and fumigating when necessary.

On the West Coast the total storage capacity is 992 000 t, most of which is at 5 terminals in Vancouver. There is also a 60 000 t terminal, which is scheduled for expansion, at Prince Rupert. West Coast terminals operate on a year-round basis. The terminal at Churchill, with a storage capacity of 140 000 t, has a very limited shipping season (less than 3 months per year). Thunder Bay has 15 terminal elevators with a combined storage capacity of approximately 2 million t; these terminals ship grain for approximately 8 months of the year. Grain loaded onto

ships at Vancouver, Prince Rupert and Churchill moves directly to export destinations. In the case of Thunder Bay, only about 10% is loaded directly onto oceangoing ships; the remainder is carried by lake vessels to transfer elevators situated along the waterway between Thunder Bay and the seaboard. There are 27 transfer elevators with a capacity of 3.7 million t. Grain received at transfer elevators is either loaded onto oceangoing ships or is stored for future export shipment or for domestic distribution in eastern Canada. In addition to terminal and transfer elevators, there are 24 process elevators with a capacity of 550 000 t, located mostly in the prairies. Their function is to receive and store grain for direct manufacture or processing into other products.

The WINNIPEG COMMODITY EXCHANGE is a voluntary association of representatives of practically all firms and agencies involved in marketing western Canadian grain. Members are from private and co-operative elevator companies, shippers, millers, the CWB, banks, railways and foreign grain companies. The exchange provides facilities for trading in both cash and future contracts and establishes the conditions under which grain trading shall be conducted.

Reading: T. Veeman and M. Veeman, *The Future of Grain: Canada's Prospects for Grains, Oilseeds and Related Industries* (1984).

**Grammont, Joseph-Éloi-Augustin, dit de Grandmont**, writer, director (b at Baie-du-Febvre, Qué 17 Apr 1921; d at Montréal 25 Nov 1970). He studied at the Séminaire de Nicolet and Montréal's Ecole des beaux-arts, where he was a leading opponent of the conservative director, Charles Maillard, a proponent of naturalism. During 1944-46 he was an arts critic for *Le Devoir*; in 1946 he directed the series "Les Cahiers de la file indienne" and wrote the first collection of poetry in this series: *Le Voyage d'Arlequin*, illustrated by his former teacher, Alfred PELLAN. He spent 1946-48 studying at the Sorbonne and the Ecole du Louvre.

Upon his return from Europe, he wrote screenplays for Renaissance Film, as well as about 30 short stories for Radio-Canada, most of which were produced by Guy BEAULNE (1950-52). In 1949 he cofounded, with Jean-Louis ROUX, the Théâtre d'Essai which opened with one of his plays, *Un fils à tuer*. This theatre was replaced in 1951 by the THÉÂTRE DU NOUVEAU MONDE, which he directed for 3 years. Between 1954 and 1964,

Radio-Canada broadcast a novel for radio by him (over 1½ years), 4 radio plays in the "Nouvelles dramatiques" series and 4 humorous weekly or daily serials. He authored an excellent adaptation of *My Fair Lady* and died only a few months after his appointment as professor at U de M's School of Translation. See RADIO DRAMA, FRENCH LANGUAGE.

ANDRÉ G. BOURASSA

**Granby, Qué., City,** pop 38 069 (1981c), inc 1916, located on the N Yamaska R, is an industrial crossroad of Québec's EASTERN TOWNSHIPS. First settled by British colonists and LOYALISTS, it was named for an English village. The city's present population is predominantly French Canadian. Situated 84 km SE of Montréal and about 25 km from the US border, Granby remained a modest agricultural centre until the 1940s. Subsequently, municipal annexation and an ambitious economic promotion program by the city administration has resulted in large-scale industrial diversification and population growth. Twenty of its 170 industrial plants are based in western Europe and the US. Major employers include producers of textile and knitted goods, consumer and rubber clothing, precision metal, plastic and electronic products, printed paper and publications, and food products. Smaller firms are part of the high-technology sector. Regional services, including CEGEP Granby (a college), and provincial offices employ a large professional work force. Granby's tourist industry links the city's rural surroundings with its industrial base. Granby Zoo, one of the largest in Canada, and nearby Mt Yamaska are complemented by an auto museum, an ecological centre, and a gastronomic festival.

PAULA KESTELMAN

**Grand Banks,** part of Canada's continental shelf, lying SE of Newfoundland, consist of several separate banks, foremost of which are Grand, Green and St Pierre; their area (for water depths shallower than 200 m) is 282 500 km². Water depths over the banks are generally less than 100 m.

The banks are an internationally known fishing ground most noted for cod, but haddock, redfish, flatfish (including halibut), mackerel and herring are also caught. This abundant fish resource was first noted by John CABOT in 1498 and shortly thereafter began to attract numerous European fishermen. The first settlements on Newfoundland were established as bases for drying and salting fish for transport back to Europe. In this century, European, American and Canadian boats have continued to fish on the banks, being joined in the mid-1950s by large Soviet and Japanese vessels. Since 1977, when Canada extended its offshore jurisdiction to include most of the Grand Banks, foreign fishing has been greatly reduced.

The water over the banks is mainly supplied by the southward-flowing cold Labrador Current and, to a lesser extent, the eastward-flowing warm Gulf Stream. The Labrador Current splits as it approaches the Grand Bank, with one branch moving S along the coast of Newfoundland through Avalon Channel to St Pierre Bank. The other branch circulates clockwise around the Grand Bank, concentrated at its outer edge. The warm Gulf Stream waters are generally located S of the Grand Banks, but do on occasion move N onto their southern edge. Warm air masses moving from the Gulf Stream over the colder Labrador Current water produce

heavy fog, especially in spring, when the air-sea temperature differences are greatest. Icebergs, carried along the edge of the banks by the Labrador Current, are also most numerous in spring.

Oil drilling, which began on the banks in the late 1970s, gained public attention with the disastrous loss of the Ocean Ranger rig. Test wells have been promising and expectations are high that oil production will begin in the near future.

KEN DRINKWATER AND ALLYN CLARKE

**Grand Falls, NB, Town,** pop 6203 (1981c), inc 1890, is located 228 km up the SAINT JOHN R from Fredericton at the point where the Canada-US boundary begins to be designated by the river. The cataract from which the town's name originates was the site of overnight encampments from the time of the MALISEET. Grand Falls had a brief stint as a military post at the time of the boundary dispute, but the initial surge of settlement came through the entrepreneurial efforts of Sir John Caldwell, who brought settlers in to run his around-the-clock sawmill operation in the late 1830s. The surrounding area was settled by farmers in the ensuing decades and with the completion of railway links in the 1870s the town embarked on an era of being a tourist and resort attraction in the vein of Niagara Falls. In the 1920s a dam and electrical-generating station changed the effect of the falls, and Grand Falls's post-WWII prosperity has depended almost entirely on potato production and export.

FRED FARRELL

**Grand Falls, Nfld, Town,** pop 8765 (1981c), inc 1961, is located in central Newfoundland on the EXPLOITS R. The pulp and paper town is named after the river's spectacular falls. In 1905 the Anglo Newfoundland Development Co acquired a 99-year lease to 10 360 km² of timber land and its minerals. The construction of the pulp and paper mill, supplied with power from the falls, on the route of the trans-insular railway, and with access to the seaport of Botwood (35 km NE), was completed 1909, as was the first phase of the well-planned town, which continued to be company built and administered until 1961. It then incorporated as a munic-

ipality. The mill was acquired in 1961 by Price Brothers, which in 1981 became a division of ABITIBI-PRICE; it remains the town's largest employer. The position of Grand Falls on major water and overland routes has made it an important regional centre.

ROBERT D. PITT

**Grand Lake, 539 km²,** elev 87 m, max length 91 km, average depth 110 m, largest lake in Newfoundland, is located on the W side of the Island, 24 km SE of CORNER BROOK. Fed by numerous small streams and brooks, it drains into Deer Lk, via the Newfoundland Canal, and then, via the HUMBER R and Humber Arm, into the Bay of Islands. The lake contains the uninhabited Glover I (200 km²), and to the NE, together with Sandy and Birchy lakes, forms a 145 km waterway much used by canoeists.

DAVID EVANS

**Grand Manan Island, NB, 142 km²,** is the largest and most remote of the 3 isles located in BAY OF FUNDY. It is 24 km long and 10 km at its widest point. Accessible year round by ferry from Blacks Harbour, it is 27 km from the NB mainland, 13 km from the Maine coast. Its name is part-French, part-Amerindian (*munanook*, meaning "island") in origin. With a population of about 2500 — chiefly in the villages of North Head, Grand Harbour and Seal Cove — its chief industries are fishing (sardines, herring, lobster), forestry (spruce, balsam, birch, poplar), dulce (seaweed) gathering and tourism. Steep cliffs rise to 125 m on the N and W showing 7 different strata of the Earth's crust, including 900-million-year-old sedimentary rock. Mixed in as well is 16-million-year-old volcanic rock.

Grand Manan is on the eastern flyway for migratory birds, and more than 400 species have been counted at the E coast sanctuary between Grand Harbour and Seal Cove. The island is a convenient spot for whale watching, as several species, including N American humpback, minke, finback, pothead and the nearly extinct right whale, inhabit the surrounding waters. Seals and whitesided dolphins are seen as well. The first recorded visit by Europeans was made in 1604 by Samuel de CHAMPLAIN and the Sieur de MONTS, though the NORSE may have visited earlier. The island was a French seigneurie for many years, but most inhabitants are descended from LOYALISTS who settled here following the American Revolutionary War. Among the first

Grand Manan I, in the Bay of Fundy, is on the eastern flyway for migratory birds; more than 400 species have been counted at its east coast sanctuary (photo by Freeman Patterson/Masterfile).

to arrive (1784) was Moses Gerrish, whose Grand Harbour home is now the Grand Manan Museum. HENRY F. HEALD

**Grand Portage**, fur-trade depot and route of the VOYAGEURS at the western extremity of Lk Superior. It was the first and most strenuous of the 29 PORTAGES from Lk Superior to Lac La Croix, requiring that each voyageur carry 4 loads of 80 kg over some 14 km of rocky trails around the cascades of the Pigeon R. The Pigeon R route had long been used by the Indians and was opened to the FUR TRADE by LA VERENDRYE. The NORTH WEST CO established an extensive post at the mouth of the river, which by 1784 was the wilderness capital of the fur trade, providing a meeting place for the voyageurs bringing supplies from Montréal (PORKEATERS) and the traders bringing furs from the North-West (WINTERERS). Within the post, which was protected by a 5 metre high palisade, reinforced with a bastion and a heavy gate, were the Great Hall, living quarters, shops, warehouses and a stone powder magazine. Because the settling of the Canada-US boundary left the post in American territory, the post was abandoned in 1802 and NWC activities were relocated at FORT WILLIAM at the mouth of the Kaministiquia R. This route, which had been travelled by de Noyon in 1688, was more arduous than Grand Portage, requiring a portage of Kakabeka Falls and a gruelling haul over the height of land to the Savanne R. JAMES MARSH

**Grand Pré**, NS, UP, pop 305 (1981c), 83 km NW of HALIFAX. Founded by ACADIANS in 1675, the name refers to the 1000 ha "Great Meadow" of fertile marshland that drew settlers eastward from PORT-ROYAL to farm on the shores of MINAS BASIN. Using traditional French diking techniques to protect the low-lying marsh from the saltwater tides of the basin, Grand Pré farmers annually exported agricultural products to Port-Royal, other French colonies and New England. By the early 18th century, Grand Pré was the focus of Les Mines (Minas), the most populated of 3 Acadian districts. In the 1740s it consisted of 150 houses that stretched in a line some 4 km long. On 11 Feb 1747, it was the scene of the Battle of Grand Pré, a surprise attack by French and Indians on British troops during the WAR OF THE AUSTRIAN SUCCESSION. Longfellow's romantic poem *Evangeline* portrayed the tragic events of the Acadian deportation at Grand Pré (1755). In 1917 property near the centre of the village was set aside to develop as a tourist attraction. A bronze statue of Evangeline was unveiled in 1920, and a memorial chapel in the style of mid-18th-century French architecture opened in 1930. The area is now a historic site — Grand Pré National Historic Park. DEBRA MCNABB

Church and statue of Evangeline at Grand Pré, NS (photo by Malak, Ottawa).

Proscenium arch of the Grand Opera House, London, Ont, which opened 1881 and was rebuilt after a fire in 1900. The building now houses the Grand Theatre Co (courtesy Grand Theatre/James Hockings).

**Grand Theatre** The original Grand Opera House opened amid a strong amateur and professional theatrical tradition on 8 Sept 1881 in the upper floors of the Masonic Temple at London, Ont. At its peak in the 1890s, the 2070-seat Grand was host to 100 companies and 300 performances annually. World-renowned artists, including Sarah Bernhardt, Lily Langtry and Ellen Terry and Canadians Clara MORRIS, Emma ALBANI and Henry MILLER, performed in the classical melodramas of the time. When this theatre, part of a Michigan-Ohio-Ontario circuit, burnt in 1900, C.J. Whitney, the original lessee, and Ambrose Small, a Canadian impresario, rebuilt and relocated the Grand. Although the capacity was reduced to 1850, the proscenium was larger. In 1924 the building was sold to Famous Players. The Grand regained its legitimacy in 1945 when it was purchased by London Little Theatre, an active amateur group that won many Dominion Drama Awards. In 1971 this group was replaced by a professional company. Major structural renovations in 1977-78 reduced capacity to 829. In 1983 the company, renamed The Grand Company under artistic director Robin Phillips, announced an ambitious season of 9 plays, but the repertory system was terminated after one year. KATHLEEN D.J. FRASER

**Grand Trunk Pacific Railway** was a 4800 km system whose main line ran from Winnipeg via Yorkton and Edmonton to Prince Rupert, BC. Incorporated in 1903, it was built between 1907 and 1914 to provide the GRAND TRUNK RY with western connections. It also assumed responsibility for the operation of the government-built National Transcontinental Railway from Winnipeg to Québec City. The Grand Trunk Pacific faced severe competition from the CANADIAN PACIFIC RY and the CANADIAN NORTHERN RY, both of which had excellent branch and feeder lines on the prairies. Construction costs, the exigencies of wartime financing, and the lack of a viable system of branch lines brought the Grand Trunk Pacific into receivership. The Grand Trunk, which had guaranteed Grand Trunk Pacific securities, tried to escape its obligations, but eventually the western road also dragged the Grand Trunk into default and NATIONALIZATION. The federal government decided in 1919 to acquire both the Grand Trunk Pacific and the Grand Trunk at a price to be established by arbitration, and in 1923 the operations of the Grand Trunk, the Grand Trunk Pacific and the National Transcontinental merged with those of the recently nationalized Canadian Northern Railway to form the new CANADIAN NATIONAL RAILWAYS system. T.D. REGEHR

**Grand Trunk Railway of Canada**, railway built to provide a main trunk line "throughout the entire length of the Province of Canada, and from the eastern frontier thereof . . . to the city and port of Halifax." Under the sponsorship of Sir Francis HINCKS, the GTR was formally incorporated in 1852 to build a railway from Toronto to Montréal. The Grand Trunk Railway of Can-

ada East was also incorporated to build a line from opposite Québec City (Lévis) to Trois-Pistoles, Qué. The recently completed ST LAWRENCE AND ATLANTIC RAILROAD was purchased in 1853. Much of the financing had to be raised in England, and the English construction firm of Peto, Brassey, Jackson and Betts received the contract to build the Montréal-to-Toronto section in return for agreeing to promote the company. Gzowski & Company received the contract for the Toronto-to-Sarnia section. Brassey claimed his company suffered heavy losses on its contract, while Casimir GZOWSKI, more familiar with Canadian conditions, made a fortune. Hincks's enemies claimed that he, too, made a fortune — at the expense of the railway.

Work proceeded vigorously from town to town. Navvies from England swelled the labour force — at one time 14 000 men and 2000 horses were employed in Canada West alone. The line did not face challenges such as those of the CANADIAN PACIFIC RAILWAY in the mountains but achieved at least one notable engineering feat in construction of the tubular Victoria Bridge across the St Lawrence R at Montréal. The 2009 m long iron tube rested on 2 abutments and 24 piers designed to resist the crushing ice of the river; it was opened to traffic on 17 Dec 1859. The Montréal-to-Lévis line opened 1854 and the "trunk" from Montréal to Toronto in Oct 1856. Despite financial difficulties, the GTR expanded steadily, leasing the Buffalo and Lake Huron Railway in 1864, adding a line from Pt Huron to Chicago, acquiring the Georgian Bay and Lake Erie railways in 1881, and the Midland Railway (750 km) in 1884. It eliminated its main competitor and added another 1450 km of track with the takeover of the GREAT WESTERN RAILWAY in 1884. Additional links to the US rail system were established with the International Bridge across the Niagara R, and the impressive St Clair Tunnel beneath the St Clair R. At Confederation the GTR was the largest railway system in the world, with 2055 km of track; by the late 1880s it had grown to over 700 locomotives, 578 cars, 60 post-office cars, 131 baggage cars, 18 000 freight cars and 49 snowplows. The GTR ran unbroken from Sarnia to Portland, Maine.

Cost of construction, absentee management (the head office was in London, Eng) and failure to generate anticipated levels of traffic left the company debt ridden and unable to upgrade its equipment. It suffered bad publicity with several accidents; on 28 June 1864 a GTR train plunged off the Beloeil Bridge into the Richelieu R, killing 90 people. Another incident made headlines around the world when, on 15 Sept 1885, a GTR train was charged by Jumbo, the famous circus elephant, near St Thomas, Ont. The elephant was killed. From the mid-1890s until WWI the GTR undertook a massive betterment program on its property. This included double-tracking of the main line from Montréal to Sarnia, reducing curves and grades to improve operating efficiency, and reconstruction of bridges, buildings and yards. Subsequent rebuilding of the system was not required until after WWII.

Envious of the CPR thrust into the West, the GTR set up a subsidiary, the GRAND TRUNK PACIFIC, to build a transcontinental line. Completed in 1914, the railway was a financial disaster and was largely responsible for the bankruptcy of the GTR in 1919. The federal government, which had already given the GTR some \$28 million in subsidies and loans, took over the railway on 10 Oct 1919. It was placed under the management of the CANADIAN NATIONAL RAILWAYS on 30 Jan 1923. JAMES MARSH

Reading: A.W. Currie, *The Grand Trunk Railway of Canada* (1957).

**Grand Valley**, Man, is a provincial recreation park 10 km W of Brandon on the Trans-Canada

Hwy. Once a community on the N bank of the Assiniboine R, Grand Valley died when BRANDON, 3 km W on the S bank of the Assiniboine, was created in 1881 as the CPR's divisional headquarters. Settlers from Nova Scotia and Québec homesteaded here 1877-79. Population, stores and services grew. Several attempts were made to entice the CPR to locate at Grand Valley but the rivalries involved, combined with spring flooding in 1881, caused the higher site of Brandon to be chosen. Homesteaders moved across the river; businessmen moved to Chater or Brandon. By 1884 only a few houses remained, and the townsite eventually reverted to a homestead. D.M. LYON

**Grandbois, Alain**, poet (b at St-Casimir, Qué 25 May 1900; d at Québec City 18 Mar 1975). He is considered the first great modern Québec poet. He travelled the world 1918-39 and shared the hopes and problems of contemporary man. His work closely integrates the themes of exploring the secrets of the world and studying human destiny, each one reinforcing the other. His writing and subject matter thus had a depth and breadth previously unknown in Québec, making them a model for various young poets of the 1950s. *Né à Québec: Louis Joliet* (1933), *Les Voyages de Marco Polo* (1941), *Avant le chaos* (1945) and *Vivages du monde* (1971) all demonstrate his knowledge of the world. The confrontation with destiny (adventure, glory, love, liberty, death) occurs in precise locations, through specific characters. His poetry — *Îles de la nuit* (1944), *Rivages de l'homme* (1948), *L'Étoile pourpre* (1957), *Poèmes épars* — develops these topics within a single character, the man of the "long voyage insolite/A travers l'incantation du temps." The poetry is metaphysical, its scope being that of destiny explored, through exploratory words, and with its developed rhetorical structure it speaks for all in an intimate and personal tone.

YVES BOLDUC

Reading: Yves Bolduc, *Alain Grandbois: le douloureux destin* (1982).

**Grande Cache**, Alta, Town, pop 4523 (1981c), inc 1966, located 430 km NW of Edmonton, was created 1966 to mine coking coal. The coal's location had been known for years, but awaited development of a market in Japan's blast furnaces and completion of the Alberta Resources Ry N from the CNR main line. Named for a "grande cache" of furs said to have been left there by Ignace Giasson (1820), it is a neatly laid out, model town. Nearby Willmore Wilderness Prov Pk promises the development of tourism. The *Grande Cache Mountaineer* is the weekly newspaper. ERIC J. HOLMGREN

**Grande Entrée, Île de**, Qué, pop 867 (1981c), situated almost in the middle of the GULF OF ST LAWRENCE, and flanked in the N by Île d'ANTICOSTI, in the S by PRINCE EDWARD I and on the E by CABOT STR, is one of the 16 islands comprising the Magdalen Islands archipelago (Îles de la MADELINE). The island group was discovered by Jacques CARTIER (1534) and was later explored by Samuel de CHAMPLAIN (about 1609). Grande Entrée was leased to Nicolas DENYS in 1653 by the COMPAGNIE DES CENT-ASSOCIÉS. After 1775 it became part of the holdings of Capt Isaac Coffin (Coffin is the island's English name today) of the Royal Marines as a reward for services to the English Crown. A Canadian corporation, the Magdalen Island Co, bought all the islands from the absentee Coffin family in 1903. Grande Entrée is joined to the other islands by lagoon-forming sandbars, and is characterized by rapidly eroding red sandstone cliffs. A constant hazard to shipping, the island group is noted for fishing, sealing and its spectacular colonies of seabirds. During the summer, the entire archipelago attracts many tourists.

DAVID EVANS

**Grande Prairie**, Alta, City, pop 24 263 (1981c), inc 1958, is located 460 km NW of Edmonton. Surrounded by rich agricultural land, it is the business and transportation centre of the PEACE RIVER region.

**History** Although the area had been the domain of fur traders since Alexander MACKENZIE ascended the Peace R (1792-93), the present townsite was not settled until 1881, when Tom Kerr erected an HBC trading post. Shortly thereafter, Louie Callihou, a part-Iroquois farmer who sowed grain, constructed the first barn and corral. The community received its name from Father Grouard, an RC missionary who labelled the gently undulating wilderness "la grande prairie." After 1900 a trickle of pioneers traversed the Edson Trail and ATHABASCA LANDING TRAIL and took up homesteads here. Growth continued with completion of the Edmonton, Dunvegan and BC Ry extension line in 1916.

**Economy** Historically, Grande Prairie has evolved around agriculture. With demobilization following WWI, soldier settlement schemes, continued high wheat prices and publicity for the Peace R district as Canada's new agrarian mecca, migration increased throughout the 1920s. Strategically situated with a vast expanse of fertile land N, E and W, Grande Prairie by the 1930s served as the wholesale centre for the region. Although its population was only 1464 (1931c), its retail business in 1929-30 surpassed \$2 million. In recent years the city's economy has become diversified, with the forestry and petroleum industries augmenting agri-business. The major employer is Procter and Gamble (which completed an \$80-million pulp mill 1973) followed by North Canadian Forest Industries. Grande Prairie experienced an unprecedented boom 1978-80 due largely to the discovery of the Elmworth "deep-basin," a major gas field near the city. Extensive gas and oil activity with its concomitant impetus to the commercial and service industries resulted in a large population increase 1979-80. However, as Canada's economy stagnated in 1981, particularly in the energy sector, the flood of people into the city decreased and there has been a substantial economic slowdown.

**Cityscape** The city contains beautiful parkland surrounding a man-made reservoir in its centre. Cultural life is focused on the regional college (designed by Douglas CARDINAL), which provides not only diverse educational opportunities, but possesses one of the finest auditoriums in western Canada. J. PETRYSHYN

Reading: L.M. Campbell, *Grande Prairie: Capital of the Peace* (1968); C.A. Dawson, *The Settlement of the Peace Country* (1934).

**Grande Société**, contemporary name for war profiteers charged with providing food for Canada and the French troops stationed there during the SEVEN YEARS' WAR. The official supplier received only one-fifth of the société's profits, and silent partners almost certainly shared their three-fifths with Canada's last intendat and possibly with the governor. The other one-fifth was divided among those who looked after the Québec and Montréal operations. Intendant

BIGOT wielded extensive power over Crown expenditures in the colony, so the société was in the enviable position of buying supplies from itself with the king's money. Since supplying the FUR-TRADE posts was most remunerative, the société shipped much-needed foodstuffs westward. Much of the money seems to have found its way back to France; some was even returned to the royal treasury in the late 1760s after conviction of those involved. Speculation common under the Ancien Régime was all the more tempting in Canada because of the enormous expenditures incurred by the Crown in order to save its colony from the British. THOMAS WIEN

**Grandin, Vital-Justin**, Roman Catholic bishop of St Albert, b at St Pierre-la-Cour, France 8 Feb 1829; d at St Albert, Alta 3 June 1902). As a pioneering Oblate missionary of the Canadian West, he became the first bishop of the then vast and newly created diocese of St Albert in 1871. Wholly dedicated to bringing Roman Catholicism to the Indians and the Métis, he worked despite great hardships to develop the missions. In 1875 he lobbied the Canadian government for funding to aid agriculture, education and health care. During the 1885 NORTH-WEST REBELLION he advocated moderation and "obedience" to the Canadian authorities. His cause for sainthood was introduced at Rome in 1937.

LOUISE ZUK

**Grands Ballets canadiens, Les**, of Montréal, was founded by Ludmilla CHIRIAEFF in 1958 as a troupe of 16 dancers. It was the natural outgrowth of Mme Chiriaeff's earlier activities in Montréal, where she had settled after emigrating from Europe in 1952. Her first ballets were created for the acclaimed CBC French Network TV program, *L'Heure du concert*. Her company, Les Ballets Chiriaeff, began giving live public performances in 1954, despite opposition from the then highly conservative Catholic Church in Québec. Mme Chiriaeff had established her first school in 1952 and, in 1958, the Académie des grands ballets canadiens was established to prepare dancers for the emerging company. Schooling has remained a vital part of the company's activities. Branches of the general school — the Académie — have been opened throughout Québec and, in 1970, the École supérieure de danse was founded to provide professional training for advanced students. Since relinquishing her position as artistic director in 1974, Mme Chiriaeff has focused her attentions on the schools, where she has been able to provide ballet training for talented children from all parts of Québec.

Throughout its existence, Les Grands Ballets (now about 35 dancers) has been distinguished by its commitment to French Canadian themes and Canadian composers, designers, and choreographers. In the early years, Mme Chiriaeff choreographed many ballets. Since then other important contributions to the repertoire have been made by such Canadian choreographers as Fernand NAULT, Brydon PAIGE and Brian MACDONALD. The company has also accumulated a diverse repertoire representative of the best in traditional and contemporary ballet and modern dance, performing works by such renowned choreographers as George Balanchine, John Butler, Lar Lubovitch and Paul Taylor. It also continues to present the works of a younger generation of Canadian choreographers including, among others, James Kudelka, Judith MARCUSE and Linda Rabin.

Les Grands Ballets has travelled extensively across Canada. It made its first US appearance in 1959, visited Europe in 1969, 1974, and 1982, and has appeared in Latin America and Asia. From 1970 to 1972 it became internationally known for its popular dance adaptation, by Fernand Nault, of the rock opera *Tommy*, composed by the British group, The Who. In the ear-

ly 1980s the artistic direction of the company was provided by a committee consisting of ballet mistress Linda Stearns, répétiteur Daniel Jackson, and director general Colin McIntyre. They succeeded in maintaining a high profile for Les Grands Ballets as a versatile, creatively vital company. MICHAEL CRABB

**Grange, The** Throughout its history this elegant brick building, constructed about 1817 on a 40 ha property stretching from Queen to Bloor streets, has been linked to the social, intellectual and political life of Toronto. Built for D'Arcy Boulton, Jr, it subsequently became home to Goldwin Smith. Acquired in 1911 by the Art Museum of Toronto (now ART GALLERY OF ONTARIO), the building was restored to its appearance of the years 1835-40. The composition of its facade, with a slightly projecting section topped by a pediment, shows the influence of 18th-century British classical architecture as it was expressed in several grand colonial homes in the early 19th century. NATHALIE CLERK

**Grant, Cuthbert**, fur trader, Métis leader, captain of the Métis at SEVEN OAKS (b at Fort de la Rivière Tremblante [Sask] c 1793; d at White Horse Plains [St-François-Xavier, Man] 15 July 1854). Grant, his reputation tarnished by the events at Seven Oaks, overshadowed in history by RIEL, has not been given due credit for his leadership of the MÉTIS. Of Scottish and Cree or Assiniboine background and educated apparently in Montréal, Grant came back to the North-West as a trader-bourgeois of the NORTH WEST CO in 1815. In 1816 he led the Métis to victory at Seven Oaks, an unplanned clash of Métis and Selkirk settlers. Three years after the amalgamation of the NWC and HUDSON'S BAY CO, in the spring of 1824, Grant led 80 to 100 Métis families to settle and farm at White Horse Plains (Grantown, later St-François-Xavier). In 1828 he was appointed warden of the Plains by HBC Gov George SIMPSON, and for at least 25 years his followers served as providers and protectors of the RED RIVER COLONY. Grant was a founder of the Métis Nation, but ironically, it was a younger generation of Métis nationalists who, by defying his attempts to uphold the HBC monopoly at the Sayer trial in 1849, ended his career as warden and sheriff of ASSINIBOIA. EMMA LAROCQUE

**Grant, George Monro**, Presbyterian minister, educator (b at Albion Mines, NS 22 Dec 1835; d at Kingston, Ont 10 May 1902). Educated at Pictou Academy and West River seminary in Nova Scotia, Grant attended Glasgow U (MA 1857) and was ordained in the Church of Scotland in 1860. After spending 3 years in different Maritime locations as a missionary, he was offered the pulpit of St Matthew's Church, Halifax, in 1863, a position he held until he accepted the principalship of Queen's U, Kingston, in 1877. He was principal of Queen's until his death.

Grant inherited a small and financially unstable denominational college and spent much of his indomitable energy thereafter in raising an endowment fund and acquiring (and retaining) major scholars, especially in the humanities. He was also fully aware, however, of the necessity of strong faculties of science (pure and applied) if Queen's was to acquire a truly national stature. By the time of his death few denied that his goal had been realized.

Principal Grant was an almost archetypal "muscular Christian," greatly admiring Thomas Arnold of Rugby as well as Victorian social reformers. While not a systematic scholar, he read widely and his thought and conduct were practical applications of the philosophical idealism given voice by his colleague at Queen's, John WATSON. He believed that the knowledge and ideals acquired at university should be actively used in professional public life for the so-

cial good, and the power of his example encouraged commitment of students to a SOCIAL GOSPEL. To this organic view of society he added a firm commitment not only to the Canadian nation but also to its place within the British Empire. A leader in the Presbyterian Church in Canada (he was moderator in 1889), he was nevertheless a major spokesman for ecumenicism. He left behind him no great body of scholarship but at his death the phrase "Principal Grant" had become one of legendary significance. A.B. McKILLOP

**Grant, George Parkin**, social philosopher, university professor (b at Toronto 13 Nov 1918), son of William Lawson Grant and grandson of George Monro Grant and Sir George Parkin. A brooding philosopher of apparently implacable pessimism, Grant is one of the most influential Canadian thinkers of his era, having evolved from a nationalist and "red Tory" position to a concern with the fate of the entire Western World. Educated at Queen's and Oxford, Grant taught philosophy at Dalhousie 1947-60, then became chairman of the Department of Religion at McMaster. In 1980 he returned to Dalhousie as a professor of political science and classics. In *Philosophy in the Mass Age* (1959), he began to wrestle with the conflict between Western moral traditions and the new religion of technological progress. *Lament for a Nation* (1965), a meditation on the implications of the DIEFFENBAKER period, attracted wide attention for its sombre conclusion that Canada — a nation with conservative roots — was doomed to disappear in the American-led empire of modern liberalism, which for Grant is an inexorable force leading to a universal and homogenous state of almost certain tyranny. Similar concerns dominate *Technology and Empire* (1969), in which Grant saw the Vietnam War as an evil and exemplary product of Western ideology.

Using contemporary issues as a springboard for his speculations, Grant has attracted a large following among younger writers and nationalists, most of whom see his pessimism less as an irrevocable verdict than as an invigorating challenge to unite the achievements of modern science and classical philosophy. This challenge was maintained in *English-Speaking Justice* (1978), in which Grant concludes that traditional concepts of freedom and justice have been transcended by the doctrine of technological progress, with an implication that the entire Western experience has been some sort of gigantic error. CHARLES TAYLOR

Reading: Charles Taylor, *Radical Tories: The Conservative Tradition in Canada* (1982); L. Schmidt, ed, *George Grant in Process* (1978).

George Grant's *Lament for a Nation* (1965) attracted wide attention for its sombre conclusion that Canada was doomed to disappear in the American empire of modern liberalism (courtesy Canapress).

**Grant, Sir James Alexander**, physician, politician (b at Inverness, Scot 11 Aug 1831; d at Ottawa 5 Feb 1920). A graduate of Queen's and McGill, he practised medicine for all of his professional life in Ottawa. He was personal physician to the first 8 governors general (1867-1905). Successful care of Princess Louise, Marchioness of Lorne, earned him a KCMG in 1887 and Queen Victoria's motherly thanks. His professional eminence led to election as president of the CANADIAN MEDICAL ASSN and the Royal Soc of Canada. Grant sat in Parliament for Russell County 1867-73 and Ottawa 1893-96 and gained distinction by introducing the original CANADIAN PACIFICRY Bill in 1872, using an appropriate medical metaphor, when he said Canada would become one great country by "placing an iron splint on these provinces to strengthen the union and develop trade." A.A. TRAVILL

**Grant, John Charles Boileau**, anatomist (b at Loanhead, Scot 6 Feb 1886; d at Toronto 14 Aug 1973). After service as a medical officer in the imperial forces in WWI, Grant became professor and head of the Dept of Anatomy, U of Man (1919-30), of U of T (1930-56), professor emeritus, U of T (1956-73), and visiting professor of anatomy, U of Calif, Los Angeles (1961-69). Author of *A Method of Anatomy*, *An Atlas of Anatomy* and *A Dissector of Anatomy*, Grant was also a contributor to Gray's *Anatomy* 18th and 20th editions, Morris's *Anatomy*, *Myology*, 10th and 11th editions, Cunningham's *Anatomy*, *Respiratory System*, 9th and 10th editions, and *Anthropometry of the Saulteaux, Cree, and Chipewyan Indians*. Grant was a stimulating teacher of human anatomy and his influence through his textbooks was worldwide. During the GREAT DEPRESSION he provided encouragement and monetary assistance to dozens of unemployed. ROSS G. MACKENZIE

**Grant, John Webster**, UNITED CHURCH clergyman, church historian (b at Truro, NS 27 June 1919). He attended Dalhousie, Princeton and Oxford universities (Rhodes scholar 1941), graduated in theology from Pine Hill Divinity Hall, Halifax, and served as a wartime chaplain in the RCN. He taught church history at Union Coll, Vancouver, 1949-59, except for one year as a visiting professor in India. In 1959 he joined RYERSON PRESS and a year later became its editor in chief. From 1963 until retirement in 1984 he was professor of church history at Emmanuel Coll, Toronto. Besides numerous scholarly articles, he has written more than a dozen books on church history, particularly Canadian. He has been active in several academic and religious organizations, including the United Church's commission on union with the Anglicans, where he was chairman of the executive committee 1967-71. JOHN S. MOIR

**Grape**, common name for a family (Vitaceae) of woody, climbing vines and the fruit clusters they produce. The genus *Vitis* includes 30-50 species. The Old World species *V. vinifera* has been cultivated for at least 5000 to 6000 years. Many different grape species exist from Canada to Mexico. *V. labrusca* and *V. riparia* are the 2 main northern species. As early as 1616 attempts were made to grow *V. vinifera* in eastern N America. Cultivation of this species has continued but remains economically unsuccessful in Canada, although small quantities are grown for special wines. However, *V. vinifera* has been used extensively in hybridization of many important cultivated varieties. There are 2 main grape-growing areas in Canada, the NIAGARA PENINSULA, Ont (85% of plantings), and the OKANAGAN VALLEY, BC, with some plantings in SW Ontario and NS. Approximately 10 000 ha of grapes are grown in Ontario, 2000 ha in BC. The Niagara region has 177 frost-free days and an average rainfall of 678 mm. The 2335 heat units (above 5°C) are adequate for crop maturity. In

BC, irrigation is required to supplement rainfall. Some cultivation is necessary for best results in vineyards. Chemicals are used for WEED control, except on young vines. Green-manure crops are sown in midsummer and fertilizers are applied as needed. Common INSECT PESTS include leafhoppers, flea beetles, berry moth and phyloxera. The main PLANT DISEASES are powdery mildew, downy mildew, black rot, botrytis and dead arm. Most of the grapes produced in Canada are used by processors to make WINE and juice. Small quantities are sold for home winemaking and dessert purposes. The main varieties grown are Concord, De Chaunac, Niagara, Elvira and Foch. About 45 varieties are used by the wineries. Agriculture Canada and Ontario Ministry of Agriculture and Food scientists, working at RESEARCH STATIONS in Summerland, BC, and Vineland, Ont, respectively, have aided local wineries by breeding new hybrid vines and evaluating wines. See CROP RESEARCH.

O.A. BRADT

**Graphic Arts,** see GRAPHIC DESIGN; PRINT INDUSTRY; PRINTMAKING.

**Graphic Design** originated from graphic or commercial art and is often called visual communication. As the term covers typographic and type design, book, magazine, audio-visual and advertising design, the graphic designer is concerned with both alphanumeric symbols and nonalphanumeric images in order to clarify information and enhance communication in a variety of media.

The roots of graphic design in Canada lie in the fledgling newspaper business of the early 19th century. With rapid technological progress in type casting and printing presses (see PRINT INDUSTRY), the demand for printed advertising increased — for promotion of stagecoaches and lake boats, posters and broadsheets for circuses, agricultural fairs and exhibitions, and playbills for theatre and concerts. Since design was an unknown profession, layout and artwork were performed by anonymous craftsmen and freelance artists, both often referred to as "graphic" artists.

At the turn of the century the Toronto Lithographing Co and Grip Ltd were among the first firms anywhere to add illustrators and graphic artists to their full-time staff. The idea of housing under one roof the services of draftsmen, photographers, platemakers, layout artists, copywriters and advertising salesmen was introduced to Great Britain in 1902 by 4 members of the Toronto Art League and former employees of Grip Ltd, A.A. Martin, W.T. Wallace, T.G. Greene and Norman Price, who became founders of London's Carlton studios. The artists at the Grip and later Rous and Mann included Tom THOMSON and members of the GROUP OF SEVEN, many of whom had studied and worked in England and who introduced elements of the international style, particularly from William Morris and the Beggartstaff Brothers, to Canadian design. The immigration posters required by the national railway and steamship companies and patriotic recruitment posters commissioned during both world wars gave a great impetus to graphic design. The Poster in 1919 complimented Canada on its "remarkably successful war poster advertising campaign," especially Henry Eveleigh, and during WWII the NATIONAL FILM BOARD was made responsible for designing and distributing numerous poster series, resulting in some excellent work by Leslie Trevor, Eric Aldwinkle and Harry Mayerovitch (Mayo). The railway initiative slumped after about 1920, however, and when A.C. Leighton came to Canada in 1929 to direct advertising for the CPR, he followed a widely used formula poster design often incorporating a map, train, ships and hotel inserts. It was only in 1960 that CN acquired a new corporate symbol of inter-

national calibre conceived by Toronto designer Allan Fleming. Many prominent artists, including Carl SCHAEFFER and Jack BUSH, continued to earn their living as commercial designers.

The NFB and the CANADA COUNCIL have had a positive influence on Canadian graphic design as they commissioned first-rate designers to produce their posters, brochures and publications such as *Canada: A Year of the Land* (1967) and *Between Friends* (1976). Already in the late 1940s 2 Canadian-born designers were outstanding — Carl DAIR and Henry Eveleigh, who formed a partnership in Montréal in 1947. The studio failed in 1951, but Eveleigh won the first United Nations poster contest in 1947 with a brilliant photo montage. Dair wrote and lectured widely on typography and in 1967 designed the Cartier typeface for Canada as a CENTENNIAL project. Publishers became more conscious of "the look of the book," and strong design departments developed at the U of T Press with Allan Fleming and Will Rueter, at McClelland & Stewart with Frank Newfeld, and at Queen's U with Peter Dorn. The work of Fleming and of graphic designer Jim Donohue was characterized by a synthesis combining the order of the European grid system design with the more intuitive and illustrative Anglo-American approach.

The 1950s and 1960s had brought an influx of European-trained designers (first Rolf Harder and Ernest Roch, later Gerhard Dorrié and Fritz Gottschalk) to Montréal, where they captured a large share of institutional and corporate design commissions. In Toronto, Stuart Ash and Burton Kramer acquired international reputations, especially in corporate identity design. Order and clarity were hallmarks of their work. European influence was obvious in the design work for EXPO 67 and the Montréal Olympics of 1976, when Pierre-Yves Pelletier and Georges Huel, with Gottschalk and Ash, exerted an effective quality control over all aspects of design. Gottschalk and Ash International is unique in now having offices in Montréal, Toronto, New York and Zurich. Leading Québec designers were Georges Beaupré and Laurent Marquart, both partly Swiss trained, and Jean Morin and Pierre-Yves Pelletier. In Toronto Paul Arthur, Carl Brett and John Gibson continued a line of design that evolved from the British typographic traditions of restrained balance between the innovative and the practical. Paul Arthur was particularly influential in the early 1960s, employing a number of young immigrant designers who later became eminent in their own right (eg, Fritz Gottschalk). Theo Dimson in Toronto updated Art Nouveau poster styles. Neville Smith near Ottawa combined illustrative flair with good typography. Eiko Emori of Ottawa excelled in designing government publications with a native Japanese flair and meticulous Western typography. Ian and Judith Gregory established their reputation in publication design in Ottawa. Inside the federal government, Ulrich Wodicka and a small team brought order into the chaotic signage and identity system of federal agencies, first in Information Canada, then in the Treasury Branch.

In the late 1960s graphic designers who had immigrated to the Maritimes and the West, often from abroad, began to exert an influence in those regions. Tony Mann and Gerhard Dorrié were mentors to a generation of students at the NOVA SCOTIA COLLEGE OF ART AND DESIGN and these graduates became "bridgeheads" of good design in Halifax (Greg Silver, Denise Saulnier and David Peters) and Charlottetown (Anne Patterson). In Winnipeg Bernard Michaleski won numerous awards, and at the U of Alberta Walter Jungkind, a Swiss designer, established a program of graphic design in 1969 which, with Jorge Frascara from Argentina, concentrated on research into the perception and design of public symbols. In Vancouver the design scene was for

long broadly oriented towards the West Coast Artist Guild dominated by Los Angeles and San Francisco, but Fred Peters, John Long, Marion Llewellyn, Jim Haynes and Ken Hughes are among the leading contemporary designers.

A Society of Typographic Designers was founded in 1959 in Toronto, and in 1974, at a meeting in Ottawa which included representatives from across the country, the Society of Graphic Designers of Canada (SGDC) was established. It received a federal charter in 1976 and is now organized into a number of autonomous regional or city chapters. Like all professional associations, SGDC is concerned with standards of professional conduct, performance, integrity and development, as well as public information. The majority of graphic designers in Québec decided in 1972 to associate themselves at the provincial level and incorporated as the Société des graphistes du Québec. There is good rapport between the SGDC and SGQ and most national exhibition/publication/award events are organized jointly.

The first international design education conference in N America took place in 1975 at the U of Alberta, sponsored by both national graphic design associations, the International Council of Graphic Design Associations, the NATIONAL DESIGN COUNCIL and the Canada Council. In 1980 an International Design Symposium was held at UQAM. In 1982 a major graphic design conference took place, under the aegis of the Alliance graphique internationale, at York U, organized by educator and designer Andy Tomcik.

Graphic design in Canada, unbeknown to most Canadians, has come of age. See also ONTARIO COLLEGE OF ART; PRIVATE PRESSES.

WALTER JUNGKIND

Reading: C. Dair, *Design with Type* (1967); J. Gibson and L. Lewis, eds, *Sticks and Stones: Some Aspects of Canadian Printing History* (1980); R. Stacey, *The Canadian Poster Book* (1982).

**Grasses** are among the most familiar and important flowering PLANTS. They are used primarily as foodstuffs. Humans consume grasses directly as CEREALS (eg, wheat, corn, barley, rye, oats) or as sweetening (eg, sugar from sugar cane, molasses from sorghum). Most meat and dairy products are derived from grass-eating domesticated animals (see ANIMAL AGRICULTURE). Many wild animals are also grass eaters. Grasses contribute to the aesthetic environment as turfs gracing playing fields, golf courses and lawns, and as ornamental garden grasses. They stabilize SOIL and prevent EROSION. Grasslands began to appear about 25 million years ago, changing the face of much of the world and providing food for grazing animals. Grasses and grazers evolved together. Grasses benefit because grazers control the growth of competing species and provide fertilizers. Grasses owe their success largely to peculiarities of their structure. They consist of vegetative structures (roots, stems and leaves) and reproductive structures (flowers and associated modified leaves). Although most grass parts are like those of other flowering plants, certain structures are unique. Usually, the stems (culms) are hollow, except at points (nodes) where leaves are attached. However, some well-known grasses do not have hollow internodes, eg, corn (*Zea mays*) and big bluestem (*Andropogon gerardii*) of the Canadian prairies. The characteristic grass leaf consists of a sheath (basal portion of the leaf) surrounding the stem for some distance above the node. The part of the leaf that diverges away from the stem is the blade. At the junction of sheath and blade, there is often a small structure (ligule) forming a continuation of the sheath. Sheaths of grass leaves may be open (with edges overlapping but not fused) or closed (with fused edges). Closed sheaths are less common but are found in the widespread bluegrasses (*Poa*) and brome grasses (*Bromus*).

Grass (artwork by Claire Tremblay).

Grasses range in size from 3 cm (eg, *Aira praecox* of Vancouver I) to 2 m (eg, *Elymus cinereus* of BC and Alberta). Their life cycle may be completed in a single year, as in many annual crop plants, or they may survive for hundreds of years, as do native prairie perennials. Canadians usually associate grasses with prairie vegetation, although they occur in all habitats except the densest woods. Some grasses (eg, 3-awn grass, *Aristida longiseta*) are found in arid regions of BC, others (eg, wild rice, *Zizania aquatica*) in eastern Canadian lakes. Certain genera (eg, *Arctagrostis* and *Arctophila*) are native to the Canadian Arctic.

Turf grasses are developed from species that show desirable characteristics, eg, density of growth, fast growth after seeding, ability to remain green, etc. In Canada cold hardiness and, frequently, drought resistance are also important. Popular Canadian lawn grass mixtures often include species of *Poa* (eg, Kentucky bluegrass, roughstalk bluegrass) and *Festuca* (especially creeping red fescue, chewing fescue), although other useful species have been developed.

JACK MAZE

Reading: A. Arber, *The Graminae* (1959).

**Grasshopper**, common name for straight-winged insects which, together with locusts, make up the order Orthoptera. Over 12 000 species are known worldwide; about 140 in Canada, ranging in length from 2-12 cm. All provinces have grasshoppers; most species occur in the western grasslands, but some live in forest clearings and on trees in river valleys north to YT. Grasshoppers are herbivorous and diurnal. Most have wings; many are strong fliers. Unlike locusts, grasshoppers are usually nonmigratory.

Usually one generation is produced annually, from eggs that have overwintered. Some grassland species overwinter as immature nymphs; a few, in the interior of BC, require 2 years to mature. Females lay several clutches (egg pods), each containing 10-90 eggs, depending on species. Under favourable, late summer conditions, large numbers of egg pods are deposited by pest species in densely packed egg beds or distributed through cultivated fields. In spring, many nymphs hatch and attack seedling cereal crops. Damage can be extensive: in outbreak years 5-10% of cereal crops may be lost to grasshoppers. Several species, especially the Rocky Mountain locust (*Melanoplus spretus*), extinct since 1902, discouraged, for a time, settlement of western Canada. Winged adults, flying downwind, can emigrate to invade ripening crops many kilometres distant. Five species are important INSECT PESTS: 4 species of genus *Melanoplus* and the clear-winged grasshopper, *Camnula pellucida*. All damage cereal crops; the latter devastates BC rangeland grasses. Several other species compete with cattle for forage. Hot, dry weather favours population growth; cool, damp weather retards growth and encourages fungi and bacteria that can wipe out large grasshopper populations. Birds, small mammals, and other insects prey on grasshoppers; small worms and maggots are internal parasites. Although weather and natural control agents are most effective in keeping numbers down, chemical control during an outbreak is still required for crop protection. The so-called long-horned grasshoppers are not true grasshoppers. They are more closely related to CRICKETS. P.W. RIEGERT

**Grasslands National Park** (est 1981, 920 km<sup>2</sup> provisionally) situated in the SW Saskatchewan PRAIRIES on the Canada/US border. At first glance, the park area appears empty; a gently undulating expanse of sun-scorched plains arches to meet a deep cobalt sky. But hidden from view are BADLANDS filled with weird, water-eroded shapes, meandering rivers and fertile sloughs. The hot, dry summers and cold winters produce an environment that supports a unique flora and fauna, including several species of rare herbs, 2 rare grasses and Canada's only black-tailed prairie dogs. Among its sweeping grasses the park also supports pronghorn, coyote, red fox, mule deer and numerous small mammals. Species of reptiles and amphibians, rare elsewhere in Canada, can be found along the Frenchman R Valley. Until the 1850s the park area was inhabited only by nomadic Indians who hunted throughout the territory. At that time, rapid settlement led to the growth of ranching.

LILLIAN STEWART

**Gravenhurst**, Ont. Town, pop 8532 (1981c), inc 1887, located at S end of Lk MUSKOKA, 170 km N of Toronto. The name was arbitrarily assigned by the federal government, perhaps after a place in Washington Irving's novel *Bracebridge Hall*. In the 19th century it was a sawmilling centre, but as logging declined tourism became the most important activity. The Muskoka district, with its many wooded islands set among the crystal waters of a series of interconnected lakes, developed into a popular cottage and tourist resort area, earning Gravenhurst its nickname "Gateway to the Muskokas." The town was long a base for steamer service for the Muskoka Lks, and the paddle steamer *Segwun* has been restored to its original (1887) condition. The birthplace of

native son Norman BETHUNE has been restored as a museum and national historic site.

DANIEL FRANCIS

**Gray, George R.**, track and field athlete (b at Coldwater, Canada W 4 May 1865; d at Sault Ste Marie, Ont 7 Jan 1933). After high school he competed for 17 years at his specialty, putting the shot, without being defeated. At age 20 in 1885, at the Canadian Amateur Athletic Assn meet in Toronto, he defeated champions from other countries with his first put of 41' 5.5" (12.64 m) and was acclaimed world champion. From 1887 he competed for the famous NY Athletic Club, which paid his expenses, while continuing his Canadian career in the lumber business. He held and broke the world shotput record several times, competing throughout N America and in Britain. By retirement he had won 188 1st-place medals and trophies.

GERALD REDMOND

**Gray, Herbert Eser**, politician (b at Windsor, Ont 25 May 1931). Gray has represented a Windsor constituency in Parliament since 1962. A prominent Liberal nationalist, he was appointed to Cabinet in 1969 and gained attention through his report on FOREIGN INVESTMENT in Canada tabled in 1972. Though not reappointed to Cabinet after the 1974 election, he became minister of industry, trade and commerce in 1980 and was president of the Treasury Board until defeat of the Liberal government in 1984.

JOHN ENGLISH

**Gray, James Henry**, journalist, social historian (b at Whitemouth, Man 31 Aug 1906). Gray grew up in Winnipeg, left school to help support his family, and after a series of jobs went on relief during the Depression. He worked for the *Winnipeg Free Press* 1935-47, first as a reporter and later as an editorial writer. He edited Calgary's *Farm and Ranch Review* 1947-55, introducing unaccustomed topics such as farmers' subsoil rights, and the *Western Oil Examiner* 1955-58, where he championed the unpopular notion that independent Canadian oil producers should take precedence over American multinationals. Later, he moved to the Home Oil Co to promote the building of a Canadian pipeline to the East. Gray's 9 books, written after his retirement, draw on personal experience and original research. Lively and detailed, they investigate such facets of Prairie life as the fight against the dustbowl, the Depression, prostitution and prohibition.

JEAN O'GRADY

Reading: J.H. Gray, *The Winter Years* (1966), *The Boy from Winnipeg* (1970), *Booze* (1972) and *Troublemaker!* (1978).

**Gray, Jessie Catherine**, surgeon, lecturer, researcher (b at Augusta, Georgia 26 Aug 1910; d at Toronto 16 Oct 1978). Canada's "first lady of surgery," and one of the 4 leading cancer surgeons in N America, Gray earned a formidable succession of firsts: first woman gold medalist in medicine at U of T (1934); first woman to obtain the Master of Surgery degree (1939); first woman resident surgeon at the Toronto General Hospital; first woman Fellow of the Royal Coll of Surgeons (Canada, 1941); first woman member of the Central Surgical Society of N America; first woman elected to the Science Council of Canada (1966). She was appointed associate surgeon in chief at Women's College Hospital, Toronto, in 1941, and held the post of surgeon in chief from 1945 to her retirement in 1965.

DONNA YAVORSKY RONISH

**Gray, John Hamilton**, soldier, premier of PEI (b at Charlottetown 14 June 1811; d there 13 Aug 1887). Educated in England, Gray served for many years in South Africa and India with the 7th Dragoon Guards, retiring permanently to PEI in 1856. Elected to the Legislative Assembly in 1858 and 1859, Gray supported Bible reading in the schools and a commission to set-

tle the LAND QUESTION. He became premier on 2 March 1863, supporting Maritime union and, after the CHARLOTTETOWN CONFERENCE, which he hosted, CONFEDERATION. When the Islanders rejected the union of British North America after the QUEBEC CONFERENCE, Gray suddenly resigned as premier on 20 Dec 1864, perhaps influenced by his wife's illness. He became increasingly involved in the military affairs of the Island and later the Dominion. J.M. BUMSTED

**Gray, John Hamilton**, lawyer, politician, judge, premier of NB (b at St George, Bermuda 1814; d at Victoria 5 June 1889). Remembered as a FATHER OF CONFEDERATION, Gray, a brilliant orator, used his skill in the courtroom, as lieutenant colonel in the militia, on the stump, in the NB Assembly, in the Canadian House of Commons and on the BC Supreme Court. A "Conservative of the old school . . . gentlemanly . . . forgiving," he was considered somewhat shallow, shifting to any wind. His premiership of New Brunswick 1856-57 was tarnished by imperial influence, and his support of CONFEDERATION saw him abandon his colleagues for the Liberal S.L. TILLEY. He had however advocated union as early as 1849. His reward was the puisne judgeship of British Columbia's Supreme Court in 1873. Though resented by some in BC as an "empty-headed favourite," Gray's reputation as a jurist and arbitrator grew. He stood against the majority in his defence of the rights of the CHINESE, and became an expert on Canadian-American boundary negotiations.

CARL M. WALLACE

**Gray, Joseph Alexander**, physicist (b at Melbourne, Australia 7 Feb 1884; d at London, Eng 5 Mar 1966). After graduating from Melbourne U in 1907, Gray worked in Sir Ernest RUTHERFORD's laboratory in Manchester, Eng, concentrating on the study of the interaction of electrons and X rays with atoms. In 1912 he went to McGill to conduct further research. On the Western Front in WWI, he was in charge of locating enemy batteries by sound ranging. Awarded an OBE, Gray returned to McGill in 1919. From 1924 until his retirement in 1952, he was research professor at Queen's. His discoveries regarding the breadth of the energy spectrum of electrons and the scattering of X rays were important contributions to the development of the new theory of the atom. The Royal Society of London, to which he was appointed in 1932, credited his work as "clearly foreshadowing what is known as the Compton effect" (for which A.H. Compton received the Nobel Prize). He was elected to the RSC in 1922 and received the first gold medal of the Canadian Association of Physicists in 1956. YVES GINGRAS

**Gray, Robert Hampton**, aviator (b at Trail, BC 2 Nov 1917; d in Onagawa Wan, Honshu I, Japan 9 Aug 1944). During WWII he served aboard the RN aircraft carrier HMS *Formidable*. He was awarded the VICTORIA CROSS for a valiant dive-bombing attack on a Japanese destroyer. Though he was wounded and his aircraft was in flames, he sank the ship with a direct hit. He was killed when his plane crashed.

**Gray Burial Site**, N of Swift Current, Sask, lies on a sandy hillside to the W of an ancient glacial outwash channel. Excavations between 1970 and 1974 showed that it was used as a traditional burial ground by a small band of hunters who roamed the region between 3500 and 1000 BC. With a mobility based on the use of pack dogs, they followed the seasonal wandering of the bison herds. They supplemented their diet with berries, other mammals such as deer and pronghorn, and smaller animals including birds and their own dogs. During their seasonal travels they are thought to have accumulated the bones of their dead, returning periodically to the location of the Gray Site for formal burial

ceremonies. The bones were interred in composite groups, including those of a number of children and one or more adult crania. The associated artifacts and the character of the burial remains reveal the antiquity of the ritual and ceremonialism that was typical of the Plains Indians of the historic period. See also ARCHAEOLOGY; PREHISTORY.

JAMES F.V. MILLAR

**Grayling**, common name for freshwater FISHES of class Osteichthyes, family Salmonidae (SALMON), subfamily Thymallinae (sometimes elevated to family rank). Graylings are most easily identified by their very large dorsal fins. Arctic grayling (*Thymallus arcticus*), the only species in Canada, is one of 4 species widely distributed throughout the Northern Hemisphere. In Canada, it is confined to areas W of Hudson Bay, including northern portions of Manitoba, Saskatchewan, Alberta and BC, as well as YT and NWT, exclusive of the arctic islands. It also has a limited distribution in the Flathead R in southeastern BC and the Belly R in southeastern Alberta. Grayling occupy a wide variety of freshwater habitats but, although they sometimes enter brackish waters of coastal lagoons, they are generally intolerant of marine water.

Typically, adults spawn and young are reared in small, warm streams. They leave in fall to overwinter in larger streams or lakes or in the vicinity of perennial springs. Some populations are highly migratory, eg, some individuals of a population spawning in the upper reaches of the Donnelly R, NWT, overwinter in Great Bear Lk, over 350 km away. During the short northern summer, grayling feed voraciously on a wide variety of foods. They grow relatively rapidly until they reach maturity. Thereafter, growth slows as much of their energy intake is committed to reproduction. In the Far North, grayling sometimes live for 20 years. Grayling spawn in spring, often migrating under ice to reach spawning locations as early as possible. No nest is prepared. Eggs may fall among cracks between large rocks or the vigorous quivering of the spawning fish may deposit fine materials over them. Graylings are a prized sportfish, easily taken by fly-fishing or spinning gear, but are highly susceptible to overfishing. In some areas, populations have declined dramatically because of excessive angling. Although sometimes taken by native fishermen, grayling are not especially sought after.

PETER J. MCCART

**Great Auk** (*Pinguinus impennis*), largest and only flightless AUK, is now extinct. All auks are expert divers which swim underwater using their wings, but the great auk had flipperlike wings, too short for flight. It was the original penguin (true penguins are unrelated birds native to the Southern Hemisphere). Great auks bred in large colonies at a few offshore islands in low arctic and boreal waters of the N Atlantic, from the Bird Rocks in the Gulf of St Lawrence to northern Britain. They laid a single, large egg on bare rock and the breeding cycle was completed in about 7 weeks. Their pattern of incubation and chick-rearing may have resembled that of the RAZORBILL, their closest living relative. The main food was probably fish. In winter, birds ranged offshore from southern Greenland to southern Spain and Florida. They were especially numerous on the GRAND BANKS. The great auk was destroyed by man. Flightless,

and colonial when breeding, it was heavily exploited by early explorers for fresh food, by fishermen for bait and, in the late 1700s, by commercial hunters for feathers. The largest and best-documented colony, on FUNK I, Nfld, had been destroyed by about 1800. The last, known breeding pair was collected (3 June 1844) on Eidey Rock off SW Iceland. D.N. NETTLESHIP

**Great Awakening**, New England-based movement of religious revivalism and evangelical pietism which came to Nova Scotia in 1775 with Henry ALLINE's decision to preach; it subsequently spread across the Maritimes. The religious currents which produced it were international and at least a century old. Evangelical pietism had begun among LUTHERANS in Germany at the close of the 17th century, spread to England to influence the growth of METHODISM, and contributed to a major religious outpouring in colonial America between 1720 and 1745. From New England, the centre of American revivalism and the source of most early British settlement in Nova Scotia, beliefs and experiences familiar to those acquainted with revival and pietism came to the Maritimes. But the Canadian Awakening was also an indigenous response to peculiarly local conditions. In their scattered wilderness settlements Maritimers teetered on the brink of economic disaster, and with the outbreak of the AMERICAN REVOLUTION — which the isolated settlers did not really understand — there was a crisis of identity which a movement emphasizing personal salvation could allay, if not resolve.

Alline was soon joined by others. Some, such as John Payzant, were converts through Alline's preachings, but others, such as William BLACK and his Methodist colleagues, apparently arrived at a similar point independently of Alline's "New Light" movement. Alline and his immediate followers accepted infant baptism, but many of those later involved rejected the concept as incompatible with the crisis conversion experience of being "born again." By the 1790s, when the movement had spread beyond NS into NB and PEI and even to the US, the main competition was between Methodists and BAPTISTS. The Great Awakening contributed to religious fragmentation in the Maritimes, and helped establish a regional inclination toward EVANGELICAL churches which remains characteristic. The revival never really ended, but ebbed and flowed throughout much of the 19th century as settlement spread. J.M. BUMSTED

**Great Bear Lake**, 31 153 km<sup>2</sup>, elev 156 m, lies astride the Arctic Circle in the northwestern NWT, about 200 km S of the Arctic Ocean. It is the eighth-largest lake in the world, fourth in N America and the largest lying entirely within Canada. It is 320 km long, up to 175 km wide and very deep — 413 m at one point. Dotted with numerous small islands, it is shaped like a giant amoeba with 5 great arms — Keith, McVicar, McTavish, Dease and Smith — which meet in a common centre. Great Bear R (120 km) drains the cold waters SW to the MACKENZIE R at Ft Norman. A string of interconnected lakes to the S — Hottah, Hardisty, Rae, Faber — are drained by the Camsell R into Conjuror Bay. Great Bear Lk lies in a vast wilderness, with the S and W arms reaching into the tundra and the E shore lapping the hard rock edge of the Canadian SHIELD. The S and W shores are wooded, mostly with stunted spruce. The lake is ice-bound for 8 months of the year, often into July, and is served by tugs and steamers when free.

Europeans only slowly became aware of the location and immensity of the lake. Peter POND learned of its general location in 1783-84, and the FUR TRADE came to the area around 1800. Sir John FRANKLIN's expedition established Ft Franklin on Keith Arm 1825-26, while John Richardson surveyed the N shore. P.W. DEASE

Great Bear Lake, NWT, the largest lake lying entirely in Canada and the 8th-largest lake in the world. Port Radium (now Echo Bay) is shown (photo by John de Visser).

spent the winter of 1837-38 at Ft Confidence, and a geological survey was carried out by Robert BELL 1900. Settlement was transient until pitchblende (an ore containing radium and uranium) was discovered in 1929, and Port Radium (now Echo Bay) was established at the E end of McTavish Arm 1933. Exploration and servicing were made possible by BUSH FLYING. Some of the ore used to make the atomic bombs used by the US in WWII was mined here. Exhaustive mining depleted the reserves and the mines have been abandoned. The lake is well stocked with fish, including relic species thought to have moved S from the Arctic Ocean ahead of the glaciers. Commercial fishing is not allowed because of the slow regeneration of the fish in the ice-cold water. The lake's name, adopted 1902, likely refers to the bears in the area and to the size of the lake. A more poetic explanation is that it was named for the northern constellation of stars, called Great Bear, which is reflected in its waters.

JAMES MARSH

**Great Coalition** The politics of the PROVINCE OF CANADA in the early 1860s were marked by instability and deadlock. The external dangers posed by the AMERICAN CIVIL WAR combined with a legislative impasse to make drastic action necessary. The Union of the Canadas had clearly failed, and its political leaders were ready to forget old political feuds to create a new political order. REFORM MOVEMENT leader GEORGE BROWN proposed that a parliamentary committee with members from all groups investigate how the impasse might be broken. This committee quickly concluded that the best solution was confederation of BRITISH NORTH AMERICA or the federal union of the Canadas. Brown quickly responded to the report by joining a coalition with the Conservatives with the intention of creating a new union. Thus the Great Coalition was formed under the leadership of Brown,

George-Étienne CARTIER and, above all, John A. MACDONALD. The broadly based coalition was remarkably successful in meeting its major aims: the ending of political deadlock and the creation of a new political entity. It remained largely intact as the government of the Province of Canada until CONFEDERATION.

JOHN ENGLISH

**Great Depression** Few countries were affected as severely as Canada by the worldwide Depression of the 1930s. It is estimated that between 1929 and 1933 Gross National Expenditure declined by 42%, 30% of the LABOUR FORCE was unemployed, and 1 in 5 Canadians became dependent upon government relief for survival. Until WWII the UNEMPLOYMENT rate never declined below 12%. The Depression's severity was aggravated by its uneven impact, a rudimentary social-welfare structure and misguided government policy. Because 33% of its Gross National Income derived from exports, Canada was particularly affected by the collapse in world trade. The 4 western provinces, which depended almost exclusively on primary-product exports, were the most affected. In Saskatchewan, plagued by crop failures and the lowest price for wheat in recorded history, total provincial income plummeted by 90% within 2 years, forcing 66% of the rural population onto relief. The other western provinces were technically bankrupt from 1932 onwards. Although Ontario and Québec experienced heavy unemployment, they were less severely afflicted because of their more diversified industrial economies, which produced for the protected domestic market. The Maritimes had entered into severe economic decline in the 1920s and had less distance to fall.

The burden of the Depression was also unequally distributed between classes. Although wages dropped throughout the 1930s, prices declined even faster. As a result, the standard of living of property owners and those with jobs increased. Farmers, young people, small businessmen and the unemployed bore the brunt of economic hardship.

Demographic changes were a revealing index of hardship. POPULATION growth throughout the 1930s reached the lowest point since the 1880s through a combination of plummeting IMMIGRATION and birthrates. The number of immigrants accepted into Canada dropped from 169 000 in 1929 to fewer than 12 000 by 1935 and never rose above 17 000 for the remainder of the decade. During that time European JEWS fleeing Nazi Germany were denied a sanctuary in Canada (see REFUGEES). The number of Canada's deportations, however, rose from fewer than 2000 in 1929 to more than 7600 just 3 years later. Almost 30 000 immigrants were forcibly returned to their countries of origin over the course of the decade, primarily because of illness or unemployment.

Canada's birthrate dropped from 13.1 live births per 1000 in 1930 to only 9.7 by 1937, the

lowest ratio until the 1960s. During the 1930s, 50 years of urbanizing momentum were reversed as Canada's rural population (outside of Saskatchewan) grew more rapidly than its urban population. For many of the unemployed "going back to the land" was preferable to a miserable existence on urban relief.

With almost 33% of its gainfully employed still engaged in agriculture in 1931, Canada did not have an adequate system of dispensing welfare to the jobless. Although unemployment was a national problem, federal administrations led by the Conservative R.B. BENNETT (1930-35) and the Liberal W.L. Mackenzie KING (1935-40) refused, for the most part, to provide work for the jobless and insisted that their care was primarily a local and provincial responsibility. The result was fiscal collapse for the 4 western provinces and hundreds of municipalities and haphazard, degrading standards of care for the jobless. Monthly relief rates for a family of 5 varied from \$60 in Calgary to \$19 in Halifax. Although there were no official accounts of starvation, reports by medical authorities of scurvy and other diet deficiency diseases were common throughout the decade. Because local governments refused to aid single, homeless men, between 1932 and 1936 the federal government established UNEMPLOYMENT RELIEF CAMPS. Run by the Dept of Defence, the camps paid the men 20 cents a day for construction work in the bush. In 1935 a protest against conditions in the camps culminated in the Regina Riot — the most violent episode of the 1930s, in which one policeman was killed, dozens of men were injured and 130 arrested (see ON TO OTTAWA TREK).

The Depression altered established perceptions of the economy and role of the STATE. The faith shared by both the Bennett and King governments and most economists that a balanced budget, a sound dollar and changes in the tariff would allow the private marketplace to bring about recovery was misplaced. The Depression spawned a variety of political reform movements, particularly at the provincial level, which advocated the use of the state to initiate recovery. The reforms included the inflationary SOCIAL CREDIT theories of Alberta premier William ABERHART, the "Work and Wages" program of BC premier Thomas PATTULLO, and the democratic socialism of J.S. WOODSWORTH and the CO-OPERATIVE COMMONWEALTH FEDERATION. The UNION NATIONALE in Québec, led by Maurice DUPLESSIS, H.H. Stevens's Reconstruction Party and the New Democracy movement of W.D. Herridge were also spawned by the Depression. The COMMUNIST PARTY OF CANADA was virtually outlawed from 1931 (when 9 of its leaders were arrested and convicted under s98 of the Criminal Code for being members of an "unlawful association") until 1936, and banned when war was declared in 1939, although affiliated groups such as the Workers' Unity League, the Relief Camp Workers Union and the National Unemployed Workers Association played a significant role in organizing the unskilled and the unemployed in protest marches and demonstrations.

Although the national impact of these organizations was minimal, the Depression did ultimately result in an expansion of state responsibility for the economy and for social welfare. In 1934 Bennett's government created the BANK OF CANADA to regulate MONETARY POLICY; in 1935 the CANADIAN WHEAT BOARD was established to market and establish a minimum floor price for wheat; and in 1940 the federal government assumed responsibility for the unemployed by introducing a national UNEMPLOYMENT INSURANCE scheme and employment service. The Depression also legitimized the economic theories of British economist John Maynard Keynes, who argued that, if private investment failed to produce full employment, the state must initiate

Prairie drought deepened the Depression in the western provinces. Saskatchewan's provincial income plummeted by 90% in 2 years, forcing two-thirds of the rural population onto relief (courtesy Saskatchewan Wheat Pool).

public investment through deficit spending to create jobs. Keynes's ideas influenced the National Employment Commission report (1938) and the report of the Royal Commission on DOMINION-PROVINCIAL RELATIONS (1941). The latter was important in generating the idea of EQUALIZATION PAYMENTS. Not until war broke out in 1939, however, did KEYNESIAN ECONOMICS become a deliberate part of government policy, and it was the massive state expenditures necessitated by the war that finally reduced unemployment to minimal levels by 1942. See also HISTORY SINCE CONFEDERATION; BUSINESS CYCLES; BENNETT'S NEW DEAL.

JAMES STRUTHERS

Reading: J.L. Granatstein et al, *Twentieth Century Canada* (1983); M. Horn, ed, *The Dirty Thirties: Canadians in the Great Depression* (1972); H.B. Neatby, *The Politics of Chaos: Canada in the Thirties* (1972); B. Palmer, *Working-Class Experience: The Rise and Reconstitution of Canadian Labour 1800-1980* (1983); James Struthers, *No Fault of Their Own: Unemployment and the Welfare State, 1914-1941* (1984).

**Great Divide Trail** is a long-distance hiking trail, paralleling where possible the CONTINENTAL DIVIDE of Canada's Rocky Mt range. Some 560 km of the trail lies within the boundaries of Banff, Kootenay, Yoho and Jasper national parks, extending from Palliser Pass in the S to Mt ROBSON in the N. A series of high alpine trails combine to form a "Great Divide Route" which, if followed in its entirety, brings the hiker to elevations of just below 3000 m and gives a perspective of the entire Rockies landscape. In the mid-1970s the Great Divide Trail Assn of Calgary began work to designate and extend the trail S from Banff National Pk along the BC-Alberta border to Waterton Lks National Pk. This section would follow some of the most spectacular scenery of the southern Rockies, adding about 700 km to the overall trail length and making the trail the longest hiking trail in Canada.

BART DEEG

**Great Lakes** are the largest group in a chain of large lakes (including Winnipeg, Athabasca, Great Slave and Great Bear) that lies along the southern boundary of the Canadian SHIELD. From W to E the Great Lakes comprise Lakes SUPERIOR, Michigan (entirely in the US), HURON, ST CLAIR, ERIE and ONTARIO. They have a total area of approximately 246 050 km<sup>2</sup> and drop from 183 m above sea level at Lk Superior to 75 m at Lk Ontario — the most dramatic drop occurring at NIAGARA FALLS (51 m). After withdrawal of the Paleozoic seas, which had spread across most of the continent, there is little record of geological events in the Great Lks area between the end of the Pennsylvanian and late Tertiary periods. Al-

though broad river valleys likely crossed the area, remnants of Tertiary erosion surfaces in Illinois and Wisconsin cannot be traced across the Great Lks, and reconstructions of preglacial drainage are uncertain. The Great Lks lie near the intersection of the Hudson Bay, Mississippi R and St Lawrence R drainage basins; because of progressive headwater capture by the Mississippi, that watershed now lies only about 10 km from parts of the southern shores of Lks Erie and Michigan, and only about 20 km from the western end of Lk Superior. Postglacial isostatic uplift, along a generally NW-SE hinge line, continues to raise the northern shorelines of the Great Lks by about 0.4 m per century, relative to the southern shores of Lks Erie and Michigan.

The Great Lks occupy bedrock depressions that have been differentially eroded by glacial ice, and their form and location are largely controlled by structural geology. The arcuate forms of Lks Huron and Michigan have developed around the periphery of the Michigan structural basin, and the more resistant Silurian limestones and dolomites (NIAGARA ESCARPMENT) separate GEORGIAN BAY and Green Bay from the main lakes. The form of Lk Superior is largely controlled by Precambrian geology; that of Lks Erie and Ontario by trends in the underlying Appalachian geosyncline.

During the last glacial period (which lasted more than a million years) there were 4 glacial stages and, with each, the lake basins were progressively enlarged. Towards the end of the last glaciation (Wisconsin), lakes formed in front of retreating ice margins, first in the Erie and Michigan basins, and drained S to the Mississippi more than 14 000 years ago. Subsequently, a lake formed in the southern part of the Huron basin and drainage between Erie, Huron and Michigan was linked. There was also an outlet to the Hudson R (S of the Ontario basin). The Ontario basin became ice-free about 12 000 years ago; Lk Superior and Georgian Bay later. The presence of ice margins caused many early lakes to form at very high levels. At one time, a single huge lake covered much of the up-

per Great Lks area (Superior, Michigan and Huron). As the ice melted away from the natural outlets, lake levels often dropped quickly and to extremely low levels, for example, about a 150 m drop in the Ontario basin, with the opening of the St Lawrence Valley (12 000-11 500 years ago). As a result of continued uplift during the past 10 000 years, upper lakes drainage was fully transferred (through Lks St Clair and Erie) to Lk Ontario only 4000-5000 years ago, when the Chicago outlet (Lk Michigan) closed.

The Great Lakes have, since the days of the early FUR TRADE, provided an important transportation route to the interior of the continent, and with the opening of the ST LAWRENCE SEAWAY (1959) they became a truly international waterway.

P.G. SLV

**Great Lone Land: A Narrative of Travel and Adventure in the North-West of America, The**, by William Francis BUTLER, appeared 1872 in London. Butler's accounts of his adventures are the most poetic and the most personable of the 19th-century Canadian travel narratives. His lyrical descriptions of landscape, climate and seasonal change testify to his deep admiration for the sheer, unpopulated expanse and beauty of the Canadian West. Sent by the English in 1870 to gather intelligence about the RED RIVER REBELLION, Butler actually met with Louis Riel at Ft Garry; his description of the encounter remains one of the most vivid portraits of Riel in our literature. *The Great Lone Land* was reprinted (Edmonton, 1968) with an introduction by Edward McCourt.

NEIL BESNER

**Great Slave Lake**, 28 570 km<sup>2</sup>, elev 156 m, fifth-largest lake in N America, tenth in the world, located in S-central NWT. It was named by Samuel HEARNE after the SLAVEY Indians. Great Slave, along with GREAT BEAR, ATHABASCA and a tangled chain of lakes between, are remnants of a single postglacial pool. Its S and E shores cut into the granite edge of the Canadian SHIELD; to the N and W lie the Barren Lands. Cold, very deep (614 m) and frozen 8 months of the year, Great Slave is a vast reservoir for numerous rivers and streams which spill over the crest of the Shield. Among these are the Yellowknife, Snare, Emile, Beaulieu, Snowdrift, Taltson, and HAY; the Slave R carries the waters of the PEACE R past thick forest into the flat, grassy marshes of the delta on the S shore of the lake. The great MACKENZIE issues from the extreme W end. Alexander MACKENZIE found the outlet in 1789, but the lake was first crossed by Hearne in the winter of 1771.

The CHIPWEYAN of the area carried furs to Hudson Bay as early as the 1730s, and the fur trade dominated the economy almost to WWII. The earliest settlements in the area were HBC posts: FORT RESOLUTION, FORT RAE (now RAE-EDZO), FORT PROVIDENCE and FORT RELIANCE. ROBERT BELL conducted the first survey (1899) and described the area's mineral potential. Klondike-bound travellers prospected in the area, but the gold rush came in 1934, when gold was discovered in the volcanic rock W of Yellowknife B. Next year the town of YELLOWKNIFE was established. The min-

Cold and deep, and frozen 8 months of the year, Great Slave Lake is the 2nd-largest lake lying entirely in Canada and the 10th-largest lake in the world (photo by Hålle Flygare).

ing of the huge lead-zinc deposits SW of the lake began 1964 after completion of the Great Slave Lake Ry to HAY RIVER and PINE POINT and the construction of a hydroelectric plant on Taltson R. A prosperous commercial fishery centered on Hay River dates from 1945; the chief catches are whitefish and lake trout. The all-weather Mackenzie Hwy, built to Hay River 1945 and to Yellowknife 1960, was constructed primarily to serve the fishery but also reaches communities hitherto isolated by the winter freeze. Great Slave has long been part of the Peace-Mackenzie waterway, and tugs and barges still ply the lake, though it is susceptible to savage storms.

JAMES MARSH

**Great Western Railway** The London and Gore Railroad Co, incorporated 6 May 1834, changed its name to the Great Western Rail Road Co in 1845 and to the Great Western Railway in 1853. Promoted by lawyer-politician Allan Napier MacNAB and more significantly by Hamilton merchants Isaac and Peter Buchanan, R.W. Harris and John Young, and aided by government guarantees, the road attracted sufficient American and British capital to open its main line (Niagara Falls-Hamilton-London-Windsor) in Jan 1854. By 1882 it operated about 1280 km of track throughout SW Ontario and 288 km in Michigan.

Under Charles John Brydges's aggressive management, the road enjoyed initial financial success, but following the depression of 1857 it reaped the fruits of careless construction, rapid expansion, increased local competition and protracted internal managerial conflict. While the railway helped to stimulate and integrate the local economy, it also relied for 40-60% of its gross revenue on through American traffic between New York and Michigan states. As American competitors consolidated lines, through rates fell and the Great Western and its chief local rival, the GRAND TRUNK RAILWAY, suffered. In 1882, after decades of disastrous competition, the 2 railways merged forces in order to compete more effectively with rival American railways.

PETER BASKERVILLE

**Grebe**, common name for members of the family Podicipedidae, aquatic BIRDS with almost worldwide distribution. Grebes have pointed bills and very short tails. Adults are black, grey or reddish above, white below. Grebes use their feet and wings to propel themselves under water where all species obtain most of their food. Their legs, lobed toes and nails are flattened for efficient use under water, but because the legs are set far back under the body, movement on land is difficult. Wings are small and flight inefficient; some species found outside Canada are flightless. About 20 species are known, including the recently described hooded grebe (*Podiceps gallardoi*), discovered in 1974 in southern Argentina. Five species occur in Canada: pied-billed,

horned, red-necked, eared and western grebes (*Podilymbus podiceps*, *Podiceps auritus*, *Podiceps grise-gena*, *P. podiceps nigricollis* and *Aechmophorus occidentalis*, respectively). Grebes spend most of their lives in the water and build nests with aquatic vegetation. These nests float, anchored to emergent water plants, or are built up from the bottom of a pond or lake. They are usually surrounded by water plants protecting them from waves and predators. Some species nest in large colonies; others are solitary, nesting as isolated pairs. Courtship behaviour involves complex vocal and visual displays. In Canada clutches contain 3-7 eggs (range 1-10). Parents take turns incubating. Both adults care for young, which leave the nest sometimes within minutes of hatching. Hatchlings ride on their parents' backs; after 1 or 2 weeks chicks swim by themselves. Canadian grebes range in size from the 287 g eared grebe to the 1.5 kg western grebe. Larger grebes eat mostly fish; smaller ones generally eat insects, crustaceans, snails and small fish. In Canada they nest from NS and PEI to central BC, and N along the TREELINE to the YT and western NWT. Grebes migrate at night, wintering in salt water along both coasts of N America and also in fresh water in the US. Grebes are thought to be most closely related to LOONS

SPENCER SEALY

Five species of grebe occur in Canada, including the eared grebe (*P. podiceps nigricollis*), nesting as far north as the treeline in the YT and western NWT (photo by Tim Fitzharris).

**Greeks** Greek immigration to Canada began early in the 19th century. Greeks from the islands (eg. Crete, Syros and Skopelos) and from the Peloponnese, especially the poor villages of the provinces of Arcadia and Laconia, settled in Montréal as early as 1843. However, in 1871 only 39 persons of Greek origin were known to be living in Canada. Greek immigration, sporadic prior to 1900, increased considerably in the early 20th century as a result of poverty, wars and political upheavals at home. By 1981 there were over 250 000 people of Greek origin in Canada.

**Migration and Settlement** In 1901, 213 Greek immigrants resided throughout Canada; in 1911 the number was 2640; in 1931, 5580 and in 1941, 5871. Immigration was halted during WWII, but from 1946 to 1981 about 116 300 Greek immigrants entered Canada. By 1981, 80% of Greek Canadians lived in the cities of Montréal, Toronto and Vancouver, many in patterns of residential clustering.

**Economic Life** Generally the pre-WWII immigrants had little formal education, yet some of them are now among the wealthiest members of the Greek community, in which they are very active. The Canadian-born Greeks tend to in-

clude many professionals and entrepreneurs. Immigrant entrepreneurs (post-WWII) are actively involved in the restaurant business, the fur business, fruit and grocery wholesale and retail firms, theatres, etc. The majority of postwar immigrants, however, have been skilled and unskilled workers who worked in various industries.

**Social and Cultural Life** Since the early 1900s Greek Canadians have organized themselves into ethnic communities centered on the Greek ORTHODOX CHURCH and various ethnic associations. The establishment of the first Greek churches in Montréal (1906) and in Toronto (1909) signified the beginning of Greek ethnoreligious communities in Canada. Approximately 95% of Greek Canadians belong to the Greek Orthodox Church, headquartered in Toronto. The church has contributed significantly to the preservation of Greek identity through the use of the Greek language in religious services and through its devotion to Greek ideals. The leader is the Metropolitan Bishop of Canada, through whom the church is associated with the Greek Orthodox diocese of N and S America. Greek organizations include the American Hellenic Educational and Progressive Association (AHEPA) introduced into Canada in 1928, the Greek Orthodox Youth of America, and many regional philanthropic and social societies which were established to help newcomers and the regions from which they emigrated, and to promote understanding of Greek culture.

Several Greek Canadian newspapers, eg. *Hellenikon vema* (*Hellenic Tribune*), have helped Greeks integrate into Canadian life while keeping them informed of events in Greece. Customs and traditions include celebrations of Greek national holidays (particularly March 25, Greek Independence Day), religious festivities and holidays, as well as annual dances and picnics.

**Group Maintenance** The Greek family plays an important role in teaching children the Greek language and values, and providing them with some sense of identity with Greek culture. Overall, Greek immigrants are not highly integrated into Canadian society, because of low academic attainment in the homeland, short length of residence in Canada, and unfavourable employment conditions for many new immigrants in the early years. This situation is likely to change, however, as the second and third generations of Greek Canadians take their place in Canadian society.

PETER D. CHIMBOS

**Green, Blankstein, Russell** (GBR) Prominent architectural firm in Winnipeg, founded 1932 by J. Green (1899-1969) and C.M. Blankstein (b 1908), who were joined 1934 by G.L. Russell (1901-77) and R.C. Ham (d 1940). All were graduates of the School (later Faculty) of Architecture at University of Manitoba. In the 1930s the firm's most notable work was a series of housing proposals for the city of Winnipeg that eventually bore fruit with the design of Wildwood Park 1946. Based on the plan of Radburn, NJ, it was the first residential garden suburb on the Prairies. The 1950s saw GBR do buildings at U of Manitoba, the Winnipeg Post Office, Norquay office building, and Polo Park Shopping Centre. In the next decade it won competitions for Winnipeg's city hall and international airport. Throughout 3 decades GBR helped bring modernist architecture to Manitoba.

WILLIAM PAUL THOMPSON

**Green, Howard Charles**, lawyer, politician (b at Kaslo, BC 5 Nov 1895). Appointed minister of public works in the first DIEFENBAKER government, Green assumed the Dept of External Affairs portfolio in 1959 after Sidney SMITH's

sudden death. Green was a strong supporter of the COMMONWEALTH, a position he shared with his prime minister. During his tenure in external affairs, Green was an advocate of nuclear disarmament and sponsored UN resolutions that furthered that goal. He took an active role for Canada in various international discussions that contributed to a higher profile internationally. First elected to the House in 1935, Green served until his defeat in the 1963 general election.

PATRICIA WILLIAMS

**Green Fishery**, the cod fishery carried out in Newfoundland and Labrador in which the product is preserved in salt on board the fishing ship to be dried later. The green fishery was undertaken by fishermen on fishing grounds too far from suitable or convenient land sites where the fish could be dried. It required the use of much more salt than did the DRY FISHERY, but it had the advantages of less handling time during the fishing season and less dependence on variable curing weather near the fishing grounds. The green fishery made ships less dependent on shore facilities and therefore was not tied to one geographical area (see FISHERIES HISTORY).

ROBERT D. PITT

**Green Paper**, a statement by the government, not of policy already determined, but of propositions put before the whole nation for discussion. Like a WHITE PAPER it is an official document sponsored by the Crown. It is produced early in the policymaking process, while ministerial proposals are still being formulated. Many so-called White Papers in Canada have been, in effect, Green Papers, while at least one Green Paper — that on immigration and population in 1975 — was released for public debate after the government had already drafted legislation.

C.E.S. FRANKS

**Greene, Daniel Joseph**, lawyer, politician (b at St John's 1850; d there 12 Dec 1911). He became prime minister of Newfoundland 13 Dec 1894 in the wake of the legal and political turmoil surrounding the 1893 elections. Educated in law at Laval, he began his 22-year political career in 1875, became leader of the Opposition in 1887 and in 1890 was part of a delegation to Ottawa protesting French fishing rights in Newfoundland (see FRENCH SHORE). Greene's most pressing problems upon succeeding Augustus GOODRIDGE's brief Conservative administration were the consequences of the collapse of 2 major Newfoundland financial institutions on Dec 10, but the most significant legislation passed during his 58-day tenure was the Disabilities Removal Act. This allowed candidates who had been disqualified because of election irregularities in 1893 to seek election again. This Act, and Greene's resignation on 8 Feb 1895, allowed William WHITEWAY to resume the prime ministership.

ROBERT D. PITT

**Greene, Lorne Hyman** entertainer (b at Ottawa 12 Feb 1915). While taking chemical engineering at Queen's, he became involved in amateur theatrics and after graduation spent 2 years in New York studying drama. Settling in Toronto, he became active in radio, eventually as chief news broadcaster for the CBC 1939-42. Following service in WWII, he returned to radio in Toronto, was co-founder of the Jupiter Theatre there and established and taught at the Academy of Radio Arts. In 1953, like many of his talented contemporaries, he headed south and for 5 years appeared in Broadway plays. Then for 14 years, beginning in 1959, he was Ben Cartwright on the highly successful TV series "Bonanza." Thereafter, he continued to appear on television, including stints in several other series. In the 1980s his energy has mainly been directed at wildlife and environment preservation, notably through his television series "Lorne Greene's New Wilderness."

CHARLES DOUGALL

**Greene, Nancy**, alpine skier (b at Ottawa 11 May 1943). Raised in Rossland, BC, she only began serious racing at age 14. Outstanding ability led to her selection to the 1960 Olympic team after only 2 years of racing. Finishing twenty-second in the Olympic giant slalom, she became determined to match her roommate Anne HEGGTVEIT's victory. During the early 1960s she had several major US and European victories, but was inconsistent. Her aggressive style caused several injuries, including torn ligaments in the 1966 world championships. Resolving to try for more control she achieved remarkable results, concluding the 1967 season with 3 straight victories to win the World Cup. In 1968 she continued her domination of the sport, winning an Olympic gold medal in the giant slalom, a silver in the slalom, and 9 straight victories to clinch her second World Cup. She was Canada's Athlete of the Year in 1968.

MURRAY SHAW

Nancy Greene dominated World Cup skiing in 1967 and 1968, culminating in Olympic gold and silver medals and 9 straight victories to clinch her second World Cup in 1968 (courtesy Canada's Sports Hall of Fame).

**Greenfield, Herbert**, farmer, politician, businessman, premier of Alberta 1921-25 (b at Winchester, Eng 25 Nov 1867; d at Calgary 23 Aug 1949). Greenfield migrated to Canada in 1892 and established a homestead N of Edmonton in 1906. By 1921 he was president of the Alberta Assn of Municipal Districts and an interim VP of the UNITED FARMERS OF ALBERTA. Though not initially a candidate when the UFA entered the 1921 provincial election campaign, he was asked to accept the position of premier after it was refused by Henry Wise WOOD. Sworn in as premier, provincial secretary and provincial treasurer on 13 Aug 1921, Greenfield led the novice UFA government in its response to drought and credit problems of Alberta farmers and its assistance in establishing a voluntary wheat pool and other commodity marketing pools. Often ill and absent during 1923, and increasingly regarded as ineffective thereafter (although he maintained his personal popularity), Greenfield resigned on 23 Nov 1925 in favour of John Edward BROWNLEE.

CARL BETKE

**Greenhouse Crops** The cultivation of greenhouse crops is the most intensive form of agricultural production. Investment and labour costs are greater in this sector than in any other; however, the yield and value of crops are correspondingly high. The greenhouse essentially provides a controlled climate which, in adverse conditions, may be adapted to the needs of particular crops. For example, in northern countries such as Canada, where outdoor cultivation

is possible for only about 5 months of the year, greenhouses provide a temperature-controlled environment which also shelters plants from heavy rain, strong winds, insects and other pests. Although greenhouses are used by amateur gardeners and by training and research institutions, highly specialized growers of ORNAMENTAL plants and MARKET-GARDEN produce form the most important group in Canada's greenhouse-crop industry. The overall objective of this industry is to provide Canadian consumers with fresh produce for as much of the year as possible.

The major producers of greenhouse crops are located in Ontario, Québec and BC, which had 2 500 088 m<sup>2</sup>, 458 176 m<sup>2</sup> and 436 182 m<sup>2</sup>, respectively, of greenhouse space in 1983. About 60% of the Canadian greenhouse industry is located in Ontario, the largest production centre being Leamington, Essex County; Kent County is also very important. Both regions are at the most southerly point of Canada and have favourable climates. In other provinces, the major production areas are located near large cities (eg, Montréal, Vancouver). Although over 60% of the total greenhouse area in Canada is devoted to market produce (tomatoes, cucumbers, etc), the market value of greenhouse-grown ornamentals is generally 4 or 5 times greater, and was worth over \$226 million in 1983. Tomatoes represent over half of vegetable sales; cucumbers, over 40%. The major species of greenhouse-grown FLOWERS are ROSES and CHRYSANTHEMUMS; green-leaved tropical plants are also popular. The major challenge for the greenhouse sector in future is to maintain industry profits by reducing energy costs and increasing production. A great deal of engineering and horticultural research is devoted to ensuring the survival of one of the most important sectors of Canada's horticulture system.

MARC J. TRUDEL

**Greenpeace**, originated in Vancouver (1970) as a small group opposed to nuclear testing in the Pacific, and has blossomed into one of the largest and best-known environmental organizations in the world, addressing itself to a wide range of international and local issues. Through nonviolent confrontation it attempts to draw attention to violations of ecological principles, such as the equal rights of all species to exist and flourish. No longer based in Canada, Greenpeace maintains relatively autonomous offices throughout the world, co-ordinated by the Greenpeace Council in Amsterdam. Total membership is difficult to estimate as it fluctuates according to interest in current issues, but over \$2 million is raised yearly in N America alone through membership fees, donations and the sale of promotional items.

In the hope that public pressure will help change policies, Greenpeace aims for maximum publicity for its activities. In its most publicized campaigns, against nuclear testing and SEALING and WHALING policies, the environmentalists have intervened directly and exposed themselves to risk. The success of such tactics is difficult to measure, but certainly Greenpeace has brought various issues to public attention. The public's response to Greenpeace has varied widely from apparently almost unanimous support of antinuclear testing campaigns to very strong opposition to some of the tactics the group employs, often on more local issues.

P. DEARDEN

Reading: R. Hunter, *Warriors of the Rainbow* (1979).

**Greenstone**, general term for dark green, compact metamorphic rocks formed by the alteration of dark-coloured IGNEOUS ROCKS. Basalt, a common example, is a major component of the greenstone belts of the Canadian SHIELD. These belts contain the Shield's principal gold and base-metal mines. The term greenstone is also used for green ornamental materials used for

sculpture and gems, such as nephrite jade, serpentine, fuchsite (a chrome-mica rock) and chlorastrolite (a tortoiseshell-like GEMSTONE composed of pumpellyite needles). See INUIT ART.

ANN P. SABINA

**Greenway, Thomas**, merchant, farmer, land speculator, politician, premier of Manitoba (b at Kilhampton, Eng 25 Mar 1838; d at Ottawa 30 Oct 1908). Instrumental in the formation of the Liberal Party of Manitoba, Greenway was its first leader and premier of Manitoba 1888-1900. In 1844 the Greenways immigrated to Huron County, Canada W. Thomas eventually became an independent supporter of Sir John A. MACDONALD's Liberal-Conservative Party and MP for South Huron, 1875-78. However, he broke with Macdonald on the NATIONAL POLICY tariff and became a Liberal. In 1879 he moved to Manitoba and was elected MLA that year; by 1882 he led a provincial rights opposition which became the Liberal Party. As premier he ended federal disallowance of Manitoba railway legislation and the CPR monopoly, bringing the Northern Pacific into the province to induce competition in freight rates. He is remembered, however, for the elimination of minority educational rights for Roman Catholics; the MANITOBA SCHOOLS QUESTION dominated provincial and federal politics during his years as premier. He remained leader of the provincial Liberals until his election as MP for Lisgar in 1904.

DAVID HALL

**Greenwich, Sonny**, né Herbert Lawrence Greenidge, guitarist (b at Hamilton, Ont 1 Jan 1936). This most intriguing of Canada's jazzmen has divided his life between musical and spiritual pursuits, thus turning away from a potentially major career. Emulating jazz saxophonists, he developed a highly personal music and original guitar style, which left him working largely in isolation. He has performed only sporadically, beginning c1958 with small ensembles in Toronto and Montréal and reaching a wider audience through brief liaisons with other musicians (eg, John Handy, 1966-67) and through his 1970s recordings, *The Old Man and the Child*, *Sun Song* and *Evol-ution, Love's Reverse*.

MARK MILLER

Reading: Mark Miller, *Jazz in Canada: Fourteen Lives* (1982).

**Grenfell, Sir Wilfred Thomason**, medical missionary (b at Parkgate, Eng 28 Feb 1865; d at Charlotte, Vt 9 Oct 1940). Grenfell entered the London Medical School in 1883 and 2 years later was converted to active Christianity at a tent meeting of American evangelist Dwight L. Moody. In 1888 he followed the suggestion of one of his teachers, Sir Frederick Treves, that he join the National Mission for Deep-Sea Fishermen. He was made superintendent in 1889 and for 3 months in 1892, at the mission's request, cruised the Newfoundland and Labrador coast where 30 000 stationers, 3300 "livvies" (permanent settlers) and 1700 Inuit received only an annual visit from one government doctor. Grenfell treated 900 patients and saw a great opportunity for medical and missionary work. He raised funds to open the first hospital at Battle Harbour in 1893. Grenfell was a forceful speaker and easily gained the friendship of influential men. His medical mission grew rapidly with hospital, orphanage and nursing stations and the first co-operatives in Newfoundland. Grenfell did not winter in the North until 1899 and spent comparatively few winters there, establishing his headquarters at ST ANTHONY, Nfld. A prolific writer and forceful publicist, he often used artistic licence in accounts of life on the northern coasts. His main financial support came from the US. In 1909 he married a Chicago heiress, Anne MacClanahan, who took him away from life on the coast. Growing fric-

Wilfred T. Grenfell opened the first hospital at Battle Harbour (1893), and with funds raised around the world he built further hospitals, an orphanage and nursing stations to serve the people of the Newfoundland and Labrador coasts (courtesy Public Archives of Canada/C-68717).

tion with the mission eventually led to a split, and the International Grenfell Assn was incorporated in 1912. The practical medical work of the IGA was carried on by dedicated if autocratic doctors, while Grenfell himself became increasingly involved in fund raising. He was made CMG in 1906 and KCMG in 1927, the year in which he retired to Vermont. Famous in his lifetime, he is now largely forgotten; his papers are in the Yale medical history library.

TERENCE MACARTNEY-FILGATE

**Gretzky, Wayne**, hockey player (b at Brantford, Ont 26 Jan 1961). He was a hockey prodigy who, with his father's guidance, mastered the skills of the sport on a backyard rink. He played junior hockey for Sault Ste Marie Greyhounds and in 1978 turned professional with WHL Indianapolis Racers and EDMONTON OILERS. At age 17 he was the youngest athlete playing a major-league sport in N America. He tied for the scoring lead in Edmonton's first season in the NHL (1979-80), won the HART TROPHY as the league's "most valuable player" and the LADY BYNG TROPHY, and began an assault on scoring records that is likely unprecedented in any sport. In his second NHL season (1980-81) he scored 164 points, breaking Phil ESPOSITO's single season record of 152 points and surpassing Bobby ORR's assist record of 102 with 109. The following year he

Captain Wayne Gretzky holds aloft the Edmonton Oilers' first Stanley Cup, 1984 (photo by Mike Pinder/*Edmonton Journal*).

scored 212 points, including 92 goals — shattering Esposito's previous record of 76 goals. He has won the Hart Trophy in all 5 of his NHL seasons, the ART ROSS TROPHY 4 times, and at the end of the 1983-84 season he held 34 individual records, including a consecutive-game point streak of 51 games (1983-84). After only 5 NHL seasons, Gretzky's 356 goals, 558 assists and 914 points placed him 21st among the all-time career point leaders and 5th among active players.

Gretzky is an agile skater, accurate shooter and undoubtedly the greatest passer in hockey history. But it is his instinctive grasp of the flow of play — his sense of how opposing players and teammates will react to each situation — that makes him such a creative player. His personal charm as well as his scoring feats have endeared him to the N American sporting public.

JAMES MARSH

**Grey, Albert Henry George Grey, 4th Earl**, governor general of Canada, 1904-1911 (b at St James's Palace, London, Eng 28 Nov 1851; d at Howick, Eng 29 Aug 1917). A keen imperialist Grey saw his appointment as governor general as an opportunity to forge stronger links of empire. In public speeches in Canada he tried to foster imperial pride and in private he urged PM Wilfrid LAURIER to respond favourably to proposals for closer defence ties. He devoted much of his time to Canadian-American relations, working closely with the British ambassador to the US and acting as mediator when Britain and the US seemed to misunderstand Canada's position. Despite vigorous effort, he was unable to achieve the entry of Newfoundland into the Canadian federation. Perhaps best remembered as the donor of the GREY CUP for football supremacy, Grey himself was more interested in the music and drama festivals he inaugurated. It was fortunate for Canada and Britain that in this difficult transition period in imperial relations a governor general of Grey's energy and charm was associated with a prime minister of Laurier's strength and patience. M.E. HALLETT

**Grey Cup**, trophy produced by Birks Jewellers that has been part of Canadian sports since 1909, when it was donated by Governor General Lord GREY for the Canadian FOOTBALL championship. The original conditions stated that the "cup must remain always under purely amateur conditions," although there is good reason to believe that this was at the urging of P.D. Ross of the *Ottawa Journal* rather than Lord Grey. Until 1966, the cup was presented to the Canadian champion by various trustees, including, from 1921, the Canadian Rugby Union (CRU). In 1966, the CRU named the Canadian Football League (CFL) trustee. In the early years (1909-24) the university teams were invariably the Grey Cup champions. From 1925 to 1945 the representatives from senior city leagues were supreme, and they continued to contest the cup until the early 1950s, when the professional teams that later comprised the CANADIAN FOOTBALL LEAGUE began to dominate.

In 1948 the Calgary Stampeders and their supporters transformed the Grey Cup game into a week-long carnival of festivities, a national celebration, and the most watched sporting event in Canada. In 1962, hailing the game as an instrument of national unity, Parliament decreed that both major Canadian television networks must make the television transmission of the game available to the other so that all regions could see it.

FRANK COSENTINO

**Grey Nuns**, see CHRISTIAN RELIGIOUS COMMUNITIES.

**Grierson, John**, film producer (b at Deanston, Scot 26 Apr 1898; d at Bath, Eng 19 Feb 1972). Grierson is best known as the father of documentary cinema and the man who created the NATIONAL FILM BOARD of Canada. In 1938, after

some 10 years' involvement in government filmmaking in England, he was invited to Canada to study the Canadian government's use of film. His report led directly to the creation of the NFB in May 1939. Shortly after the outbreak of war, Grierson was appointed government film commissioner in Canada, a post he held until 1945. Under his direction the NFB grew to be a large organization, producing both regular series of theatrical shorts (*Canada Carries On* and *The World in Action*), which were shown monthly in

Canadian and US cinemas, and hundreds of nontheatrical films shown across Canada in a network of industrial, rural and trade-union circuits.

Grierson activated the Canadian film industry almost single-handedly. He had enormous energy, a deep-seated vision of what he wanted to accomplish, an excellent eye for talent and got the best out of the people who worked with him. His belief in the documentary film — a term he coined in a review in 1926 — influenced a generation of filmmakers, and his thinking governed the evolution of the dominant aesthetic of Canadian cinema, strongly rooted in reality. He provided a rationale and a purpose for the NFB that turned it into one of the most creative film organizations in the world.

Grierson left Canada in 1945 to form a film company in New York, but he was implicated in the communist scare that followed the defection of Igor GOUZENKO and this effectively ended his career in N America. In 1947 he was named director of mass communications at UNESCO in Paris. After 3 years he joined Group 3, an unsuccessful experiment in feature filmmaking established in England 1950. Grierson then hosted a popular TV program based in Scotland, "This Wonderful World," for 10 years, and spent the last period of his life travelling and teaching, including lecturing at McGill. PIERS HANDLING

**Griffon**, first ship to sail the Upper Great Lakes, launched at Cayuga Creek, on the Niagara R, 7 Aug 1679. A small barque, armed with 7 cannon, it sailed under the command of LA SALLE to Michilimackinac and Green Bay. Loaded with furs, the *Griffon* was lost on the return voyage, likely in the storms of Lk Michigan. J. MARSH

**Grignon, Claude-Henri**, journalist, critic, novelist, author of radio and TV serials (b at Ste-Adèle, Qué 8 July 1894; d there 3 Apr 1976). Grignon is known primarily for his novel *Un Homme et son pèché* (1933), whose hero, the miserly Séraphin Poudrier, became the central figure in adaptations for radio, TV and 2 films. This original, powerful novel broke with the convention of extolling rural life and won Québec's Prix David (1935). Some 100 000 copies of the book have been printed, and it has been adapted for series on radio and TV. Grignon, who has other publications to his credit, also became well known as a virulent critic, thanks to *Les Pamphlets de Valombre* (1936-43). In 1962 he became a member of the RSC. *Un Homme et son pèché* was translated into English as *The Woman and the Miser* (1978). ANTOINE SIROIS

**Grimsby**, Ont, Town, pop 15 797 (1981c), inc 1876, is situated in the Niagara Peninsula to the E of Hamilton. The first European settlers, primarily LOYALISTS, arrived in the 1780s after the American Revolution. Originally called The Forty, it was named for Grimsby, Eng. Following the clearing of the land for mixed-farming practices, Grimsby grew as an agricultural service centre. In the late 19th century, 2 developments aided its growth. The large-scale expansion of orchards and vineyards in the area resulted in several packing and canning plants and a winery. For a while the town was popular as a lakeside resort, with steamboat services from Toronto. More recently, it has attracted a variety of light industries. Good communications with Hamilton, first by interurban electric railway and later by the QUEEN ELIZABETH WAY, have fostered the growth of a dormitory community. The Manor, a gracious Loyalist residence (1798) is one of Ontario's few remaining 18th-century buildings. H.J. GAYLER

Reading: P. Dechman, ed, *Once Upon a Little Town* (1979).

**Grisdale, Joseph Hiram**, agronomist (b at Ste-Marthe, Qué 18 Feb 1870; d at Iroquois, Ont 24 Aug 1939). Son of a farmer, trained at OAC and

Iowa State Coll, Grisdale joined the staff of the Central Experimental Farm, Ottawa, in 1899, and in 1911 succeeded William SAUNDERS as director. He became deputy minister of agriculture, the first agronomist in this post, in 1918, and was a powerful figure in Ottawa, sitting on the National Research Council and leading the Canadian delegations at the 1926 and 1928 imperial conferences on co-ordinating research. He retired owing to ill health in 1932, was shipwrecked 4 days later on a Bermuda cruise ship, and survived to breed Jersey cattle and apples on his own farm. DONALD J.C. PHILLIPSON

**Grise Fiord**, NWT, UP, pop 106 (1981c), is located on the S coast of ELLESMERE I. Canada's most northerly INUIT community is situated in game-rich country from which the residents derive their living. The settlement is the result of federal government efforts to alleviate poor economic conditions among the Inuit and to establish Canadian sovereignty over the arctic islands. Inuit families from other areas of the North were settled in the area in 1953. Grise Fiord means "Pig Fiord" in Norwegian. Many NWT residents consider the community setting the most beautiful in the North. ANNELIES POOL

Grise Fiord, NWT, Canada's most northerly Inuit settlement, is located on the S coast of Ellesmere I (photo by Karl-Heinz Raach).

**Grit**, a popular reference to a member of the LIBERAL PARTY of Canada. The nickname derives from grit, fine sand or gravel, which is often valued for its abrasive quality, and from an American slang term implying firmness of character, as used in the phrase "true grit." Canadian political usage of the word dates from 1849, when progressive members of the Upper Canada Reform Party were dubbed CLEAR GRITS and characterized as being "all sand and no dirt, clear grit all the way through." Led by George BROWN of the *Globe*, in the early 1870s the progressive members joined with Lower Canada reformers to create the Liberal Party, and the description of the few was applied to the many.

JOHN ROBERT COLOMBO

**Grizzly Bear** (*Ursus arctos horribilis*), large MAMMAL of the order Carnivora. It differs from other N American carnivores in that it eats primarily plant matter. Grizzlies opportunistically kill or scavenge animals, especially ungulates, ground squirrels and insects. They also are attracted to edible garbage. In fall they dig dens and begin a 4-7 month dormant period during which they usually do not eat, urinate or defecate. Courtship and copulation occur mid-May through early July; embryo implantation is delayed until fall. In delayed implantation the fertilized egg develops slowly, while floating in the uterus. Eventually, it becomes attached to the wall of the uterus and development continues normally until birth. Young are born Jan-Feb. Newborns weigh about 0.5 kg, are very immature, and are nursed inside dens for up to 3 months. Litters average 2 young (range 1-4). Females breed about once every 3 years (range 2-5 years). Grizzlies thus have few young and hunting must be carefully regulated to maintain a population. In

Grizzly Bear (*Ursus arctos horribilis*), so called for the grizzled (ie, flecked) hair on its flanks, back and shoulders (photo by Stephen J. Krasemann/DRK Photo).

the wild most die before reaching adulthood and 15-25 years is considered old. Grizzlies have longer front claws and are larger than black bears. Large males may weigh 250-400 kg; large females, 150-200 kg. Grizzlies have a hump on the back and a dish-shaped facial profile. They range from black through brown to blond. Often the ends of hair on the flanks, back and shoulders are grizzled (ie, have white or grey flecks). Mothers may defend their young and males may fight, especially during breeding season. Occasionally, aggression is directed toward humans: in Canada's National Parks, about one visitor in 2 million is injured by a grizzly. Grizzlies may stand on their hind legs when sensing their environment. They typically charge on 4 legs and can run at least 50 km/h. They prefer semi-open habitats; an adult male may have a home range of 1000-1500 km<sup>2</sup>. As human populations have expanded, grizzly bear numbers have declined. They were extirpated from the prairies by about 1900. Today they are found in Alberta (estimated population 800-1200), BC (6000-8000), the NWT (4000-5000), and the YT (5000-9000). Grizzlies were sacred, yet fearsome, animals to most native people. STEPHEN HERRERO

**Gros-Louis, Max**, or Oné-Onti, politician, businessman (b at Huron Village Indian Reserve, Loretteville, Qué 6 Aug 1931). After working as a surveyor's labourer and travelling salesman, he became a producer of pan-Indian handicrafts and manager of a Huron dance troupe. First elected chief of the Huron of Lorette in 1964, he was involved in the Indians of Canada pavilion at Expo 67, in the foundation of the Indians of Quebec Association (secretary and spokesman, 1966-73), and in the National Indian Brotherhood (Québec representative, 1970). As a publicist claiming to speak for Québec Indians, and as a community leader advocating individualist approaches to economic and social problems, he has differed with native and other groups over LAND CLAIMS and relations with non-Indian governments. His autobiography, *First among the Huron*, was published in 1973. BENNETT MCCARDLE

**Gros Morne National Park** (est 1970) covers 2000 km<sup>2</sup> on the W coast of Nfld. The spectacular landscape was created by the grinding action of glaciers on the ancient Long Range Mts. Barren rocky ridges and tundra-like slopes contrast with forested foothills and boggy

coastal plains, where mosses and pitcher plants thrive. The presence of caribou and arctic hare reflect the northern character of the PARK. Pine marten inhabit dense forest areas while moose and snowshoe hare, although not native, are frequently observed. Terns and gulls abound along the coast; ptarmigan typify the bird life of the heathlands and barrens. Pre-European culture in the area dates from 2500 BC when the Maritime Archaic Indians inhabited the area. DORSET and BEOTHUK cultures followed. European contact was established with the arrival of Jacques Cartier in the adjacent Gulf of St Lawrence (1534); however, European settlement did not occur until the late 1800s. The park has facilities for tent and recreational-vehicle camping and for primitive winter camping. In summer, hiking, fishing and cool saltwater swims are popular. Visitors in winter can cross-country ski, snowshoe and snowmobile. LILLIAN STEWART

**Grosbeak**, common name for large members of 2 families, Emberizidae (SPARROW, BUNTING) and Fringillidae (FINCH), with large, deep bills adapted for cracking hard-coated seeds. In Canada, 4 breeding species occur. Another species, blue grosbeak (*Guiraca caerulea*), is a rare straggler to southern Ontario. Rose-breasted grosbeaks (*Pheucticus ludovicianus*) are common in deciduous forests from NS to northern BC. Males have striking plumage: black heads; black and white backs; wings and tails; white underparts; rose red, triangular patch on the breast; and white bill. Females are brown with dark streaks but have the characteristic large, white bill. The black-headed grosbeak (*P. melanocephalus*), occurring in wooded valleys from southern BC to southwestern Saskatchewan and rarely Manitoba, is distinguished by its yellow-brown underparts and brownish collar and rump. These 2 species are similar in size; females of both are easily confused; and males have similar songs. Hybrids have been found where ranges overlap. Evening grosbeaks (*Coccothraustes vespertinus*) are familiar winter birds and readily attracted to feeders with sunflower seeds. Males have lemon yellow bodies; brown crowns, necks and upper backs; black tails and wings with large, white wing patches; and large, greenish yellow bills. Plumage of females is duller. Their summer distribution is incompletely known; they are known to occur from BC across the coniferous forests to the Maritimes (recent arrivals). Pine grosbeak (*Pinicola enucleator*), the largest grosbeak in Canada, breeds across northern Canada from YT to NB, and S along the Rocky Mts in BC and Alberta. Males are predominantly pinkish red, with 2 white bars on grey wings. Females and immatures are grey, with wings similar to

males, and head and rump tinged with yellow. They prefer pine and spruce trees, extracting seeds from cones. In fall and winter they also feed on fruit and berry seeds. Their call notes of usually 3 tuneful whistles are extended to form a song.

RICHARD W. KNAFTON

**Gross National Product (GNP)** refers to the money value of all goods and services produced in a nation during a stated period of time, usually a year. Despite its limitations GNP is the best overall measure of economic performance; it is often used to calculate changes in the welfare of a country's residents. Its principal components are wages, salaries and supplementary labour income; military pay and allowances; corporation profits before taxes (minus dividends paid to nonresidents); interest and investment income (except for interest on consumer loans and government income from crown corporations); net income (pretax profits) of farm operators; net income from businesses and of professionals, eg, doctors; and rental income; and an adjustment for changes in the value of inventories because of price changes. Together these items comprise net NATIONAL INCOME at factor costs, or the earnings of various factors of production. GNP is measured by including as well indirect taxes less subsidies, eg, manufacturers' sales taxes, business property taxes and other taxes levied on businesses but paid by (or "shifted to") consumers; capital-cost allowances and miscellaneous adjustments for depreciation of business assets; and a residual error of estimate, a small statistical balancing of figures. Another measure, that of gross national expenditure (total level of demand in the economy for goods and services), reveals how GNP is consumed through consumer spending, investment and government spending. Gross domestic product (GDP) differs from GNP in that it is a measure of the value of production of goods and services in the economy resulting from the factors of production whether of Canadians or nonresidents; by contrast, GNP includes the value of goods and services produced by Canadians both at home and abroad, but excludes the returns to nonresidents on capital they have invested in Canada. In Canada interests and dividends paid to nonresidents exceeds that received from nonresidents. (See graphs below and p 777).

**Grosse Île**, or Quarantine I, 1.9 km<sup>2</sup>, 2.9 m long by 1 km wide, 46 km downstream from Québec City in the ST LAWRENCE R estuary. The island is a wooded Appalachian ridge sculpted by coves and capes. In 1646 the Île de Grâce was ceded to Gov Charles Huault de Montmagny. Usage transformed the name from Grace I to Grosse Île.

### Canada's Gross National Product, Quarter-to-Quarter Change

(All Data Seasonally Adjusted)

Source: Infomat, Statistics Canada.

# Gross Domestic Product at Factor Cost by Industry, 1980, 1981 and 1982

GDP differs from GNP in that it includes returns to nonresidents on capital invested in Canada.

In 1832 the deserted island became a quarantine station where 51 146 IRISH and ENGLISH immigrants were examined (of the total of 61 800 received in Canada). In 1833 the station received 21 732 immigrants; in 1834, 30 945. Some died of cholera. In 1847 the Irish famine sparked emigration despite a typhus EPIDEMIC. Irish immigrants endured 6-12 weeks of inhuman conditions in 221 ships to reach Canada — 8000 were buried at sea. At the Grosse Île quarantine station medical superintendent Dr George Mellis Douglas and his team removed some 4500 corpses from the ships and examined 68 106 immigrants, of whom 5424 died. Ships had to be sent to Pointe Saint-Charles, Montréal, where 6000 Irish immigrants died and are buried. Several doctors, priests and nuns died, and many orphans were adopted by French Canadian families. In 1937 the station was closed. Since secret bacteriological research began there in 1947 access to the island has been forbidden.

SERGE OCCHIETTI

**Grossman, Daniel Williams**, dancer, choreographer (b at San Francisco, Calif 13 Sept 1942). A compelling performer of contemporary dance, Grossman was a member of the renowned Paul Taylor Dance Co 1963-73, after which he joined TORONTO DANCE THEATRE. In 1975 he formed the DANNY GROSSMAN DANCE CO as a vehicle for his own compositions. Grossman's works are remarkable for their inventive exploration of grotesque but appealing movement

and for their humour, compassion and sometimes alarming virtuosity. He won the Jean A. Chalmers Award for choreography in 1978, and he and his company have earned an enviable international reputation.

PENELOPE DOOB

**Groulx, Gilles**, film director (b at Montréal 30 Aug 1931). In 1956 he joined the NFB as a film editor and co-directed with Michel BRAULT the celebrated documentary *Les Raquetteurs* (1958). After directing numerous documentaries, he turned to feature films and produced the now classic *Le Chat dans le sac* (1964). He pursued his interest in cinema, politics and aesthetics with energy, directing 3 feature films in the next 3 years. *24 heures ou plus* (1972) was deemed too politically controversial and was suppressed for 5 years. Groulx left the NFB during that period but returned in 1977. In 1980 he began production of *Au pays de Zom* but because he was in a serious automobile accident it was not completed until 1983.

PIERRE VÉRONNEAU

**Groulx, Lionel-Adolphe**, historian, priest, nationalist spokesman (b at Vaudreuil, Qué 13 Jan 1878; d there 23 May 1967). Commemorated by Claude RYAN as the spiritual father of modern Québec, Groulx was French Canada's foremost historian until the 1960s and, after Henri BOURASSA, Québec's most prominent nationalist spokesman. Through his teaching and writing, his sermons and his direction of nationalist organizations, Groulx was a controversial figure, inspiring thousands of young people with a pride in French Canada's past and a confidence in Québec's future.

Born of rural parentage, Groulx had rudimentary village schooling and then classical college training in the seminary in Ste-Thérèse. The intense religious atmosphere of his upbringing and school life led him towards the priesthood and teaching. As a student and then ordained priest he taught literature and history at the college in Valleyfield from 1900 until 1915 with a 3-year interruption for graduate theological and linguistic study in Europe 1906-09. During his early teaching days, Groulx developed his 2 lifelong passions: a commitment to young people and to the study of history. He initiated the Association catholique de la jeunesse canadienne-française, a province-wide student body, inspiring its members to develop high religious and social ideals and to put them into practice throughout their lives. Groulx gleaned illustrations for the students from the past as he trained himself to be an historian. The effort entailed creating a course and a text in Canadian history virtually from scratch. He developed François-Xavier GARNEAU's view of the CONQUEST as a disaster and his idea of history as a struggle by examining the post-Conquest period (see HISTORIOGRAPHY). The novelty of that approach is hard to imagine because Groulx was so successful in undermining the common assumption that the British presence in Québec was beneficial and that French Canadian subordination was natural. In 1915 Groulx was appointed to the first chair in Canadian history at U de M, a position he held until 1949.

Groulx saw politics through the eyes of Henri BOURASSA, embittered and unhappy over the ONTARIO SCHOOLS QUESTION and Canada's participation in WWI. With friends in the Ligue des droits du français he worried over the diminishing stature of the French language in the burgeoning world of commerce and industry. His history lectures, published annually 1916-21, continued their assault on the unknown and the commonplace. During 1917, the year of CONSCRIPTION, Groulx's history lessons threw a dash of cold water on Confederation itself. From 1920 to 1928 he edited a monthly journal ACTION FRANÇAISE and animated a nationalist organization of the same name. In the journal Groulx

Lionel-Adolphe Groulx, who urged French Canadians to draw their inspiration from their religion and their past (courtesy Public Archives of Canada/C-16657).

kept posing the worrisome question of French and Catholic survival in an urban, industrial, Anglo-Saxon environment, and he toyed with the idea of an autonomous state for French Canada. He carefully avoided the word SEPARATISM and denied all his life any advocacy of it. But still the thought was there if only as an ideal. Perhaps French Canadians *could* organize their social, economic and political existence in their own way, drawing their inspiration and their genius from their religion, their past and their French culture.

Groulx maintained that ideal through some of the darkest episodes in modern Québec history. The Depression of the 1930s found him involved with yet another nationalist organization, ACTION NATIONALE, which interpreted the Depression as the result of excess industrialization fostered by American capitalists and abetted by an overly generous provincial government. During WWII Groulx bluntly blamed English-speaking Canadians for the division over conscription. Usually Groulx was more severe with his fellow French Canadians: they must insist on their equal place in Canada. In the 1950s Groulx chastised a new generation for sloughing off their religious heritage. In an increasingly secular society, Groulx emphasized that heritage in his major work *Histoire du Canada français* (1950-51) and in the historical journal he founded in 1947 and edited for 20 years: *Revue d'histoire de l'Amérique française*. What he did share with the younger generation was a distaste for Maurice DUPLESSIS and great excitement over the beginnings of the QUIET REVOLUTION. Indeed Groulx cast off his clerical prudence momentarily to vote in the election of 1962 when nationalization of hydro was at stake. Finally, the *petit peuple* were taking part of their destiny into their own hands.

Groulx maintained his ardour to the day he died. Just 2 weeks before, he was discussing history at the Youth Pavilion at Expo 67, and on the very day the last of his more than 30 books was launched, significantly entitled *Constantes de vie*.

SUSAN MANN TROFIMENKOFF

Reading: Lionel Groulx, *Mes mémoires* (1970-74), and Abbé Groulx: *Variations on a Nationalist Theme*, ed Susan Mann Trofimenkoff (1973); Susan Mann Trofimenkoff, *Action française: French Canadian Nationalism in the 1920s* (1975), and *Dream of Nation: A Social and Intellectual History of Québec* (1982).

**Groundhog**, see MARMOT.

**Groundsel**, or ragwort, common names for PLANTS of genus *Senecio*, family Compositae or Asteraceae. The genus, one of the largest plant genera (1000–2000 species), occurs worldwide and is very diverse, including small TREES, shrubs, annual and perennial herbaceous plants and succulents (ie, plants with fleshy tissues for conserving moisture). About 30 species are native to Canada, growing in habitats ranging from ponds to prairie grasslands; from moist woods to mountain tops; and in the Arctic. Exact species numbers are difficult to determine because of the hybridization and complex variation patterns found in some groundsel. Flower heads are mostly yellow, and usually have both ray and disc florets, although the former are lacking in the ubiquitous, introduced weed *S. vulgaris*, common groundsel. The leaves (bracts) below the heads are typically arranged in a single, circular row. The fruit, a small, dry, one-seeded achene, bears a crown of white bristles. Golden ragwort or squawweed (*S. aureus*), found from Manitoba eastwards, was used by native peoples to heal wounds and for birth control. *S. cineraria*, "dusty miller" or "cineraria," is a widely grown ORNAMENTAL; *S. cruentus* is a greenhouse favourite.

**Groundwater**, the WATER filling the pores and fissures of SOILS and ROCKS beneath the land surface. Although not as widely used as RIVER or LAKE water, groundwater is a valuable water source because of its clarity, purity, and consistent, cool temperature, and because it usually provides a reliable, continuous supply, even in dry seasons and DROUGHTS. Groundwater has also played an important role over geologic time in creating some of Canada's best-known resort attractions. For example, groundwater can dissolve soluble rocks and its circulation is responsible for formation of CAVES in limestone terrain (see KARST LANDFORM). Groundwater, heated at depth, often rises to the surface to form hot SPRINGS like those at Banff and Jasper, Alta, and Radium and Fairmont, BC.

*Terre Sauvage (The Northland)* (1913), oil on canvas, by A.Y. JACKSON, one of the founding members of the Group of Seven (courtesy National Gallery of Canada).

**Group of Seven** was founded in 1920 as an organization of self-proclaimed modern artists. The original members — Frank CARMICHAEL, Lawren HARRIS, A.Y. JACKSON, FRANZ JOHNSTON, Arthur LISMER, J.E.H. MACDONALD and F.H. VARLEY — befriended each other in Toronto between 1911 and 1913. All except Harris, who was independently wealthy, made their living as commercial artists, and several of them even worked together in the same shop. Tom THOMSON, another commercial artist, was included in this circle of friends, but since he died in 1917 he never became a member of the Group. He was important to the other artists, however, for he was an avid outdoorsman and awakened their interest in painting the rugged northern Ontario landscape.

The Group were not exclusively landscape painters, and it was only after their first exhibition at the Art Gallery of Toronto in 1920 that they began to identify themselves as a landscape school. They were initially drawn together by a common sense of frustration with the conservative and imitative quality of most Canadian art. Romantic, with mystical leanings, the Group and their spokesmen zealously, and sometimes contentiously, presented themselves as Canada's national school of painters. This provoked the ire of the artistic establishment, which seems to have hated their rhetoric even more than their paintings. Eric Brown, director of the National Gallery of Canada, always stood by them. He began buying their paintings for the gallery's collection several years before the Group was formally established, and in 1924 and 1925 he made sure they were well represented in the Canadian art shows that went to the prestigious Wembley exhibition in England. This enraged many members of the Royal Canadian Academy, who felt that the Group were given an unfair advantage, but British press reports were so favourable that both Brown and the Group felt vindicated.

Like the European *fin de siècle* symbolists and postimpressionists from whom their aesthetic largely derived, the Group rebelled against the constraints of 19th-century naturalism and tried to establish a more equitable and independent relationship between art and nature. They

shifted emphasis away from similitude — the imitation of natural effects — towards the expression of their feelings for their subjects. As they often painted together, both in the bush and in the studio, their paintings developed along somewhat similar lines. The canvases exhibited in their early shows usually have heavy impasto and bright colours, and are boldly summarized with attention drawn to surface patterning. This is as true of the portraits of Harris and Varley as of the landscapes. In 1922 MacDonald began using thinner paint and more stylized designs, and Harris, Carmichael and Varley soon began heading in the same direction. Harris went further than the others, however, and by the mid-1920s he had reduced his paintings to a few simplified and nearly monochromatic forms. Ten years later he became the only member of the Group, and one of the first Canadian artists, to turn to abstraction.

Through self-promotion and through friends at the Arts and Letters Club and the *Canadian Forum*, as well as with the support of the National Gallery, the Group's influence steadily spread during the 1920s. In 1926, after Franz Johnston's resignation, A.J. CASSON was appointed a member. The Group realized they could hardly call themselves a national school of painters as long as they all lived in Toronto, so they invited other artists to join them: in 1930 Edwin Holgate from Montréal and in 1932 L.L. FITZGERALD from Winnipeg were admitted to give the organization a wider geographic base.

Harris and Jackson influenced and encouraged the next generation of Canadian artists, and Lismer, MacDonald and Varley all became distinguished and influential teachers. Disbanded in 1933, the Group had become as entrenched, and in some ways as conservative, as the art establishment it had overthrown. Its influence has therefore been a mixed blessing, and it is not surprising that it was in Montréal, which did not respond to the Group's call, that the next generation of significant Canadian painters emerged. Paintings by members of the Group of Seven can be found in most Canadian public art galleries.

CHRISTOPHER VARLEY

**Groupe de la Place Royale, Le**, integrates dance, voice and music in ways that make it Canada's most consistently innovative modern-dance company. It was formed in Montréal (1966) by Jeanne Renaud with Peter Boneham as assistant artistic editor. Renaud, a French Canadian who had studied in New York with Hanya Holm and Mary Anthony, was noted for very abstract and unemotional choreography. Boneham, originally trained in ballet, served as artistic codirector, dancer, choreographer and teacher for the company. Renaud left the company in 1971 and it came under the joint direction of Boneham and Jean-Pierre Perreault the following year. Boneham has been sole director since 1980. Le Groupe moved to Ottawa in 1977. The company now performs at the NATIONAL ARTS CENTRE and tours across Canada.

CAROL BISHOP

**Grouse** (Tetraoninae), small subfamily (18 species) of chickenlike BIRDS with circumpolar distribution above lat 26° N. It includes PTARMIGANS as well as those birds commonly called grouse. Members of the largest species weigh up to 6360 g; the smallest, 340 g. Of the 10 N American species, 9 occur in Canada (6 grouse, 3 ptarmigans). Grouse species are blue (*Dendragapus obscurus*), spruce (*D. canadensis*), ruffed (*Bonasa umbellus*), sharp-tailed (*Tympanuchus phasianellus*) and sage grouse (*Centrocercus urophasianus*). The greater prairie chicken (*T. cupido*) has virtually disappeared in Canada. Grouse inhabit woodlands, tundra and, in N America, grasslands.

Nine species of grouse occur in Canada, including the ruffed grouse (*Bonasa umbellus*) shown here — the most sought-after game bird (artwork by Claire Tremblay).

Adult plumages are cryptic patterns of brown, grey and black with paler or white underparts. There are many plumage modifications associated with displays, eg. pointed or curved tail feathers, elongate neck feathers, neck ruffs and pointed primaries. All species have completely or partially feathered legs; when toes are not feathered, they grow 2 rows of narrow scales, like the teeth of a comb, as "snowshoes." Nostrils are covered by feathers. In breeding season, males give elaborate displays alone or in groups (leks) involving strutting, whirring of wings and sometimes vocal accompaniment. Some have red or yellow erectile combs above the eyes, and colourful neck patches of bare skin which are made prominent by the inflated esophagus. As a group, grouse are important GAME BIRDS attracting over 10 million hunters annually. Ruffed grouse are the most sought after species.

S.D. MACDONALD

**Grove, Frederick Philip**, author, teacher, translator (b Felix Paul Berthold Friedrich Greve at Randomno, E Prussia, 2 Feb 1879; d at Simcoe, Ont 19 Aug 1948). Grove was raised in Hamburg, attended university at Bonn and Munich, but left to become a poet, associated briefly with Stefan George and the neoimpressionists. The volume of poems *Wanderungen* (1902) was his first book. He made a precarious living translating English and French authors into German, was in debt and briefly in prison. He left Germany in 1909 and under his new name in 1913 began a new life as a schoolteacher in Manitoba.

Encouraged by the publication of *Over Prairie Trails* (1922) and *Turn of the Year* (1923), Grove gave up teaching after 1923 and devoted his life to writing, publishing one volume of essays, one volume of short stories (posthumously), a satire, 7 novels and a fictionalized autobiography. *In Search of Myself* (1946), which won a Gov Gen's Award. *Settlers of the Marsh* (1925), a harsh yet romantic story of a settler's ambition betrayed by sexuality, is said to have introduced realism to Canadian fiction. With *Our Daily Bread* (1928), *The Yoke of Life* (1930) and *Fruits of the Earth* (1933), it records the high ambitions, personal failures and belated self-knowledge of its aloof and strongly individual protagonist. Something of a dandy in his youth, the later, austere Grove is reflected in these uncompromising pioneers. *A Search for America* (1927) is Grove's most successful book. Failure, and a kind of triumph, inform the 3 late works: *The Master of the Mill*

(1944), *In Search of Myself* and *Consider Her Ways* (1947). *The Master of the Mill* is the first Canadian novel to explore the social effects of monopoly capitalism. Its protagonist, like the narrator of the autobiography, tries to account for his own, and mankind's, failure to realize his potential greatness.

Neglected in his lifetime, Grove has been studied in 6 books and numerous articles and theses. Desmond Pacey's *Frederick Philip Grove* (1945) was the first, but Pacey mistakenly accepted the autobiography as fact. D.O. Spettigue's *F.P.G.: The European Years* (1973) brought the German and Canadian careers together. Margaret Stobie's *Frederick Philip Grove* (1972) examined his life and work in Canada. The principal German works are becoming available in translation. Unpublished novels, essays and poems, mostly in the Grove collection at U Man, are being published. The *Letters* were edited by Desmond Pacey (1976).

D.O. SPETTIGUE

**Groves, Abraham**, physician (b at Peterborough, Canada W, 8 Sept 1847; d at Fergus, Ont 12 May 1935). After graduating from the Toronto School of Medicine in 1871, Groves practised in Fergus for 60 years. He performed the first successful appendectomy in N America (10 May 1883) and was as skillful in a farm kitchen as in a hospital operating room — sterilizing his in-

struments before it became standard practice. In 1902 he established the Fergus Royal Alexandra Hospital, later renamed the Groves Memorial Hospital, and in 1934 his *All in the Day's Work: Leaves from a Doctor's Case-Book* was published.

J.T.H. CONNOR

**Guarantee Act**, 1849, conceived by Francis HINCKS and carried in the Legislative Assembly of the PROVINCE OF CANADA, established the principle of government assistance to railways. Under the terms of the Act, any railway more than 75 mi (120 km) long was eligible for a government guarantee on the interest of half its bonds as soon as half the line had been completed. Several railways received assistance under this Act, most notably the GREAT WESTERN, the ST LAWRENCE AND ATLANTIC, and the Ontario, Simcoe and Huron. Indeed, with the incentive of the Guarantee Act, as well as with the aid provided by the 1852 Municipal Loan Act, railway building became a mania in the Canadas, the amount of track increasing from 106 km in 1850 to more than 3200 km in 1860. The darker side of this policy was the economic recklessness that government assistance encouraged: by 1860 railways in the Canadas were suffering severe financial problems, and many municipalities had so overextended themselves that they were having difficulty meeting their obligations to the MUNICIPAL LOAN FUND.

CURTIS FAHEY

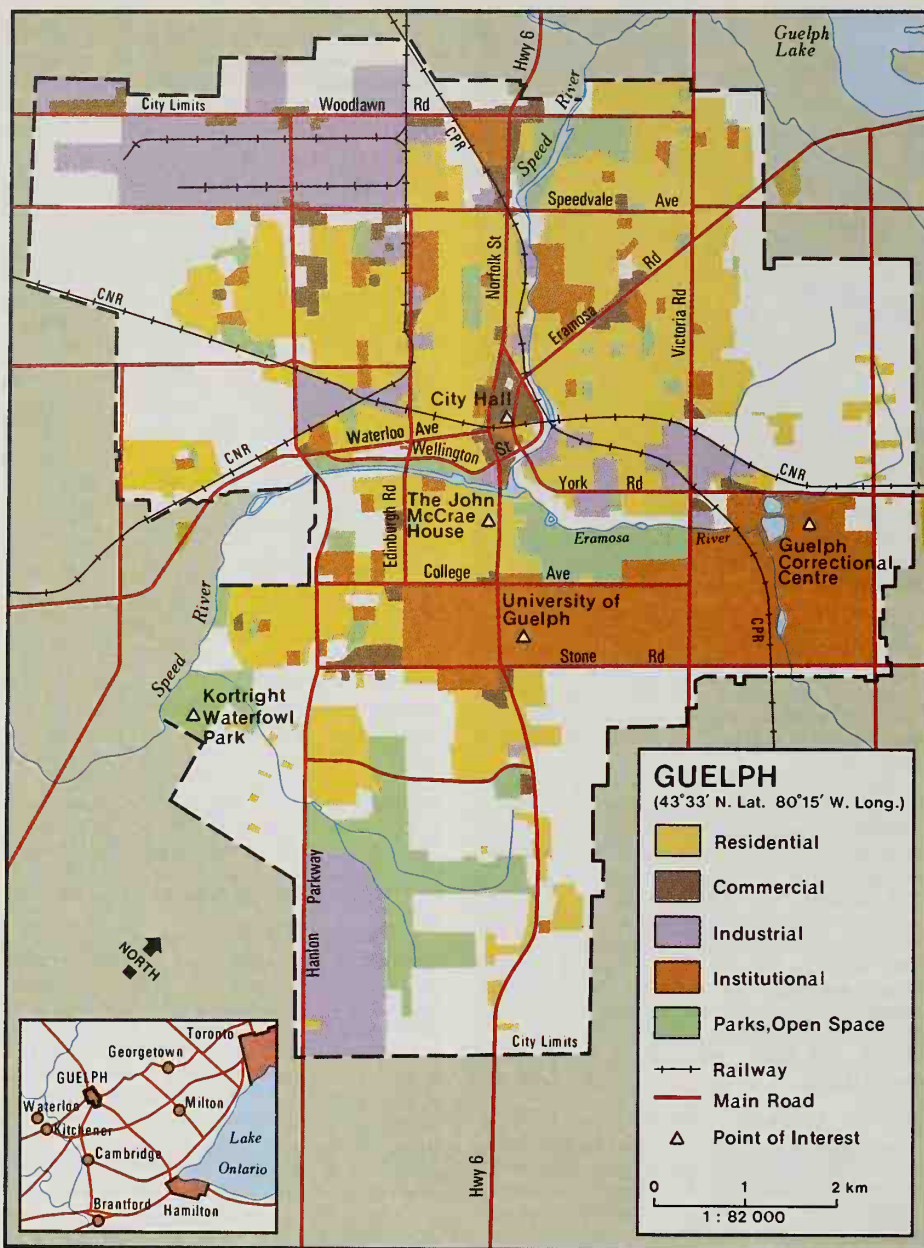

**Guelph**, Ont, City, 71 207 (1981c), inc 1851 as a village, 1856 as a town and 1879 as a city. The seat of Wellington County, it is located on the Speed R in S-central Ontario, 96 km W of Toronto and 28 km E of Kitchener-Waterloo. It has a land area of 68 km<sup>2</sup> and an elevation of 300-360 m above sea level. This industrial and educational centre is set in the heart of an attractive and highly productive agricultural region.

**Settlement and Development** Guelph was founded as a planned town in 1827 by John GALT, a Scottish novelist, who was superintendent of the CANADA COMPANY, a land company based in London, England. Galt effectively used the concept of planning towns in advance of general settlement in order to stimulate sales of agricultural land. To this end he laid out an imaginative town plan, with streets radiating from a focal point, based on American precedents such as Buffalo. The original design is still discernible in the present business core. Galt

The use of locally quarried limestone, continuous cornice heights and consistent window spacings give much of downtown Guelph a visual unity (photo by Bill Brooks/Masterfile).

chose the town's name to honour Britain's royal family, the Hanoverians, who were descended from the Guelfs, one of the great political factions in late medieval Germany and Italy. The water-power potential at the townsite attracted a number of large mills during the 19th century; the most important of these were owned by William Allan and James Goldie. From the 1860s, several local industries established a worldwide reputation, based on technological innovation; these included the Raymond Sewing Machine Co and the Bell Organ Co.

**Economy** The economic base of the community has continued to be diversified manufacturing, which employs about 40% of the local work force. Major firms include Canadian General Electric (appliances), Hammond Manufacturing (electrical), International Telephone and Telegraph, Imperial Tobacco and W.C. Wood (freezers). The city has been a pioneer in the trend to municipal ownership of utilities. In the 1880s it built its own railway, the Guelph Junction, which it still owns. After the turn of the century, led by its major businessmen through the Board of Trade, the city took over the water, gas, electricity and streetcar systems.

**Education** The UNIVERSITY OF GUELPH was established in 1964, but it represents an amalgam-

ation of several colleges whose traditions go back more than a century. The Ontario Agricultural Coll was founded in 1874 on a 200 ha experimental farm S of the townsite. It has been an important force in agricultural research throughout the world. Among its noted graduates is the economist John Kenneth GALBRAITH. A second college, the Macdonald Institute, was built in 1903, at the instigation of Adelaide Hoodless, to teach household science. In 1922 the Ontario Veterinary Coll was moved to the Guelph campus. The present university's full spectrum of programs attracts about 10 000 undergraduates; its research has won international recognition in a wide variety of fields, especially for helping to solve the complex agricultural problems of developing countries.

**Cityscape** Much of the city's 19th-century townscape still exists. The wide use of a warm-hued, locally quarried limestone, easily worked by stone carvers, has given a visual unity to much of the community. This is especially evident on major downtown streets such as Wyndham where architects used almost continuous cornice heights and consistent window spacings with neighbouring buildings. Particularly significant structures include the Renaissance Revival-style City Hall (1956), designed by Wil-

liam THOMAS, and Joseph Connolly's Church of Our Lady (1877-88), which still dominates the city visually.

**Population** The population of Guelph has always been highly British in ethnic origin, with those of English background dominating (92% British, 1880; 87%, 1921). More recently (1971) the British proportion had dropped to 67%. The most important new group, those of Italian origin, stands at about 10%.

**Culture** The city and district are home to a number of well-known artists, such as Ken DANBY. Major support for artistic activity is provided by the new Macdonald-Stewart Art Gallery on the university campus. Guelph's cultural heritage, however, is primarily musical. Edward JOHNSON (1878-1959), the world-famous operatic tenor and manager of New York's Metropolitan Opera, was born and educated here. His tradition is carried on by the Edward Johnson Music Foundation, which annually sponsors the highly acclaimed Guelph Spring Festival, a 2-week presentation of concerts, operas, films and plays.

G.A. STELTER  
Reading: Leo Johnson, *History of Guelph, 1827-1927* (1977).

**Guerre, Yes Sir!, La** (1968), Roch CARRIER's first and best-known novel, is a surrealist fable set in rural Québec during WWI. Carrier uses the CONSCRIPTION crisis to allegorize the tragedy of fear and hatred governing French-English relations. The novel is dominated by the wake and funeral of the war hero Corriveau — an occasion for praying and swearing, feasting and brawling. Corriveau's friend Bérubé beats his bride Molly, a Newfoundland whore, while his officers, the "English" soldiers who delivered the corpse, are attacked by the villagers. Other vignettes reflect violence both literally and linguistically: Joseph chops off his hand in order to avoid conscription, while Amélie rules over her deserter husband and the draft-dodging Arthur, loving both cowards. Carrier's nightmare vision portrays the peasant and his language realistically but sympathetically. The novel was translated by Sheila Fischman (1970) and was adapted for the stage in French (1970) and English (1972).

MICHELLE LACOMBE

**Guess Who**, leading Canadian rock band (1968-75), formed in Winnipeg (1965) as Chad Allen and the Expressions. Personnel changed frequently. Singer Burton Cummings and drummer Garry Peterson were constants; guitarist Randy Bachman was an important member until 1970. The band had many international hit singles and albums, and toured worldwide. Cummings pursued a successful solo career after 1975. A reconstituted Guess Who was active after 1978.

MARK MILLER

**Guèvremont, Germaine**, née Marianne-Germaine Grignon, writer (b at St-Jérôme, Qué 16 Apr 1893; d at Montréal 21 Aug 1968). After studies in Ste-Scholastique, St-Jérôme, Lachine and Toronto (Loretto Abbey), Guèvremont worked at Ste-Scholastique courthouse. She published her first article in *L'Avenir du Nord* in 1912. On 24 May 1916 she married Hyacinthe Guèvremont, an Ottawa civil servant. Five children were born of this marriage. In 1920 the family moved to Sorel where they lived until 1935, when they moved to Montréal. Guèvremont took up journalism in Sorel, writing for the *Montreal Gazette*, *Le Courrier de Sorel*, *Paysana* and *L'Oeil*. In 1942 she published her first book, a collection of stories called *En pleine terre*, and began editing her major work, *Le Survenant*, 2 chapters of which appeared in *Gants du ciel* in 1943. *Le Survenant*, for which she won the Prix Duvernay, Prix David and Prix Sully-Olivier de Serres, was published by Beauchemin (1945) and in Paris by Plon (1946). *Marie-Didace*, second instalment of *Le Survenant*, appeared in 1947. It

was a triumph, winning her election to the Académie canadienne-française in 1948, the Gov Gen's Award for the English translation in 1950, honorary doctorates, popular acclaim with radio (1951) and TV adaptations (1954-60), and election to the RSC in 1962. She is buried in Sorel, close to the islands she had immortalized.

YVAN G. LEPAGE

**Guggisberg, Sir Frederick Gordon**, soldier, governor (b at Galt, Ont 20 July 1869; d at Bexhill, Eng 21 Apr 1930). Commissioned in the Royal Engineers in 1889, he served first in Singapore, then at the Royal Arsenal, Woolwich, and as a surveyor in West Africa 1902-14. After distinguishing himself in WWI, he was governor of the Gold Coast (Ghana) 1919-27, where he implemented a 10-year development plan to provide an economic and social infrastructure. He constructed a harbour, college and hospital, improved transportation and encouraged agriculture. He pushed for African advancement in the colonial service, but conceded little to national political demands. He later served briefly as governor of British Guiana. Gold Coast chiefs placed a memorial over his grave, and in 1974 Ghana erected a statue of him in Accra.

RICHARD STUART

**Guibord Affair** One of the most dramatic incidents in the conflict between Catholicism and liberalism in Québec was the suppression by the bishop of Montréal of the INSTITUT CANADIEN. Founded in 1844, it possessed a library for the use of the members containing many books prohibited by the Roman Catholic index of forbidden books. Bishop Ignace BOURGET regarded the activities of the society as dangerous to the faith of the French Canadians and its very existence as a challenge to the authority of the church. In July 1869 the bishop, supported by Rome, placed the Institut under an interdict. In Nov 1869 Joseph Guibord, who explicitly refused to renounce his membership in the Institut, died, and Bourget denied him burial in consecrated ground. That action opened more than 5 years of violent argument. A suit was brought against the bishop by Guibord's widow Henriette, and in 1874, after a series of appeals, the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL ordered that Bourget's decision be reversed. Guibord's body meanwhile had been placed in a Protestant cemetery. But because of outraged feelings among Catholics in Montréal, an attempt at interment in the Roman Catholic cemetery on 2 Sept 1875 failed. It was finally accomplished on Nov 16 with an armed military escort. Even then Bishop Bourget had the last word. After the burial, he immediately deconsecrated the plot of ground where Guibord's body lay. The Institut canadien did not survive the affair. With only a handful of members remaining, it soon disappeared from public life.

H. TURNER

Reading: L.C. Clark, *The Guibord Affair* (1971).

**Guillaume-Delisle, Lake**, 702 km<sup>2</sup>, is a large, triangular, saltwater lake in northern Québec, connected to the E shore of HUDSON BAY by a long, narrow channel bound by steep cliffs. The W side of the lake is actually a high, rocky ridge separating it from the bay; the E side is irregular and barren, but less bold. The TREELINE begins a few km N and the many islands that litter the southern portion of the lake are wooded. The area was visited seasonally by INUIT and NASKAPI, especially at the 2 Whale rivers, a short distance to the S, where beluga whales congregate in the summer. The lake was originally called Richmond Gulf by the HBC, which operated a trading post on the S shore in the 1750s.

DANIEL FRANCIS

**Guitar** With its small body and 6 nylon strings, the classical guitar is played on a wide fingerboard, allowing for control of simultaneous melody and harmony. It is responsive to a con-

siderable degree of musical expression, on par with the violin and other concert instruments. The guitar can be traced back to harp and lyre-like instruments found in the ruins of the ancient Sumerian city of Ur (2500 bc). The course of guitar evolution lead circuitously to the 15th- and 16th-century 4- and 5-string guitar which, however, did not gain much recognition until the 17th century in the French court of Louis XIV. The 19th century saw the classical guitar as we know it today develop in construction, performance, pedagogy, repertoire and popularity; and the 20th century brought it worldwide popularity, almost solely through the efforts of its master performer Andres Segovia. The electric guitar was introduced in the US in the 1930s and became extremely popular in JAZZ, and later in POPULAR MUSIC.

Although the guitar was brought to Canada as early as the mid-17th century, it had limited use. There were few if any classical guitarists in Canada even in the 1950s, although the influential guitarist and teacher Eli Kassner came to Toronto in 1951 from Austria. Composer Harry SOMERS took guitar lessons from Kassner in 1957 and his "Sonata for Solo Guitar" (completed 1959 and premiered 1964) was the first major Canadian work written for the classical guitar. Though pieces were written by composers John BECKWITH, Walter Buczynski and others, there were few Canadian guitarists to perform them until the 1970s and 1980s, when a number of superb professionals emerged, including Pierre Augé, Liona BOYD, Philip Candelaria, Lynne Gangbar, Paul-André Gagnon, Davis Joachim, Norbert Kraft, Michael Laucke, Peter McCutcheon, Gordon O'Brien, Alan Torok, Jean Vallières, the Wilson-McCallister Duo, Tom and Lynn West and the Laval Trio. Guitarists Michael Shutt (from the UK) and Paul Gerrits (from the Netherlands) immigrated to Canada. Well-known professional pop and folk guitarists in Canada have included Randy Bachman, Bruce COCKBURN, Robbie Robertson and Dom Triano; jazz guitarists have included Ed Bichert, Sonny GREENWICH, Nelson Symonds and Lenny BREAU.

Guitar making has spread to several centres, mostly at the craft level; Richard Berg, Marshall Dun, Oscar Graff, Neil Herbert, Robert Holroyd, Pat Lister and Michael Shriner are a few of the excellent luthiers across Canada.

Canadian works composed for the classical guitar have had a corresponding increase, and Boyd, Kraft and Laucke, among others, have launched successful recording careers. Amateur playing, competitions and workshops have been encouraged by the Classical Guitar Soc of Toronto (est 1956) and similar organizations across Canada. Formal instruction is offered by the ROYAL CONSERVATORY OF MUSIC OF TORONTO, the BANFF CENTRE SCHOOL OF FINE ARTS and the Orford Art Centre (JEUNESSES MUSICALES DU CANADA). Canada's first international guitar festival, Guitar '75, was held in Toronto and has been held every 3 years since. Under Kassner's direction, the festival has commissioned new works and has become the most important event of its kind in the world. Guitar '84 featured new concertos by Stephen Dodgson (UK), Leo Brouwer (Cuba) and Harry Somers.

D'ARCY GREAVES

**Gulf Canada Limited** was incorporated in 1906 as the British American Oil Company Limited. In 1969 Gulf Oil Corp of the US bought BA, which became Gulf Oil Canada Limited. The present name was adopted in 1978. Gulf has amalgamated with and acquired other companies; in 1978 it established a Calgary-based subsidiary, Gulf Canada Resources Inc, which handles all resource operations. Today the company explores for and develops oil, gas and coal properties, and refines and markets crude-oil, natural-gas, petroleum and petrochemical products. It holds large areas in western and north-

ern Canada. In 1982 it had sales or operating revenue of \$4.7 billion (ranking 11th in Canada), assets of \$4.9 billion (ranking 16th) and 10 179 employees. Foreign ownership stands at 75%, with Pittsburgh-based Gulf Oil Corp owning 60% of the shares.

DEBORAH C. SAWYER

**Gulf Islands** are a cluster of 225 islands and islets in the Str (originally Gulf) of GEORGIA E of VANCOUVER I, BC. SALTSRING is the largest and most populated, and is linked with GALIANO, N and S Pender, MAYNE and Saturna islands by car ferry. VALDES, Thetis, Kuper and Gabriola islands have similar physical and climatic features. Glacial movement created distinctive oceanside and hill-and-valley landscapes on the larger islands, eroding folded sedimentary rock into ridges of sandstone and conglomerate and narrow valleys of softer rock. Exposed bedrock on the islands' numerous points and coves forms interesting stacks, fretworks and galleries. A smooth-barked leafy evergreen, the arbutus tree, occupies exposed rocky sites overlooking the water, and the Garry oak grows on parkland on the islands' sunny sides. Their bucolic charm, calm waters, rich bird and marine life and mild climate, in the driest zone on Canada's Pacific coast, have attracted homesteaders and cottagers since about 1859. Stands of tall timber growing in deep soil were logged early in this century. With improved ferry service since the 1960s, tourism has challenged farming as the islands' most productive industry. The resident population has burgeoned, mostly from an influx of retired people. A number of West Coast artists, craftsmen and writers have also settled here. Preserving the Gulf Islands' character in the face of development pressure is a local political issue.

PETER GRANT

**Gull** (Laridae), family of long-winged, web-footed BIRDS containing 2 subfamilies: Larinae (true gulls and kittiwakes, about 44 species) and Stercorinae (TERNs, about 40 species). Larinae are distributed worldwide; in Canada 22 species of gulls and kittiwakes have been recorded, 18 as breeding. All but one species of Larinae have a squared-off tail. Most adults are white with grey back and wings, and black wing tips. Most have white heads, but some smaller species have black heads. Nearly all juveniles are brownish, becoming white adults in 2-3 years. They are relatively long-lived (banding records show 20-30 years), breeding from 3 to at least 12 years of age. On the West Coast, the glaucous-winged gull (*Larus glaucescens*) is the common nesting gull. Herring, ring-billed, California and Franklin's gulls (*L. argentatus*, *L. delawarensis*, *L. californicus*, *L. pipixcan*, respectively) nest on the prairies. Herring gulls and ring-billed gulls also nest on the Great Lakes. They are joined, in the St Lawrence R and Maritimes, by great black-backed gulls (*L. marinus*) and, in the Maritimes, by black-legged kittiwakes (*Rissa tridactyla*). Bonaparte's and mew gulls (*L. philadelphia* and *L. canus*) and herring gulls nest in the boreal forest region of Canada. Glaucous, Iceland, Thayer's, ivory, Sabine's and Ross's gulls (*L. hyperboreus*, *L. glaucoideus*, *L. thayeri*, *Pagophila eburnea*, *Xema sabini*, *Rhodostethia rosea*, respectively) nest in arctic Canada.

Gulls frequent coastal and freshwater shores. Although omnivorous, gulls feed primarily on fish. Most nest on the ground, on islands or peninsulas in wild, rural or urban settings. Franklin's and Ross's gulls nest in marshes; Bonaparte's and less frequently mew gulls nest in trees. In southern Canada, nesting begins mid-late Apr, progressively later to the N. Most Canadian species lay 3 olive green, brown-spotted eggs. Nests range from small accumulations of vegetation and debris to large (46 cm diameter), well-made structures with well-maintained nest bowls. Eggs hatch in 3-4 weeks; down-covered young have open eyes, and can walk

hours after hatching. Adult gulls swallow their food whole, then fly to the nest to regurgitate it for young. Young gulls fly about 6 weeks after hatching. A pair of adults may raise 1-2 young from 3 eggs. Young gulls die from exposure, toxic chemicals passed into the egg from the female, starvation, or attacks from adult gulls or predators. Deaths often result because young are unskilled at competing for food.

Most gulls in Canada migrate to areas of open water. Generally, gulls breeding from Manitoba westward migrate to the Pacific coast and southward; those nesting E of Manitoba go to the Atlantic coast and southward. Franklin's gull, which winters in S America, has one of the longest MIGRATION routes of any gull in Canada.

D.V. WESELOH

**Gun Control** laws seek to limit access to firearms by the potentially dangerous, irresponsible or criminal and to encourage the responsible handling, storage and use of firearms. The Criminal Code, amended in 1977 to strengthen its provisions relating to gun control, defines a firearm as any barrelled weapon from which a bullet may be discharged and which is capable of causing serious bodily injury or death to a person. It defines a prohibited weapon as one that is capable of firing bullets in rapid succession during one pressure of the trigger.

In order to acquire and use firearms, individuals must register for a permit and meet criteria set out in the Code. The issuance of registration certificates is controlled, and businesses are required to maintain inventory and transaction records.

The Code also provides for the enforcement of gun-control laws. It authorizes a peace officer to search for and seize a firearm without a warrant whether on a person, in a vehicle, or in a place, and provides for penalties for the criminal use of firearms and the use of prohibited weapons; it prohibits the improper storage and transportation of firearms, the pointing of a firearm, the carrying of a concealed weapon without permit, and the gift of a weapon to an intoxicated person, or a person of unsound mind.

The Code does allow for certain uses of firearms by gun clubs and collectors (eg, for sporting activities) and by people who require them in their employment, such as peace officers, customs officers. Even these exceptions are subject to the provision, however, that anyone may be prohibited by a court from possession of a firearm for a period of time if the court considers such prohibition desirable in the interests of public safety.

VINCENT M. DEL BUONO

**Gundy, James Henry**, investment dealer (b at Harrison, Ont 22 Mar 1880; d at Toronto 10 Nov 1951). After working for the Central Canada Loan and Savings Co and Dominion Securities Corp, in 1905 Gundy organized the firm of Wood, Gundy and Co, which within several years became Canada's largest investment firm. During WWI he was chairman of the special subscriptions committee of several Victory Loans and later president of the Investment Bankers' Assn of Canada. As an investment dealer he was active in the merger wave of 1923-30 in Canada, mainly in the financial reorganization of companies such as Simpsons, Canada Power and Paper, Dominion Steel and Coal Corp and Massey-Harris. He was a member of the boards of directors of dozens of Canadian companies, including British Columbia Power Corp, Halifax Shipyards, Dominion Life Assurance Co, London Canadian Investment Corp, North American Life Assurance Co and Canada Cement.

JORGE NIOSI

**Gunn, William Walker Hamilton**, ornithologist, ecologist (b at Toronto 18 Mar 1913; d at Lindsay, Ont 15 Oct 1984). His research on bird migration and behaviour has been applied eff-

ectively to ecological management and public education. He was the first executive director of the Federation of Ontario Naturalists 1952-55 and helped found several naturalist and professional biologist organizations. His research into conflicts between birds and aircraft in the 1960s helped develop a warning system still in use by Canadian officials. He was a founder, first president (1971-80) and chairman (1980-84) of LGL Ltd, an early environmental consulting firm. He also pioneered the recording of bird songs, and in 1963 became associated with the CBC as consultant and sound recordist, especially for "The Nature of Things" series. His research, conservation efforts and educational endeavours have been recognized by awards and appointments to several naturalist organizations.

MARTIN K. McNICHOLL

**Gunning, Harry Emmett**, scientist, administrator (b at Toronto 16 Dec 1916). After obtaining an MA in English and a PhD in chemistry at U of T (1942), he was a research fellow at Harvard and NRC; professor at U of Rochester (1946) and Illinois Inst of Technology (1948); professor and head of chemistry at University of Alberta (1957) and president there 1974-79. He made major contributions to science and published 175 articles in photochemistry, chemical kinetics, separation of isotopes and petroleum sciences. Council member of NRC and president of the Chemical Inst of Canada, he introduced many innovations in science policy and administration.

OTTO P. STRAUZ

**Gurik, Robert**, dramatist (b at Paris, France 16 Nov 1932). He immigrated to Canada in 1951 and qualified as an engineer before deciding to devote himself to theatre. His plays treat a variety of themes, from the one-act satire *Le Chant du poète* (1963) to the science fiction of *Api 2967* (1966) and the Kafkaesque *Le Procès de Jean-Baptiste M.* (1972), the latter depicting an average Québécois who out of frustration turns to violence and revenge against society. Apart from *Le Pendu* (1967), Gurik's best-known plays have strong political content, especially his parody of contemporary Canadian politicians, *Hamlet, prince du Québec* (1968), *Play Ball* (1974) and *La Baie des Jacques* (1978). He is the author of 2 novels, *Spirales* (1966) and *Jeune Délinquant* (1980).

L.E. DOUCETTE

**Gutenberg Galaxy: The Making of Typographical Man, The**, by Marshall McLuhan (Toronto 1962), is a brilliantly eclectic analysis in which McLuhan claims that print technology has modified the form of our perception, shifting and concentrating perceptual emphasis from the ear to the eye, with tremendous consequences for individuals and cultures. McLuhan describes the condition of "typographic man" at the historic moment when electronic media meet with print media, an encounter McLuhan studies in his next major work, *Understanding Media* (1964). *The Gutenberg Galaxy* established McLuhan as one of the Western world's most influential and controversial writers in the redefined field of communications; the implications of his often-quoted watchwords, phrases and syntheses continue to fascinate and disturb the post-modern imagination. *The Gutenberg Galaxy* has been translated into French (Paris, Montréal, 1967), as *La Galaxie Gutenberg: la genèse de l'homme typographique*, by Jean Paré; and into German and Italian.

NEIL BESNER

**Gutteridge, Helena Rose**, feminist, trade unionist, socialist politician (b at London, Eng 1879 or 1880; d at Vancouver 3 Oct 1960). Gutteridge immigrated to BC in 1911 and organized the BC Women's Suffrage League. Her interest in working-class women contributed to her participation in trade-union activities, and before long she took a leading role on the Vancouver Trades and Labour Council. Her responsibilities

there kindled a turn to socialist politics and membership in the CO-OPERATIVE COMMONWEALTH FEDERATION. In Mar 1937 she was elected as a CCF representative to Vancouver City Council, becoming its first woman member. SUSAN WALSH Reading; B. Latham and C. Kess, eds, *In Her Own Right* (1980).

**Guy, John**, merchant venturer, colonizer, governor of the first English colony in NEWFOUNDLAND (d Mar 1629, monument at Bristol, Eng). Guy, an early advocate of colonizing Newfoundland, was appointed governor of the colony created by the London and Bristol Co in 1610. He selected Cuper's Cove (now CUPIDS) in Conception Bay as the site of the settlement; from 39 members in its first year the colony increased to over 60 under his leadership. After 5 years he returned to England but remained a strong supporter of the Newfoundland plantation against English migratory-fishing interests, economic difficulties and war.

G.M. STORY

**Guyon, Jean**, priest, artist (b at Château-Richer, Qué 5 Oct 1659; d at Paris 10 Jan 1687). Bishop LAVAL had great hopes for this young Canadian priest, who died before he could create any significant body of work. The lovely oil portrait of Mother Jeanne-Françoise Juchereau, dite de Saint-Ignace, in the Hôtel-Dieu in Québec C, is attributed to him. In addition the SÉMINAIRE DE QUÉBEC at one time had some of his watercolour studies of the flora of Québec. At his death his effects included some oil paints and sculptor's tools, evidence that he intended to help decorate the religious buildings constructed under Laval.

FRANÇOIS-MARC GAGNON

**Gymnastics** This sport is performed in many different formats: women on the vaulting horse, uneven bars, balance beam and in floor exercises; men on the vaulting horse, pommel horse, rings, parallel bars, horizontal bar and in floor exercises. It is participated in by all ages for fun, fitness, competition and social relaxation, and is included in modern-day school curriculums across Canada. One of the oldest and most fundamental sports, it originated in ancient Greece. Modern-day artistic gymnastics developed in Germany in the early 1800s. The first Olympic Gymnasium opened in Montréal in 1843, followed by others in Québec City, Toronto, Hamilton, Ottawa, Halifax and Victoria. The inspiration for these clubs came mostly from immigrants from Germany and Czechoslovakia; an Englishman, F. Barnjum, was responsible for developments in the most active centre at that time, Montréal. The sport was introduced into school curriculums in the 1800s under the advisement of Egerton Ryerson, and in 1899 Canada became the fourteenth country to join the International Gymnastics Federation.

Competitively, individuals such as Lou Sievert, Alan Keith and Orville Elliott represented Canada at the 1904 and 1908 Olympic Games. In 1956 Ernestine Russell was Canada's first woman Olympic competitor. Canada entered full teams (men and women) in the 1962 world championships in Prague and in the 1968 Mexico Olympics. By 1976 Canada's women's team was ranked in the top 10 in the world; by 1979 the men ranked in the top 15. The first national championship was held in 1923 at the Canadian National Exhibition in Toronto. The CNE donated all awards and for 11 consecutive years hosted this event for men. Women entered the championships for the first time in 1954. Canada has hosted many teams, the first being the Japanese in 1962, and was the host country of the 1980 World Cup in gymnastics.

Canadian gymnastics now has an organization with a full-time staff, sophisticated national programs, a registered membership of over 150 000, over 500 active coaches and many thousands of dedicated supporters. Recent outstanding Canadian gymnasts include Philip De-

Elfi Schlegel, the first Canadian to win a medal in an international gymnastics meet — a bronze in vaulting at the 1980 World Cup (photo by Ron Watts/First Light).

lesalle, the highest ranking Canadian in individual all-around world competition; Elfi Schlegel, the first Canadian medal winner in an international meet (bronze in vaulting, 1980 World Cup); and Karen Kelsall, first Canadian to compete at the World Cup. In the 1983 World Student Games at Edmonton, Canada won 4 medals in gymnastics, including a gold by Philippe Chartrand. In the 1984 Los Angeles Olympics, the women's team placed 5th overall; Kelly Brown was 6th in the vault. The men's team placed 8th. The Canadian Gymnastics Federation boasts fine development programs for all ages.

CAROL ANNE LETHEREN

**Gypsum**, MINERAL consisting of water-containing calcium sulphate ( $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ ). When calcined (roasted) at temperatures of 120-250°C, gypsum releases 75% of its water. The resulting plaster of paris, when mixed with water, can be molded, shaped or spread, then dried or set to form hard plaster. Gypsum was used by the builders of the pyramids as a construction material and earlier by artisans producing decorative objects. Nova Scotia gypsum was shipped to the

eastern US in the 1780s for use as land plaster. The popularity of gypsum as a building material grew from the mid-1880s as methods of controlling setting time were developed. Crude gypsum is pulverized and heated to form stucco, which is mixed with water and aggregate (sand, vermiculite or expanded perlite) and applied over wood, metal or gypsum lath to form interior wall finishes. Gypsum board, lath and sheathing are formed by introducing a slurry of stucco, water, foam, pulp and starch between 2 unwinding rolls of absorbent paper, resulting in a continuous sandwich of wet board. Gypsum is also used as a filler in paint and paper manufacture, as a substitute for salt cake in glass manufacture and as a soil conditioner. Canada ranks second among world producers of crude gypsum, after the US. Over 80% of Canadian production comes from the Atlantic provinces, about 70% of this being shipped to American wallboard plants. Other major sources are in Ontario, Manitoba and BC. Crude gypsum is a low-cost, high-bulk mineral commodity and contributes only marginally to the Canadian GNP (about 0.014% in 1980). The gypsum products industry contributes considerably more (0.73% in 1980).

D.H. STONEHOUSE

**Gzowski, Sir Casimir Stanislaus**, engineer (b at St Petersburg [Leningrad], Russia 5 Mar 1813; d at Toronto 24 Aug 1898). He began his engineering career in Canada in 1842. As a superintendent of public works of the Province of Canada, he improved waterways and canals and constructed roads, harbours and bridges. Later he built the Canadian portion of the ST LAWRENCE AND ATLANTIC RAILROAD (1845-53) and constructed the GRAND TRUNK RAILWAY LINE from Toronto to Sarnia (1852-57). He designed and built the international bridge between Fort Erie and Buffalo, NY (1870-73), a difficult job because of strong currents, ice and winds. At the same time he served on a commission to study inland waters from the Atlantic to Lake Superior; its report of 1871 anticipates the system now known as the St Lawrence Seaway. Gzowski was the first chairman of the Niagara Parks Commission and planned the park system along the Canadian bank of the river. Together with several other engineers he formed the Canadian Soc of Civil Engineers and later served as president (1889-91). Established during his term of office, the gold Gzowski Medal has been awarded annually for outstanding written contributions to engineering. Keenly concerned over the defence of Canada, Gzowski fought for the strengthening of the Canadian militia and served in it as lieutenant-colonel and colonel. Appointed aide-de-camp to Queen Victoria (1879), he was awarded a KCMG (1890) in recognition of his services in the military and engineering fields.

PHYLLIS ROSE

Sir Casimir Gzowski, born in St Petersburg, Russia, began his career in Canada as a superintendent of public works of the Province of Canada (courtesy Public Archives of Canada/C-86.20).

**Habitant** (inhabitant), a relatively precise social connotation initially signifying a status: in NEW FRANCE, habitants were free proprietors who were differentiated from indentured servants and those whose stay was perceived to be temporary. By the late 17th century, "habitant" came to mean peasant proprietor, as opposed to seigneur or town resident. Finally, in the waning years of the 18th century, when landless peasants had become common, all those who earned their living from agricultural labour were known as habitants. See SEIGNEURIAL SYSTEM.

THOMAS WIEN

**Hachey, Henry Benedict**, oceanographer (b at West Bathurst, NB 7 June 1901). Educated at St Thomas U, Saint Francis Xavier, McGill and U of T, he was professor of physics at UNB before joining the Biological Board of Canada (later the Fisheries Research Board) at St Andrews, NB, in 1928. In 1930 he was appointed officer in charge of the Hudson Bay Fisheries Expedition. His service with the armed forces (1940-46) included operational research and antisubmarine duties. As chief oceanographer of Canada (1946-64), he co-ordinated the work of various government agencies in developing Canadian OCEANOGRAPHY. As head of the Atlantic Oceanographic Group of the FRB he established the course of oceanographic studies on the East Coast and Arctic now largely sustained by the BEDFORD INSTITUTE OF OCEANOGRAPHY. His outstanding scientific contributions to oceanography have been widely recognized.

NEIL J. CAMPBELL

**Hackett, James Keteltas**, expatriate actor (b at Wolfe I, Ont 6 Sept 1869; d at Paris, France 8 Nov 1926). A handsome, swashbuckling, matinee idol, he made his name as the romantic hero of such 1890s hits as *The Prisoner of Zenda* and *Rupert of Hentzau*. He made his professional debut in 1892 in Philadelphia where he was amateur duelling champion. He toured to Halifax and Saint John in 1893 and opened his own theatre in New York in 1905. Aspiring to serious roles, he mounted with an inherited fortune New York productions of *Othello* (1914) and *Macbeth* (1916), remembered for their advanced scenic design. In 1920 *Macbeth* was taken successfully to London and Paris. He was awarded the French Legion of Honour.

DAVID GARDNER

**Haddock**, see COD.

**Haendel, Ida**, violinist (b at Chelm, Poland 15 Dec 1924). Celebrated for flawless technique and beauty of tone, Haendel has enjoyed great demand as a soloist, recitalist and recording artist, performing a large repertoire ranging from Bach to Bartók through a lengthy international career. A child prodigy in her native Poland, she immigrated to England prior to WWII. She gave recitals for British servicemen and appeared as soloist in concertos with many well-known British and European conductors. Haendel immigrated to Canada in 1952 and settled in Montréal. She has given recitals in Canada and performed with major orchestras, among them the Montréal, Toronto and Vancouver symphonies. In 1977, with a CBC orchestra conducted by Franz-Paul Decker, she gave the Canadian premiere of Benjamin Britten's *Concerto*.

BARCLAY MCMILLAN

**Hagerman, Christopher Alexander**, lawyer, politician, judge (b at Adolphustown, UC 28 Mar 1792; d at Toronto 14 May 1847). "Handsome Kit" grew up outside the charmed circle of pupils educated by John STRACHAN. Rising spectacularly by dint of his service during the WAR OF 1812, he was appointed to the lucrative collectorship of customs at Kingston. He was called to the Bar in 1815 and proved a brilliant lawyer and eloquent orator. This latter gift served him well as an assemblyman and leading conservative spokesman in 4 parliaments. A large, powerfully built man, he was bumptious and

aggressive: on one occasion, he horsewhipped Robert GOURLAY. His impulsive actions at times had disastrous political results, notably his role in handling the ALIEN QUESTION and the expulsion of William Lyon MACKENZIE from the assembly. His bellicose personal traits, natural abilities and ardent defence of Toryism in successive administrations made Hagerman a *bête noire* of the Opposition. He was a particular favourite of Lt-Gov COLBORNE and served as solicitor general 1829-33 and attorney general 1837-40 when like others of the so-called FAMILY COMPACT he was appointed to the Court of Queen's Bench, a position he held until his death.

ROBERT L. FRASER

**Hagfish**, group of primitive VERTEBRATES which together with LAMPREYS and various extinct forms comprise the FISH class Agnatha. Hagfishes have an eellike body with a cartilaginous skeleton which permits a degree of flexibility unique among vertebrates. The mouth is a fleshy tunnel with an eversible tongue carrying 2 rows of horny teeth; a single tooth occurs on the palate. Hagfishes have 6-8 barbels (whiskerlike tactile organs) around the mouth and a single nostril. The eyes lack a lens. External gill openings (1-16 pairs) occur on each side. Scales and paired fins are absent; a single fin extends around the posterior profile. A well-marked series of mucous pores occurs along the sides;

when handled or disturbed, hagfishes produce large amounts of mucus. Hagfishes are hermaphroditic and lack a larval stage. A few large (30 x 10 mm) keratinized eggs are laid. Unlike lampreys, hagfishes do not shrink in size at spawning. All species live only in salt water, sometimes at great depths. They feed on dead or dying fish by boring into the body cavity, and may be damaging to FISHERIES. In Canada, one species, *Myxine glutinosa*, is found in the Atlantic; 2 species of genus *Eptatretus* in the Pacific.

VADIM D. VLADYKOV

**Haida** live along the coastal bays and inlets of the QUEEN CHARLOTTE IS. BC. Archaeological evidence confirms continual habitation on the islands for at least 8000 years (see PREHISTORY). A few hundred years ago a small group of Haida migrated N to the southernmost islands of the Alaskan "panhandle," where their descendants live in the village of Hydaburg. The Haida language is an isolate with 2 dialects — Masset is spoken in the northern islands and Skidegate in the S. Haida culture and art are distinctive within Northwest Coast traditions, though there are cultural similarities to the neighbouring TSIMSHIAN and TLINGIT.

Traditionally, each village was an independent political unit, and to a great extent each family in a village was an independent entity. All Haida, however, belonged to one of 2 clans — the Eagle or the Raven. A Haida always married a member of the opposite CLAN, and clan membership was inherited from the mother. Individuals publicly proclaimed clan membership through an elaborate display of inherited family crests, carved on TOTEM POLES erected in front of houses and carved or painted on great war CANOES, cedar boxes, MASKS, and utilitarian and decorative objects. Large ceremonial feasts (see POTLATCH) were a focus of Haida life, a means of reinforcing the social and economic organization and the interdependence of clans, lineages and villages.

The first recorded European contact (1774) was with the Spanish explorer Juan PEREZ. British Capt George Dixon initiated trade (1787) with the Haida for sea-otter pelts, and the Haida remained at the centre of the lucrative China

Haida village on the Queen Charlotte Islands, BC, with totem poles depicting stories and family crests, 1878 (courtesy Geological Survey of Canada/255).

A Haida face mask with the outer mask of a hawk and unfolding segments to show a green human face inside (courtesy National Museums of Canada/National Museum of Man/S72-1529).

sea-otter trade until the mid-1800s. European settlers did not significantly populate the Queen Charlotte Is until almost 1900. Mainland fur traders estimated a Haida population before 1850 of 6000-8000. By the 20th century the population had declined to under 1000 people, mainly because of smallpox and other diseases. Though the Haida were traditionally a warlike people, their large seagoing canoes carrying them on raiding expeditions as far S as Washington state, incidents of violent confrontation with Europeans were few. In 1983 the Haida population on the Queen Charlotte Is was approximately 1400, with another 700 living off the islands, mostly in urban centres.

Contemporary Haida are famous for their fine art (see NORTHWEST COAST INDIAN ART), and many work as prosperous commercial fishermen, loggers and artists. See also NATIVE PEOPLES; NORTHWEST COAST and general articles under NATIVE PEOPLE.

TRISHA GESSLER

*Reading:* J.R. Swanton, "Contributions to the Ethnology of the Haida," *The Jesup North Pacific Expedition*, Vol 5, Part 1 (1901).

**Haida**, a powerful WWII "Tribal" Class destroyer, commissioned 30 Aug 1943, built in England for the Royal Canadian Navy. From Jan 1944 to Jan 1945 it patrolled the English Channel and the Bay of Biscay, and it was present at the NORMANDY INVASION, 6 June 1944. *Haida* became famous for participating in the destruction of several German ships. After peacetime service, 1947-50, it received modern armament and from 1952 to 1954 served with UN forces in Korea. It remained in service with the RCN until 11 Oct 1963. The next year friends and admirers bought it, and in 1970 it was taken over by the Ontario government and moved permanently to Ontario Place, Toronto, as a naval memorial.

ROGER SARTY

**Haig-Brown, Roderick**, author, conservationist (b at Lancing, Eng 21 Feb 1908; d at Campbell River, BC 19 Oct 1976). Haig-Brown's early appreciation of nature greatly influenced his later life. A 1926 visit to the American West impressed him with the hunting and fishing opportunities of the Pacific coast, and he emigrated to Vancouver I in 1931, eventually settling at Campbell R. He made his living by logging, trapping, guiding and increasingly by writing. His early stories fictionalized various types of wildlife, including cougars (*Ki-ya — A Story of Panthers*, 1934) and Atlantic and Pacific salmon (*Return to the River*, 1941; *Silver*, 1932). Although his later adult novels were moderately successful, he is perhaps best known as an author of children's literature. *Starbuck Valley Winter* (1943) and its sequel *Saltwater Summer* (1948) received much acclaim, the latter winning a Gov Gen's Award. His essays on sportfishing (*A River Never Sleeps*, 1946; *Measure of the Year*, 1950) have considerable literary merit and wide popular readership. His *A Primer of Fly Fishing* (1964) is considered a standard work on the subject. A committed conservationist, Haig-Brown elo-

quently supported the preservation of wilderness areas and condemned the rank exploitation that has characterized much of the development of the West.

CJ TAYLOR

**Hail**, precipitation consisting of lumps of ice, 5 mm to 10 cm in diameter and about 0.1 g to 1 kg in weight. A 290 g hailstone that fell near Cedoux, Sask, is one of the largest recorded in Canada. A hailstone begins as a frozen RAIN droplet or snow pellet, falling through a CLOUD which has a temperature below 0°C. The embryo hailstone collects water by collision with supercooled (unfrozen) cloud droplets. Vertical air currents of 10-50 m per second help keep it in the cloud as it grows. Some of the accreted water freezes, yielding ice which may be bubbly or clear, depending on the cloud liquid-water concentration, air temperature and hailstone size. Variations of these parameters during the hailstone's growth lead to an onionlike appearance, consisting of alternating layers of clear and bubbly ice. These layers, clues to the hailstone's history, can be seen by cutting the hailstone in half, or by examining a thin slice between crossed, polarizing filters.

Although hail occurs in all provinces, it is most frequent and severe in Alberta and Saskatchewan, where farms have been hit up to 10 times in one year. Here, hail comes mostly from late-afternoon, summer THUNDERSTORMS, which can grow to heights of almost 20 km. Severe hailstorms may last for several hours and leave a hail swath up to 50 km wide in places and hundreds of kilometres long. Large hailstones damage crops, buildings and automobiles. Very big ones have as much energy as a bullet and can injure or kill animals and people. A hailstorm in Calgary on 28 July 1981 caused \$100 million of damage to property. The total annual loss to crops and property in Canada may exceed twice that amount. In Alberta attempts to reduce hail damage, through cloud seeding with silver iodide, have been undertaken since 1956. Although some evidence appears to indicate benefits from this practice, hail suppression remains controversial.

E.P. LOZOWSKI

This hailstone, 7 cm across, fell near Cedoux, Sask, on 27 Aug 1984. A thin slice reveals colourful ice-crystal layers, which provide clues to how the stone was formed (courtesy Edward Lozowski/Tony Kot).

**Hailey, Arthur**, author (b at Luton, Eng 5 Apr 1920). He served in the RAF 1939-47 as a flight lieutenant and immigrated to Canada in 1947. He has become a successful writer of POPULAR LITERATURE, and his forte lies in his practice of writing novels — dealing with fashionable subjects — that have been well researched. His literary career has spanned a quarter of a century. After collaborating on adventure novels in the 1950s, he produced a string of BEST-SELLERS, including *The Final Diagnosis* (1959), *In High Places*, dealing with the Ottawa political scene (1962), *Hotel* (1965), *Airport* (1968), *Wheels* (1971), *The Money-changers* (1975), *Overload* (1979) and *Strong Medicine* (1984). He has written scripts for a number of movies, including *Hotel* (1966) and *Airport*

(1970), and numerous television plays. He now lives in the Bahamas.

DAVID EVANS

**Haileybury**, Ont, Town, pop 4925 (1981c), inc 1904, located on NW shore of Lk TIMISKAMING, 150 km N of North Bay. Haileybury was established and named (after his English *alma mater*, Haileybury College) by C.C. Farr, who came to the area as an employee of HBC in 1883. Because of its readily accessible port facilities on Lk Timiskaming and its proximity to the silver mines of COBALT and to the agricultural region known as Little Clay Belt, Haileybury developed as a residential, mercantile and service centre for the whole vicinity. Famous for its devastation by several forest fires, most notably the Great Fire of 1922 which dispossessed over 2900 people, the town has since maintained and strengthened its role as commercial entrepot, and has taken on new functions as seat of the District of Timiskaming and site of a campus of the Northern College of Applied Arts and Technology (School of Mines).

MATT BRAY

**Haines Junction**, YT, UP, pop 366 (1981c), is located at the junction of the ALASKA HWY and the Haines Hwy, built to the port of Haines, Alaska, by US Army engineers 1942-45. Army barracks and shops were the first buildings on the site, and a Canadian customs office and RCMP station followed completion of the road. As headquarters of KLUANEN NATIONAL PARK, Haines Junction offers facilities for trail riding, mountain climbing and photographic expeditions.

H. GUEST

**Hainsworth, George**, hockey player (b at Toronto 26 June 1895; d near Gravenhurst, Ont 9 Oct 1950). He joined MONTREAL CANADIENS in 1926 as a replacement for Georges VÉZINA and was traded to TORONTO MAPLE LEAFS in 1933, playing 3½ years before returning briefly to Montréal. He won the VÉZINA TROPHY the first 3 years it was awarded and recorded 22 shutouts in 44 games in 1928-29 and 94 shutouts in 464 NHL games. He was killed in a car crash.

JAMES MARSH

**Haldimand, Sir Frederick**, army officer, governor (b at Yverdon, Switz 11 Aug 1718; d there 5 June 1791). As governor of Québec Haldimand concentrated on defending the province militarily and the status quo politically. After service in Prussia and Holland, he transferred to the British army in 1756. He served in N America during the SEVEN YEARS' WAR, and after the CONQUEST of Canada he was twice military governor of Trois-Rivières. He was governor of Québec 1777-86 between Guy Carleton's 2 terms, but was in the province only 1778-84. He attempted to improve the province's defences and sent raiding parties against the American frontier. Politically, Haldimand agreed with the French party that the QUEBEC ACT represented the charter of government and rejected the English-speaking community's demands for English institutions. As the AMERICAN REVOLUTION ended, he was responsible for establishing the LOYALIST refugees in what is now Ontario, a task he carried out efficiently, and for reconciling the six NATIONS to their resettlement in Canada.

STUART R.J. SUTHERLAND

**Haliburton, Thomas Chandler**, author, judge, politician (b at Windsor, NS 17 Dec 1796; d at Isleworth, Eng 27 Aug 1865). Haliburton was a born Tory, whose father and grandfather had been lawyers and judges. An Anglican, he was educated at King's Collegiate School and King's College, Windsor, NS. Following graduation in 1815 he studied law and was admitted to the bar in 1820. Gregarious and ambitious, he soon founded a law practice in Annapolis Royal and established a sufficient local reputation to become an MLA in 1826. Three years later he was elevated to the bench. In 1854 he was appointed to the NS Supreme Court but retired 2 years later because of ill health. While a judge, and in addi-

Thomas Chandler Haliburton, lithograph by E.V. Eddie. Haliburton's book, *The Clockmaker; or, the Sayings and Doings of Samuel Slick, of Slickville*, made him the first Canadian writer to gain an international reputation (courtesy Public Archives of Canada/C-6087).

tion to his family and social life and his writing, Haliburton was an active businessman. He relinquished direct participation in his business endeavours when he moved to England following his retirement from the bench. There Haliburton settled at Isleworth and in 1859 became the Tory MP for Launceston. He retired from politics in England in 1865.

Haliburton's reputation lies in the many substantial works in provincial history, political pamphlets and fiction that he wrote from 1823 to 1860. His first book was published in 1823 when he was 27. *A General Description of Nova Scotia* (1823) was followed by a more ambitious, 2-volume work, *An Historical and Statistical Account of Nova Scotia* (1829). His other historical writings include *The English in America* (1851) and *Rule and Misrule of the English in America* (1851). Two political works also demonstrate Haliburton's lifelong interest in Canadian affairs: *The Bubbles of Canada* (1839) and a shorter pamphlet, *A Reply to the Report of the Earl of Durham* (1839). It was *The Clockmaker; or, the Sayings and Doings of Samuel Slick, of Slickville* that made Haliburton the first Canadian writer to gain an international reputation. Twenty-two instalments of *The Clockmaker* appeared in the newspaper *Novascotian* before it was first published in book form by Joseph Howe in 1836. There soon followed *The Clockmaker*, 2nd series (1838), and in 1840 the 3rd series. It is estimated that as many as 80 editions of *The Clockmaker* appeared during the 19th century.

Perhaps Haliburton's finest and most enduring work is *The Old Judge; or Life in a Colony* (1849). This work reveals Haliburton in a more sombre and reflective mood as he states with genuine feeling his farewell to Nova Scotia. *The Old Judge* lacks the wisecracking observations that made the adventures of Sam Slick so readable, but it is balanced and marked by a maturity not always present in Haliburton's other writings.

Like his fellow Nova Scotians, Thomas McCulloch and John Young ("Agricola"), Haliburton provoked Nova Scotians to better themselves in agriculture and business to combat the depression of the 1820s. Despite his initial debt to McCulloch, he extended his writings to fight the political situation both at home and in England. *The Clockmaker* has been described as "a series of moral essays pointed by satire." There can be no

doubt about Haliburton's extraordinary ability as a writer of social satire which was heightened by his ear for local idiom, dialect and anecdote. No full bibliographical study of Haliburton's career has yet been made, nor is there a book-length biography.

DOUGLAS LOCHHEAD

**Halibut**, see FLATFISH.

**Halibut Treaty**, 2 Mar 1923, a Canadian-American agreement concerning fishing rights in the N Pacific Ocean; the first treaty independently negotiated and signed by the Canadian government. Although Canada's right to negotiate commercial treaties was well established, the British wished to sign the convention along with Canada, as they always had. PM Mackenzie KING argued that the matter was solely the concern of Canada and the US; he threatened separate Canadian representation in Washington, and the British acquiesced. The Halibut precedent, confirmed by the Imperial Conference of 1923, was an important step towards establishment of Canada's right to separate diplomatic action.

NORMAN HILLMER

**Halifax**, capital of Nova Scotia and largest city in Atlantic Canada, occupies a strategic and central location on the province's E coast. With neighbouring Bedford and Dartmouth, it surrounds one of the world's largest harbours. Sometimes called "Warden of the North" for its historic military role, today it is a major regional centre for Atlantic Canada's economy. Founded in 1749 and first named Chebucto, it was renamed shortly after as Halifax in honour of George Dunk, earl of Halifax and chief Lord of Trade and Plantations, who masterminded its settlement.

**Settlement** MIGMAC occupied various harbour sites, as did French forces temporarily as late as 1746. To counter the French presence at LOUISBOURG, but ultimately and more importantly to exploit the rich cod fishery, the British government sponsored a settlement plan for Nova Scotia focused on Halifax. Some 2500 settlers, recruited mainly from England and led by Col Edward CORNWALLIS, established a new town in the summer of 1749. The gridlike plan, with a central square, was later copied throughout the region. Settlers drew free building lots, but few completed houses before winter, when half the population fled to the American colonies. Dartmouth was first settled in 1750, but the Indian threat and isolation from Halifax's defences restricted growth.

**Development** Halifax functions on the margin of the Canadian and N Atlantic trading world. This "tyranny of location" makes it less favoured for growth than other Canadian cities.

Population: 114 594 (1981c); 277 727 (CMA)

Rate of Increase (1971-81): (City) 6.6%; (CMA) -24.7%

Rank in Canada: Thirteenth (by CMA)

Date of Incorporation: 1841

Land Area: City 62 km<sup>2</sup>; 691 km<sup>2</sup> (CMA)

Elevation: 25 m (est)

Climate: Average daily temp, July 18.5°C; Jan -33°C; Yearly precip 1376 mm; Hours of sunshine 1872 per year

Exports of fish and forest staples were comparatively small and mercantile activity risky until the early 19th century. Wartime activity buoyed the local economy during the Napoleonic Wars (1793-1815). Economic growth based on trade to the West Indies and international shipping expanded wealth and population, culminating in a "golden age" of prosperity at mid-century. Enos COLLINS established the Halifax Banking Co; Samuel CUNARD earned his early fortune in the city. The age of sail was surpassed by railway building after 1850 and the new industrialism of the 1870s, both linking Halifax to the continental economy. But the industrial spurt in Halifax and Dartmouth, including a cotton factory, 2 sugar refineries, a ropework and railcar plant, was short-lived. Some of these businesses were destroyed during the HALIFAX EXPLOSION (1917). Distance to markets, lack of local resources, and central Canadian competition limited further manufacturing expansion.

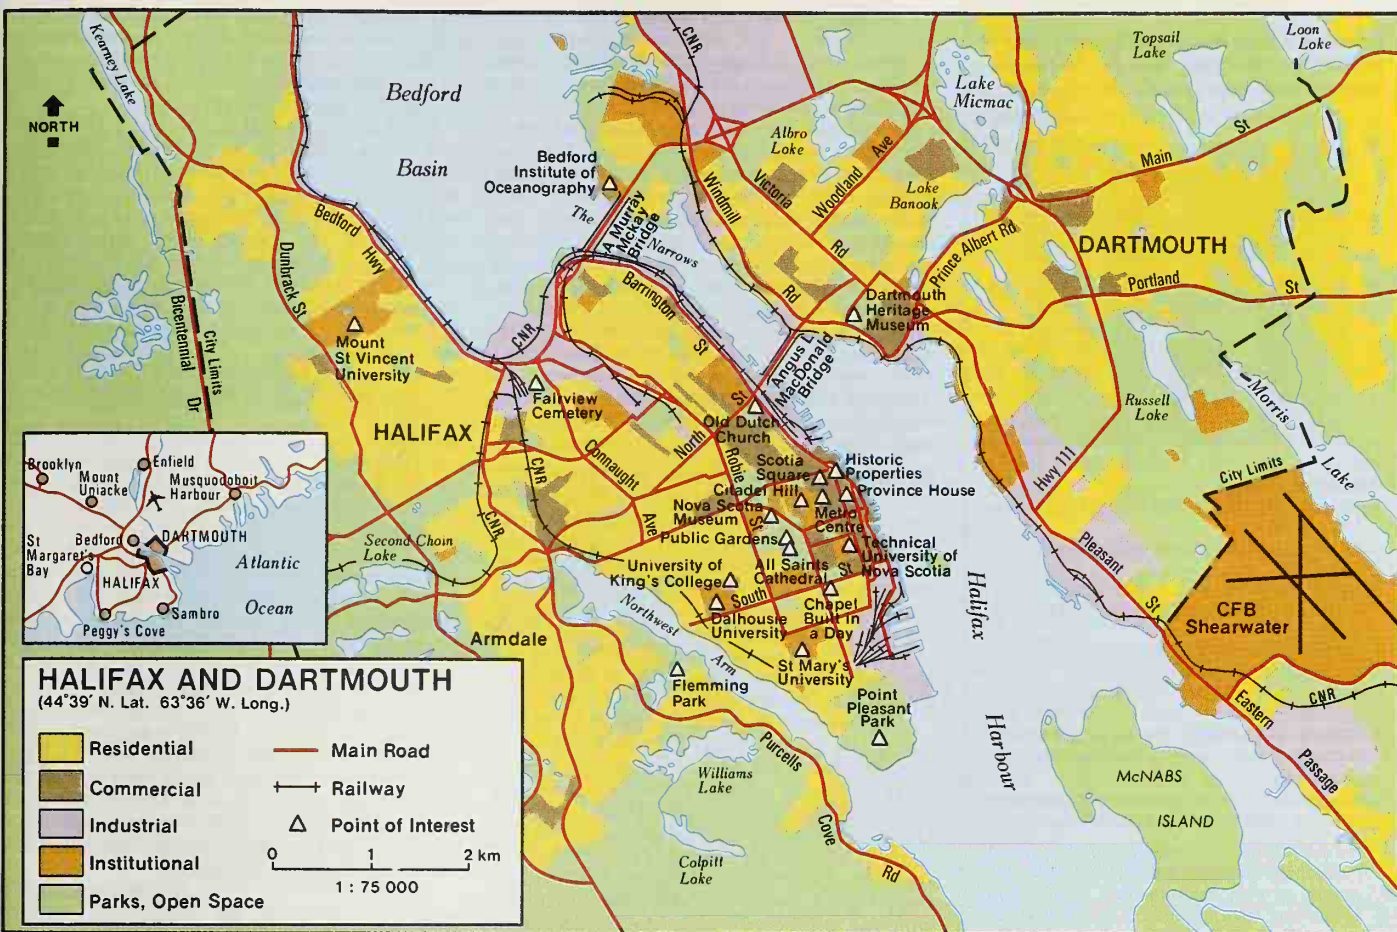

By WWI, the BANK OF NOVA SCOTIA and the Mercantile Bank (ROYAL BANK) had relocated in Toronto and Montréal. Halifax strengthened only its transportation function. The large-scale ocean terminals were initiated in 1912. Wartime activity (1914-18 and 1940-45) heightened Halifax's enduring strategic role, but steady development from the 1950s stems from wholesale distribution, transportation, government services, and specialized functions such as the internationally famous BEDFORD INSTITUTE OF OCEANOGRAPHY. Offshore oil discoveries promise additional growth. Halifax's economic base is largely determined by its maritime, but nonetheless peripheral, location in Canada.

**Cityscape** Early Halifax stretched N and S for several kilometres along the harbour, flanked to the W by the Citadel and the Common. The Naval Dockyard (1758) occupied a site in the North Suburbs, a working-class district even today. The South Suburbs and large estates on the Northwest Arm were preserves of the upper classes. St Paul's, Canada's oldest Anglican

The Tandem Club, an association of the urban gentry that met in Halifax in the winter months (courtesy Public Archives of Canada/C-13362).

church (1749), PROVINCE HOUSE (1818), Government House (1827) and other important institutional and residential buildings attest to Halifax's rich architectural heritage. Like Vancouver's Stanley Park, Halifax's Point Pleasant Park (1866) was once a military reserve. By the 1950s, much of peninsular Halifax was built up. In Dartmouth, locks of the Shubenacadie Canal and waterfront manufacturing tell of 19th-century industries. With the recent spanning of Halifax Harbour by the Angus L. Macdonald (1954) and A. Murray MacKay (1970) bridges, Dartmouth's residential importance grew rapidly. Suburban Bedford and the Sackville district now share this growth. Central Halifax has been revitalized by extensive redevelopment around the original central square and waterfront. Projects include Scotia Square, Historic Properties, the Maritime Museum and a courthouse. Dartmouth's historic core has been similarly restored.

**Population** Until recently, Halifax has been overwhelmingly British; people of British origin now make up about 80% of the population. Most are either ENGLISH or IRISH; Scots number fewer. These groups were present at Halifax's founding and were soon joined by GERMANS ("Foreign Protestants") and Americans. The Irish gained the majority through the early 19th century. Late 19th-century immigration bypassed Halifax for Ontario and the West. Growth was therefore slow, dependent on natural increase and on migrants from rural NS. Expansion of the city boundaries westward in 1969 boosted population considerably. Summer brought additional army and navy personnel (as did war); winter, extra dockworkers. Today, many newcomers to Halifax-Dartmouth are transients, employees of the armed forces, national corporations, research institutes and the federal government.

**Economy and Labour Force** The strength of

the metropolitan area economy rests on Halifax's defence and port functions, and on the service sector. Manufacturing employs few people; fishing is unimportant. Regional prominence in government administration, health services, university education, research activities, as well as the traditional functions of trade, distribution, transportation and finance all sustain Atlantic Canada's most dynamic urban economy. In fact, considerable disparities distinguish the well-being of Halifax-Dartmouth from most of the Maritimes. Despite success, control of the economy lies beyond the city; branch businesses are the major employers.

**Transportation** Halifax is the principal port in the Maritimes. Two large container terminals, recently built, serve all Canada. Containers travel over the CNR, the successor to the INTER-COLONIAL RY, which was once headquartered briefly in Halifax (1872). The CPR's Dominion Atlantic Ry runs to the Annapolis Valley and by car ferry across the Bay of Fundy to SAINT JOHN. Other lines along the southwestern and eastern shores now stand idle. Halifax merchants once owned many ships and they dominated the province's shipping industry throughout the 19th century, a prominence not sustained in the steamship era; major steamship companies were owned by outsiders. The Halifax International Airport is now home field to Eastern Provincial Airways and is served by Air Canada and CP Air. Water, rail and air facilities will expand with offshore oil development.

**Government and Politics** Continuity and accommodation mark Halifax politics, but significant reforms have occurred through the city's history. Until incorporation as a town in 1841, local affairs were governed by an appointed "clique of magistrates." Joseph HOWE promoted reform, and with Halifax's incorporation, an elected mayor and council of aldermen representing city wards managed urban

affairs. This system still exists. Through RESPONSIBLE GOVERNMENT, established in NS in 1848, Halifax lost dominance over provincial politics. Since 1967, however, when more legislative seats were created, metropolitan Halifax has reasserted a prominent position in provincial politics. Other changes include a short-lived board of control, established at the time of WWI during the Urban Reform era, and the introduction of a city manager in 1951 to administer day-to-day business affairs. Partisan politics play little role in local government, despite significant class and religious divisions. A "dual" school system, introduced in the 1860s, operates Catholic and other "public" (nonsectarian) schools, but the 1969 annexation of suburban districts from the County of Halifax and school closures in central Halifax have weakened this system. A century-old "gentleman's agreement" of alternating Catholic and Protestant mayors ended in 1968 when incumbent Allan O'Brien, a Protestant, won re-election against another Protestant. Metropolitan government for Halifax, Dartmouth, Bedford and neighbouring communities does not yet exist, but several metropolitan agencies provide region-wide planning, sanitary and transit service.

**Cultural Life** Halifax is the cultural centre of Nova Scotia. From its founding, music, art and the theatre have been central attractions. When it was a garrison town, many officers both supported and participated in these activities. The Neptune Theatre, the Nova Scotia College of Art and Design, and the Atlantic Symphony today continue these traditions. Well-known writers associated with the capital are Thomas Chandler HALIBURTON, Thomas MCCULLOCH, Thomas RADDALL, Hugh MACLENNAN and Charles RITCHIE. MacLennan's *Barometer Rising* details the drama surrounding the Halifax Explosion of 1917. The *Halifax Gazette* (1752), Canada's first newspaper, and the *Novascotian*, once a forum

### Distribution of Industrial Activity\* by Industry Grouping within Census Metropolitan Areas, 1980

#### Industry groupings

1. Food and beverage and tobacco products industries
2. Leather, textile, knitting mills and clothing industries
3. Wood, furniture and fixtures, paper and allied and printing, publishing and allied industries
4. Machinery, transportation equipment and electrical products industries
5. Primary metal and metal fabricating industries
6. Rubber and plastic products, petroleum and coal products and chemical products industries
7. Non-metallic mineral products and miscellaneous manufacturing industries.

for Joseph Howe's reform politics, are no longer published; remaining are the *Chronicle-Herald*, the *Mail Star*, the (Sackville) *Daily News* and Dartmouth's weekly *Free Press*.

The NS Museum and the Maritime Museum exhibit the historic past, which is also recorded by the Public Archives of NS. Traditions are further upheld by long-established ethnic organizations such as the Charitable Irish Soc (1786) and the North British Soc (1761). There are several universities in Halifax, most with religious affiliations. DALHOUSIE (founded 1818) was the first. ST MARY'S (chartered 1841) is the oldest English-speaking Roman Catholic university in Canada. King's Coll U, founded by Anglicans in 1788 at Windsor, moved to Halifax in 1929. MOUNT ST VINCENT, a university since 1966, was founded in 1873 by the Sisters of Charity as a residential school for young ladies. The TECHNICAL UNIVERSITY OF NOVA SCOTIA, the NS Institute of Technology, and the NS College of Art and Design offer specialized programs. Amateur rather than professional sports characterize the metropolitan area. The Wanderers' Amateur Athletic Assn (1882) is most renowned. Yachting, rowing, canoeing, curling, swimming and other sports have produced national champions.

L.D. McCANN

**Halifax Citadel** The present citadel, located on an imposing elevation overlooking the original town and harbour of the capital of Nova Scotia, is actually the fourth fortification built on the site. Earlier works were built in 1749-50, 1776-81 and 1795-1800. Plans and estimates for the present fort were submitted in Dec 1825. Three years later the British government granted

the necessary funds and work began in Sept 1828. The men most responsible for the construction were Sir James Carmichael Smyth and Col Gustavus Nicolls, both Royal Engineers officers. Construction was plagued with design and structural problems and took almost 30 years. The fort, finally completed 1855-56, cost £242 122. The general introduction of rifled artillery (with greater range and accuracy than earlier guns) shortly after completion of the Citadel rendered the costly installation obsolescent. It was partially rearmed in the 1860s and 1870s, and continued in use as a barracks into the 20th century. Upon departure of the British garrison in 1906, it was handed over to the Canadian militia. In May 1951 it was transferred to the Dept of Resources and Development; and finally, in July 1956, the site was declared a National Historic Park. About 1 million people visit the site annually.

ROBERT ALLEN

**Halifax Explosion** At 8:45 AM, 6 Dec 1917, at the height of WWI, the Belgian Relief vessel *Imo*, through human error and negligence, collided with the French munitions carrier *Mont Blanc* in the narrowest part of Halifax harbour. Sparks generated by the collision ignited benzol stored on the *Mont Blanc's* deck; the burning liquid then seeped into the holds, where it lit 2766 t of picric acid, TNT and gun cotton. At 9:06 the munitions ship blew a mile high in the world's greatest man-made explosion before Hiroshima.

Over 2½ km² of Halifax's industrial N end was totally levelled, either by the blast, the subsequent tidal wave or the raging fire caused when structures collapsed inward on roaring stoves and furnaces. Homes, offices, churches, factories, vessels, the railway station and freight yards — all were obliterated. Farther from the epicentre, Citadel Hill deflected shock waves away from S and W Halifax, where shattered windows and doors were the predominant damage. Across the harbour, Dartmouth suffered devastation to a lesser degree, since its N section was sparsely developed. The blast shattered windows in Truro, 100 km away, and was heard in PEI.

Out of a population of less than 50 000, over 1600 people died and 9000 were injured, including 200 blinded by flying glass. Sixteen hundred buildings were destroyed and 12 000 damaged; 6000 people were homeless and 20 000 lacked adequate shelter. Total damage amounted to

The Halifax Citadel, completed 1855-56, took almost 30 years to build and is the fourth fortification on the site (photo by Sherman Hines/Masterfile).

\$35 million. The misery was compounded by a forced evacuation of the city, necessitated by fire threatening the main dockyard magazine, and by appalling weather conditions in the days immediately following the explosion.

Relief assistance was immediate and extensive. Trains from throughout the Maritimes and from central Canada and New England brought medical aid, food, clothing, building materials and skilled labourers. The continuing assistance provided by the Massachusetts Relief Committee was particularly noteworthy. Money donated by government, industry and individuals worldwide eventually totalled some \$30 million, and was administered 1918-76 by the HALIFAX RELIEF COMMISSION.

LOIS KERNAGHAN

Reading: M.J. Bird, *The Town that Died* (1962); G. Metson, *The Halifax Explosion* (1978); Hugh MacLennan, *Barometer Rising* (1941).

**Halifax Relief Commission** began 6 Dec 1917 as an emergency committee to provide immediate relief after the HALIFAX EXPLOSION. In Apr 1918, a 3-man commission was incorporated by provincial statute to administer a \$30-million fund for medical care, social welfare, compensation and reconstruction. Total destruction and lingering human misery encouraged the rapid implementation of various innovative civic-planning and social-rehabilitation schemes, including a master town plan in 1921 and Canada's first public-housing project, the Hydrostone development, built in the devastated area and administered by the commission. By 1948 the commission's priorities had changed and it became a pension board. In 1976, with \$1.5 million remaining and 65 disabled dependants, the Halifax Relief Commission was terminated and its responsibilities transferred to the Canada Pension Commission.

LOIS KERNAGHAN

**Hall, Emmett Matthew**, lawyer, judge (b at St-Colomban, Qué 9 Nov 1898). In 1910 Hall moved to Saskatoon with his family. A classmate of John G. Diefenbaker, he graduated in law from U of Sask in 1919 and was appointed chief justice Court of Queen's Bench for Saskatchewan in 1957. He became chief justice of Saskatchewan in 1961 and was elevated to the Supreme Court of Canada in 1962, retiring in 1973. He has reported on a national health scheme for Canada (1964), the Ontario primary and secondary-school programs (1968), railway arbitration (1973), provincial court structure in Saskatchewan (1974) and grain handling and transportation in western Canada (1977). He received the only honorary medical degree (U of

O) ever awarded, and has been chancellor of U of Sask since 1978.

FREDERICK VAUGHAN

**Hall, John Scott**, painter (b at Edmonton 17 Jan 1943). Hall studied at the Alberta College of Art, Calgary (1960-65) and Instituto Allende in Mexico (1965-66) and has taught at Ohio Wesleyan U, Delaware, Ohio (1969-70), Alberta College of Art (1970-71) and U of Calgary (1971-). He rose to national prominence during the 1970s with his large hyper-realist still-life paintings of common objects that he selected intuitively, then carefully arranged in glass-covered boxes. More recently he has painted from photographs of similar still-life arrangements of toys and souvenirs. His painstaking enlargements of these objects on canvas adds to their implied importance, but the paintings are so cool and detached that they are impossible to interpret literally.

CHRISTOPHER VARLEY

**Halpenny, Frances Georgina**, editor (b at Ottawa 27 May 1919). After studies in English at U of T, she began in 1941 her long association with U of T Press, interrupted only by service in the RCAF 1942-45. She headed the editorial department of UTP 1957-69 and then became general editor of the *Dictionary of Canadian Biography*, a joint UTP-Presses de l'U Laval project. While continuing as general editor, she was dean of the Faculty of Library Science at U of T 1972-78 and was appointed to the National Library Advisory Board in 1977, a board she chaired 1979-82. She was associate director (academic) of UTP 1978-84. Through these years she continued an interest in theatre as an actor and writer. Indefatigable and unfailingly optimistic, she has encouraged scholarly publishing in Canada over 40 years by her teaching, writing, editorship of the DCB, and dedicated committee work at the national level. A member of the Royal Soc of Canada, she was awarded the MOLSON PRIZE in 1983 and made a companion of the Order of Canada in 1984.

MARY McDUGALL MAUDE

**Hamel, Théophile**, painter (b at Ste-Foy, Lower Canada 8 Nov 1817; d at Québec City 23 Dec 1870). Appointed official portrait painter in 1853, Hamel was referred to as the national painter by contemporary journalists, and was throughout his career one of the most popular painters with notables and clergy alike. From age 16 to 22, Hamel apprenticed with Antoine PLAMONDON in Québec C. He travelled to Europe in 1843, studying in Rome and visiting France and Belgium. He returned to Québec in 1846, and opened a studio. He moved to Montréal in 1847 for 2½ years before establishing his permanent residence in Québec.

Given the poorly developed communications of the 19th century, the upper classes used artists to make them known and spread their influence over either their flock (clergymen), or voters (politicians) or their social circle (professionals). Inspired by Titian, Hamel developed a style perfectly suited to the aspirations of members of the liberal professions. With Plamondon he had developed the technical mastery needed to paint faithful portraits and learned to handle daring chromatic effects, reflections and the rendition of beautiful fabrics. He refined his sober art during a stay in Italy 1843-46, studying the works of his mentor, Titian. Hamel created an interesting gallery of historical figures, including Jacques CARTIER, CHAMPLAIN and General James MURRAY. He did official portraits of the Province of Canada politicians, now housed in the Parliament Buildings in Ottawa, and many other portraits of politicians in Québec C, Kingston, Montréal and Toronto. Catholic and Protestant bishops, grand vicars, priests and founders of religious communities all posed for Hamel. Several notaries, doctors and merchants had themselves painted, with their wives and children on 2 separate panels. Except for children,

Hamel generally showed only one figure in a given composition.

Hamel's talent allowed him to move in a few years from a farming background to the liberal professions; his brothers could only reach the level of commerce. Hamel possessed a handsome fortune, was captain of the militia and a member of the INSTITUT CANADIEN; he regularly met with the leading personalities of the day, such as F.X. GARNEAU, P.J.O. CHAUVEAU and Octave CRÉMAZIE. His magnificent, lifelike, austere and dignified portraits helped popularize Titian's style. Hamel also taught other artists, including Napoléon BOURASSA, one of the best Canadian artists of the 19th century. Besides its artistic value, his work allows us to study a section of Canadian society in the mid-19th century. Some of the people he painted left no photographs of themselves or their families. Each portrait shows us what a member of the ruling class thought of himself and how he wished the population to view him.

RAYMOND VÉZINA

Reading: Raymond Vézina, *Théophile Hamel* (1975-76).

**Hamilton**, Ont, City, seat of Wentworth County, located at W end of Lk ONTARIO, on Burlington Bay, 68 km SW of Toronto and 66 km W of Niagara Falls and the American border. It is Canada's largest steel producer and ranks high in industrial production. It forms part of the Regional Municipality of Hamilton-Wentworth (pop 411 445, 1981c), which also includes Ancaster, Dundas, and Stony Creek.

**Settlement** The earliest references to habitation in the Hamilton area come from 17th-century French accounts referring to the NEUTRAL nation. French adventurer Etienne BRÛLÉ had visited the Neutrals 1616 and again 1624, and Jesuit missionary Jean de BRÉBEUF in 1641. LOYALISTS from the Niagara region — including John Depew (1786) and Richard Beasley (1790-1) — began to settle on and develop the land around Burlington B. In Jan 1815, George Hamilton, son of Robert Hamilton (one of the wealthiest and most influential men in Upper Canada) purchased 104 ha of land in Barton Township, laid out a townsite and successfully promoted its selection as the seat of administration for the newly created Gore Dist (1816). Because of the concentration of streams descending the NIAGARA ESCARPMENT and the area's location at the head of navigation on Lk Ontario, it had been developed as a milling and transportation centre even before the establishment of Hamilton.

**Development** Hamilton's townsite grew slowly until the late 1820s when a newly constructed canal through Burlington Beach permitted schooners and steamers entry into Burlington B. With the access points for roads ascending the Niagara Escarpment, the canal transformed the fledgling community into a significant transshipment point. With enormous migration from the UK during the 1830s, its fortunes grew; its situation made it an ideal location for mercantile houses and manufacturing establishments that could serve the surrounding region. Plans were made for a steamboat company, a bank and a railway to London. An economic panic and the Rebellion of 1837 delayed the railway's construction until the early 1850s. Led by land agent and lawyer Sir Allen MACNAB and others, the city bought into the GREAT WESTERN RY and other lines. Though the railway boom collapsed in 1857, it had attracted stove and farm-implement foundries. Ready-made clothing and sewing-machine manufacture developed during the American Civil War.

The city's industries prospered from the mid-1880s to the early 1890s. In the early 1900s, national railway construction and American branch plants serving the Prairie market touched off a factory and residential construction boom that lasted until 1913. The Hamilton

Population: 306 434 (1981c); 542 095 (CMA)

Rate of Increase (1971-81): (City) -8.9%; (CMA) 8.7%

Elevation: 76.2 m; 198 m (mountain)

Climate: Average daily temp, July 20.6°C, Jan -5.9°C;

Yearly precip 796 mm; Hours of sunshine 2044.6 per year

Blast Furnace Co began to produce pig iron in the 1890s. During both world wars, Hamilton industries concentrated on the production of war material, converting successfully after 1945 to serve the strong market for appliances, automobiles and houses. With the closing of textile mills and knit-wear plants in the 1950s and 1960s, Hamilton became increasingly dependent on steel. More recently, several of its long-time employers (Westinghouse, International Harvester, Firestone) have suffered economic troubles.

**Citiescape** Hamilton Harbour (Burlington B) extends 8 km W from the channel at Burlington Beach to the steep embankment of Burlington Heights. Until the end of WWII, the harbour and escarpment squeezed urban development along an E-W axis and the 100-m limestone face of the escarpment posed a considerable transportation obstacle to suburban development. Though a series of expressways were constructed during the 1960s and 1970s, the division between the "mountain," as the escarpment is known locally, and the older city below plagues planning. The city's older industries are clustered along the waterfront and CNR tracks. Laboratories, parts distribution centres and light in-

dustries have been locating outside the city and along the highway corridors for the past 20 years. The cultural, financial and administrative core has remained near the corner of James and King at Gore Park, extending recently to the W. Residential areas include the old elite Durand District between James and Queen; the innovative west-end middle-class community of Westdale; and extensive working-class areas to the E and NE. Ethnic neighbourhoods abound, usually in association with parish churches and small business districts.

During the 1960s and 1970s, the skyline changed radically, as high-rise dwellings began to appear near the city's core and spread to adjacent areas. Comparatively few office towers were constructed, reflecting Toronto's proximity and Hamilton's industrial emphasis. The IBM, Stelco, Century 21 and Government of Ontario buildings have been notable exceptions. Though many handsome stone structures were lost in the construction boom, 19th-century structures such as the Commercial Block (1858), residential Sandford Place (1858) and the renowned St Paul's Church (1857) remain. The city operates an extensive park system, the famous Royal Botanical Gardens and, through the Hamilton Historical Board, Dundurn Castle (1835), Whitehern (1848), a military museum and a children's museum.

**Population** The city's population growth has paralleled its economic cycles. After the Great Western Ry plan failed, Hamilton is estimated to have lost 20-25% of its population 1857-64. Immigration from the UK brought increases to 1900. The phenomenal industrial expansion 1900-13 led to territory annexations and attracted industrial and construction workers from the UK, US, Italy and Poland. Refugees from central Europe and the Baltic states arrived during the 1920s. Natural increase was blunted by the economic hardship of the 1930s. During

WWII, workers from Québec, the Maritimes and the West came to labour in the war industries. After the war, immigration (Dutch, German, Italian, Polish) reached a peak in 1954. Portuguese, S Asian and W Indian immigrants arrived during the 1960s and 1970s. Industrial uncertainties and the expansion of Ancaster and Dundas have decreased the population of the city proper 0.9% (1971-81).

**Economy and Labour Force** Two of Canada's 4 largest steel firms (Stelco and Dofasco) are located in Hamilton. The 1968 move of Stelco's head office to Toronto and construction of a new mill outside the city at Nanticoke shook civic optimism. Westinghouse, International Harvester, Firestone, Dominion Glass, Otis Elevator, National Steel Car, Canada Cannery and Procter and Gamble also have large plants here. Most Hamilton industries have suffered from increased energy costs and economic recessions of the 1970s and 1980s. Hamilton is thought of as a workingman's city, highly unionized. Currently, some 220 local unions have a membership of 70 000 — at one-third the total work force, roughly the national average. The NINE-HOUR MOVEMENT began in Hamilton in 1872 and the KNIGHTS OF LABOR and AFL actively recruited in the late 19th and early 20th centuries. The CIO campaigned in the 1930s and 1940s for unions that would represent all men in a plant and after serious strikes at 3 major plants in 1946 concluded agreements ensuring higher pay and increased benefits. Another major strike occurred at Stelco in 1981.

**Transportation** Hamilton's unique location has ensured a significant transportation function for the city. During the middle decades of the 19th century it was an important wholesale and immigrant distribution centre. In the 20th, its transportation pattern has been shaped by industrial giants, such as International Harvester and Stelco, which retain considerable pri-

vate interest in waterfront development. In tonnage, the port ranks 4th in Canada, ahead of all Atlantic ports and Toronto. The CNR maintains industrial freight facilities and a limited passenger service to Toronto and Niagara Falls. The Toronto, Hamilton and Buffalo Ry, now controlled by the CPR, primarily maintains business loops within the city. Intercity bus service has expanded in recent years with the growth of the Ontario government's fleet between Hamilton and Toronto. An Ontario rail commuter service also operates between Burlington and Toronto. Nordair connects Hamilton by direct flights with Windsor, Ottawa and Montréal.

**Government and Politics** From incorporation as a city (1846), Hamilton has had a council-committee form of government: aldermen elected by wards conduct general business together and meet in committees. As of Jan 1974, 17 council members assumed additional duties on the council of the new Regional Municipality of Hamilton-Wentworth, joined by officials from other jurisdictions. The regional government planning authority manages social services, police protection and water and sewer facilities. Certain local responsibilities are still managed by special commissions, some with regional or federal connections. Elected trustees constitute the public and separate school boards. Since WWII, Hamilton's mayors have served long terms. Party machines with federal and provincial party connections have remained an important aspect of local elections. Though organized labour has endorsed a few candidates, unions and the parties of the left have not always had a forceful presence on city council.

**Cultural Life** MCMASTER UNIVERSITY, with an enrolment of nearly 11 000 full-time and 6000 part-time degree students, has been an important city institution since 1930. Hamilton's central library was opened atop the new civic market 1980. Its substantial Art Gallery includes

General View of Hamilton (1853), by Robert Reginald Whale, oil on canvas (courtesy National Gallery of Canada).

works by Cornelius KRIEGHOFF and William KURELEK. The Hamilton Philharmonic Orchestra, Mohawk College Singers and McMaster Chamber Orchestra continue the city's music traditions. Unfortunately, the Royal Hamilton Conservatory of Music ceased operations 1981 for want of funding. Theatre Aquarius and dramatic productions at McMaster and by small theatre groups maintain long association with the stage. Touring companies perform in the attractive Hamilton Place complex. The *Hamilton Spectator*, the SOUTHAM chain's first newspaper (1846) and various ethnic and weekly suburban journals provide newspaper communications. TV station CHCH is one of the country's few independent and unaffiliated television operations. Several ethnic clubs have co-operated to establish the Hamilton Multi-Cultural Centre. In sports, the city has shown a special interest in running, with the annual race around the bay and regular track meets. In professional sport, the city has one team — its beloved HAMILTON TIGER-CATS — and is home to the CANADIAN FOOTBALL HALL OF FAME.

JOHN C. WEAVER

Reading: M. Katz, *The People of Hamilton, Canada West* (1975); John C. Weaver, *Hamilton: An Illustrated History* (1982).

**Hamilton, Francis Alvin George**, teacher, politician (b at Kenora, Ont 30 Mar 1912). An enthusiastic supporter of the Diefenbaker government's "Northern Vision" and an idea man in Cabinet, Hamilton was also a spokesman for western agriculture. After numerous defeats, he was elected to Parliament for Qu'Appelle in 1957; he had been leader of the Saskatchewan Tories since 1949. Appointed minister of northern affairs and natural resources in 1957, he promoted the "Roads to Resources" concept and northern development. In 1960 he became minister of agriculture. The moving force behind the Agricultural Rehabilitation and Development Agency, he engineered several wheat sales to China that gave a much needed boost to western agriculture. He was re-elected MP for Qu'Appelle-Moose Mountain in Sept 1984.

PATRICIA WILLIAMS

**Hamilton Inlet**, together with Lk MELVILLE, forms the largest estuary, over 250 km long, 40 km wide (at the western end) and 150 m deep, on the Labrador coast. The 2 are separated,

90 km from the sea, by a narrow passage, 2 km wide and 30 m deep, at Rigolet. Four major rivers, the CHURCHILL, North West, Kenamu and Goose, draining a substantial portion of the UNGAVA PENINSULA, enter the system. Hydro-electric development at CHURCHILL FALLS constitutes a major industrial benefit to the region. The existing generating station, with a capacity (5225 MW) more than 10 times that of a conventional station, was completed in the early 1960s. Further developments on the Churchill at Gull Island (1700 MW) and Muskrat Falls (600 MW) are under consideration. The region was first visited by John DAVIS in 1586 and provided sites for French and English traders in the 18th century. The inlet was named for Charles Hamilton, governor of Newfoundland 1818-24. Rigolet was founded by the HBC in 1837. The estuary was surveyed 1949-53 as part of the Blue Dolphin expedition sponsored by the Arctic Institute of N America. There are no major commercial fisheries at present within the inlet, but Hamilton Bank just offshore is the centre for a large international cod fishery.

P.C. SMITH AND R.J. CONOVER

**Hamilton Tiger-Cats**, FOOTBALL team formed through a 1950 merger between the Hamilton Tigers, who had won 2 Canadian Rugby Union Championships (1906, 1908) and 5 GREY CUPS (1913, 1915, 1928, 1929, 1932) competing as one of the Big Four (Interprovincial Football Union), and the Hamilton Wildcats, who were formed as a service club during WWII, won the 1943 Grey Cup and remained in the Ontario Rugby Football Union after the war. Future CFL Commissioner Jake GAUDAUR played on the new team, which won the 1953 Grey Cup. Beginning in 1957 under coach Jim Trimble (who retired after 1962), the Tiger-Cats played in every national final through 1967, except for those of 1960 and 1966, winning 4 Cups (1957, 1963, 1965 and 1967). Led by hard-nosed players such as John Barrow, Angelo Mosca and Vince Scott, these teams were characterized by tough defence. Another victory came in 1972, but Hamilton's Grey Cup appearance in 1980 resulted in a loss to Edmonton and in 1984 to Winnipeg. They play in 29 230-seat Ivor Wynne Stadium and were purchased by Harold Ballard in 1978.

DEREK DRAGER

**Han** territory straddled the Yukon-Alaska boundary, extending along the YUKON R from a few km S of Dawson northward to about 50 km S of Cir-

cle, Alaska. Before the KLONDIKE GOLD RUSH there were 3 Han BAND communities along the Yukon R: Nuclako-Ft Reliance near Dawson, Johnny's Village near Eagle and Charley's Village in Alaska, though the Han ranged far up the Klondike, Fortymile and other rivers. Han speech is distinct from neighbouring Athapaskan languages, but there was interaction with surrounding groups. By 1979, out of a total Han population of 300, only about 30 spoke the language.

In the spring, families moved to camps along the Yukon R where they prepared their equipment, caught whitefish and pike, and hunted moose, caribou and other game. After breakup, at the beginning of summer, they joined other band members at fish camps to catch and dry king and chum salmon. Large summer communities served as points for band and intertribal festivities and for salmon fishing. As fall approached, the Han left the river to hunt, repair their caribou surrounds, and fish in smaller rivers. In late autumn they returned to the Yukon and, during the winter, intermittently left the river to hunt and operate their caribou surrounds.

Han society was divided into 3 exogamous matrilineal clans. Clan membership carried responsibilities such as hospitality and protection to clan mates, and ceremonial obligations to those in opposite clans, such as cremating their dead. There was no formal tribe organization and status and band leadership were attained through individual ability and achievement. The primary social unit was the nuclear family, which often worked in partnership with a closely related family. Cross cousins were encouraged to marry; a young man usually lived at first with his wife's parents, then established his own residence and, wealth permitting, obtained additional wives. Polyandry also was known.

Han ideology was similar to that of other Athapaskan groups of the Yukon. Shamanism was practised by both men and women to predict the outcome of the hunt, cure illness, and destroy enemies. Artistic endeavours were manifested primarily by decorations on clothing and accessories and in songs.

Indirect European influence, principally from coastal Alaska, did not reach the Han until the end of the 18th century. After 1847 the Han dealt directly with HUDSON'S BAY COMPANY traders at Ft Yukon, but the first white settlers were American traders at Ft Reliance and Eagle, 1874-80. By 1885 the focus of trade had changed from the native FUR TRADE to servicing the fledgling placer mining industry. Thereafter, the Han obtained a relatively complete line of Euro-American hardware, clothing and food staples from the trading posts. Gold strikes on the Fortymile R late in 1886 opened the isolated area to outside settlement, and within 10 years Han lifestyle was completely disrupted by the Klondike Gold Rush. Today, many of their highly acculturated descendants live in their original homeland at Dawson and Eagle. See NATIVE PEOPLES, SUBARCTIC and general articles under NATIVE PEOPLE.

**Handball** is perhaps the oldest game played with a ball. It became popular in the 16th century and was first played in England under the name of "Fives." The Spanish also developed a variation at that time called "Peloto." The modern game is played on a court having 1, 3 or 4 walls, with 2, 3 or 4 players, or 2 teams of 2 participating. The 4-wall game is most popular today. The ball is struck with gloved hands and must strike the front wall of the court volley. Returns are made so as to make it difficult for the opponent to return to the front wall. A game

is won when one player or team scores 21 points. Points are only scored when serving. In 1863 handball matches were reported in Victoria, BC, and Saint John, NB. In Canada the sport is governed by the Canadian Handball Assn.

STAN C. FISHER

**Handsome Lake Religion** is the religion practised by a segment of the population of IROQUOIS communities in Canada and the US. Its adherents are known as "the Longhouse people" because ceremonies are held in a building called the LONGHOUSE. Its beliefs and practices are a blend of ancient Indian traditions and innovations introduced by the SENECA prophet Handsome Lake between 1799 and 1815. In Canada it is represented on Indian reserves at Caughnawaga (near Montréal), Grand River (near Brantford), Oneida (on the Thames R) and St Regis (near Cornwall).

Short versions of the *Gaiwio*, "the good words" or the Code of Handsome Lake, are recited at the Green Corn Festival in late August or early September and at the Midwinter Ceremonial in January or February. In the autumns of alternate years the *Gaiwio* is recited in full at a solemn convocation of the Six Nations by designated speakers. Each speaker holds a bundle of WAMPUM strings as his credentials, regalia acquired from his predecessors in office who taught him the *Gaiwio*. Other rites such as the Great Feather Dance, the drinking of strawberry juice, commentaries on the *Gaiwio*, and public confessions of moral lapses are performed. Members may also attend other Indian religious rites and Christian churches. The teachings of Handsome Lake played an important role in reconstructing Iroquois society after an almost complete collapse of the social and cultural order in the late 1700s. See also NATIVE PEOPLE, RELIGION.

**Hanington, Daniel Lionel**, lawyer, politician, premier of NB (b at Shediac, NB 27 June 1835; d at Dorchester, NB 5 May 1909). Clerk of circuits 1867-70 and a school trustee, he first sat as a Liberal-Conservative M.L.A. for Westmorland in 1870. He was defeated in 1874 for opposing the Common Schools legislation, but was re-elected in 1878 and sat as minister without portfolio until 1882 when he was named premier upon J.J. FRASER's resignation. Sympathetic to the Acadians, he named P.A. LANDRY his provincial secretary. Defeated by a non-confidence vote introduced by A.G. BLAIR in 1883, his government resigned. His forces were defeated again in 1886, but he continued to sit for Westmorland until 1892 when he was appointed puisne judge of the NB Supreme Court.

DELLA M.M. STANLEY

**Hanlan, Edward, "Ned,"** oarsman (b at Toronto 12 July 1855; d there 4 Jan 1908). Hanlan learned to row in Toronto harbour on a makeshift shell fashioned from a wooden plank. He proved himself to be the best sculler in Ontario in a series of races between 1873 and 1876. In 1877 he won the Canadian championship on Toronto Bay and in 1878 took the US title on the Allegheny R. He defeated all challengers and by 1879 was the unquestioned master of rowing in N America. In May 1879 Hanlan beat the English champion on the Tyne R, Eng, by an astonishing 11 lengths. He defended his title the next year against the world professional champion E.A. Trickett of Australia. After defending his world crown 6 times he lost it to William Beach in 1884.

Hanlan was Canada's first athlete to gain international recognition and its first world champion. During a time when rowing was immensely popular all over the world, Hanlan was celebrated and showered with gifts wherever he

As world rowing champion in the early 1880s, Ned Hanlan was the first Canadian athlete to gain international recognition (courtesy Public Archives of Canada/C-25324).

went. Though lectured sternly by the English press for his flamboyance, he was appreciated for his fine rowing style, with its long, smooth strokes and sharp, clean "catch." He continued to row in the 1890s, winning more than 300 races.

JAMES MARSH

**Hanna, David Blythe**, accountant, railway director (b at Thornliebank, Scot 20 Dec 1858; d at Toronto 1 Dec 1938). He came to Canada in 1882 to work with the GRAND TRUNK RY and worked with several other railway companies before joining William MACKENZIE and Donald MANN on the CANADIAN NORTHERN RY in 1896. When the Canadian government purchased Canadian Northern he resigned but was appointed first president of the board of directors of the newly formed CANADIAN NATIONAL RY. He retired 1922, but was briefly first chairman (1927-28) of the Liquor Control Board of Ont. He recounted his career in *Trains of Recollection* (1924).

ERIC J. HOLMGREN

**Hannam, Herbert Henry**, educator, farm leader (b at Swinton Park, Grey County, Ont 27 Sept 1898; d at Ottawa 12 July 1963). After attending Ontario Agricultural Coll, Herb Hannam taught school and was livestock editor of *The Canadian Countryman*. He joined the UNITED FARMERS OF ONTARIO as educational secretary in 1928, becoming its secretary-treasurer in 1933 and secretary of its sister organization, the United Farmers Co-operative Co, in 1936. He wrote *Co-operation: The Plan for Tomorrow which Works Today* (1938) and *Pulling Together for Twenty Five Years* (1940), 2 pamphlets widely used in co-operative and agrarian circles. He helped organize the Ontario Federation of Agriculture and the Canadian Chamber of Agriculture (later Canadian Federation of Agriculture) during the mid-1930s. In 1939 he was elected to the latter's presidency, which became a full-time, paid position in 1943. Hannam was an effective spokesman for Canadian agriculture. He was also a strong supporter of Farm Radio Forum which he helped start in 1939. Following WWII, Hannam was one of the first to see the importance of food production and marketing in a world with a rapidly growing population. IAN MACPHERSON

**Hanover, Man**, Rural Municipality, pop 7428 (1981c), area 71 886 ha, inc 1881, located SE of Winnipeg, encompasses the communities of Blumenort, Grunthal, Kleefeld, Mitchell, New

Bothwell, Randolph and Sarto. The town of STEINBACH is no longer part of the RM although the municipal office is located there. Hanover includes land set aside in 1873 as the East Reserve for MENNONITES from southern Russia. Several hundred families arrived in the 1870s and organized self-governing agricultural villages. A second influx in the 1920s followed the Russian Revolution. Difficult farming conditions, disagreements with provincial education policies, and secular influences on the Mennonite way of life caused some of these settlers to move away. Anglo-Saxon, French Canadian, German Lutheran, Ukrainian and Polish settlers also helped build the RM's communities.

Soil and drainage conditions encouraged a diversified agriculture — special crops, livestock, poultry, dairying and cereal grains. Blumenort is a Manitoba poultry centre; Grunthal, a dairy and milk products centre. Kleefeld is known for its beekeeping; New Bothwell for its cheddar cheese; the Steinbach area for cash crops and poultry. Business in the RM mostly serves local markets. In the 1970s several Hanover communities became locales for commuters who wished to combine urban employment with rural homes and life-styles. D.M. LYON

Reading: L. Penner, *Hanover: One Hundred Years* (1982).

**Hansard** is the unofficial name of the record of parliamentary debates. The name comes from T.C. Hansard, who printed the British debates 1812-92. It provides a statement in both official languages of spoken proceedings in both Houses of Parliament, partly for the immediate convenience of legislators but also as an indispensable historical archive. In its present form Hansard dates from 1880, when an official debates reporting branch, which now has its own director, was added to the parliamentary staff. Before that, from 1875 to 1879, a record was provided, though not by regular staff. Before 1875 somewhat haphazard collections were preserved, some of them known as Scrapbook Hansards, based on contemporary newspaper reports which covered Parliament in detail. Several of the colonies kept Hansards irregularly before Confederation, the earliest being NS in the 1820s.

The modern Hansard is an efficient enterprise which, during the session, produces a copy of each previous parliamentary day's debates by 9:00 AM. The printed copies come from shorthand reports taken on the floor of the House by reporters working 10-minute shifts. Each reporter then dictates his notes to a second person, and today electronic records supplement the printed material. The HOUSE OF COMMONS has a Broadcast Branch which keeps a complete audio and video record. Hansard is published by the Queen's Printer and in addition to the daily editions, is issued regularly in bound, well-indexed volumes readily available in libraries. Provincial debates, not all of which are referred to as Hansards, are published in a variety of ways.

NORMAN WARD

**Happy Valley-Goose Bay**, Nfld, Town, pop 7103 (1981c), inc 1955, is the result of the amalgamation of 2 towns situated on a low-lying sandy plateau at the western end of HAMILTON INLET, Labrador. Happy Valley was a townsite chosen by people relocated from Otter Cr by the Government of Canada in 1941, when it was decided to build an airport at nearby Goose Bay. By June 1943 the airport was the world's largest, used by the RCAF, the USAF and the Canadian

Army. As construction accelerated, Happy Valley grew, as over 3000 were employed on the project. The town continued as a small civilian community servicing the base, which remained a permanent airport after the war. In 1973 Happy Valley amalgamated with Goose Bay. The base is part of the DEW Line and Pinetree Line radar installations, and functions as a refueling and support installation for Strategic Air Command and as a training base for fighter pilots of the USAF, RAF and Luftwaffe.

JANET E.M. PITT AND ROBERT D. PITT

**Harbour Grace**, Nfld, Town, pop 2988 (1981c), inc 1945, with a commodious harbour in western CONCEPTION BAY, named for the French *Havre de grâce*. A base of pirate Peter EASTON, 1612-13, its settlement was begun about 1618, perhaps by former settlers of the CUPIDS colony. Until 1923 it had the second-largest population in Newfoundland. Prospering from the Labrador cod and seal fisheries, the Anglo-Irish community was by the 19th century the location of one of Newfoundland's earliest denominational schools (1843). In 1859 it was the site of sectarian riots during the general election, and in 1883 of bitter sectarian violence resulting in 5 deaths. Also, the Methodist movement was introduced to British N America from Harbour Grace in 1765 or 1766 by Rev Lawrence Coughlan, a convert of John Wesley. Several pioneering attempts at transatlantic and round-the-world flights were made from here 1919-32. In 1932 Amelia Earhart, leaving Harbour Grace, was the first woman to pilot a plane over the Atlantic. The community is today a fish-processing and service centre and supports several small industries.

JANET E.M. PITT AND ROBERT D. PITT

**Harding, Victor John**, professor of pathological chemistry (b in Eng 23 Oct 1885; d at Toronto 3 July 1934). Graduating in chemistry from Owen's Coll, Manchester (DSc, 1912), Harding began an association with McGill in 1910. He became associate professor of physiological chemistry in 1917. In 1920 he left McGill to become professor of pathological chemistry at U of T. His research was initially on analytical methods in organic chemistry, including amino acids and the chemistry of the ninhydrin reaction. He became recognized primarily for his investigations on carbohydrate metabolism in pregnancy and on toxemias associated with pregnancy. He trained many graduate students, some of whom became prominent biochemists in Canada and the US.

DAVID B. SMITH

**Hardware**, see COMPUTER SCIENCE.

**Hardy, Arthur Sturgis**, lawyer and politician, premier of Ontario 1896-99 (b at Mount Pleasant, near Brantford, UC 14 Dec 1837; d at Toronto 13 June 1901). After a promising early career as a lawyer and city solicitor in Brantford, Hardy was elected Liberal MPP for S Brant in 1873. Bills he introduced as provincial secretary (1877-89) touched on social issues and on the administration of justice, while as commissioner of crown lands (1889-96) he was responsible for important timber and mining legislation and for the establishment of ALGONQUIN PARK. He succeeded Sir Oliver MOWAT as premier and attorney general in July 1896. Following a narrow electoral victory in 1898, Hardy resigned for reasons of health in 1899.

WENDY CAMERON

**Hardy, Hagood**, pop musician (b at Angola, Indiana 26 Feb 1937). He is a major figure in the Canadian recording industry. Raised in Oakville, Ont, Hardy began his career as a vibraphonist in Toronto jazz clubs, travelled (1961-67) with US jazzmen, including Herbie Mann and George Shearing, and then turned to pop music. He led The Montage until 1974 and thereafter worked in Toronto recording studios

as a composer of music for jingles and for radio, TV and many films (*Second Wind*, *Rituals*, *Anatomy of a Seduction*, etc). His Salada Tea jingle, revised and recorded as *The Homecoming* (1975), was an international hit.

MARK MILLER

**Hare**, a group of Athapaskan-speaking people whose ancestors lived in small, nomadic bands along the lower MACKENZIE R valley of the NWT, had a precontact population of 700-800. They pursued a hunting, fishing and gathering way of life centered on caribou, moose, freshwater fish, small game and berries, and exploited a territory from the Yukon border to forested zones W and NW of GREAT BEAR LAKE. Several cultural features distinguished the Hare from neighbouring KUTCHIN, MOUNTAIN, SLAVEY and DOGRIB. They spoke their own dialect of Athapaskan and were noted for their timid relations with other native groups. The name Hare, given by early Europeans, reflected their heavy dependence on the snowshoe hare for food and clothing. Since the hare goes through a population cycle every 7 to 10 years, these Indians periodically experienced devastating starvation (see RABBIT STARVATION).

The Hare traditionally viewed their world in animistic terms. They observed many taboos to insure good hunting, and relied on SHAMANS to cure illness, protect them against enemies and intercede with the spirits. They had a rich oral FOLKLORE, and participated in drum dances and competitive gambling. Their communities were held together by kinship ties on both the father's and the mother's side. Though the Hare lacked formal leaders, outstanding hunters and shamans had considerable influence. The Hare were governed by an ethic that balanced sharing and interdependence with autonomy and freedom. There was no concept of individual ownership of land, and people were free to hunt and fish in any part of their territory.

First recorded contact with Europeans came during the explorations of Alexander MACKENZIE in 1789. Early in the 19th century the Hare were drawn into the FUR TRADE as forts spread N along the Mackenzie R. Their trading activities were centered on Ft Good Hope and also on Fts Norman and Franklin. A Roman Catholic mission was established in 1859 at Ft Good Hope, and the people's conversion to Christianity began. For much of the 19th century and until the decline of fur prices after WWII, most of the Hare combined trapping with subsistence hunting.

In recent decades the Hare have had to contend with a growing dependence on a wage-labour economy and the effects of alcohol, and tuberculosis and other diseases. Although they gave up title to their ancestral lands in a 1921 treaty with the federal government, they have retained the right to hunt, fish and trap in their traditional territory (see INDIAN TREATIES). Nevertheless, many have been attracted to the amenities of a settled life in larger towns. A notable exception to this trend was the creation, in the early 1960s, of a new village at Colville Lk, 142 km NE of Ft Good Hope, in an area rich with game and fish. Ft Good Hope and Colville Lk, with a combined population of 430 in 1978, are now the major population centres of the Hare people. See also NATIVE PEOPLES and general articles under NATIVE PEOPLE.

JOEL S. SAVISHINSKY

*Reading*: Hiroko Sue Hara, *Hare Indians and Their World* (1980); J. Helm, ed, *Handbook of North American Indians*, vol 6: *Subarctic* (1981); Joel S. Savishinsky, *The Trail of the Hare* (1978).

**Hare**, term applied to those members of order LAGOMORPHA whose young are born fully haired, with eyes open, and able to run about a few minutes after birth. All N American hares belong to genus *Lepus*: 3 species are native to Canada, one has been introduced. The northernmost species, arctic hare (*L. arcticus*), found in the tundra zone beyond TREELINE, is the largest Cana-

dian species, with adults weighing 3.2-5.4 kg. Snowshoe or varying hare (*L. americanus*) is widespread throughout Canadian forested areas and provides meat to humans in remote communities. Snowshoe hares exhibit enormous population fluctuations, peaking every 9-10 years. Numbers vary from approximately 1 hare per 50 ha to upwards of 200 per ha. The remaining native species, white-tailed jackrabbit (*L. townsendii*), largely nocturnal and solitary, is found throughout the prairies. In 1912 the European or Cape hare (*L. europaeus*) was introduced to Ontario as a game animal. Restricted to Ontario, it is sometimes a garden pest. Unlike native species, it does not turn white in winter. Young hares (leverets) are born in the open and are weaned after 2-3 weeks (5-6 in white-tailed jackrabbits). Gestation averages 36 days and, depending on the species, a litter contains 1-7 young, with up to 4 litters over a summer. Female hares are usually larger than males; hares are larger than RABBITS.

M.L. WESTON

**Hare, Frederick Kenneth**, environmental scientist, professor, administrator (b at Wylle, Eng 5 Feb 1919). A U of London graduate and wartime meteorologist with the British Air Ministry, Hare came to Canada in 1945 as a geography professor at McGill. He earned his PhD (U de Montréal) studying arctic climatology and biogeography. He has served as dean of arts and science at McGill, master of Birkbeck Coll, London and president of UBC. A professor of geography and physics at U of T since 1969, he was the first director of the Institute for Environmental Studies there 1974-79, and became provost of Trinity Coll, U of T, in 1979. His research interests include world climate, notably atmospheric carbon dioxide, CLIMATE CHANGE and arid-zone climates. Long active in movements to protect and conserve the natural environment, Hare led a federal study on nuclear-waste management in Canada and a similar program for the UN Environment Programme. He has served as director of the Washington-based energy-research group, Resources for the Future, and in 1984 was chairman of the Climate Planning Board in Canada. A frequent spokesman on the atmospheric greenhouse effect, Hare believes that the main environmental issue confronting Canada in the next 70 years will arise from climatic change induced by the expansion of fossil-fuel consumption. He has written 160 books and articles, including *The Restless Atmosphere* (1953) and, with Morley K. Thomas, *Climate Canada* (1974).

DAVID W. PHILLIPS

**Harkin, James Bernard**, environmentalist (b at Vankleek Hill, Ont 30 Jan 1875; d at Ottawa 27 Jan 1955). He worked in Ottawa as a newspaperman 1893-1901 and then served as secretary to Clifford SIFTON and Frank OLIVER, successive ministers of the interior. When a distinct parks branch was established by the ministry in 1911, Harkin became its first commissioner. With skillful eloquence he promoted the concept of unspoiled but publicly accessible wilderness, believing that PARKS represented the moral value of outdoor recreation, a haven from degenerate cities. His boundless energy pushed the parks system into 25 years of expansion. An acknowledged leader in wildlife conservation, he was instrumental in framing the Migratory Birds Convention Act 1917 and was responsible for its administration. He retired in 1936.

MAXWELL SUTHERLAND

**Harkness, Douglas Scott**, teacher, farmer, politician (b at Toronto 29 Mar 1903). A school-teacher, farmer and war hero, Harkness was elected to the House of Commons in 1945. Tory critic for northern affairs and natural resources between 1945 and 1957, he became minister of agriculture in 1957 and was especially interested in crop insurance and debt adjustment. Appointed minister of defence in Oct 1960, Hark-

ness advocated nuclear weapons for Canada and was soon in conflict with John DIEFENBAKER. He resigned from the government in Feb 1963 over the issue, but sat in the House until 1972.

PATRICIA WILLIAMS

**Harlow, Robert**, novelist, teacher (b at Prince Rupert, BC 19 Nov 1923). He was a graduate of UBC (1948) and U of Iowa (1951) and worked for the CBC, 1951-65. In 1965 he became head of UBC's creative writing dept, where he encouraged and influenced several prominent Canadian writers early in their careers. Harlow's novels include *Royal Murdoch* (1962), *A Gift of Echoes* (1965) and his best-known and finest work, *Scann* (1972), which make up the Linden trilogy, named after the imaginary northern BC town that figures in the settings of all 3 books. Later works are *Making Arrangements* (1978) and *Paul Nolan* (1983).

NEIL BESNER

**Harness Racing**, or trotting, is the competition for purse money between horses bred and trained to "trot" or "pace," driven by a driver in coloured silks who is mounted on a 2-wheeled cart called a "sulky." The horses are called standardbreds and have long pedigrees. As a rural pastime, Canadians raced horses on ice before the advent of pioneer roads. The modern sport consistently records the highest annual attendance of any professional sport in Canada or the US, and is conducted in all 10 provinces. Pari-mutuel betting on races is permitted under the supervision of Agriculture Canada. Racing conduct, rules and licensing are under the jurisdiction of provincial racing commissions and the Canadian Trotting Assn, while registration and identification are the responsibility of the Canadian Standardbred Horse Society.

Horses are owned, bred, trained and raced for pleasure and profit by individuals from all walks of life and by corporations, syndicates, breeding farms and partnerships. Familiar as the gentle, tractable "working horse" of our agricultural heritage, harness horses are close to the people who work with them and who worry over them and love them, while fans greet their favourites as old friends. Classes of racing are arranged on the basis of age, in the case of many stakes or futurities, or by money earnings, making racing available for all competent horses from slower performers to the speedy stars. Many thousands are employed full-time or part-time, or participate for recreation. Race-tracks are operated by private owners, by exhibition and fair associations, and even by fraternal and charitable organizations.

Canadians are expert horsemen and hold numerous records in the sport. Consistently more than half of the top 10 N American drivers have been native Canadians. Dave McClary of London, Ont, drove the first 2-minute mile (1.6 km) with a standardbred (1898), while Joe O'Brien of Alberton, PEI, has driven more 2-minute miles than any driver. Ben White of Whitevale, Ont, is the first to win the Hambletonian Stakes 4 times. In 1981 William O'Donnell of Springhill, NS, became the first to exceed \$4 million in yearly winnings. Hervé FILION has won more harness races than any other rider in the history of the sport. Armbr Farms of Brampton, Ont, and Gunnholme Vu Farm of Lloydminster, Alta, are among the top breeders. Among many famous Canadian-bred horses are Tacony, the first Canadian-bred world champion (1853); Gratton Bars, the first to win the top 3 pacing stakes in N America — all in one 3-week period of 1928; Jade Prince, the first 2-year-old world champion pacer (1976); and Niatross, the first to run a mile in under 1 minute, 50 seconds.

The Canadian Trotting Assn, formed in 1939, a leader in applying computer technology to sport, is the first to link all tracks under its jurisdiction in a computer network supplying instant results and information. MARGARET NEAL

**Harper, Vern**, or Asini, meaning "stone" in Cree, native dissident, native way teacher (b at Toronto 17 June 1936). As an organizer of political protests and of an urban native alternative school, Harper is a representative of the more radical wing of the native movement of the 1970s. After a troubled early life, he became politically active as VP of the Ontario Métis and Non-Status Indian Assn (1972-74). With his wife Pauline Shirt Harper (b at Saddle Lk Alta 13 July 1943) he organized the Native People's Caravan, a cross-Canada trek ending in a lengthy encampment in Ottawa (1974-75) which succeeded in bringing together native organizations to work on mutual problems and in publicizing native grievances. The ideology of the demonstration had strong traditionalist and spiritual elements which reappeared in the Wandering Spirit Survival School of Toronto, founded by Pauline and Vern Harper in 1976. He is author of *Following the Red Path: The Native Peoples' Caravan*, 1974 (1979). BENNETT MCCARDLE

**Harper, William Edmund**, astronomer (b at Dobbinton, Ont 20 Mar 1878; d at Victoria 4 June 1940). After graduating from U of T in 1906, Harper joined the Dominion Observatory, Ottawa, and later conducted a national search for a site for a proposed new observatory. In 1918 he transferred to the new institution, the Dominion Astrophysical Observatory in Victoria, becoming its second director in 1936. His field was the measurement of distances and motions of stars, and especially the study of spectroscopic binaries. He is said to have computed more orbits for these systems than anyone else and, such was his industry, it is likely that he did, at least until the advent of electronic computers. He was an active popularizer of astronomy and was awarded an honorary doctorate by U of T in 1935. A.H. BATTEN

**Harrington, Gordon Sidney**, lawyer, politician, premier of NS (b at Halifax 7 Aug 1883; d there 4 July 1943). Educated at Dalhousie (LLB, 1904), Harrington practised law in Glace Bay. After serving in the CEF, 1915-20, he became MLA for Cape Breton Centre 1925-33 and Cape Breton S 1933-37. His support from the miners contributed to the Conservatives' victory in the 1925 election and led to his appointment as minister of labour in the E.N. RHODES govern-

ment. He succeeded Rhodes as premier in 1930. An effective, though sometimes caustic, speaker and a skillful administrator, Harrington followed the orthodox policies of the day in a politically hopeless battle against the GREAT DEPRESSION. Attempts to manipulate the voting lists in the election defeat of 1933 tarnished the record of a competent administration. ERNIE FORBES

**Harris, Alanson**, manufacturer (b near Ingersoll, UC 1 Apr 1816; d at Brantford, Ont 3 Oct 1894). A sawmill operator in Brant County, Harris bought a foundry in Beamsville in 1857 and began manufacturing farm implements. His firm prospered by aggressive marketing practices and by technological leadership secured through the acquisition of Canadian rights to American patents, and later through the development of its own machinery designs. In 1872 he moved to Brantford and in 1879 began marketing his products in western Canada. His firm, A. Harris, Son and Co, merged in 1890 with its major competitor, the Massey Manufacturing Co, to form Massey-Harris Co Ltd (later MASSEY-FERGUSON LIMITED), Canada's largest farm-implement manufacturer. JOSEPH LINDSEY

Reading: Merrill Denison, *Harvest Triumphant* (1948); E.P. Neufeld, *A Global Corporation* (1969).

**Harris, Lawren Stewart**, painter (b at Brantford, Ont 23 Oct 1885; d at Vancouver 29 Jan 1970). Catalyst and leader in the creation of the GROUP OF SEVEN, founding member and first president of the Canadian Group of Painters, and the painter who influenced Jock MACDONALD, and through him other Toronto painters, to paint abstractly. Harris had a profound influence on 3 generations of art in Canada. Harris's father was Thomas Morgan Harris, the secretary of the A. Harris, Sons and Co., a manufacturer of farm machinery which in 1891 amalgamated with Massey to form the Massey-Harris Co: Lawren Harris was thus a rich man. After attending Toronto's St Andrews College, Harris went to the University of Toronto where he was encouraged by his mathematics professor to study art in Berlin. After 4 years of study (1904-08), Harris re-

Lawren Harris developed into a magnificent landscape painter, transforming the powerful forms of nature into works of force and elegance, as in *Above Lake Superior* (1924) (courtesy Art Gallery of Ontario/gift from the Reuben and Kate Leonard Canadian Fund, 1929).

turned to Canada. In 1908 he went on a sketching trip to the Laurentians; in 1909, with J.W. Beatty, he sketched in Haliburton. That fall he went to Memphremagog, Qué. At the same time, he drew and painted houses in downtown Toronto; by the winter of 1911-12, he was sketching with J.E.H. MACDONALD and had become friendly with Tom THOMSON. In 1913, Harris and MacDonald visited and were inspired by an exhibition of Contemporary Scandinavian Art at the Albright Art Gallery (now the Albright-Knox) in Buffalo.

By the early 1920s, when the Group of Seven was formed, Harris had developed into a magnificent landscape painter, transforming the powerful forms of nature into works of force and elegance in works such as *Above Lake Superior* (c1924) and *Maligne Lake* (1924). In these and other paintings he reduced the shapes of mountains, shoreline, trees, lakes and clouds, always parallel to the picture plane, to their essentials for an austere, monumental effect. He painted for 5 successive autumns in Algoma and Lake Superior (1917-22), in the Rockies from 1924 on, and in the Arctic in 1930. As artist-in-residence at Darmouth Coll, NH, he moved progressively through drawing into nonobjective art. In Santa Fe, NM, he worked with Dr Emil Bistram, leader of the Transcendental Group of Painters, which Harris also helped found in 1939. His Vancouver work (1940-70) continued to explore abstraction inspired by the rhythms of nature. Harris's belief in theosophy is intimately linked to his development as a nonobjective artist. Through abstract paintings, such as *Abstract Painting No 20*, many of which use forms from landscape, he sought to portray a binding and healing conception of the universe — to make the sublime visual. His paintings have been criticized as being cold, but in fact they reflect the depth of his spiritual involvement. His world view makes him unique among Canadian painters, although his philosophy kept him aloof from spontaneously created art — a crucial factor in later painters' abstraction. Nevertheless, his landscape paintings, such as *Lake and Mountains* (1928) and some of his abstractions, are among the icons of Canadian art.

In his own lifetime Harris was the subject of 2 retrospectives, in 1948 and 1963. In 1978 the Art Gallery of Ontario held an exhibition, *Urban Scenes and Wilderness Landscapes, 1906-1930*. In 1982-83 a national travelling exhibition of his drawings was held. The bulk of his work is found in the National Gallery of Canada, Art Gallery of Ontario, and the McMichael Canadian Collection, Kleinburg, Ont. JOAN MURRAY Reading: B. Harris and R.G.P. Colgrove, eds, *Lawren Harris* (1969); Joan Murray and Robert Fulford, *The Beginning of Vision* (1982).

**Harris, Robert**, artist (b at Vale of Conway, Wales 18 Sept 1849; d at Montréal 27 Feb 1919). He is best known for his painting *The Fathers of Confederation*, which was burned in the fire that destroyed the Parliament Buildings in Ottawa in 1916. He emigrated to PEI with his family in 1856, including his brother William Crichtlow HARRIS. He studied in Boston, Paris and Rome and travelled extensively in Europe, Canada and the US. He did illustrations for publications in Boston, Halifax, Montréal and Toronto, and was commissioned by Gordon Brown of the *Globe* in 1880 to go to Lucan to sketch the prisoners accused of murdering the DONNELLYS. A distinguished portrait painter, Harris portrayed over 200 of the leading personalities of the day, including Sir John A. MACDONALD, George MONRO GRANT and Lord ABERDEEN. He lived much of his life in Montréal teaching at the Art Assn there. He was a founding member of the Royal Canadian Academy in 1880 and of the Pen and Pencil Club in 1890. Elected president of the RCA in 1893, he worked for 13 years to promote young Canadian artists by having

Robert Harris, *Ruth Harris*, oil on canvas. Harris was born in Wales and at age 7 moved to PEI, where he developed into a distinguished portrait painter (private collection).

them represented at all major international exhibitions of the period. Two of his most popular paintings, *A Meeting of the School Trustees* and *Harmony*, are in the National Gallery of Canada. In 1928 his widow built the Robert Harris Memorial Gallery and Library in Charlottetown, PEI. This building was replaced in 1963 by the Confederation Centre and its gallery houses an extensive collection of Harris works and archives.

MONCRIEFF WILLIAMSON

Reading: Moncrieff Williamson, *Robert Harris* (1971).

**Harris, Walter**, Tsimshian artist (b at Kispiox, BC 10 June 1931). A hereditary chief of the Gitksan village of Kispiox, Harris is a senior artist at the Gitksan School of Northwest Coast Indian Art at Ksan, Hazelton, BC. Versed in the culture of the Skeena River people, he helped to erect the traditional plank-and-beam wood-carving building at the school; later he taught in that building while fulfilling major commissions. Though a competent and prolific printmaker, Harris is primarily noted as a carver. His impressive "Mother of Grouse" pole at Kispiox commemorates his family's crests, replicating one that disappeared from his home village long ago.

CAROL SHEEHAN

**Harris, Walter Edgar**, analytical chemist, professor (b at Wetaskiwin, Alta 9 June 1915). A recognized leader in the development of teaching and research in analytical chemistry in Canada, Harris studied chemistry at U of Alberta and Minnesota. He joined the dept of chemistry at Alberta in 1946, teaching and carrying on research in polarography, gas chromatography and theories of chemical separation, and developed a vigorous analytical chemistry division. A consultant in analytical education at universities throughout N America, he was also a government adviser on disposal of hazardous wastes. His books include (with H.W. Habgood) *Programmed Temperature Gas Chromatography* (1966), (with H.A. Lehtinen, 1975) *Chemical Analysis* and (with B. Kratochvil) *Chemical Separations and Measurements* (1974).

W F ALLEN

**Harris, William Crichtlow**, architect (b at Boothe, near Liverpool, Eng 30 Apr 1854; d at Halifax 16 July 1913), brother of painter Robert

HARRIS. Brought to Charlottetown as a child, he attended Prince of Wales College and in 1870 joined architect David STIRLING in Halifax. In 1875 he established his own practice in Charlottetown. His buildings reflect a talented and original approach to the High Victorian Gothic style. Over 90 are extant in PEI, NS and NB. They include St James Anglican Church, Mahone Bay, NS (1886); All Souls' Chapel, Charlottetown (1888); and his masterwork, St Paul's Anglican Church, Charlottetown (1895).

GRANT WANZEL AND KAREN KALLWEIT

**Harrison, David Howard**, physician, politician, premier of Manitoba, farmer, businessman (b at London, Canada W 1 June 1843; d at Vancouver 8 Sept 1905). Educated at U of T and McGill, he practised medicine in St Mary's, Ont, until 1882, when he settled in Manitoba and carried on extensive farming operations. Elected an MLA for Minnedosa in 1883, he was appointed minister of agriculture in John NORQUAY's government on 27 Aug 1886. Harrison became premier of Manitoba on 26 Dec 1887, but when the legislature met on 12 Jan 1888 his lack of support was apparent and his ministry resigned on 19 Jan 1888.

LOVELL C. CLARK

**Harrison River**, 15 km long, flows SW from Harrison Lk to join the FRASER R about 100 km upriver from Vancouver in southern BC. A famed holiday resort, Harrison Hot Springs, is located where the river leaves the lake. It is named after Benjamin Harrison, deputy governor of the HBC 1835-39.

DANIEL FRANCIS

**Harriss, Charles Albert Edwin**, composer, impresario, educator, organist-choirmaster, conductor (b at London, Eng 16 Dec 1862; d at Ottawa 31 July 1929). Trained as organist and choirmaster in English cathedrals, in 1882 Harriss was appointed to St Alban's, Ottawa, and then to Christ Church Cathedral, Montréal, returning to Ottawa in 1900. Honorary director of examinations of the Royal Schools of Music, first director of the McGill Conservatory, Harriss also arranged many concerts and festivals, bringing outstanding British artists to Canada, and organized massive choirs. In 1924 he became music director of the British Empire Exhibition in Wembley (London, Eng). His numerous works were performed throughout the British Empire. He received an honorary fellowship from the Royal Academy of Music and the Lambeth doctorate from the archbishop of Canterbury.

MABEL H LAINE

**Harron, Donald**, actor, writer, broadcaster (b at Toronto 19 Sept 1924). While studying at U of T, he performed for CBC Radio and the New Play Soc. He had major roles at the STRATFORD FESTIVAL in the early 1950s and then for over a dozen years worked on stage, TV and in films in England, New York and Los Angeles. As the ill-dressed, malapropish farmer from Parry Sound, Charlie Farquharson (and more recently as Toronto matron Valerie Rosedale), he has performed on Canadian radio and American TV, and written such best-selling books as *Histry of Canada* and *Jogfree of Canada*, offering social and political satire while entertaining. Harron also wrote the libretto for *Anne of Green Gables*, Canada's longest-running stage musical, and hosted CBC Radio's "Morningside" 1977-82. A warm, intelligent and thoughtful entertainer, he is notorious for his witty manipulation of language. In 1984 he published *Debunk's Illustrated Guide to the Canadian Establishment*.

ALLAN M. GOULD

**Hart, Evelyn Anne**, ballerina (b at Toronto 4 Apr 1956). Her distinctive physique, dramatic intensity and sublimely lyrical dancing have made her one of the most compelling stage personalities in Canada. By common standards a late starter, Hart trained briefly at the NATIONAL BALLET SCHOOL, with teachers in London, Ont, and

principally at the school of the ROYAL WINNIPEG BALLET, entering the company in 1976. She became a soloist in 1978 and a principal dancer in 1979. In 1980 Hart won the gold medal for best female soloist at the International Ballet Competition in Varna, Bulgaria. She has appeared around the world as a guest artist as well as with other Canadian companies.

MICHAEL CRABB

**Hart, John**, financier, politician, premier of BC (b at Mohill, Ire 31 Mar 1879; d at Victoria 7 Apr 1957). Arriving in Victoria in 1898, Hart worked in a financial firm before founding his own business, Gillespie, Hart and Co, in 1909. Elected a Liberal MLA for Victoria in 1916, and never defeated, he served as "almost a perpetual finance minister" from 1917 until 1949, except for the years 1924-33 when he retired from politics for business reasons. In Dec 1941 Hart became Liberal premier of a coalition government, a position he held until he retired in 1947. Under him the BC Power Commission was established to undertake rural electrification and a program of highway construction was begun, including the Hart Hwy from Prince George to Dawson Creek.

PATRICIA E. ROY

**Hart, Julia Catherine**, née Beckwith (b at Fredrickton 10 Mar 1796; d there 28 Nov 1867). Hart wrote the first work of fiction by a native-born Canadian to be published in Canada. Her novel *St Ursula's Convent; or, The Nun of Canada. Containing Scenes from Real Life* (1824) was written when she was 17 and it is a sentimental, moralistic melodrama. As a young girl she experienced both the English and French cultures — a dual heritage reflected in her novel. Her second novel, *Tonnewonte* (1825), is set in the US. In this work she wrote to entertain and to set forth her idealism about the freedom and serenity of western frontier life.

DOUGLAS LOCHHEAD

**Hart House String Quartet** was formed in Toronto in 1923 when Geza de Kresz, violinist, Milton Blackstone, violist, Boris Hambourg, cellist and, a short time later, Harry ADASKIN, violinist, began rehearsing together. The ensemble gave its first concert in the Hart House Theatre in 1924 before an invited audience. So successful was this concert that the Massey Foundation undertook to establish the group permanently by guaranteeing the players' salaries, and as a result the Hart House String Quartet began an internationally respected career lasting until 1946. Hambourg remained with the quartet throughout its career but the other members changed. De Kresz withdrew in 1935 and was replaced by James Levey. Adaskin left in 1938 and was succeeded by Adolph Koldofsky, followed in 1942 by Henry Milligan. Blackstone left in 1941 and was replaced by Allard de Ridder, followed by Cyril Glyde in 1944. The quartet gave 10 annual concerts at Hart House and 10 at Convocation Hall, U of T. It made numerous Canadian tours, gave many concerts in the US and toured Britain and Europe twice. In the early days of broadcasting it was contracted by the CNR, and continued radio engagements into the late 1930s and early 1940s for the CBC. Its repertoire included music from classic, romantic and modern composers. It gave several first Canadian performances and several premieres of the works of Canadian composers. Occasionally the quartet performed with an outstanding guest artist, such as Maurice Ravel, Sir Ernest MACMILLAN and Ernest Seitz. It was internationally acclaimed for its sensitive and skillful playing. Its Victor recordings are treasured by knowledgeable collectors and fortunate owners. See also CHAMBER MUSIC; MUSIC HISTORY. MABEL H. LAINE

**Hart Trophy** is awarded annually to the player chosen by hockey writers as being "most valuable" to his NATIONAL HOCKEY LEAGUE team. It was donated to the NHL in 1923 by Dr David A. Hart, father of Cecil Hart, former manager of the

Montréal Canadiens. The oldest and most prestigious individual award in hockey, it was retired to the HOCKEY HALL OF FAME in 1960 and replaced by the Hart Memorial Trophy. Gordie HOWE won it 6 times, Eddie SHORE 4, Howie MORENZ 3 and Bobby ORR 3. Wayne GRETZKY won it his first 4 seasons in the league.

JAMES MARSH

**Hartland, NB**, Town, pop 846 (1981c), inc 1918, is located at the mouth of the Becaguimec Stream, 124 km upriver from Fredericton on the SAINT JOHN R. First settled by William Orser, a New York LOYALIST, the community developed in the 19th century from being the commercial centre for the surrounding farms to being the site of many small manufactures. This varied economic base shifted towards specialization in the 20th century with the development of potato-chip production (Humpty Dumpty Ltd) and trucking (Day and Ross Ltd, one of the 10 largest transport companies in Canada). Although the town's main street has been considerably altered by fire and flood in the last few decades, Hartland is steeped in history. Three New Brunswick premiers have hailed from here. The 391 m Hartland Covered Bridge attracts visitors yearly from around the world.

FRED FARRELL

**Hartman, Barney**, skeet shooter (b at Swan River, Man 2 Nov 1916). Judged by his peers the greatest skeet shooter in the world, Hartman was 10 times captain of the National Skeet Shooting Assn all-American team and 4 times recorded perfect 100x100 with the 410 gauge. He claimed nearly 30 world titles in 12, 20, 28, 410 gauge and all-round categories. He once broke a string of 2002 clay targets without a miss and he frequently shattered records. He won a silver and 4 bronze medals in world competition and for 9 of 12 years as amateur and professional boasted the world's best average.

BOB FERGUSON

**Hartman, Grace**, labour leader (b at Toronto 14 July 1918). Hartman was the first female unionist to hold the top position in a Canadian union. In 1954 she joined the National Union of Public Employees (TLC), where she held several local and provincial positions. When the CANADIAN UNION OF PUBLIC EMPLOYEES (CUPE) was formed in 1963, by a merger of her union with the National Union of Public Service Employees (CCL), she was elected to its national executive as a regional VP for Ontario. Hartman successfully campaigned for full collective-bargaining rights for municipal and school-board employees. She promoted women's rights inside and outside of the labour movement. In 1981 she was jailed for counselling an illegal strike; she insisted that hospital workers, legally barred from striking, must have full collective-bargaining rights.

In 1965 Hartman was elected one of CUPE's 5 general VPs; in 1967 she became the national secretary-treasurer, in 1975 the national president, and in 1976 Canada Labour Congress general VP. She retired in 1983.

LAUREL SEFTON MACDOWELL

**Harvest Excursions** Before the introduction of the combine, prairie harvests required large numbers of labourers for short periods of time. Harvest excursion trains, 1890-1930, brought workers west — about 14 000 in 1908. Railways offered harvest tickets from any station as far away as the Maritimes to Winnipeg for \$15, and a return fare of \$20. Excursion trains provided crude accommodation: packed 4 per compartment, passengers slept on slatted wooden seats. Delays, crowding and drunkenness on occasion led to destructive riots. In the 1920s railways demanded and got RCMP detachments on the trains to keep order. The harvesting work paid \$1.75-\$2.25 for a 10-12-hour day with board, and usually lasted 15 days. A threshing crew of perhaps 2 dozen was paid \$2-\$3.25 each a day

A 1911 advertisement for men needed to harvest grain in western Canada. Excursion trains brought workers from as far east as Halifax (courtesy Public Archives of Canada/C-54925).

with board. Although the journey was rough and the work was gruelling, the excursions introduced Canadians and Britons to the Prairies. Many decided to return permanently to HOMESTEAD. The collapse of the wheat economy in 1930 and changing farm technology ended the era of the harvest excursion.

PETER A. RUSSELL

**Harvey, Douglas**, hockey player (b at Montréal 19 Dec 1924). He rejected offers from major-league football and baseball teams and played amateur senior hockey for Montreal Royals before joining MONTREAL CANADIENS in 1947-48. He was the greatest defenceman of his era, controlling the tempo of the game with pinpoint passing, subtle playmaking and dramatic rushes. He was the defensive leader of the powerful Canadian team that won 5 consecutive Stanley Cup victories 1956-60. He won the JAMES NORRIS TROPHY for outstanding defenceman 7 times, was first all-star 10 times and scored 88 goals and 452 assists in 1113 regular-season games and 8 goals and 64 assists in 137 playoff games. His career in Montréal ended when he became active in the NHL players association and he was traded in 1961 to New York Rangers where he was player-coach for a year. He played for several teams in the minors before returning to the NHL with Detroit and St Louis. He was briefly coach of LA Kings (1970).

JAMES MARSH

**Harvey, Jean-Charles**, journalist, writer, lecturer (b at La Malbaie, Qué 10 Nov 1891; d at Montréal 3 Jan 1967). A lively and outspoken thinker, Harvey was at the heart of almost every cultural, political and social debate of his time. After working as a reporter for *La Patrie* and *La Presse*, Harvey took an advertising position with a Montmagny company. The firm's bankruptcy inspired his first novel, *Marcel Faure* (1922). In Feb 1922 he joined *Le Soleil*, where in 1927 he became editor-in-chief. He lost his job when his novel, *Les Demi-civilisés* (1934), was indexed by Cardinal VILLENEUVE on 26 Apr 1934. He continued to publish and founded the weekly *Le Jour* (1937-46). In 1952 Harvey became a radio news commentator. A year later he moved to *Le Petit Journal*, where he was technical director (1956-66). He published numerous works, lectured across Canada and gave regular radio broadcasts. Faithful to his principles and with independence of spirit, humanitarian ideals and attachment to nature, Harvey was one of the great French Canadian journalists.

GUILDO ROUSSEAU

**Harvey, Sir John**, soldier, colonial administrator (b in Eng 23 Apr 1778; d at Halifax 22 Mar 1852). Of fairly humble origin, he rose to become a Lt-gen in the British army. During the WAR OF 1812 he distinguished himself against a superior American force at the battle of Stoney Creek, Upper Canada. After a number of minor posts he was appointed Lt-gov of PEI in 1836, where he prevented disputes between absentee landlords and their tenants from erupting into violence. He was sent to NB in 1837 and negotiated an agreement with the Assembly that ushered in an "age of harmony" there. Dismissed 1841 for seeking to settle the NB-Maine boundary dispute by direct negotiations with Maine, he was made Lt-gov of Newfoundland later that year and restored a degree of political tranquility. In 1846 he was transferred to NS, where he presided over the transition to RESPONSIBLE GOVERNMENT. Harvey was perhaps the most successful colonial governor of his day. P.A. BUCKNER

**Harvey, Moses**, clergyman, essayist, naturalist (b at Armagh, Ire 21 Mar 1820; d at St John's 3 Sept 1901). He was of Scottish descent and was ordained a Presbyterian minister in 1844. After serving in Maryport, Eng, he immigrated to Newfoundland in 1852. His ministry at St Andrew's Free Presbyterian Church in St John's was long and successful, but he is best known as a champion of Newfoundland and prolific writer of hundreds of publications. He contributed over 600 articles to the *Montréal Gazette*, some under the pen name "Delta." Elected to the Royal Soc of Canada in 1892, he served with distinction as secretary to the Newfoundland Fisheries Commission, calling for the establishment of a "world class marine sciences research laboratory in Newfoundland." His name is associated with early specimens of the giant squid *Architeuthis* from the 1870s. Truly a Victorian savant and an outstanding man of letters, Harvey was author of *Across Newfoundland with the Governor* (1879), *Text-Book of Newfoundland History* (1885) and *A Short History of Newfoundland: England's Oldest Colony* (1890). F.A. ALDRICH

**Harvie, Eric Lafferty**, oilman, philanthropist (b at Orillia, Ont 2 Apr 1892; d at Calgary 11 Jan 1975). Harvie was called to the Alberta bar in 1915. He served overseas in WWI, was wounded in France and achieved the rank of captain. As a Calgary lawyer, he was involved in the oil business and in 1944 purchased the mineral rights held by British Dominions Land Settlement Co. With these he formed Western Leaseholds, Ltd., and Western Minerals, Ltd.; in 1947-48, when oil was discovered on several of his leases in the Leduc and Redwater fields, he became wealthy. In 1955 he turned to philanthropic endeavours. His major achievement was forming the Glenbow Foundation in Calgary and later overseeing the creation of Heritage Pk. A modest man, he kept most of his good works secret, but he was known for his assistance to the Calgary Zoological Soc, BANFF CENTRE SCHOOL OF FINE ARTS and Luxton Museum. He was a founding officer of the Canada Council. HUGH A. DEMPSEY

**Harwood, Vanessa**, ballet dancer (b at Cheltenham, Eng 14 June 1947). One of Betty OLIPHANT's first pupils in Canada, Harwood attended the NATIONAL BALLET SCHOOL, graduated into the NATIONAL BALLET OF CANADA in 1965, and became a soloist in 1967 and a principal dancer in 1970. Known for her interpretation of *Swan Lake* and *The Dying Swan*, Harwood is admired for her virtuosity and her seductive stage presence. She has made numerous guest appearances in the US, Australia and Europe. PENELOPE DOOB

**Hastings, Charles John Colwell Orr**, obstetrician, medical officer of health (b in Markham Township, Canada W 23 Aug 1858; d at Toronto 17 Jan 1931). Educated at Victoria Coll Medical School in Toronto with postgraduate

training in Great Britain, Hastings was one of the first full-time obstetricians to practise in Toronto. As Toronto's MOH 1910-29, he purified the water supply and established an internationally recognized public-health nursing system. He was a leading pioneer of health education programs, medical and dental inspection in public schools, and neighbourhood baby clinics in Canada. These innovations lowered Toronto's death rate from communicable diseases (from 15.3 per 1000 in 1909 to 10.3 per 1000 in 1925) and made the city a cleaner and healthier place to live. Hastings's accomplishments were recognized with his election as president of the Canadian Public Health Assn in 1916 and the American Public Health Assn in 1918. Through his efforts, Toronto's Health Dept became internationally renowned for its achievements in preventive medicine.

HEATHER MACDOUGALL

**Haszard, Francis Longworth**, lawyer, politician, premier of PEI, judge (b at Bellevue, PEI 20 Nov 1849; d at Charlottetown 25 July 1938). Elected to the Legislative Assembly in 1904, Haszard became premier in 1908, serving until 1911 when he was appointed master of the rolls and judge of the Supreme Court. He retired from the bench in 1930.

NICOLAS J. DE JONG

**Hatfield, Richard Bennett**, politician, premier of NB (b at Woodstock, NB 9 Apr 1931). The longest-serving premier of New Brunswick, he has promoted national unity and linguistic equality and worked for the patriation of the CONSTITUTION and a CANADIAN CHARTER OF RIGHTS AND FREEDOMS. Educated at Acadia and Dalhousie Law School, he practised law briefly and was sales manager of Hatfield Industries, the family potato chip business 1958-65. In 1961 he was elected Conservative MLA for Carleton County. Unsuccessful in his 1966 bid for the party leadership, he was named House leader in 1968 and elected party leader in 1969. The next year he led his party to victory over L.J. ROBICHAUD.

Hatfield's government has consolidated the Liberal program of Equal Opportunity and implemented the Official Languages Act. Political reforms include the Political Process Financing Act and single-member electoral districts, both part of plans to reorganize government structure and responsibility. In spite of controversy over the Bricklin car venture, Point Lepreau nuclear power plant, spruce-budworm spraying and party fund-raising activities, Hatfield's Conservatives were re-elected 1974, 1978 and 1982, and he has succeeded in expanding Conservative

Richard Hatfield, the longest-serving premier in the history of New Brunswick. He first became premier in 1970 (courtesy Canapress).

support in the francophone regions. A premier of national reputation, he promotes NB as the microcosm of Canada. DELLA M.M. STANLEY

**Hatheway, George Luther**, farmer, lumberman, politician, premier of NB (b at Musquash, NB 4 Aug 1813; d at Fredericton 5 July 1872). Elected in 1850 as Reform MLA for York and defeated in 1857, he was re-elected in 1861 and named chief commissioner of public works by S.L. TILLEY. Opposed to the Québec Resolutions, Hatheway left Tilley's pro-Confederation government and was elected in 1865 as an anti-confederate. He declined to lead the government, preferring to be commissioner of public works for A.J. SMITH, and retired in 1866. On accepting the reality of Confederation, he was re-elected in 1870 and in 1871 agreed to form a coalition government. As premier and provincial secretary, he and G.E. KING passed the Common Schools Act, thereby introducing a free, tax-supported, non-sectarian school system.

DELLA M.M. STANLEY

**Haultain, Herbert Edward Terrick**, mining engineer, educator (b at Brighton, Eng 9 Aug 1869; d at Toronto 19 Sept 1961). A graduate of U of T who acquired practical mining experience in Europe, he returned to Canada in 1905 as professor of mining and engineering at U of T. He remained in that position for more than 30 years. He developed the "Ceremony of the Calling of the Engineer," a private ritual for engineers graduating from Canadian universities, and was instrumental in founding the Technical Service Council, formed for the initial purpose of keeping engineers in Canada. He also designed and built the Superpanner and Infraser, instruments used in dressing ore. PHYLLIS ROSE

**Haven, Jens**, founder of the Moravian mission in LABRADOR (b at Wust, Jutland, Denmark 23 June 1724; d at Herrnhut [E Germany] 16 Apr 1796). After 10 years at the Moravian settlement at Herrnhut (1748-58), he was sent to the Inuit Mission in Greenland. In 1764 he went to Labrador, hoping to found a mission for the Labrador Inuit. An earlier attempt (1752) had failed. Newfoundland's new governor, Hugh PALISER, whose jurisdiction included Labrador, supported Haven in the hope that the Moravians could help resolve conflicts between the Inuit and the white people. In May 1769, 40 470 ha of land in Labrador were granted to the Moravian Church, and in Aug 1771 Haven and his followers established the first Moravian Mission at NAIN on the northern coast. During Haven's 13 years in Labrador other missions were established at Okak and Hopedale. In 1784 he returned to Herrnhut. A strong-minded man, he believed it was his destiny to work among the Inuit of Labrador, a people he loved.

JOHN PARSONS

Reading: John Parsons, *Labrador* (1970).

**Haviland, Thomas Heath, Sr**, politician, businessman, public official (b at Cirencester, Eng 30 Apr 1795; d at Charlottetown 18 June 1867). A member of the ruling elite before RESPONSIBLE GOVERNMENT, Haviland was at the centre of PEI life until his death. He arrived in 1816 and was appointed to a series of increasingly lucrative offices, including assistant judge of the Supreme Court, colonial secretary, and clerk of the Executive Council. He was also agent for absentee landowners and acquired substantial holdings of his own. An MLA 1854-58, in 1857 he was elected mayor of Charlottetown, a post he held until his death. Haviland was a prominent Anglican, a leading Tory and president of the Bank of PEI. P.E. RIDER

**Hawk**, common name for several species of diurnal BIRDS OF PREY from widely separate families. These birds are superficially alike, being smaller than EAGLES and having large, keen eyes,

hooked bills and sharp, curved talons. True hawks belong to the family Accipitridae, which also includes eagles and Old World vultures and contains over 200 species worldwide. Females of all species are considerably larger than males. Ten species of true hawk breed in Canada. Buteos are the large hawks commonly seen, in spring and summer, soaring over open areas or perched on dead trees or telephone poles. The most common species across southern Canada is the red-tailed hawk (*Buteo jamaicensis*). All 6 Canadian species build their own nests and most nest in trees or on the sides of cliffs. Ferruginous and rough-legged hawks (*B. regalis*, *B. lagopus*, respectively) have adapted to ground nesting in open, treeless prairie or arctic tundra. Buteos feed largely on rodents and are considered beneficial to humans. Those that breed in Canada normally migrate S in winter, most moving to the southern and central US. Swainson's and broad-winged hawks (*B. swainsoni*, *B. platypterus*) winter in S America. Of the accipiters (forest hawks), sharp-shinned and Cooper's hawks and northern goshawks (*Accipiter striatus*, *A. cooperii* and *A. gentilis*) breed across Canada in forested areas. They tend to use different prey species and may be found nesting in close proximity in mixed woodland. Sharp-shinned and Cooper's hawks feed almost exclusively on small birds. Goshawks feed heavily on hares, squirrels and grouse. Although secretive by nature, all 3 species are bold hunters and will protect their nests against all intruders. The marsh hawk or northern harrier (*Circus cyaneus*) breeds across Canada. A slow-flying, open-country hawk, it is most often observed over marshes and meadows hunting for mice and small birds. R.W. FYFE

**Hawkesbury**, Ont, Town, pop 9 877 (1981c), inc 1896, located on the Ottawa R, 100 km NW of Montréal and 95 km E of Ottawa. Founded in 1798, the town was eventually named for Charles Jenkinson, Baron Hawkesbury. Thomas Mears built the first gristmills and sawmills, and the *Union*, the Ottawa R's first steamer. Demand for timber during the Napoleonic Wars created a boom. Timber and pulp-and-paper industries have been supplanted by textiles, synthetic fibres and metal tubes. The Grenville Canal on the Québec side of the Ottawa opposite Hawkesbury is an important link in the river's transportation system. Part of Hawkesbury was submerged by a Hydro Québec dam built 1950-62. K.L. MORRISON

**Hawkins, Ronald**, "Rompin' Ronnie," rock singer (b at Huntsville, Ark, 10 Jan 1935). "The Hawk," a father figure in Canadian rock music, was a rockabilly performer when he first toured Ontario in 1958. He settled in Toronto, despite the international success of such early recordings as "Mary Lou," "40 Days" and the classic "Who Do You Love?" (some of his bands in the 1960s (eg, The Band, Crowbar) had major careers of their own, as did individually many former Hawkins musicians. He made several comebacks in the 1970s and in 1982 starred on CTV's "Honky Tonk." MARK MILLER

**Hawley, Sanford Desmond**, jockey (b at Oshawa, Ont 16 Apr 1949). Riding professionally since 1968, Hawley has been one of N America's most successful jockeys. He has won 25% of the races he has entered, the highest winning percentage among N American jockeys; he was Canada's leading jockey in 1969 and won the N American title in 1970, 1972 and 1973. In 1973 he became the first rider to win over 500 races in a single year and, in 1980, won his 4000th career race, the youngest jockey to reach this plateau. Hawley has twice won the LOU MARSH TROPHY, awarded annually to Canada's outstanding athlete. He has also been honoured in the US, winning the prestigious Eclipse Award for his race-track performances. He rode winners in the QUEEN'S PLATE 4 times. J. THOMAS WEST

Hawthorn (*Crataegus*), with flowers and fruit (berries) (artwork by Claire Tremblay).

**Hawthorn**, small, deciduous TREE or shrub of genus *Crataegus*, family Rosaceae (rose). Hawthorns are normally armed with strong thorns (modified branches), and have fragrant, insect-pollinated, white, pink or, occasionally, red flowers in showy clusters. The leaves are serrate or lobed and brilliantly coloured in autumn. The red, applelike fruit is fleshy and has 1-5 bony seeds. Most species occur in the north temperate zone. Because of the differing treatment of the many hybrids and asexual clones found in nature, the number of species is variously estimated from 100 to 1100, although the lower numbers appear more realistic. In eastern Canada, hawthorns are very common and are represented by many species; in the West, they are less common. The berries were eaten and used medicinally by Canadian Indians and early settlers, who also made hawthorn wine. Hawthorns are ORNAMENTALS, used in landscaping as trees or in hedges. See PLANTS, NATIVE USES.

**Hay River**, 702 km long, rises out of several headstreams in northeastern BC and flows NE across Alberta to empty into GREAT SLAVE LK. Its lower reaches are broken by 2 spectacular waterfalls and a 5 km stretch of rapids surging through a deep gorge. The community of Hay River, located at the river's mouth, is one of the largest in the NWT. The river valley is a principal route into the middle north and is followed by a highway and a railway. The name refers to the luxurious growth of hay and grass along the river's banks. DANIEL FRANCIS

**Hay River**, NWT, Town, pop 2863 (1981c), inc 1963, is located on the S shore of GREAT SLAVE LK at the mouth of the HAY R, 201 air km SW of YELLOWKNIFE. The original homeland of the Slave DENE. Hay River first became settled in the late 1800s with an HBC trading post and Anglican and Catholic missions. The present community dates back to 1948 with the construction of the Mackenzie Hwy from Hay River to Grimshaw, Alta. The community became an important transportation and communications centre. It is the staging point for the shipping industry up the MACKENZIE R and also the centre of the Great Slave Lk commercial fishery. In 1963 a serious

flood at the old townsite required the evacuation of the entire population to a safer area upriver. In 1964 the community's economy was stimulated by the completion of a CNR railway link. Today, Hay River remains one of the few NWT communities that is largely dependent on private enterprise. ANNELIES POOL

**Hay River Reserve**, NWT, IR, pop 298 (1980e), is located on the E bank of the E channel of the HAY R, 201 air km SW of YELLOWKNIFE. It is the only Indian reserve in the NWT and was created in 1974 when local DENE residents requested protection of their traditional life-style and lands. In the summer of 1981, forests immediately S were heavily damaged by fire and this affected trapping, a major source of income for local residents. Today, many of those who live on the reserve work in the shipping industry in the nearby town of HAY RIVER. ANNELIES POOL

**Hayden, Melissa**, stage name of Mildred Herman, ballet dancer and teacher (b at Toronto 25 Apr 1923). During her long performing career she became internationally known as a ballerina of dazzling virtuosity and dramatic intensity. Hayden trained first in Toronto with Boris VOLKOFF before leaving at age 16 for further studies in New York. There she danced with Ballet Theatre (later the American Ballet Theatre) and other companies. In 1950 she joined the New York City Ballet where, except for a return to ABT in the mid-1950s and other brief guest engagements, she danced until her retirement in 1973. Until 1983 Hayden had her own teaching studio in New York and she continues to travel widely to teach and stage Balanchine ballets. MICHAEL CRABB

**Hayden, Michael**, sculptor (b at Vancouver 15 Jan 1943). Hayden studied at the Ontario College of Art and is a sculptor in light. His work utilizes electronic and computer technology to produce pieces of extraordinary colour and scale to complement the vast spaces of contemporary urban architecture. One of his pieces, *Arc-en-ciel* (1978), was created for the vaulted atrium ceiling.

Michael Hayden, *Arc-en-ciel* (1978), neon lightwork sculpture installed in the vaulted atrium ceiling of Toronto's Yorkdale subway station (photo by Michel Proulx / Keltia Canada).

ing of the Yorkdale (Toronto) subway station, designed by Arthur ERICKSON and Associates. The piece can be viewed from outside the station and the most spectacular perspective is from the air. It is widely recognized as a model of the successful integration of sculpture and architecture. Hayden lives in Los Angeles and has had over 30 solo exhibitions in Canada, the US and Europe.

KARYN ELIZABETH ALLEN

**Hayes, Kate Simpson**, pen name Mary Markwell, writer, journalist (b Katherine Hayes at Dalhousie, NB 1856; d at Vancouver 15 Jan 1945). Hayes moved to Prince Albert, North-West Territories, in 1879, then after a short-lived marriage settled in 1885 with her 2 children in Regina where she founded a literary and musical society. She wrote for the *Regina Leader*, was territorial legislative librarian, and as Mary Markwell published numerous plays, sketches, short stories, songs and verses. Her *Prairie Potpourri* (1895) was the first literary work published in the Territories. Her strong suffrage convictions led her long-time companion and father of 2 of her children, Nicholas Flood DAVIN, to introduce a motion in Parliament (8 May 1895) in favour of women's suffrage. In 1899 she joined the *Manitoba Free Press*, becoming women's editor; with Kit Coleman, she co-founded the Canadian Women's Press Club (1904).

SUSAN JACKEL

**Hayes River**, 483 km long, rises in Molson Lk (399 km<sup>2</sup>) NE of Lk Winnipeg, flows NE to Oxford Lk (401 km<sup>2</sup>) and Knee Lk, through the rock and bush of the Canadian SHIELD, across the clay flats of the Hudson Bay Lowlands and into the bay at YORK FACTORY. It has a DRAINAGE BASIN of 108 000 km<sup>2</sup> and a mean discharge of 694

m<sup>3</sup>/s. Its main tributaries, the Fox and Gods rivers, drain numerous lakes N and S of its course. The river, named for Sir James Hayes, a charter member of the HBC, was the chief FUR-TRADE route between Lk Winnipeg and York Factory for nearly 200 years. Though swift and rough in places, it was easier to travel than the turbulent Nelson, which the traders joined, via the shallow Echimamish R, at Cross Lk. JAMES MARSH

**Haynes, Douglas Hector**, abstract painter, teacher (b at Regina 1 Jan 1936). He graduated from the art dept of the Provincial Institute of Technology and Art (now Alberta Coll of Art) in 1958, studied at the Royal Academy of Fine Arts, The Hague (1960-61), and travelled widely throughout Europe (1967-68). He first became known for his painted constructions done on burlap, string and other materials (1963-69). In 1970 he visited New York C, renewed an interest in the work of A. Gottlieb and R. Motherwell and shifted his attention to painting. Around 1977, stimulated by Jack BUSH, his work became more personal and accomplished. Elected a member of the Royal Canadian Academy in 1974, Haynes was chairman of the dept of art and design at U of A (1976-80). KEN CARPENTER

**Hays, Charles Melville**, railway president (b at Rock 1, Ill 16 May 1856; d in the N Atlantic 15 Apr 1912). At 17 Hays entered the passenger department of the Atlantic & Pacific Ry at St Louis, Mo. His railway career advanced rapidly, and in 1889 he became general manager of the Wabash, St Louis and Pacific Railroad. He came to Canada in 1896 as general manager of the GRAND TRUNK RY, becoming president in 1909. The GRAND TRUNK PACIFIC RY, of which he became president in 1905, was largely his creation. Under his directorship the GTR suffered intense labour strife, and one of LAURIER's ministers described Hays as heartless, cruel and tyrannical. He went down in the *Titanic*. ERIC J. HOLMGREN

**Hays, Harry William**, farmer, rancher, businessman, politician (b at Carstairs, Alta 25 Dec 1909; d at Ottawa 4 May 1982). He was mayor of Calgary 1959-63, federal minister of agriculture 1963-65 and senator 1966-82. He was a director of numerous companies and president and life member of many agricultural organizations. A master Holstein breeder, he was originator of the Hays Converter breed of beef cattle, the first to be recognized for registry. In a lifetime devoted to agriculture, Hays can best be described as an innovator. He instituted the export of cattle by air. As federal minister of agriculture (1963-66) he instituted the Veterinary College at Saskatoon and the Canadian Dairy Commission, expanded the crop insurance system, a national farm accounting system, established new fairs and exhibition classifications, and the importation of exotic breeds of cattle, the Showcase Herds. As senator, he was chairman of the agricultural committee and co-chairman of the Joint Senate House of Commons Committee on the Constitution. S.B. WILLIAMS

**Hazardous Wastes** Waste is defined as any substance for which the generator or owner has no further use. Hazardous wastes may be defined as substances whose disposal in the environment constitutes a potential hazard to people, natural resources or both, or could potentially interfere with amenities. Disposal of hazardous wastes should be carried out in such a manner that the associated threats to man, resources and amenities are both minimal and acceptable.

J.M. BEWERS

#### Terrestrial Environment

In the 19th century it was realized that WASTE DISPOSAL must take place in an organized and safe manner, if only to control the spread of disease. The ever-increasing variety of consumer goods generates wastes that are becoming in-

creasingly hazardous. Standard landfills and sewage treatment facilities are inadequate for disposal of hazardous wastes, particularly hazardous industrial wastes, and additional harmful products remain in the environment as runoff or fallout of fertilizers, pesticides, etc (see POLLUTION). It is estimated that a million people produce 50 000-250 000 t of hazardous wastes each year. In Canada about 1 million t of hazardous wastes were produced in 1978.

The dumping of untreated hazardous chemicals can have far-reaching effects. The discharge of inadequately treated liquid waste to RIVERS and streams has created problems to communities downstream, and dumps of waste chemicals have created major health hazards to people living in their vicinity. Buried chemicals can produce vapours which rise to the surface and escape into the air. Liquids can seep through the Earth, mix with GROUNDWATER and affect drinking-water wells far from the dump.

The insidious nature of the effects of low levels of some chemicals in the environment makes it difficult to set safe levels. The effects of cancer-causing chemicals may not show up until many years have passed, and may be very difficult to prove. Nevertheless, most hazardous wastes can be treated to render them relatively harmless to humans or the environment. Hazardous wastes can be categorized into groups amenable to special treatments, ie, to recycling, physical or chemical reactions, incineration, biological treatments, solidification, deep-well injection or long-term storage. Recycling, by far the preferred method for recoverable materials (eg, waste oil, solvents), provides viable industries in many countries, including Canada. Some wastes can be treated chemically to form stable, nontoxic materials, eg, some acids can be neutralized to harmless brine or precipitated as insoluble salts which can be landfilled. Other materials (eg, chromium) can be treated to change the charge on the atom to produce a less toxic form. Liquid and solid organic wastes can be incinerated in properly designed furnaces (usually rotary kilns), so that only carbon dioxide and water vapour reach the air in appreciable quantities. Hazardous materials (eg, acids, alkalis) can be scrubbed out and solids can be electrostatically precipitated. Thus, even difficult to destroy chemicals like polychlorinated biphenyls (PCBs) can be safely detoxified, if the incineration time and temperature are sufficient. Many industries treat biodegradable liquid wastes with bacteria before discharge to surface waters. Heavy metal wastes (eg, electroplating liquors) can be incorporated into a concretelike mass which resists leaching from burial sites. In some regions waste liquids (eg, brine) can be injected into underground permeable formations overlain by impermeable rock (deep-well injection).

No practical detoxification methods are yet known for some hazardous wastes: some can be stored for future treatment; others (eg, radioactive wastes) must be stored indefinitely. In the latter case, the disposal problem should be considered in evaluating the perceived need for the product and, if production proceeds, storage sites must be chosen with the utmost care, considering local geology and the possibility of seismic activity (see NUCLEAR SAFETY).

Although most wastes can be treated for safe disposal, many are not now so treated because of short-term economic reasons. The costs of proper waste treatment are rarely built into production costs, and more profit can be made if wastes are disposed of untreated. Consumers must be prepared to pay for proper disposal and a loss of export markets may result from competition from countries where waste disposal is less costly. Legislation to control unsafe practices exists, but illegal dumping is still a problem and improvements to laws and their enforcement can and should be made.

When plants are sited, isolation must be balanced against the risks of transporting wastes long distances. Proper siting, design and regulation can make a disposal facility as safe as any other industry. However, the public perception of a danger often results in opposition to the siting of new treatment plants. This opposition may be overcome by public information sessions followed by participation in the planning process. In 1986, under the direction of Donald CHANT, the Ontario Waste Management Corp will build N America's first comprehensive hazardous waste treatment facility. PETER A. ADIE

#### Marine Environment

The OCEAN has long been used, both deliberately and accidentally, for the disposal of human and industrial wastes. Potential deleterious effects of hazardous wastes on the marine environment include hindrance to legitimate uses of the sea (eg, fishing); degradation of the quality of seawater, making it less suitable for recreation, desalination or other uses; and less tangible reductions in the aesthetic attractiveness of the ocean environment. The main types of deliberate waste disposal into the ocean include direct discharge from land through outfalls or other pipelines; dumping from ships or other platforms; and incineration on, or aqueous discharges from, ships or marine and coastal platforms. Waste materials discharged on land or into freshwater reservoirs (rivers and lakes) may also reach the sea indirectly through runoff. Wastes routinely discharged by pipeline or outfall into the coastal zone in Canada include sewage, metal refining wastes, animal and foodstuff processing wastes and pulp and paper industrial wastes. Nuclear fuel reprocessing wastes can be added to the list in some other countries. In Canada and other coastal states, heat is also discharged to coastal waters in cooling water from power utilities and other industrial plants. Wastes dumped into the Canadian coastal environment predominantly comprise sediments dredged from nearshore areas for navigational purposes; agricultural and industrial wastes are also dumped occasionally. Some countries use incineration at sea for the disposal of persistent organic materials. Ships and other platforms discharge bilge wastes, tank washings, drilling muds, ballast and oil (often illegally). Major global concern has shifted from contamination of the ocean with oil to the dumping of low-level radioactive wastes in the deep ocean. Several European countries and the US have carried out such dumps, but the major continuing disposal of this type occurs in the eastern N Atlantic by 4 European countries under the auspices of the Nuclear Energy Agency of the Organization for Economic Cooperation and Development. In Canada the only deliberate dumping of radioactive material has been of small quantities of single isotopes for sediment transport studies.

Indirect (ie, by way of freshwater discharges) and direct releases of chemical wastes have resulted in several cases of metal and organic matter contamination of nearshore areas, particularly within embayments having restricted water exchange with offshore areas. Various Canadian East Coast, West Coast and Arctic Coast bays and FJORDS have been affected in this way. Large-scale contamination is difficult to detect because of the great assimilative capacity of the ocean and of large marginal sea areas (eg, Gulf of ST LAWRENCE; Bay of FUNDY). Land discharges are, however, by far the largest source of anthropogenically mobilized (ie, made or moved by humans) material entering the ocean. The cumulative effects of these discharges and of atmospheric precipitation of chemicals into the ocean are evident for some radionuclides, heavy metals and artificial organic compounds.

Deliberate dumping of material into the ma-

rine environment is now generally governed by the 1972 International Convention for the Prevention of Marine Pollution by Dumping of Wastes and Other Matter, commonly referred to as the London Dumping Convention. Contracting parties (nation states) are required to establish and administer appropriate national legislation, eg, in Canada, the Ocean Dumping Control Act regulates all marine dumping. The London Convention specifies a "black list" of substances (eg, organohalogen, mercury or cadmium compounds, persistent plastics, oils, high-level radioactive wastes) which may not be dumped into the marine environment, other than as trace quantities in other materials. A further "grey list" defines potentially hazardous substances (eg, arsenic, lead, copper, zinc and organosilicon compounds, cyanides, fluorides and pesticides not included in the black list) which require special precautions in disposal. These substances may be dumped only under the provisions of special permits issued by the national authorities. The convention also specifies the procedures and criteria by which a national authority may determine suitability of all other substances for marine disposal and the locations and methods for dumping.

Land discharges are not governed by international convention in the same way as ocean dumping. The major regional convention covering discharges of waste from land is the Paris Convention to which most Western European countries are signatories. Canadian Acts governing discharges of material from land include the Fisheries Act, the Environmental Contaminants Act, the Navigable Waters Protection Act and the Arctic Waters Pollution Prevention Act (see ENVIRONMENTAL LAW).

Various views are held regarding the use of the ocean as a receptacle for wastes. Some regard the ocean as "waste space" which could be put to greater use as a waste-receiving environment because its capacity to assimilate wastes, without deleterious effects, is very large. Others feel strongly that the ocean environment should be preserved in as pristine a state as possible since any major disturbance of the vast and complex oceanic ecosystem will be very difficult to reverse. J.M. BEWERS

**Hazen, Sir John Douglas**, lawyer, politician, judge (b at Oromocto, NB 5 June 1860; d at Saint John 27 Dec 1937). A Fredericton alderman, 1885-88, he was elected mayor in 1888 and MP for Saint John in 1891. Defeated in 1896 when LAURIER came to power, he was elected MLA for Sunbury in 1899 and named leader of the Opposition. Under his leadership the modern Conservative Party emerged as an effective political force in NB, winning power in 1908 and leading battles against political corruption and federal efforts to reduce Maritime parliamentary representation. In 1911 he entered PM BORDEN's Cabinet as minister of marine and fisheries, minister of naval affairs and MP for Saint John. A member of the Imperial War Cabinet and the International Fisheries Commission, Hazen was appointed chief justice of NB in 1917.

DELLA M.M. STANLEY

**Head, Sir Edmund Walker**, 8th Baronet, scholar, public servant, lieutenant-governor of NB 1848-54, governor general of British N America 1854-61, governor of the HUDSON'S BAY co 1863-68 (b at Wiarton Place, near Maidstone, Eng 16 Feb 1805; d at London, Eng 28 Jan 1868). He was educated at Oxford, where he took first-class honours in classics at Oriel College and was elected a fellow of Merton. An author, editor and translator, Head wrote articles on law, government, language and philology as well as ballads and poems. He served on the Poor Law commission 1836-47 and was appointed lieutenant-governor of NB in 1848. An able administrator, Head helped to prepare NB for full

RESPONSIBLE GOVERNMENT. His interest in defence, railways and a larger British N American federation made him a logical choice for the post of governor general of BNA in 1854. Head's refusal to grant George BROWN dissolution of the House during the DOUBLE SHUFFLE of 1858 caused considerable controversy. As the visitor to King's College (UNB) and McGill, Head contributed to their mid-century reorganization.

CARMAN MILLER

Reading: D.G.G. Kerr, *Sir Edmund Head* (1954).

**Head, Sir Francis Bond**, soldier, author, colonial administrator (b at Higham, Eng 1 Jan 1793; d at Croydon, Eng 20 July 1875). Descended from the minor gentry, Head served in the Royal Engineers. Retiring as a major (1825), he became a mining supervisor in S America and earned the nickname "Galloping Head" for his rides across the Andes. The author of several popular travel books, he was appointed an assistant poor-law commissioner in 1834 and then lieutenant-governor of Upper Canada in 1835. When he arrived at Toronto in Jan 1836, he was welcomed by the Reformers and appointed several moderate Reformers — including Robert BALDWIN — to the Executive Council, but he rarely consulted the councillors, who resigned in a few months. The Reform-dominated Assembly censured him and he dissolved the House and won an overwhelming victory at the polls in 1836 by using the loyalty cry, although his widespread support among moderates quickly dissipated when he engaged in a bitter vendetta against all Reformers. Head cannot be held primarily responsible for the REBELLION of 1837 in Upper Canada but his unprecedented interference in the election and his uncompromising hostility to the Reformers encouraged extremists, as did his decision to denude the colony of British troops. His excesses led to his recall early in 1838 and he never held office again. PHILLIP A. BUCKNER

**Head, Ivan Leigh**, public servant (b at Calgary 28 July 1930). A law graduate of U of A, Head taught law there 1963-67 after stints in private practice and the Dept of External Affairs. In 1967 he served as a constitutional adviser to P.E. TRUDEAU, staying on as special assistant after Trudeau became PM the next year. Combative, strong-willed and idealistic, Head quickly became one of the PM's inner circle, and his key external affairs functionary. Head was a strong force behind Trudeau's call for a "north-south dialogue" to aid developing countries, and in 1978 became president of the International Development Research Centre. NORMAN HILLMER

**Head-Smashed-In Buffalo Jump**, archaeological site located on the southern end of the Porcupine Hills in SW Alberta. Beginning nearly 6000 years ago and continuing until as recently as 150 years ago, native people of the Northwest Plains used Head-Smashed-In as one of the many ingenious traps designed to kill large numbers of buffalo. They used skilful decoy techniques to round up herds of buffalo and stampeded them across the Porcupine Hills and over a 10 m high cliff. Hunters waiting below the cliff killed and butchered the animals, obtaining great quantities of meat, hide and bone. Deposits of butchered bone and stone tools extend to a depth of over 11 m at the base of the cliff. Head-Smashed-In has been designated an Alberta Historical Resource Site, and is on the prestigious list of UNESCO World Heritage Sites. See also ARCHAEOLOGY; BUFFALO HUNT; PREHISTORY.

JACK BRINK

**Heagerty, John Joseph**, physician, public-health official, historian (b at Montréal 26 Dec 1879; d at Ottawa 7 Feb 1946). Entering federal service as a bacteriologist in 1911, Heagerty joined the new Dept of Health in 1919 and became director of public-health services in 1938.

He was noted for his work in Canada's campaign against venereal disease in the 1920s and his proposals for national health insurance in 1943. He also broadcast lectures on Canadian medical history and wrote the 2-vol *Four Centuries of Medical History in Canada* (1928) and *The Romance of Medicine in Canada* (1940).

JANICE DICKIN MCGINNIS

**Health Policy** Canada's national health-insurance program (also called medicare) is designed to ensure that every resident of Canada receives medical care and hospital treatment, the cost of which is paid through general taxes or through compulsory health-insurance premiums.

Medicare developed in 2 stages. The first was the Hospital Insurance and Diagnostic Act of 1957, which gave the Canadian government authority to enter into an agreement with the provinces to establish a comprehensive, universal plan covering acute hospital care and laboratory and radiology diagnostic services. Nine years later, the Medical Care Act of 1966 extended health insurance to cover doctors' services. While the basic principles of medicare are determined by federal legislation, responsibility for health under the Constitution falls under provincial jurisdiction. Therefore, there are certain variations in the plan from province to province. However, to be eligible for federal cost sharing, the provinces must meet, in their health policies, criteria of accessibility, universality, comprehensiveness, portability and administration.

Until 1977, federal contributions to acute hospital care and doctors' services matched (approximately, dollar for dollar, provincial spending. At that time, unhappy that its share of health costs was in effect under provincial control, the federal government altered the arrangement by passing the Federal-Provincial Fiscal Arrangements and Established Programs Financing Act. Instead of 50-50 cost sharing, the federal government transferred to the provinces a lump sum based on a 3-year moving average of the Gross National Product (GNP) and per capita cash payment.

The new arrangement allowed the provinces more flexibility, in that they were not limited to using federal funds only for insured hospital and medical services; federal money could now be applied to programs such as extended health care in nursing homes or drug-benefit plans not included in medicare. At this time, however, hospital costs were rising at a rate far exceeding general inflation, leaving the provinces with a heavier share of the health-cost burden. Matters worsened when, beginning in 1982, the federal government further restricted TRANSFER PAYMENTS.

**History of Health Policy** Prior to Confederation in 1867, there was little organized health care. Local communities had authority to set up their own health boards, and some did so in response to EPIDEMICS such as the cholera outbreak that devastated Toronto in 1832. The formal legislation authorizing such boards was passed by the Parliament of Upper Canada in 1834, but it was not until 50 years later that the PUBLIC HEALTH Act compelled local governments to set up health boards and impose sanitary regulations.

At meetings of the CANADIAN MEDICAL ASSOCIATION, an organization created the same year as Confederation, doctors called for public-health measures, safe water and the reporting of contagious diseases. Not until 1882 did Ontario legislation establish a provincial board of health. Three years later, with a smallpox epidemic raging in Québec, Ontario put public-health doctors on trains crossing the border into Ontario to inspect passengers; the doctors were empowered to arrest anybody who refused to be vaccinated.

**Dental Care** Until the late 1800s there was a scarcity of dentists in Canada. Tooth decay among children was so prevalent that one Toronto dentist estimated that 50% of the schoolchildren at the turn of the century had rotten teeth. Today, provincial health-insurance plans provide some dental coverage, although such coverage varies from province to province, being generally limited to dental care in hospitals. Some provinces, eg, Nova Scotia and Newfoundland, cover dental care for children, while Alberta provides coverage for citizens over 65. PEI has launched mobile child DENTISTRY units staffed by salaried dentists. In 1976 it was estimated 18% of the population of Canada (ranging from a low of 3% in the Maritime provinces to 43% in BC) had some form of dental care provided through private insurers.

**Mental Health** Under the CONSTITUTION ACT, 1867, the provinces were made responsible for asylums for the mentally ill (see MENTAL HEALTH). At that time, almost everywhere in the world the insane were kept at home or brutally treated. In Toronto, when a new and better jail was built in 1800, the old jail became an asylum. The Canadian National Committee for Mental Hygiene was founded in 1918, largely due to the efforts of Dr Clarence M. HINCKS, who with the help of leading Canadians raised funds for a survey of conditions in asylums across Canada. These institutions were generally disgraceful, dirty and overcrowded. The committee brought this to the attention of the public, and the provinces soon began to spend more money on institutions for the mentally ill. By the 1950s, discoveries of drugs that could help control the behaviour of mental patients led to a new trend in care. Many patients from psychiatric hospitals were returned to the community (see PSYCHIATRY).

Prior to medicare, the only treatment available to the less affluent was in provincially owned psychiatric hospitals. Although the psychiatric care provided in general hospitals has greatly improved, the gaps in the continuum of care for the mentally ill are only beginning to be closed.

**Health Insurance** The idea of health insurance had emerged in Germany in the late 1880s and spread throughout Europe, but SOCIAL SECURITY programs were scarcely a priority in infant Canada. By WWI, Saskatchewan had created a plan under which municipalities could tax the population to build hospitals, hire doctors and pay for hospital care. In 1919 the federal Liberal Party made a health plan a plank in its election campaign, but nothing came of it. During the GREAT DEPRESSION, the push for government assistance in meeting health-care costs gained momentum. People could not pay doctors' bills; indigents flooded the hospitals; municipalities, especially those on the Prairies, were bankrupt.

Prior to the enactment of a national hospital-insurance scheme, BC and Saskatchewan operated public, universal hospital-insurance plans. Alberta and Newfoundland had plans that provided partial coverage. By 1956, 50% of Canadians were covered by voluntary private or non-profit prepayment plans, but public pressure for a nationwide program to protect people from catastrophic health-care costs was growing. This led to a federal government offer to share, on a grant-in-aid basis, the costs of a Canada-wide plan, on condition that the majority of provinces take part and a majority of the population be covered. By mid-1957, 8 provinces indicated that they would join in such a proposal. By 1961 all provinces had hospital plans in operation and 99% of the population was covered. This included coverage for all standard-ward hospital care, apart from nominal charges levied in a few provinces, primarily BC, which has consistently charged patients a small daily fee (\$8.50 in 1983).

Medical-services insurance was born, with

considerable difficulty, in 1962 in Saskatchewan. The Saskatchewan medical profession fiercely opposed the intentions of T.C. DOUGLAS's provincial government to require doctors to collect their fees solely from the government plan. On July 1, 90% of the doctors closed their offices in protest. The "strike," during which only emergency services were provided, lasted 23 days and made international headlines. The doctors won the right to bill patients if they so chose and to charge more than would be reimbursed to the patients under the provincial plan. Today, extra billing by doctors is an increasingly contentious issue across Canada.

A year before the Saskatchewan battle, PM John Diefenbaker had appointed Justice Emmett HALL, then chief justice of Saskatchewan, as chairman of a royal commission on health services. In a 2-volume report (1964-65), Hall recommended medicare for all of Canada. Known as the "founding father" of medicare, in 1980 he was again asked to review the system, at which time he claimed it was, despite its problems, "by world standards one of the very best health services today." Following the 1964 report, PM Lester Pearson promised that Canada would have a federal medicare program by 1967, and the necessary legislation was passed before the close of 1966. Not all provinces were eager to join the plan. A majority of Canadians were already insured under a variety of private or nonprofit plans, including a major one, Physicians Services Incorporated (PSI), run by doctors in Ontario. Nevertheless, by 1972 all the provinces and the territories had joined in.

Contrary to a widely held belief that doctors oppose medicare, the plan is supported by the Canadian Medical Association. Indeed the medical association itself proposed a national insurance plan in the 1940s. However, within the limits established by the federal Acts, each province has its own version of the plan. Some, such as BC and Ontario, pay to a limited extent for chiropractic services, optometry and physiotherapy, whereas Nova Scotia and Newfoundland do not. Saskatchewan and Manitoba pay for their plans from general revenues, whereas Alberta and Ontario charge insurance premiums for those who can pay. Some provinces also cover prescription-drug costs for senior citizens and social-assistance recipients.

Nevertheless, implementation of medicare by the provinces has led to considerable tension between the provincial governments and provincial medical associations. Doctors feared, and still do, that medicare would become "state medicine," with governments the sole paymaster and doctors virtually civil servants. There have been no further strikes such as that in Saskatchewan, although medical specialists in Québec did withdraw their services for a short time when Québec implemented its plan in 1970. The Québec plan is unique in that under it patients are not entitled to be reimbursed if they see doctors who bill patients directly. Thus, virtually all Québec doctors bill the plan and there is no extra billing.

Among Canadian doctors fears of state medicine escalated in the wake of the Hall Commission's 1980 report. The report cautioned that extra charges to patients (by 1984 Canadians were paying \$70 million to physicians who extra billed) constituted a barrier to accessibility to medical care that was contrary to the principle and spirit of medicare and that charges by doctors or hospitals would lead to a 2-tier health system, with different standards of care for those who could pay and those who could not.

Conflict among the various protagonists — the federal government, the provinces and the Canadian Medical Association (which represents the majority of Canada's 47 000 doctors) — was inevitable. The federal government claims that it contributes more than 50% (\$9.3 billion)

of medicare's costs by block grants to provinces and has sought to abolish extra charges to patients for insured services. In 1983 it unveiled provisions designed to curb barriers to access and to eliminate extra billing. It requires that 100% of residents be entitled to insured health services, compared with 95% in previous legislation. The new Canada Health Act provides for a reduction of the federal contribution to any province that does permit such patient charges by an amount equal, dollar for dollar, to the amount patients paid. The allied provincial and territorial health ministers deny that extra charges threaten medicare, claiming that the extra revenue is needed to supplement health funds in the face of rising costs and shrinking federal cost sharing. Each province allots roughly 33% of its budget to health.

The Canadian Medical Association claims that medicare is underfunded and that this has resulted in overcrowded hospitals, outdated equipment and waiting lists of patients requiring nonurgent surgery. The CMA estimated that 150 000 patients were on waiting lists in mid-1983. The medical profession fervently defends the right to bill patients directly and remains fiercely opposed to the elimination of extra billing.

Canada's medicare system compares well with health systems elsewhere in the world. Health-insurance administration costs in Canada were 3% of expenditures, compared with over 10% in the US, yet there is no convincing evidence that the Canadian health-care system is underfinanced.

MARILYN DUNLOP

*Reading:* R. Badgley and S. Wolfe, *Doctors' Strike* (1967); D. Coburn, C. D'Arcy, P. New and G. Torrance, eds, *Health and Canadian Society* (1981); S.E.D. Shortt, ed, *Medicine in Canadian Society* (1981).

**Heaps, Abraham Albert**, labour politician (b at Leeds, Eng 24 Dec 1885; d at Bournemouth, Eng 4 Apr 1954). An impoverished English Jew who immigrated to Canada 1911, Heaps, an upholsterer, became a distinguished parliamentarian as member for Winnipeg N 1925-40. He first gained prominence in Winnipeg as a self-taught statistician for the local Trades and Labor Congress, a labour alderman and a leader of the WINNIPEG GENERAL STRIKE. Arrested and charged with seditious conspiracy in June 1919, he cleared himself after a 10-month ordeal in jail and court proceedings. Though an independent Labour (later CCF) MP and a class-conscious socialist, Heaps developed personal and political relationships with PMs Mackenzie King and R.B. Bennett. His wit and deep humanism earned him few real enemies, but they included Arthur Meighen, whose prime ministership in 1926 Heaps gladly helped bring to an abrupt end, and Tim Buck, who tried to unseat him in 1935. Heaps's tireless efforts as the most credible economic critic in the Commons during the 1920s and 1930s contributed to the passage of vital though limited social legislation by Liberal and Conservative governments. He was unsuccessful in his advocacy of constitutional amendments that would have made direly needed labour legislation possible. His most keenly felt failures were his unheeded warnings about the dangers of fascism and his desperate lobbying on behalf of anti-Nazi refugees. Ironically, spurious charges of pacifism and disloyalty played the key role in the defeat that ended his political career in the 1940 election. Heaps retired to private life in Montréal and died while on a visit to England. ALLEN SEAGER

**Heard, Robert Donald Hoskin**, chemist, biochemist (b at St Thomas, Ont 13 Feb 1908; d at Montréal 1957). Well known for research on the biochemistry of steroid hormones, Heard was largely responsible for the 1944 choice of a Canadian site for the annual prestigious Laurentian Hormone Conference. He was a BA and

MA (1930) of U of T and as an 1851 Exhibition Scholar received his PhD from U of Manchester (1932). After a year at Oxford, he returned to U of T as a Banting Grantee. His university appointments in biochemistry, at Dalhousie in 1937 and McGill in 1942, enabled him to continue his outstanding teaching and research career until his early death. Author of many scientific papers with his students and collaborators, Heard was noted for developing methods for labelling steroid hormones with radioactivity and for using these "tracers" to reveal the pathways of formation and interconversion of ovarian and adrenal hormones. J.L. WEBB

**Hearne, Samuel**, explorer, fur trader (b at London, Eng 1745; d there Nov 1792). He joined the HBC in 1766 and was chosen to search for a western passage, by river or sea, across the barren lands. His first 2 attempts ended ingloriously, as he was bullied, robbed and deserted by his Indian guides. He left PRINCE OF WALES'S FT again, 7 Dec 1770, with MATONABBE, a skilful leader of great prestige among the Chipewyan. They walked across trackless wastes, cold, wet and hungry, patiently following the seasonal migrations of the caribou. They travelled W, likely to Alcantara Lk, and then N to the COPPERMINE R. Hearne followed the shallow river to the Arctic Ocean, realizing that it was useless as a trade route. Furthermore, an intensive search yielded a single lump of copper. Hearne earned the contempt of his companions when he refused to join them in the massacre of a helpless party of Inuit, their traditional enemies, at a place he called Bloody Falls. The exhausted Hearne followed his guides as they hurried S, impatient to meet their wives. They crossed GREATSLAVE LK Dec 24, and Hearne suffered from the extreme cold, losing his toenails. Wintering in the forest, where they could hunt and build canoes, Matonabbee's band brought Hearne to base 30 June 1772. Hearne admitted that his expedition brought no material advantage to the HBC. In 1774 he tried to meet competition from Canadian pedlars by directing construction of CUMBERLAND HOUSE, the HBC's first inland post. In 1776, he was appointed chief at Prince of Wales's Ft, which he surrendered to the French in 1782. He retired 1787, criticized for his timidity and in failing health, and spent the last few years of his life writing and speaking about his remarkable adventure. The literary artistry of *A Journey from Prince of Wales's Fort in Hudson's*

*Bay to the Northern Ocean*, published 3 years after Hearne's death, secured his fame in letters as well as exploration. He left a dramatic description of his own sufferings and a vivid portrait of Matonabbee and his resourceful people.

JAMES MARSH

**Hearst, Sir William Howard**, lawyer, politician, premier of Ontario (b in Arran Twp, Canada W 15 Feb 1864; d at Toronto 29 Sept 1941). A lawyer in Sault Ste Marie, he was elected a Conservative MPP in 1908. A leading spokesman for northern Ontario, he entered the Cabinet of Sir James P. Whitney as minister of lands, forests and mines in 1911. He played an important role in the negotiations that in 1912 added the Keewatin Terr to Ontario, increasing the province's size by 56%, and succeeded to the premiership in 1914. A strong supporter of the war effort (he was knighted for his contribution in 1917), he also enfranchised women, enacted prohibition, established a department of labour and authorized construction of the Queenston hydroelectric plant, the largest in the world when it opened in 1921, establishing ONTARIO HYDRO as the province's primary producer of electricity. When his government was defeated in 1919, he resumed his law practice. He served on the INTERNATIONAL JOINT COMMISSION 1920-40.

BRIAN D. TENNYSON

**Heart Disease** In industrial countries more people die from diseases of the heart and blood vessels than from any other single cause. Over the last 30 years, extensive cardiovascular research has resulted in such revolutionary techniques as cardiac catheterization, heart-lung machines, artificial valves, cardiac pacemakers, echocardiography (a machine that uses ultrasound to produce a picture of the heart) and nuclear diagnostic technology. In addition, the management of heart disease by drugs has also improved with the discovery of new agents capable of controlling the force of cardiac contraction. These drugs include inotropic agents, beta blockers (which reduce the amount of work the heart must do) and calcium antagonists.

Coronary artery disease, the most common type of heart disease and the leading cause of death in N America, is almost always the result of atherosclerosis, the clinical name for hardening of the coronary arteries. Atherosclerosis is characterized by the accumulation of fatty deposits and the formation of fibrous tissue in the walls of arteries which then become narrow, thus diminishing the flow of blood and oxygen to the heart muscle. Although atherosclerosis develops quite early in life as the result of a diet rich in animal fat, cigarette smoking and the leading of a sedentary life, symptoms usually develop in the 4th or 5th decade of life. The disease may result in a sudden death in approximately 50% of the patients who have coronary artery disease without knowing it. The average age of death due to coronary artery disease is 52 years. In the remaining 50% of patients the disease may produce attacks of crushing pain (angina pectoris) in the central chest. The surgical management of coronary artery disease enjoys unprecedented popularity because of very low operative mortality (1 to 3%) and because relief of pain is obtained in about 90% of cases. Close to 200 000 such operations were performed in N America in 1983.

Another form of heart disease is that associated with the heart valves. They can be damaged by rheumatic fever, bacterial infections or other disease processes. A defective valve fails to close completely or cannot open fully, thus disturbing the smooth unidirectional flow of blood required for normal functioning of the body. Some malfunctioning valves can be repaired through surgical techniques, but in some cases the valve is so severely damaged that it must be replaced with an artificial (prosthetic) one. The

outlook for patients with valvular heart disease has changed dramatically with the introduction of prosthetic valves some 25 years ago. Despite occasional malfunction, clot formation and infection which occur with valve prostheses, a high percentage of patients can now live normal lives.

The heart is a pump made of special muscle whose contractions are triggered and synchronized by electrical impulses produced by its own natural pacemaker. When the natural pacemaker falters, an artificial pacemaker, using batteries and timers, can be used to produce electrical impulses which are transmitted along tiny wires secured to the heart. The pacemaker is a small battery-powered unit usually implanted under the skin and wired to the heart to control its rate and rhythm of contraction. These devices are now very small and durable.

One baby in about a hundred is born with an abnormality of the cardiovascular system. In general, such congenital defects include incorrectly formed valves, holes in the walls (septa) that separate the 2 sides of the heart, and abnormalities in the blood vessels leading in and out of the heart. These fall into 2 broad categories: conditions in which the baby is "blue" (cyanotic heart disease) and those in which the baby's color is normal (acyanotic heart disease). Most congenital heart defects can be corrected surgically in infancy or early childhood. The surgical risk is relatively low (about 5%) and the long-term results are excellent.

The last 30 years have witnessed remarkable achievements in cardiovascular medicine and surgery. Some of these achievements have been made by Canadians. Dr W.G. Bigelow of Toronto, along with Dr J.C. Callaghan of Edmonton, pioneered the work on total body hypothermia (cooling off of the body to reduce oxygen requirements during surgery) and laid the foundations for modern cardiac pacemakers. Dr Callaghan was also the first to use successfully the heart lung machine for open-heart surgery in Canada in 1956 and the first to insert an artificial valve and correct the tetralogy of Fallot. Dr W. Mustard of Toronto's Sick Children Hospital pioneered techniques in pediatric cardiovascular surgery and the "Mustard Repair" for transposition of the great vessels in children has gained international acceptance. Dr A.M. Vineberg of Montréal studied myocardial revascularization for many years and developed an implantation procedure that was widely used before the introduction of coronary artery bypass procedures and is still sometimes used.

J.C. CALLAGHAN

**Heart's Content**, Nfld, Town, inc 1967, pop 625 (1981c), is a fishing town on a protected, urn-shaped harbour in eastern TRINITY BAY. Besides being one of Newfoundland's oldest enduring fishing settlements, it is prominent in the history of international communications. Originally a summer fishing station, by the late 1600s it was a year-round settlement populated mainly by English West Country fishermen who also later developed a shipbuilding industry. In July 1866 the *Great Eastern*, the largest steamship then afloat, made the first successful landing of a transatlantic submarine telegraph cable at Heart's Content. Subsequently, the Anglo-American Telegraph Co established a cable station, which brought an influx of company employees and services. The station closed 1965, mainly because of new technological developments, but the station building was restored as a communications museum.

JANET E.M. PITT AND ROBERT D. PITT

**Heath, David**, photographer (b at Philadelphia, Pa 27 June 1931). He first gained recognition in 1965 with the publication of *A Dialogue with Solitude*, a subjective and moving portfolio of black-and-white photographs exposing the

troubled facets of N American society. Abandoned by his parents at age 4, Heath became interested in PHOTOGRAPHY as a teenager and continued to pursue it while serving in the infantry in Korea. In the late 1950s, he moved to New York C, where he worked as a fashion and magazine photographer and was influenced by documentary photographer Eugene Smith. He won a Guggenheim Fellowship in 1963, and taught at various colleges and universities before moving to Toronto and Ryerson in 1970. In addition to teaching, he has mounted several solo exhibitions, including a retrospective at the National Gallery in Ottawa in 1981.

LOUISE ABBOTT

**Heavyside, Charles**, poet (b at Huddersfield, Eng 2 May 1816; d at Montréal 14 July 1876). Heavyside immigrated to Montréal in 1853 as a woodcarver. In 1860 he became a reporter for *Montreal Transcript* and later for the *Montreal Daily Witness*. A quintessential pious Victorian, he published a series of long religious poems under the influence of Milton, Shakespeare and the Bible: *The Revolt of Tartarus* (1852), *Jephthah's Daughter* (1865) and "Jezebel, A Poem in Three Cantos" (1868). His Old Testament spirit also found expression in 2 dramatic works, the famous *Saul: A Drama in Three Parts* (1857; 1859) and *Count Filippo: or, The Unequal Marriage* (1860), an Italianate verse tragedy of adultery and retribution. His one novel, *The Advocate* (1865), was unsuccessful. *Saul* found many admirers, among them Henry W. Longfellow and Sir John A. MACDONALD. Coventry Patmore's praise in the influential *North British Review* was particularly positive. The play was premiered in a CBC radio adaptation in 1974.

ROTA HERZBERG LISTER

**Hebb, Donald Olding**, psychologist (b at Chester, NS 22 July 1904). He was a brilliant pupil who completed grades 1 to 4 in one year and 5 to 6 the next. But school proved too easy and when he graduated from Dalhousie, his record was undistinguished. A book by Freud stimulated him to go back to university and he earned an MA in psychology from McGill (1932) and a PhD from Harvard (1936). At that time, the brain was regarded as a relay station to process incoming and outgoing impulses; behaviour was just stimulus and response. Hebb believed more went on in the brain. He worked with Wilder PENFIELD 1937-39 and noted that loss of large parts of the brain did not necessarily diminish intelligence. He studied the development of behaviour in rats, primates and infants. He was convinced that neural circuits linking incoming and outgoing neurons were the loci for thought and emotions. In 1949 he published *The Organization of Behaviour* which revolutionized psychology by putting "mind" back into the brain. His studies of development showed the importance of environmental stimulation in early childhood that led to the US adoption of Operation Headstart, a program to help children in disadvantaged families. He showed the requirement of constant input for normal brain activity by the abnormal response of subjects to sensory deprivation.

DAVID T. SUZUKI

**Hébert, Adrien**, painter (b at Paris, France 12 Apr 1890; d at Montréal 20 June 1967), son of celebrated church sculptor Louis-Philippe HÉBERT. Adrien came to Canada with his family in 1894. He trained at the Monument National de Montréal under Edmond DYONNET and Joseph St-Charles (1904-06), and taught there in 1914. He also studied 1912-14 in Paris at the Ecole des Beaux-Arts with Fernand Cormon. In 1917 he taught drawing in Montréal, and sold his own work to magazines. He became an associate of the Royal Canadian Academy of Arts in 1932. He is known for scenes of the Montréal waterfront that concentrate on industrial buildings, machinery, early tramcars and factory smoke.

ANNE MCDUGALL

**Hébert, Anne**, poet, playwright, novelist (b at Ste-Catherine-de-Fossambault, Qué 1 Aug 1916). Hébert's father Maurice, a provincial civil servant and writer, guided her in the early stages of her literary career. Through her mother, Hébert is a descendant of 19th-century historian François-Xavier GARNEAU and has carried on the family's literary tradition spectacularly. She was also cousin and friend of Hector de Saint-Denis GARNEAU, whose poetry affected her deeply and whose lonely death in late 1943 strongly influenced her. From that point, she felt impelled to open revolt, as her subsequent writings demonstrate. She grew up, studied and lived in Québec C until her mid-30s. From 1950 to 1954, she worked on Radio-Canada broadcasts and wrote scripts for the NFB. She then went on a scholarship to Paris where, with frequent visits to Québec, she has lived for the past 30 years.

Hébert's road to maturity as a poet had 3 stages. In 1942 she published her first collection, *Les Songes en équilibre*, which portrays herself as existing in a dreamlike torpor. In 1953 appeared *Le Tombeau des rois*, where the self triumphs over the powerful dead who rule the dreams. Finally, in 1960 (when Québec was in the spring of the QUIET REVOLUTION), the powerful verse of *Mystère de la parole* reveals the liberated self. Her first volume of prose, *Le Torrent*, a collection of tales which appeared in 1950, shocked the reading public but has become a classic. Her first novel, *Les Chambres de bois* (1958), contained particularly original imagery, though it was not until 1970 that Hébert convincingly demonstrated her virtuosity in the great novel, *KAMOURASKA*. Here she skillfully combines 2 plots in a 19th-century Québec setting. The writing has a breathless, anguished and romantic rhythm that underlines well-controlled suspense. The novel earned her France's Prix des Libraires and was made into a film by Claude JUTRA. Like almost all of Hébert's works, *Kamouraska* has been translated into English. In *Les Enfants du sabbat* (1975), Hébert tells a tale of sorcery in Québec. *Héloïse* (1980) is about ghost-vampires in the Paris subway. *Les Fous de Bassan* (1982, Prix Fémina) is set in Gaspé, where 2 teenagers from an Anglo-Protestant village are killed. Hébert has written several plays, published as *Le Temps sauvage*; in the play of that name a mother vainly attempts to shield her children from the outside world.

Anne Hébert's career, studded with literary honours and awards (including the MOLSON PRIZE in 1967 and election to the RSC 1960), is founded on a disciplined life that has always been devoted to writing. Her poetry and prose have become models for other writers and have been analysed in hundreds of studies, particularly in Québec, but also in France and English Canada.

PIERRE H. LEMIEUX

Poet Anne Hébert, writing in LaFontaine Park, Montréal, Qué (courtesy National Film Board/Photothèque).

**Hébert, Henri**, sculptor (b at Montréal 3 Apr 1884; d there 11 May 1950). The son of sculptor Louis-Philippe HÉBERT, he studied at the Monument National, Montréal, under painter Edmond DYONNET and at the Art Assn with William BRYMNER. He twice went with his parents to Paris, studying under Thomas and Injalbert. He taught several years at McGill while sculpting many busts, and has left some 20 monuments, the most famous being of Louis-Hippolyte LA FONTAINE (in both Québec C and Montréal), *Évangéline* (Grand Pré, NS) in collaboration with his father, the *Monument aux Morts* (Montréal) and *Jacques de Lesseps* (Gaspé). MICHEL CHAMPAGNE

**Hébert, Louis**, apothecary, colonist (b at Paris c 1575; d at Québec Jan 1627). Hébert visited Canada 3 times between 1604 and 1613 with the expeditions of DE MONTS, CHAMPLAIN, and Jean de BIENCOURT de Poutrincourt. In 1617 he decided to settle in Québec C with his wife and 3 children. He was ceded 10 ARPENTS of land near the site of the present cathedral of Québec, and his family is renowned for having been the first to cultivate land in Canada. His wife, Marie Rollet, was the first Frenchwoman to scratch the soil of New France. It is said that, thanks to his medical knowledge among other reasons, Hébert was on good terms with the Indians. JACQUES BERNIER

**Hébert, Louis-Philippe**, sculptor (b at St-Sophie de Mégantic, Qué 27 Jan 1850; d at Montréal 13 June 1917). Around 1869 he left the family farm to join the army of pontifical ZOUAVES destined for Rome and Tripoli. The wealth of art he then discovered stunned and stimulated him. Once home, he worked in the studio of painter Napoléon BOURASSA, and over 6 years learned the craft of sculptor. Thereafter he received increasingly important commissions, finally becoming the principal Québec sculptor of his generation. He was the first Canadian-born commemorative sculptor, and his more than 40 monuments include *Queen Victoria* (Ottawa); *Maisonnette, Jeanne Mance, Mgr Bourget* and *Edward VII* (Montréal); *Mgr de Laval* (Québec); and 6 sculptures in front of the Québec parliament. He also sculpted busts, commemorative medals and numerous statues in wood, bronze and terra-cotta. For many years he taught at Montréal's Conseil des arts et manufactures.

A member of the Royal Academy of Canada (1880), Hébert was awarded the Medal of Confederation (1894), made a chevalier of France's Legion of Honour (1901), and Companion of St Michael and St George (Great Britain, 1903). In 1971, the St-Jean-Baptiste Soc of Montréal honoured his memory with the Prix Philippe-Hébert, given to an artist of outstanding ability and stature in Québec arts. MICHEL CHAMPAGNE

Readings: Bruno Hébert, *Philippe Hébert, sculpteur* (1973).

**Hébert, Pierre**, director of animated films, engraver (b at Montréal 19 Jan 1944). Stimulated by Norman MCLAREN, Hébert experimented with scratching directly on film early in his career and directed films dominated by effects made possible through optical printing: *Opus I* (1964), *Op hop hop op* (1965) and *Autour de la perception* (1968). Later he was attracted to a more political and profound type of animation and, using simple techniques, produced 2 original works, *Père Noël, Père Noël* (1974) and *Entre chiens et loups* (1977). Hébert's latest films, *Souvenirs de guerre* (1982) and *Étienne et Sara* (1984), are a synthesis of his previous work. PIERRE VÉRONNEAU

**Hébert, Yves**, pen name Yves Sauvageau, actor, playwright (b at Waterloo, Qué 17 May 1946; d at Granby, Qué 12 Oct 1970). After studies in education at the École normale de Sherbrooke (1963-65), he enrolled in the National Theatre School (1965-68). He had previously founded a theatre company in Waterloo called La Lanterne (1962-63) and had performed with the Atelier and the Union théâtrale de Sherbrooke. When

he left the National Theatre School he toured Canada with the Jeunes Comédiens of the THÉÂTRE DU NOUVEAU MONDE (1968-69). Later he joined the Enfants de Chénier (1969-70), directed by Jean-Claude GERMAIN at the Théâtre du même nom. He won 2 awards in Radio-Canada's Jeunes Auteurs competition (1966) for 2 short plays published under his pseudonym. His major plays were published and produced posthumously. ANDRÉ G. BOURASSA

**Hecate Strait** is a body of water 48-140 km wide, underlain by a shallow basin (less than 45 m at the N end), separating the QUEEN CHARLOTTE is from mainland BC. Marine weather conditions are severe: winter storms originating in the Gulf of Alaska bring high waves through the strait and winds persistently higher than 40 km/h off the S end of Moresby I. The open strait and numerous sheltered inlets are rich in marine life. Halibut, groundfish, herring, shellfish and salmon fisheries are centered around PRINCE RUPERT. Hecate Str was navigated for trade and plunder by the HAIDA, whose water-based settlements on the E coast of the Charlottes date from at least 9000 years ago. Spanish explorer Jacinto Caamaño (1792) was the first European into the waters of the strait, although its name is that of a British paddlewheel ship that surveyed the N Pacific coast 1860-63. Offshore oil drilling under the southern strait began in the 1950s, but was halted in 1972. PETER GRANT

**Hecla**, Man, pop 25 (1983e), an Icelandic fishing hamlet on Lk WINNIPEG's largest island, is part of Hecla Provincial Park, a 86 350 ha marine park 176 km N of Winnipeg, which includes several islands. Hecla is joined to the mainland by a causeway. Icelandic immigrants opened homesteads on the island beginning 1876. Isolated for many years, they built a self-sufficient community based mainly on fishing for food and export, but including farming, lumbering, lake transport, trapping and quarrying. In the 1890s Winnipeggers began building cottages here. Roads, electricity and a ferry service came only after WWII. In the early 1950s the fishery began to decline and young islanders moved to opportunities elsewhere. Proposals to establish a park and restore the hamlet of Hecla were welcomed initially, but land expropriation and relocation policies caused controversy. Hecla park has several year-round facilities, including a hotel-convention complex. Black I has the greatest geological and biological diversity in Manitoba and is the site of high-grade-silica sandstone quarrying. See also ICELANDERS. D.M. LYON

**Hector**, the brig which carried 178 Scottish immigrants to the PICTOU area of northern Nova Scotia in 1773. Pictou was located on the "Philadelphia Plantation," an 81 000 ha tract granted to 14 Scots proprietors and settled desultorily since 1767. Active promotion of the land began in Sept 1772 when John Pagan of Glasgow and John Witherspoon, principal of Princeton College, New Jersey, advertised for settlers in Scottish newspapers, offering land on easy terms and passage to America at £3 5s per adult passenger. Most who accepted this offer came from Loch Broom in Ross and adjacent areas of Sutherland, principally from lands administered by the Board of Forfeited Estates. They were tenants fleeing high rents and bad harvests rather than clearance for sheep, and were not by Highland standards poor.

With a piper, the party left Loch Broom in early July 1773, collecting a few people on Clydeside along the way. The voyage was difficult: 18 children were buried at sea before the passengers stepped ashore into the Nova Scotia wilderness on Sept 15. Complaining about the location of their lands, the settlers were denied provisioning unless they accepted the land offered. They seized the provisions by force, and

many left the settlement. The 78 who remained were producing crops by 1774 and within a few years were welcoming other immigrants. Although the *Hector* is popularly regarded as the first vessel to bring Highland immigrants to what is now Canada, several other ships (including the *Falmouth* and the *Alexander*) had previously carried Highlanders to the Island of St John [PEI]. Nevertheless, the *Hector's* voyage remains the most celebrated in the stories of early Highland settlement in BRITISH NORTH AMERICA.

J.M. BUMSTED

**Hector, Sir James**, geologist, naturalist (b at Edinburgh, Scot 16 Mar 1834; d at Wellington, NZ 5 Nov 1907). As surgeon and geologist to the PALLISER EXPEDITION (1857-60), Hector explored the country from the Red R settlement (Winnipeg) to Vancouver I. In the plains he recognized 3 topographic levels; in 1857 measured the first stratigraphic section including coal layers; attempted to subdivide Cretaceous and Tertiary strata on a geological map published in 1861; and recognized erratics as evidence of extensive former glaciation. He described and sketched the general structure of the Rocky Mts. KICKING HORSE PASS and River were named to commemorate an accident Hector had with his horse. On Vancouver I he studied coal deposits at Nanaimo. In 1861 Hector settled in New Zealand, where he became director of the geological survey. He travelled in BC for a few months after his retirement in 1903, his second and only other visit to Canada. W.O. KUPPSCH

**Heeney, Arnold Danford Patrick**, public servant, diplomat (b at Montréal 5 Apr 1902; d at Ottawa 20 Dec 1970). A clergyman's son, he was educated at U of Manitoba and Oxford. A successful lawyer in Montréal, he was invited to become principal secretary to PM Mackenzie KING in 1938. Two years later he was named clerk of the Privy Council and secretary to the Cabinet. He organized the work of the Cabinet War Committee, the key ministers, and made his office a clearing point for information and advice. In 1949 he became undersecretary of state for external affairs. He then served as ambassador to NATO, twice in Washington and as chairman of the Civil Service Commission. Until shortly before his death, he was Canadian head of the INTERNATIONAL JOINT COMMISSION and the Permanent Joint Board on Defence. J.L. GRANATSTEIN

**Hees, George Harris**, politician (b at Toronto 17 June 1910). One of the Diefenbaker ministers who resigned during the Feb 1963 crisis, Hees was an able and energetic promoter of Canada. A businessman and athlete, he was elected to Parliament as MP for Broadview (Toronto) in 1950, and held the seat until 1963. Contrary to the wishes of the Tory establishment, who saw him as a brash playboy, he was elected national party president in 1953; his successful tenure was marked by visits and speeches in all parts of the country. Appointed minister of transport in 1957, he was an able administrator; in 1960 he became minister of trade and commerce and immediately organized a successful export drive. Hees did not stand for election in 1963, but was returned for Northumberland in 1965. He ran unsuccessfully for the Tory leadership in 1967. He was appointed minister of veterans affairs by Brian MULRONEY in 1984. PATRICIA WILLIAMS

**Heggveit, Anne**, alpine skier (b at Ottawa 11 Jan 1939). She started skiing at age 2 and by 7 was senior ladies combined champion at Camp Fortune. In 1954, at age 15, she became the youngest-ever winner in the half-century history of the Holmenkollen giant slalom in Norway. In 1960 she won Canada's first Olympic skiing gold medal in the slalom as well as the world slalom and alpine combined titles.

MURRAY SHAW

**Height of Land**, a region of high ground that may act as a watershed. Heights of land were important in the historic FUR TRADE for their influence on the determination of routes and PORTAGES, and they have affected many transportation routes since then. Heights of land were important to native people in demarcating territoriality, as they were later to European colonists. A political boundary, like the boundary between Labrador and Québec, may correspond to a height of land.

JOHN ROBERT COLOMBO

**Heintzman & Co Ltd**, a Canadian piano manufacturing firm established in Toronto by German immigrant Theodore August Heintzman in 1866, is renowned for high-quality craftsmanship. By the beginning of the 20th century the firm had opened branches in other Canadian cities and developed an export trade. Heintzman built its first grand pianos about 1886, and player pianos were produced for several years until their popularity waned in the 1920s. By the early 1960s the firm manufactured about 1500 upright and grand pianos each year, retailing from 16 branches. The bulk of production was moved to a new factory built in Hanover, Ont, in 1962, followed by grand-piano manufacturing and headquarters when the Heintzman firm merged with the Sherlock-Manning Piano Co. The new company, sold in 1981 to Canadian furniture firm Sklar Manufacturing Ltd, continues to produce the Heintzman piano. Early Heintzmans are in the Glenbow Museum in Calgary and the Western Development Museum in Yorkton, Sask.

FLORENCE HAYES

**Helava, Uno Vilho**, inventor (b at Kokemaki, Finland 1 Mar 1923). He invented the analytical plotter for automatically drawing maps from photographs. Helava trained as a surveying engineer and came to Canada in 1953 as a research fellow in photogrammetry at the NATIONAL RESEARCH COUNCIL. By 1957 he had patented a method of using computers to produce maps from aerial photographs, automatically corrected for the curvature of the Earth and atmospheric distortion. The first prototype was built in 1963, using the analogue computer then available, and Helava left Canada to promote his invention. About 70 plotters were built by an Italian-American partnership, chiefly for military clients. In the late 1970s (digital) microcomputers made the Helava system much cheaper, and several hundred plotters have been built. Because of its affinity with other technologies (eg, digital transmission of photographs from orbiting satellites), the Helava system is expected to become the world's standard method of making maps by the end of the century.

DONALD J.C. PHILLIPSON

**Helders, Johan (John) Anton Joseph**, internationally acclaimed amateur pictorial photographer (b at Rhenen, Netherlands 3 May 1888; d at Homestead, Fla 4 Feb 1956). Helders arrived in Canada from the Dutch East Indies in 1924, first settling in Vancouver where his interest in photography was nurtured by John VANDERPANT. Two years later, Helders became maître d'hôtel of the Château Laurier, Ottawa. For the next decade, he was one of Canada's leading fine-art photographers. His prints won awards at salons all over the world and were published in the leading photographic periodicals. A fellow of the Royal Photographic Soc of Great Britain, he served as director for Canada of the Photographic Soc of America. Helders's salon photography diminished after he moved back to Vancouver in 1939.

JOAN M. SCHWARTZ

**Helicopter**, an aircraft that derives its lift and propulsive force from horizontally rotating rotors or blades and is capable of ascending and descending vertically. The torque generated by the blades is balanced either by a vertical tail rotor or by having 2 sets of blades rotating in op-

posite directions. The helicopter originated as a toy centuries ago, a feathered top which rose in the air when spun between the hand or by means of a string. In the 19th century a few powered helicopter models were made, and the advent of the internal-combustion engine brought a spate of unsuccessful helicopter prototypes in many countries; but the first man to get airborne and descend safely was Paul Cornu of France on 13 Nov 1907. Control was the problem, and the men who showed the way to the practical helicopter were Juan de la Cierva of Spain, with his autogyros, Heinrich Rocke of Germany, and Igor Ivanovich Sikorsky of Russia and the US. The persistence and ingenuity of the many contributors has produced a truly versatile machine, suited to war and peace, and capable of performing tasks beyond the capability of other vehicles.

In Canada, the Froebe brothers of Homewood, Man, designed and built a helicopter, which flew in 1938. Mechanical problems were encountered and the project was abandoned, but the helicopter survived and is now in the Western Canada Aviation Museum in Winnipeg. The SG-IV-C helicopter was designed and built in Montréal by Bernard Sznycer and Selma Gottlieb, and flew on 9 July 1947. After successful completion of the initiated test program, the SG-N-D Grey Gull, the first production machine, was produced, flown on 6 Feb 1948, and granted a Certificate of Airworthiness on 15 Mar 1951. However, financial backing was withdrawn in 1954. There have been no more Canadian designs, and all helicopters used in Canada are of foreign origin.

Military use of helicopters started in the RCAF in 1947, with the RCN and army following later. Air-force operations have been mainly concerned with search, rescue and mercy mission, and with heavy lift capability; the navy has been concerned with anti-submarine operations and has developed aids to permit operation from small ships in rough weather, notably the haul-down recovery system; and the army with battlefield operations. The RCAF was heavily involved in the construction of the Mid-Canada Line, and Squadron Leader R.T. Heaslip was awarded the MCKEE TROPHY in 1956 for his contribution to the success of these operations.

Helicopters have been used for forestry protection, crop dusting, surveying, exploration, commuter services, and the support of other industries such as building and off-shore oil. The brilliant pioneer Carl AGAR imported several Bell 47 helicopters in 1947 for spraying the rugged terrain of the Okanagan Valley, and later for oil exploration. Agar's company became one of the world's major helicopter companies. Today, over 1000 helicopters are used commercially in Canada.

PHILIP MARKHAM

**Hell's Gate** is a rocky gorge of the FRASER RIVER CANYON S of Boston Bar, BC. Explorer Simon FRASER recorded a difficult portage (1808) around Hell's Gate. Its name is associated with the disastrous impact of CNR construction on the river's salmon resources. After landslides (1913-14) blocked much of the sockeye run, the catch from the river's stocks plummeted and has never fully recovered. Fishways were constructed here in 1944 to permit spawning fish to pass the rapids. Hell's Gate now has an aerial tram ride and highway tourist facility.

PETER GRANT

**Hellyer, Paul Theodore**, politician, journalist (b at Waterford, Ont 6 Aug 1923). A successful businessman, Hellyer sat in the House of Commons 1949-57 and was re-elected in a by-election Dec 1958. From 1958 until 1963, when the Liberals gained power, Hellyer was instrumental in developing the party's defence policy and urged Lester PEARSON to accept nuclear weapons. After the election victory, Pearson appointed him minister of national defence, and

under Hellyer's leadership, the Canadian ARMED FORCES were unified. The controversy surrounding the unification likely did not help his political career. In 1968 he ran unsuccessfully for the Liberal leadership. The victor, Pierre TRUDEAU, placed him in charge of housing policy. After the report of his Task Force on Housing and Urban Development did not win Cabinet approval, Hellyer resigned from the Cabinet and later from the Liberal Party. He tried to form a new political movement, Action Canada. When it faltered, he drifted towards the Conservative Party, unsuccessfully running for the leadership in 1976. He has not re-entered the House of Commons, but his political views are widely known through a syndicated column he has written since 1974.

JOHN ENGLISH

**Helmcken, John Sebastian**, surgeon, politician (b at London, Eng 5 June 1824; d at Victoria 1 Sept 1920). In 1847 Helmcken sailed to York Factory and back as surgeon on the HBC supply ship *Prince Rupert* and in 1848-50 was appointed surgeon and clerk to the HBC at Fort Rupert and then at Fort Victoria. Son-in-law of James DOUGLAS, he was Speaker of the Legislative Assembly of Vancouver 1856-66 when he was elected to the Legislative Council of the HBC. In 1870 he was one of 3 CONFEDERATION delegates to Ottawa from BC. When BC entered Confederation in 1871, Helmcken retired from politics and devoted himself to medicine and his reminiscences. In 1885 he became first president of the BC Medical Society.

ERIC J. HOLMGREN

Reading: D. Blakey Smith, ed, *The Reminiscences of Doctor John Sebastian Helmcken* (1975).

**Helmcken Falls**, located on the Murtle R at the entrance to BC's Wells Gray Provincial Park, an area noted for its many waterfalls, is the highest in the park and fifth highest in Canada. Situated in the SW corner (about 270 km SE of PRINCE GEORGE), a region characterized by volcanic upheavals, the lava-layered falls have a 135 m vertical drop. They were named after the prominent BC physician John Sebastian HELMCKEN in 1913 by Premier Sir Richard MCBRIDE.

DAVID EVANS

Helmcken Falls, located on the Murtle R in BC's Wells Gray Provincial Park, is the 5th-highest waterfall in Canada (photo by Valerie J. May).

**Hemlock**, evergreen CONIFER, genus *Tsuga*, PINE family (Pinaceae). Early settlers named the hemlock after a European flowering WEED because the odour was similar when needles were crushed. Ten species are recognized: 6 in eastern Asia, Japan and Taiwan, and 4 in N America. Of the latter, 3 occur in Canada: eastern hemlock (*T. canadensis*), in southern Ontario, Québec and the Maritimes; western hemlock (*T. heterophylla*) and mountain hemlock (*T. mertensiana*), on the West Coast from Alaska to northern California. Hemlocks are tall, stately trees with slender, usually drooping, leader and branches. Leaves are needlelike but blunt. Cones are nonwoody and small, about 2 cm long (up to 7 cm in mountain hemlock). POLLINATION occurs in spring and winged seeds are shed in late summer or fall. The root system is shallow and wide-spreading. Hemlock wood is fairly hard, and these trees are harvested extensively for pulp, paper and lumber. JOHN N. OWENS

**Hémon, Louis**, writer (b at Brest, France 12 Oct 1880; d at Chapleau, Ont 8 July 1913). Hémon immigrated to Canada in 1911. After working (1911-12) as a bilingual stenographer with a Montréal life insurance company, he went to the Lac St-Jean region. There he wrote *Maria Chapdelaine: récit du Canada français*, the novel that gave him worldwide success. Unfortunately, Hémon never knew of his fame, for he died in an accident. MARIA CHAPDELAINE was serialized first in Paris in 1914 and 2 years later appeared in Montréal in book form. But it was only after its 1921 French publication that the novel became a success. Today, this account of Québec peasant life is often seen as a symbol of individual and collective alienation. At the time, the novel was used to support a nationalist ideology of fidelity to the past and its traditions. Other works by Hémon are *La Belle que voilà* (1923), *Colin-Maillard* (1924), *Battling Malone* (1925), *Monsieur Ripois et la némésis* (1950), *Lettres à sa famille* (1968) and *Récits sportifs* (1982). JACQUES COTNAM

**Hénault, Gilles**, writer (b at St-Majoric, Qué 1 Aug 1920). After studying at Collège Mont Saint-Louis, he began a program of self-directed reading and writing, and published several poems. Turning to journalism, he became friendly with various literary figures including Jean-Aubert LORANGER and in particular Éloi GRAMMONT, dit de Grandmont, with whom he co-founded the "Cahiers de la file indienne" (1946), a journal they intended to devote to experiments in automatic writing. His decision to join the Communist newspaper *Combat* with Pierre Gélinas (the newspaper was closed down in 1947 by Maurice DUPLESSIS'S PADLOCK ACT) temporarily shut other journalistic doors against him. Hénault then worked as a union organizer in a Sudbury nickel mine and published a number of dissident poems. He returned to Montréal in 1953 and worked in radio, TV and film as journalist, scripwriter and host. In 1959 he became literary and artistic editor for *Le Devoir* and was director 1966-71 of the Musée d'art contemporain de Montréal. He received awards for his poems and translations in 1962, 1972 and 1979. He was writer-in-residence at U of O in 1975-76 and was in charge of the plastic art dept of UQAM in 1983-84.

ANDRÉ G. BOURASSA

**Henday, Anthony**, explorer (probably b on the Isle of Wight, Eng; fl 1750-62). Henday travelled farther into western Canada than any white person had before him, and his journal contains important glimpses of how the native population lived at that time. A labourer for the HBC at York Fort [YORK FACTORY], Man, he volunteered for a mission to encourage distant tribes of Indians to come and trade. Travelling with some Cree, he set out in June 1754 via the Hayes R. The party paddled up the Saskatchewan and

then proceeded on foot, apparently along the Battle R valley, meeting many Assiniboine en route. In the autumn they seem to have been SE of present-day Red Deer, Alta, when they found a great camp of "Archithinues" (Blackfoot or Gros Ventre). Henday and some of the Cree spent part of the winter nearby. In the spring they descended the N Saskatchewan. Middlemen in the fur trade, the Cree collected furs from other Indians as they travelled E. The best were sold at French posts conveniently located on the lower Saskatchewan. The remainder were taken to York, where the party arrived in June 1755. In 1759 Henday went west again for a year, this time with some "Archithinues." He left the HBC's service in 1762 and probably returned to England. Described by Andrew GRAHAM as a "bold, enterprising" man, he felt ill rewarded for his great hardships.

JANE E. GRAHAM

Reading: A.J. Ray, *Indians in the Fur Trade* (1974); Glyndwr Williams, "The puzzle of Anthony Henday's journal, 1754-55," *The Beaver* (winter 1978).

**Henderson, Alexander**, photographer (b at Edinburgh, Scot 1831; d at Montréal Mar 1913). Soon after his 1855 marriage, Henderson immigrated to Canada with his wife and settled in Montréal where he worked in accounting for several years. Taking up photography as a hobby, he made it his profession in 1866. He first did portraits, but attained an international reputation with his landscape photography, receiving medals in London, Dublin, Paris and New York. He documented the principal cities and resort areas of Québec and Ontario, and many Québec villages. Especially fond of the wilderness, he made many photographic trips by canoe to the Blanche, the Rouge and other eastern rivers. In 1872 he began a series on the construction of the INTERCOLONIAL RY. He made his first trip to the West for the CPR in 1885 and was eventually hired by the CPR in 1892 to set up a new photographic department, his duties including 4 months spent in the field each year. He retired in 1897.

STANLEY TRIGGS

**Henderson, John Tasker**, radio-physicist (b at Montréal 9 Dec 1905; d at Perth, Ont 2 Jan 1983). Educated at McGill and London, Henderson joined the NATIONAL RESEARCH COUNCIL (1933) in charge of its radio section, where he worked on "atmospherics" (later discovered to be the effect of the ionosphere on radio signals) and built the Cathode Ray Direction Finder invented by A.G.L. MCNAUGHTON and W.A. STEEL. In 1939 he was secretly informed about British advances in RADAR and, in the next few months, Henderson laid the foundations for radar research and manufacture in Canada. He returned to the NRC after RCAF and diplomatic service 1942-47 and became head of its electricity section, which built several cesium atomic clocks (accepted in 1968 as the international time-keeping standard).

DONALD J.C. PHILLIPSON

**Hendry, Thomas Best**, playwright, theatre administrator (b at Winnipeg 7 June 1929). Tom Hendry began acting and writing for the CBC in Winnipeg in the early 1950s. With John HIRSCH in 1957 he founded Theatre 77, which merged with the Winnipeg Little Theatre in 1958 to become the MANITOBA THEATRE CENTRE, English Canada's first regional theatre. He was administrator of MTC 1958-63, producer of Winnipeg's Rainbow Stage 1958-61, secretary general of the Canadian Theatre Centre 1964-69 and literary manager of the STRATFORD FESTIVAL in 1969. Hendry has fostered Canadian playwriting as a founder of the Playwrights Co-op and Toronto Free Theatre (1971) and the Playwrights Colony at the BANFF CENTRE SCHOOL OF FINE ARTS (1974). His most important dramas include *Fifteen Miles of Broken Glass* (first produced in 1966), *Satyricon* (1969), *Gravediggers* of 1942 (1973), *Byron* (1976) and *Hogtown: Toronto the Good* (1981).

ANTON WAGNER

**Hennepin, Louis**, Récollet missionary, explorer (b at Ath, Belgium 12 May 1626; d c 1705). In 1675 Hennepin was sent to Canada with René-Robert Cavalier de LA SALLE, commandant of Ft Frontenac, where Hennepin was chaplain 1676-77. In 1678 he was asked to join La Salle's expedition through the Great Lks and, in 1680, with 2 others was sent ahead to explore the upper Mississippi. His journal was the source for *Description de la Louisiane* published in 1683, a year after his return to France. It described the places visited, notably NIAGARA FALLS, and the Iroquois and the Sioux who held the travellers in captivity for 6 months. Hennepin was vain-glorious and rebelled against church discipline; he seldom held a position for long. In 1697 he published *Nouvelle Découverte d'un très grand pays* and in 1698 *Nouveau Voyage d'un pais plus grand que l'Europe* in which he claimed he had travelled to the Mississippi's mouth. This attempt to appropriate La Salle's discovery was another self-serving embellishment to justify retelling the 1683 narrative. Hennepin's books were enormously popular in Europe, but he was excluded from Canada and passed into obscurity.

PETER N. MOOGK

Reading: *Father Louis Hennepin's Description of Louisiana* (1938); L. Hennepin, *A New Discovery of a Vast Country in America* (1698/1903).

**Henry, Alexander**, fur trader (b in New Jersey Aug 1739; d at Montréal 4 Apr 1824). He was one of the first English traders known as the "pedlars from Quebec" to do business in the North-West following 1763. He came to Québec as a young merchant supplying the British army. Travelling to Michilimackinac, the fur-trade entrepôt, he was present at the 1763 Indian attack there, was taken prisoner and lived with the Indians for a year. For several years he traded on Lk Superior, but by 1775 he was on the Saskatchewan R. By 1781 he had retired to Montréal as a general merchant. He joined the NWC but sold his interest in 1796. His memoir, *Travels and Adventures in Canada and the Indian Territories* (1809), is a classic of Canadian travel literature.

DANIEL FRANCIS

**Henry, Alexander**, "the Younger," fur trader (d at Fort George [Astoria, Ore] 22 May 1814), nephew of Alexander Henry, "the Elder." After entering the fur trade in 1791 he served the NORTH WEST COMPANY for 23 years at posts ranging from Lk Superior to the Pacific Ocean. His journals are among the finest accounts of the western trade and are interesting for their comments on native languages and cultures.

DANIEL FRANCIS

**Henry, George**, or Maungwudaus, meaning "the great hero," or "courageous," Mississauga (Ojibwa) interpreter, Methodist mission worker, performer (b on the NW shore of Lk Ontario c 1807; d after 1851). Educated in Methodist mission schools, George Henry seemed designed for a role in the church as interpreter and translator. A more exciting career, however, attracted him. In 1844 he organized an Indian troupe which toured Britain and the continent, 1845-48, putting on Indian dances and exhibitions. After his return from Europe Maungwudaus performed for several years in Canada and the US, and later became a well-known Indian herbalist. He wrote a pamphlet, *An Account of the Chipewya Indians, who have been travelling among the Whites, in the United States, England, Ireland, Scotland, France and Belgium* (1848), excerpts from which are found in P. Petrone, *First People, First Voices* (1983).

DONALD B. SMITH

**Henry, George Stewart**, farmer, businessman, Conservative politician, premier of Ontario (b in King Twp, Ont 16 July 1871; d near Toronto 2 Sept 1953). As Ontario entered the automobile age, he provided the province with its first high-

way system, but he has been remembered as the dour premier of Depression days. Serving in the legislature for 30 years (1913-43), as minister of public works and highways 1923-31 and then as premier 1930-34, he was dedicated to building good roads. Paved highways were extended from 670 to 3888 km and Canada's first concrete bridge was constructed. With less success he tried to promote a metropolitan Toronto area to plan development. But "Honest George" was drab and prosperous and in 1934 no match for the populist Mitch HEPBURN.

BARBARA A. MCKENNA

**Henry, Robert Alexander Cecil**, "Red," businessman, public servant (b at Montréal 20 Sept 1884; d at St Petersburg, Fla 1 Jan 1962). Educated at McGill, Henry worked for the CPR before entering the federal public service in 1908. He worked in the departments of the Interior and Railways and Canals until 1923 and then headed the economics bureau of the CNR 1923-28. In 1929 he became deputy minister of railways and canals, but left in 1930 to become general manager of Beauharnois Light, Heat and Power Co in Montréal. Beauharnois's relations with Mackenzie KING's government were called into public question 1931-33, but there was no proof of misconduct on Henry's part. In 1939 Henry joined the War Supply Board and, as a member of the executive committee of the Dept of Munitions and Supply, was C.D. HOWE's right-hand man and troubleshooter. After ill health 1941-44, Henry returned to full duty as deputy minister of reconstruction 1944-45. In later years he was a consultant on the development of the St Lawrence Seaway.

ROBERT BOTHWELL

**Henry, William Alexander**, lawyer, politician, judge (b at Halifax 30 Dec 1816; d at Ottawa 3 May 1888). Henry achieved a solid legal and political reputation, cemented by his role as a FATHER OF CONFEDERATION. First elected in 1840 for Antigonish, he rose to provincial Cabinet rank in 1852, but broke with the Liberals (1857) and thereafter served as a minister under Conservative governments. Henry attended the 3 Confederation conferences as Nova Scotia's attorney general and enthusiastically promoted the movement at home; he reputedly helped draft the BNA Act in London. Defeated in the 1867 federal election, he was politically rewarded in 1875 with appointment to the Canadian Supreme Court, where his service was able, but not brilliant.

LOIS KERNAGHAN

**Hensley, Sophia Margaretta**, née Almon, author, lecturer (b at Bridgetown, NS 31 May 1866; d at Barton, NS 10 Feb 1946). An early protégé of Sir Charles G.D. ROBERTS, Hensley published articles, poetry and fiction that reflected her interest in women's issues and social tolerance. Active in literary and philanthropic circles, she studied or lived in England, France and the US before re-establishing herself in NS (1929). In addition to writing 10 books and periodical contributions under her own name, she used the pseudonyms Gordon Hart, J. Try-Davies and Almon Hensley. Like Roberts, Bliss CARMAN and many other Canadian literary contemporaries of her generation, she published internationally while always describing herself as "a Canadian in thought, feeling and expression."

GWENDOLYN DAVIES

**Henson, Josiah**, founder of the BLACK settlement at Dawn, Upper Canada (b at Charles Co, Md 15 June 1789; d at Dresden, Ont 5 May 1883). Born a slave, Henson escaped to Canada in 1830. Four years later he founded the Dawn community near Dresden, Upper Canada, for American fugitive slaves. Aided by a white American missionary, Hiram Wilson, he and his associates organized a manual-labour school, the British-American Institute. He was active on the

executive committee until the institute closed in 1868. Although a poor administrator, constantly engaged in disputes over finance and management, Henson served as Dawn's spiritual leader and patriarch and made numerous fund-raising trips in the US and England. He published his autobiography in 1849, and he was allegedly Harriet Beecher Stowe's model for the leading character in *Uncle Tom's Cabin*.

JANE H. PEASE AND WILLIAM H. PEASE

*Reading: Josiah Henson, An Autobiography of the Rev. Josiah Henson ("Uncle Tom") from 1789 to 1881*, ed, John Lobb (rev ed 1881; repr 1969).

**Hepburn, Douglas**, weightlifter (b at Vancouver, BC 16 Sept 1927). Hepburn's birth was difficult, and he has suffered from a club foot and a withered leg all his life. These infirmities did not deter him from training with weights, nor did they lessen his determination to excel. Competing in the heavyweight category (over 90 kg) at the 1953 World Weightlifting Championships in Stockholm, Sweden, Hepburn defeated the 1952 Olympic champion by a total of 10 kg. In 1954 he won the heavyweight title at the British Empire and Commonwealth Games held in Vancouver. He then turned to professional wrestling and business. RICHARD CAMPION

**Hepburn, Mitchell Frederick**, politician (b at St Thomas, Ont 12 Aug 1896; d there 5 Jan 1953). Confident and affable, "Mitch" was a popular farmer who won a narrow victory in Elgin W in the 1926 federal election and was re-elected with a healthy majority in 1930. That year he was elected leader of the provincial Liberal Party and broadened its base by allying with the Progressives, conciliating the liberal and labour left, and trying to resolve the split over the Roman Catholic school question and prohibition. His speeches on behalf of Ontario farmers and for freer trade were noted more for their wit than for economic insight. Aided by the Depression, the ineptness of Conservative Premier George HENRY, and funding from business and mining interests, Hepburn won an overwhelming victory in the 1934 provincial election. In office, Hepburn implemented a number of populist measures — the auction of government limousines and the closing of the lieutenant-governor's residence. He cancelled power contracts with 4 Québec companies, tried to bring order to provincial finances, improved labour legislation and aided the iron-ore industry. He regarded the compulsory pasteurization of milk as his greatest accomplishment. Less successful was his attempt to aid parochial schools.

The most celebrated event of his first administration was the strike at General Motors in Oshawa in 1937 (see OSHAWA STRIKE). Hepburn, while sympathetic to the unemployed, was opposed to unionization and to letting the Congress of Industrial Organization into Canada. He supported GM in its refusal to negotiate with the CIO organizers, and when Ottawa refused to dispatch a unit of the RCMP, he organized his own volunteers — Hepburn's Hussars. Ultimately, the strike was settled with what amounted to an acceptance of the union. The strike ruptured Hepburn's relationship with PM KING (which had never been close), and in Jan 1940 he passed a resolution in the Ontario legislature critical of King's war effort. King thereupon called an election, which he won handily. Hepburn's day was over; he helped to scuttle the 1941 federal-provincial conference and supported A. MEIGHEN in the S York by-election of 1942, but his struggle with King ruined his party and destroyed his health. In 1942 he resigned as premier and in 1943 as provincial treasurer. The Liberals asked him to lead the party in the 1945 election, but the party was routed and Hepburn lost his seat.

JOHN SAYWELL

*Reading: N. McKenty, Mitch Hepburn* (1967).

**Heraldry**, the creation or study of armorial bearings. Signs and symbols both convey messages, and symbols also play on our emotions. An arrow showing direction elicits no emotional response, but grasping the symbolic value of a flag requires emotional involvement: pride, devotion, patriotism or admiration. An EMBLEM is a sign with a conventionally accepted meaning. The parliamentary mace had its probable origin as an instrument of physical discipline in assemblies, but today it is accepted by convention as an emblem of authority, and as a symbol it arouses respect in viewers. Symbols are found in religion, in the arts and in customs. Coats of arms are visual symbols which reflect the beliefs, aspirations and history of individuals or of groups.

During the Crusades (11th-13th centuries), the European nations felt the need to identify themselves with crosses of various colours, and at the same time to reduce casualties with improved armour. The knight, whose head was entirely covered by a helmet, adopted for recognition a personal symbol which he displayed on his surcoat, shield and banner. Such symbols became the main components of a coat of arms (of which a crest is only a part). Coats of arms, or arms, have survived because they became hereditary within families and their use was extended to corporate and civic entities.

In 1407 a college of arms was created in France by Charles VI, and the use of arms continued until 1790. The first known heraldic instance in Canada occurred 24 July 1534, when Jacques CARTIER planted at Gaspé a large cross bearing the royal arms of France. The royal arms, 3 gold fleurs-de-lis on a blue field, continued to represent the king of France in the New World. One did not have to be of nobility to bear arms, but in practice most of the armigers (bearers of arms) in New France — government officials, military officers, clergymen and merchants — were nobles. A number of men received letters of nobility and subsequently grants of arms for their services to the sovereign, eg, Charles Le Moyne de LONGUEUIL (1668), Nicolas Juchereau de Saint-Denis (posthumously, 1697) and Joseph-François HERTEL DE LA FRESNIÈRE (1716).

With the fall of New France, the officers of the British sovereign, the College of Arms in England and the Court of the Lord Lyon in Scotland became the granting authorities in Canada. Few Canadians of French origin have had recourse to British institutions to have their arms legitimized or to have new ones granted. One early exception, Gaspard-Joseph Chaussegros de Léry, recorded his arms and cross of Saint Louis at the College of Arms in June 1763. The first known grant to a Canadian after 1763 was made to James Cuthbert in 1778. The next known grant was to William MCGILLIVRAY in 1801. Early grants were not numerous, in part because Canadians were busy building a country and had little time or money for the niceties of life. A number of cities and institutions took an interest in heraldry, but few had their arms officially recorded. This gave rise to a rather naive style of heraldry, with representations of steamboats, locomotives, grain elevators, factories and forests.

Today there is a revival of heraldry, probably because people are seeking special expressions of their own identities, but also because the importance of symbolism has been recognized in art, religion, psychology and the social sciences. The HERALDRY SOCIETY OF CANADA has done much to foster a knowledge of heraldry and to induce cities, corporations, institutions and individuals to obtain grants of arms. Canadians who have become armigers include Gov Gen Georges P. VANIER, Lord Beaverbrook (see MAX AITKEN) and Lt-Gov George F.G. STANLEY. The number of municipalities with grants has considerably

increased, and now includes Fredericton, Hamilton-Wentworth, Peace River (Alta), Esquimalt (BC) and Grand Falls (Nfld). Among the many corporate or civic bodies bearing arms are the ROYAL SOCIETY OF CANADA, the HUDSON'S BAY COMPANY, the Grey Sisters of the Immaculate Conception and numerous universities. Bishops and dioceses usually have arms, as do some counties.

A description in heraldic language is a blazon; the pictorial rendering is the emblazonment. Forms are stylized to bring out the salient points; proportions and the tonality of the colours are important. A good heraldic artist strives for individual style and avoids stereotypes. Without a Canadian heraldic authority, Canadians have been confused in heraldic matters, and designs on the whole have been poor. Canadians should be wary of anyone trying to sell them arms without solid documentary support. The arms could be the property of an entirely different family branch with the same name. In most European countries and in Canada, arms are granted to an individual and his descendants; not every family has a coat of arms.

The Public Archives of Canada responds to inquiries and, within reasonable limits, offers guidance to researchers or designers. It co-operates with museums and individuals to identify coats of arms on artifacts. With the help of heraldic artist and scholar Hans D. Birk, the arms of families from countries other than France and Britain now living in Canada are being documented and painted in colour. The main threat to heraldry today appears to be the logo, although heraldists warn that logos may be a passing form which, unlike heraldry, will not endure the test of time.

**Heraldry Society of Canada**, headquartered in Ottawa, est 1966 to encourage interest in the history and practice of HERALDRY in Canada. A quarterly illustrated journal issued since 1967, *Heraldry in Canada*, is now the largest single published source relating to historical and contemporary Canadian heraldry. Society activities also include sponsorship of the annual George M. Beley Lecture on Canadian heraldry and the development of a roll of Canadian arms. In 1981 the HSC published a landmark reference text, *Canadian Heraldry*, based on a manuscript by founder Alan B. Beddoe (1893-1975). The society has promoted the establishment of a national authority to grant and regulate the use of arms, with key representations being made to the Joint Commons Senate Committee on the Constitution in 1971 and the Federal Cultural Policy Review Committee a decade later. Since 1976 those who have given outstanding service to the society have been recognized by appointment to a faculty of Fellows of the Heraldry Society of Canada (FHSC).

ROBERT D. WATT

**Herbarium** [Lat *herba*, "herb," formerly any medicinal plant], collection of dried specimens of PLANTS, mounted on sheets of heavy paper and stored in cabinets or bound in book form, and the building that houses such a collection. The term replaced *hortus siccus* [Lat, "dried garden"], which was used until 200 years ago. Herbaria originated in Europe in the 16th century. The largest, in Paris, has over 10.5 million specimens. In 1979, the total holdings of more than 250 institutional and private herbaria in Canada were estimated at just over 5 million. The largest Canadian herbaria are as follows: Biosystematics Research Institute, Agriculture Canada, Ottawa; National Herbarium of Canada, National Museum of Natural Sciences, Ottawa; Herbar Marie-Victorin, Institut Botanique Université de Montréal; University of British Columbia, Vancouver; University of Toronto. The largest private herbarium in Canada was that of Frère MARIE-VICTORIN, which forms the basis of the herbarium which now bears his name.

**Herbs**, technically, are nonwoody, vascular PLANTS, ie, relatively soft plants with specialized systems of vessels for conducting water and nutrients. More commonly, the word refers to various, often aromatic, plants used especially in medicine or as seasoning. Here, "herb" is used in its less technical sense. Herbs and spices differ largely by usage. Spices are normally more aromatic than herbs, and are often of tropical origin. They may consist of seeds, bark, flower buds, fruits, etc. Herbs are usually leafy and locally grown, and their use extends far back into history. Culinary herbs are still of great importance as flavouring; before refrigeration, they were essential as preservatives and to disguise the flavour of bad meat. "Pot herbs" were almost any young, green growth that could be eaten early in spring to supply needed minerals and vitamins after the privations of winter. Various herbal teas, filling the same need, were very important to the inhabitants of the New and Old worlds.

North American Indians were very conversant with the use of herbs for health, healing and spiritual needs. In many cases, discoveries paralleled those of Europe; eg, willow (*Salix*) and poplar (*Populus*), each containing salicylic acid (as does aspirin), were used by both Europeans and Indians for relief of pain and rheumatic complaints. Rose hips (containing vitamin C) were important on both sides of the Atlantic, as were yarrow, sorrel, mint and nettles. Indians introduced European settlers to medicinal herbs which they could substitute for those left at home. Particularly noteworthy were the effective cures for scurvy, chief of which, available even in winter, were teas made of spruce (*Picea*) or cedar (*Thuja*) needles.

Many favourite herbs come from the Mediterranean area and their position in northern gardens must be planned accordingly. A sunny spot, with a light sandy soil that warms up quickly in spring, is ideal. For maximum flavour, herbs should not be given too much water or nitrogen. Luckily, many herbs are annuals or can be grown as such; therefore, they present no problem in any part of Canada. Seed should be sown outside as soon as the soil is warm, or started indoors and transplanted when all danger of frost is past. Dill (*Anethum graveolens*), summer savory (*Satureia hortensis*), sweet basil (*Ocimum basilicum*), chervil (*Anthriscus cerefolium*) and sweet marjoram (*Majorana hortensis*) are annuals that may be grown this way. Parsley (*Petroselinum crispum*) and sage (*Salvia officinalis*) are perennial only in warmer parts of the country, but may be successfully grown as annuals. Woody perennials such as rosemary (*Rosmarinus officinalis*) and lavender (*Lavandula officinalis*) will not generally overwinter outside. Thyme (*Thymus vulgaris*) is not very hardy, but creeping thyme (*T. serpyllum*) may be used as a substitute. Two popular herbs require somewhat different conditions. Chives (*Allium schoenoprasum*) are easy perennials in any good garden soil and should be divided and replanted every few years. Mint (*Mentha*) is a vigorous perennial, spreading rapidly in moist soil by means of underground stolons (horizontal branches); in dry prairie conditions, it may die out unless moved to new ground frequently.

The medicinal use of plants has a long and honourable history. The Greek Theophrastus (c371-286 BC) was the first botanist/physician to write about plants, their identification and uses. Medical knowledge was kept alive in the monasteries during the Middle Ages, and emerged during the 16th century, hand in hand with botany, when schools of medicine and botanic gardens were first established. Meanwhile, the local herbalist, wise woman, or shaman continued to minister to the sick, often in competition with the professional doctors. Herbal specialists were sometimes revered, sometimes

burnt as witches. Because much ancient herbal lore relied on psychological as well as physical methods of curing, the use of herbal medicine fell into disrepute with the advent of "scientific" methods. Herbs, however, are the bases of modern medicines, some of which (eg, digitalis, belladonna and the many opium derivatives) are still obtainable only as plant extracts. Others, first discovered as plant ingredients, are now being manufactured synthetically. Many scientists are now looking at old remedies, and interest in herbal lore has revived as people seek alternatives or supplements to modern medicine. However, the use of herbal medicine is an exacting science in its own right, involving the correct identification and use of what may be highly toxic plants. The use even of simple home remedies and herbal teas should be attempted only by those familiar with plant identification. See individual species entries; PLANTS, NATIVE USES; POISONOUS PLANTS.

GILLIAN FORD

Reading: Malcolm Stuart, *The Encyclopedia of Herbs and Herbalism* (1979).

**Heriot, George**, artist, public official (b at Haddington, Scot 1759; d at London, Eng 1839). He learned watercolour technique from Paul Sandby at the Royal Military Academy, Woolwich, Eng (see TOPOGRAPHIC PAINTERS), and he arrived in Québec City in 1792. The sketches he made during his extensive travels as deputy postmaster-general of BNA (1799-1816), his more formal watercolours and the aquatints that accompany his classic, picturesque *Travels through the Canadas* (1807) are marvellously evocative studies of nature as well as a valuable record of early Canadian life and landscape. Heriot's abrasive personality brought him into frequently fractious relationship with colonial administrators and he resigned in 1816.

JAMES MARSH

**Heritage Canada Foundation**, est 28 Mar 1973 under executive director R.A.J. Phillips and chairman Hart McDougall, with a one-time government grant of \$12 million, as a private nonprofit trust for the "preservation and demonstration of the nationally significant historical, architectural, natural and scenic heritage of Canada." With existing organizations already concerned with the natural landscape, the foundation has concentrated on the built-up environment. In 1984 it had some 30 000 members and a staff of 30 in its Ottawa headquarters. Its executive has included Jacques Dalibard, Pierre Berton and J.P.S. MacKenzie. An elected board of 14 governors, chosen by regions at an annual convention, and 2 government appointees meet 3 times a year to set the foundation's goals.

The foundation's accomplishments in its first decade include establishment of heritage legislation in all provinces; demonstration projects in conservation areas in St John's; Charlottetown; St Andrew's, NB; Halifax; Annapolis Royal, NS; Saint John; Quebec City; Ottawa; Winnipeg; Edmonton; Vancouver; and Dawson, YT; establishment of an educational and technical-services department; publication of a bi-monthly magazine, *Canadian Heritage*, together with books, pamphlets and technical manuals; an awards program for excellence in heritage preservation; and a public campaign for heritage awareness, including the establishment of National Heritage Day on the third Monday in Feb.

By 1982 the foundation was concentrating on preserving main streets of small towns through demonstration projects in Windsor and Bridgeport, NS; Perth and Cambridge, Ont; Moose Jaw, Sask; Fort Macleod, Alta; and Nelson, BC. It was also engaged in a campaign to educate banks, railways and the post office in its philosophy. The foundation sees its task as "teaching the teachers," using demonstration projects to train personnel and to produce technical manu-

als for scores of communities across the nation. Its "University Without Walls," launched with private funds in 1980, is designed to train artisans, architects and builders in forgotten skills. The foundation does not give grants, nor does it purchase property except for demonstration purposes. It has also expanded the original definition of "heritage" to include the entire built environment, the great number of buildings which give our communities their special character. In 1982 executive director Jacques Dalibard defined a heritage building as one that is structurally sound and for which a viable use can be found. See HISTORIC SITE. PIERRE BERTON

**Heritage Conservation** is the understanding, appreciation and preservation of things that are important in our culture and history. Heritage can be a tangible object, such as a building (church, post office, railway station), or it can be an artifact, such as a Red River cart or a NW Coast Indian TOTEM POLE. Heritage can also be intangible, as in FOLKLORE, customs, language, dialect, songs and legends. The term "conservation" means protection from any agent (be it climate or man) that threatens to destroy heritage; it also means increasing our understanding and awareness of heritage. The practice of heritage conservation in Canada usually refers to protecting the built environment, that is the preservation of buildings, streetscapes, hamlets, neighbourhoods and rural landscapes that have been created in the development of Canada.

Concern for monuments has existed for some time. When the original PARLIAMENT BUILDINGS burned in 1916, the new buildings (completed in 1920) were built in a Gothic revival style to complement the earlier East and West Blocks that remained on the site. However, attention to everyday buildings and their protection has developed only recently. It is now common to see communities and individuals protecting, restoring, recycling and conserving shops, banks, houses and industrial buildings. Privateer's Wharf in Halifax, a grouping of early 19th-century buildings, has been restored for commercial uses; the residential neighbourhood centering on the corners of Milton and Park avenues in Montréal has been rehabilitated and is the locus of a number of housing co-operatives; and the Orpheum Theatre in Vancouver has been restored and adopted as the home of the Vancouver Symphony Orchestra. Before WWII interest in conservation had been limited to the protection of sites of national historic importance or scenic beauty. The earliest legislation in Canada to protect a site was the Rocky Mountains Parks Act of 1887. The Historic Sites and Monuments Board of Canada was formed in 1919 to advise the government on sites worthy of official recognition, and the National Parks Act was passed in 1930. Provincial historical associations, particularly in the Maritimes, Québec and Ontario, had been pressuring their governments since the early 20th century for the preservation of sites. These developments determined the nature of government intervention in heritage conservation: federal involvement is limited to the identification and protection of sites of national historic and architectural value, and to the development of programs of research in history, architecture and archaeology which relate to the national interest. Canada has signed international treaties on this subject. Under the Constitution Act, 1982, matters pertaining to property and civil rights are an exclusive concern of the provinces; thus, except for sites of clearly national significance, heritage conservation is primarily a matter of provincial policy.

In recent years, 2 events have fostered concern for retaining built heritage — the Canadian CENTENNIAL of 1967 and the ecology movement which began in the late 1960s. During the Centennial, local events commemorating the past

Heritage conservation includes the protection of historically important buildings such as those in Bonsecours Market in Old Montréal (photo by Harold V. Green/Valan).

drew attention to the wealth of Canada's architectural heritage and encouraged its preservation. At the national level, events such as EXPO 67 and the Voyageur Canoe Pageant drew Canadians together in a celebration of the past and future. The ecology movement gained momentum from public reaction to projects such as the ST LAWRENCE SEAWAY, which destroyed entire communities and a rich architectural heritage. Earth Day in 1970 was a celebration of the unity of the planet, and the energy crises has drawn attention since 1973 to the limits of natural resources. Thus, both the philosophy of CONSERVATION and awareness and pride in Canadian history have fostered the growth of the heritage conservation movement in Canada.

In the early 1970s the federal government, through Parks Canada, began to record and interpret architectural history in the Canadian Inventory of Historic Building, a nationwide survey of buildings constructed before 1914. The HERITAGE CANADA FOUNDATION and the Society for the Study of Architecture in Canada were established to lobby for building conservation and to research specific areas of architecture and its history. Today, every province has some form of heritage conservation legislation, which usually concerns itself with specific issues such as individual building protection, area conservation, archaeology and the establishment of a provincial body to encourage heritage conservation publicly and privately. Some provinces have also included museums and archives in their legislation.

Heritage conservation involves the protection of objects and materials of interest in the interpretation of history. This is done mostly by ART GALLERIES AND MUSEUMS AND ARCHIVES which collect, identify, preserve and interpret objects taken from their everyday setting. These objects may be small and discrete, such as projectile points or farm implements, or large and interconnected, such as buildings or building groupings. The collections of local museums and heritage villages are examples of this approach.

Heritage conservation also means the commemoration of an event, person, building or site of historical importance. Thus, plaques are erected to note HISTORIC SITES. In many cases, marking a site is not enough, as demolition and destruction have occurred even on marked buildings. For example, the Atlantic Lunatic Asylum at 999 Queen Street West in Toronto (architect J.G. HOWARD) was demolished in 1976 by the provincial government, despite opposition from the Toronto Historical Board and the Ontario Heritage Foundation. Protection of a heritage

building by a government can occur in 2 ways: by outright purchase or by legislation. As purchase can be costly, preference is often given to legislative means, such as heritage designation. By means of designation, a provincial or municipal government declares that a building must not be altered from the state that makes it a heritage building.

Heritage conservation may be included in land-use planning and development. In some places, heritage conservation is becoming as important in local planning as the provision of social services and community development. Several provinces have tied heritage legislation to environmental legislation and have developed procedures to ensure assessment of the impact of government expenditures or private developments on heritage. The results of a growth in heritage consciousness can be seen across Canada, as areas are protected, buildings restored, museums expanded, and long-range plans for the protection of the built environment are implemented. There are still many threats to heritage resources. Wilful neglect of important buildings, a public that is not appreciative of heritage, inappropriate conservation of sites and buildings, tax laws that fail to encourage renovation, and zoning that does not consider heritage all threaten conservation.

The key to success is a growing appreciation by all Canadians of the contribution which this heritage can make to our quality of life, and a consensus to use economic and legal measures to capitalize on it. That consensus is still in the formative stage.

GEORGE KAPELOS

Reading: M.C. Denhez, *Heritage Fights Back* (1978) and *Protecting the Built Environment* (1978).

**Heritage Trail**, route along which selected features of history or natural history are explained for the general public. The earliest interpreted trails, some 60 years ago, dealt only with natural history and were called nature trails. Originally, a typical nature trail was an existing path through a natural area, interpreted by means of signs or a booklet.

The first interpreted nature trails in Canada were probably those developed in BANFF NATIONAL PARK in 1959 at the Hoodoos and Bow Summit. Hundreds of trails are now found from coast to coast in Canada, installed and run by national and provincial parks, the Canadian Wildlife Service, tourist departments, conservation authorities, museums, universities, schools, BOTANICAL GARDENS and private agencies.

Visitor numbers are often counted to measure use; however, few trails are systematically evaluated, although the Wye Marsh Centre now uses microcomputers to encourage visitors to evaluate all aspects of their visits. Trails can be expected to increase and diversify, and to become more sophisticated as interpreters and audience use them more extensively. The following is a short list of selected nature trails by province or territory.

**Alberta:** DINOSAUR PROVINCIAL PARK — Dead Lodge Canyon Nature Trail; ELK ISLAND NATIONAL PARK — Lakeview Trail; WATERTON LAKES NATIONAL PARK — Bertha Falls Trail; WOOD BUFFALO NATIONAL PARK — Lane Lake Trail, Salt River Trail.

**British Columbia:** GLACIER NATIONAL PARK — Abandoned Rails Trail, Loop Trail, Trestle Trail; MOUNT REVELSTOCK NATIONAL PARK — Inspiration Woods, Giant Cedars, Mountain Meadows.

**Manitoba:** RIDING MOUNTAIN NATIONAL PARK — Arrowhead, Burls and Bittersweet, Brûlé, Ma-ugun, Oninimik, Loon's Island and Grey Owl trails.

**New Brunswick:** Various trails at Anchorage Provincial Park, FUNDY NATIONAL PARK, Grand Falls, Hartland, Les Jardins de la République Provincial Park, Mactaquac Provincial Park, North Lake Provincial Park.

**Newfoundland:** GROS MORNE NATIONAL PARK — Berry Head Pond, Green Gardens, Berry Hill, Lobster Cove Head, Southeast Brook Falls and Stanleyville trails.

**Northwest Territories:** NAHANNI NATIONAL PARK — South Nahanni River canoe trail.

**Nova Scotia:** KEJIMUKIJ NATIONAL PARK — Mersey Meadow Trail, Mill Falls Trail; Lake Echo — Echo Look Off Trail; Cabot Trail; Evangeline Trail.

**Ontario:** Bellevue House National Historic Park; Fort Wellington National Historic Park; GEORGIAN BAY ISLANDS NATIONAL PARK — Beausoleil Island, Bobbies Trail, Flowerpot Island Trail; PUKASKWA NATIONAL PARK — Coastal Hiking Trail; Queenston Heights; Rideau Canal — Merrickvale Lockstation walking tour, Ecotour; Woodside National Historic Park.

**Prince Edward Island:** Prince Edward Island National Park — Balsam Hollow, Bubbling Springs, and Reeds and Rushes trails.

**Québec:** FORILLON NATIONAL PARK — Grande-Greve; Lachine Canal; LA MAURICIE NATIONAL PARK — Cascades Trail, Falaises Trail; ST LAWRENCE SEAWAY.

**Saskatchewan:** Meadow Lake; Prairie Wildlife Interpretation Centre — Swift Current Trail; PRINCE ALBERT NATIONAL PARK — Boundary Bog Trail, Mud Creek Trail.

**Yukon Territory:** Chilkoot Pass Trail; KLUANE NATIONAL PARK — various trails. DAVID SPALDING

**Heron** (Ardeidae), family of BIRDS comprising 60 species worldwide, 12 in Canada (including true herons, egrets, night herons and bitterns). Most are long-legged, long-necked wading birds which look for food (tiny fish, crustaceans, insects, amphibians and reptiles) in shallow fresh or salt water. They have long, rounded, rather broad wings and relatively short tails. They are distinguished from CRANES by their position in flight, necks bent and heads supported between their shoulders. All have straight, rather long bills that distinguish them from ibises, which are similar in appearance but have long, curved bills. The sexes vary little in appearance. Plumage is generally dull, but certain species have crests and ornamental plumage during breeding season. Under flank plumage, the bird has layers of powder down, used to rid feathers of oil, grease and mud. The powder is applied by the claw of the middle toe, which has comblike teeth on its inner surface. Once the feathers are

preened, the bird waterproofs them with oil from its uropygial glands.

Most herons and egrets nest in colonies, sometimes in mixed-species groups. Nests of small branches are built, sometimes high in trees, usually in wooded areas out of reach of predators. Bitterns nest closer to the ground, usually in freshwater marshes among clumps of reeds. Most species lay 3-5 (usually 4) pale blue or bluish green eggs. The great blue heron (*Ardea herodias*), the largest and most common heron in Canada, stands over 1 m tall. It frequents river banks and tidal bays, where it wades deep into the water to fish. It is found from NS to Alberta, and on the BC coast and islands. The black-crowned night heron (*Nycticorax nycticorax*) is a squat, short-toed bird of NS, the Great Lakes-St Lawrence R area, and southern Manitoba and Saskatchewan. It is usually found at river mouths and is especially active at dusk. Its vernacular name, night squawk, results from its cry in flight. The guttural cries of American bittern (*Botaurus lentiginosus*) may be heard in marshlands throughout southern Canada and up to Great Slave Lk, NWT. The bird blends perfectly with surrounding vegetation. Other breeding species include green-backed heron (*Butorides striatus*), in the Niagara region, southern Québec, part of NB and, possibly, NS; cattle egret (*Bubulcus ibis*), recently and very locally in Ontario; great egret (*Casmerodius albus*), very locally in southern Ontario and rarely in SE Saskatchewan and Manitoba; yellow-crowned night heron (*Nycticorax violaceus*), only at East Sister I, Ont; least bittern (*Ixobrychus exilis*), locally in southern Manitoba and NB, and in Niagara region.

JEAN-LUC DESGRANGES

**Héroux, Denis**, film director, producer (b at Montréal 15 July 1940). Héroux established himself in 1968 with *Valérie*, the first pornographic film made in Québec. After several erotic films, Héroux tried historical melodrama in *Quelques arpents de neige* (1972) and light comedy in *J'ai mon voyage* (1973) and *Pousse mais pousse égal* (1974). In the 1970s he became one of Canada's major producers of international co-productions. He directed a few films but abandoned directing for producing. His international reputation has enabled him to work with other celebrated directors: Claude Chabrol, *Violette Nozière* (1977) and *Blood Relatives* (1978); Claude Lelouch, *A nous deux* (1979); Claude Pinoteau, *L'Homme en colère* (1979); Louis Malle, *Atlantic City* (1980); and Jean-Jacques Annaud, *Quest*

for *Fire* (1981). Despite his dominant position in the private industry and his commercial success, Héroux's views on the Québec film industry and on national cinema have placed him at odds with his colleagues. He silenced criticism in part by producing Gilles CARLE's *Les Plouffes* (1981) and repeated this success with *La Crime d'Ovide Plouffe* (1983). Héroux is also a film critic and was a member of the 1982 Applebaum-Hébert Federal Cultural Policy Review Committee.

PIERRE VÉRONNEAU

**Herridge, William Duncan**, lawyer (b at Ottawa 18 Sept 1888; d at Ottawa 21 Sept 1961). Herridge was the brother-in-law of PM R.B. BENNETT, his minister to the US, 1931-35, and one of his key advisers. He served with distinction in WWI, winning both the DSO and MC. He came to political prominence during the election of 1930, when he wrote speeches for Bennett and helped formulate Conservative strategy. While in Washington he was impressed by F.D. Roosevelt's activist philosophy of government, and he played a prominent role in convincing Bennett to bring a version of the New Deal to Canada in 1935 (see BENNETT'S NEW DEAL). In 1939 the mercurial Herridge launched New Democracy, a short-lived political movement advocating monetary reforms and far-reaching government intervention in the economy.

NORMAN HILLMER

**Herring**, common name for FISH of the widely distributed family Clupeidae. The true herring (*Clupea harengus*), a relatively small, bony, soft-rayed fish with an elongate, laterally compressed body, is silvery in colour, shading to bluish or bluish green on the back. Perhaps the most abundant of fishes, it is widely distributed throughout temperate and subarctic waters of the Northern Hemisphere, and is the only member of the genus found in Canadian waters. Adults move in vast schools, often many kilometres long, and migrate annually to spawning grounds in shallower waters. Herring feed on larger ZOOPLANKTON, abundant on or at the edge of the Continental Shelf. They are a major food of larger fishes (eg, COD, SALMON, TUNA, Halibut), marine mammals and sea birds.

Herring, abundant on Pacific and Atlantic coasts, also occur occasionally in Arctic waters. The Pacific subspecies (*C. h. pallasi*) differs from the Atlantic form (*C. h. harengus*) in several respects. Pacific herring spawn in spring, directly onto vegetation in intertidal and subtidal waters. They mature in their third year and seldom live more than 8 years. Their maximum standard length is about 26 cm. Atlantic herring spawn either in spring or autumn, usually over a gravel bottom. They mature in their fourth or fifth year, live 18 years or more and attain lengths of 35 cm or over. Herring have supported major commercial fisheries on both coasts. Both subspecies experience major population fluctuations caused by differences in brood survival. Prior to the mid-1900s, catches were limited by markets or catching capacities of fishing fleets. The development of an almost unlimited world market for herring meal and oil, plus major advances in fishing technology, led to overfishing of Pacific stocks in 1956-66, when annual catches usually exceeded 200 000 t, and of Atlantic stocks in 1968-71, when Canadian catches exceeded 400 000 t annually. Both fisheries have since been strictly regulated. Pacific fishermen, using mainly purse seines and gillnets, took about 50 000 t annually during the late 1970s; this was further reduced to an average of 34 000 t between 1981 and 1984. However, the value of the catch was much higher than before because of the prime price fetched on the Japanese market for quality Herring roe. Catches of Atlantic herring averaged about 235 000 t during the late 1970s, taken primarily by purse seine and mid-water trawl for sale to

Great blue heron (artwork by John Crosby).

European processors. Abundance declined on the East Coast also during the early 1980s, with catches declining steadily from 260 000 t in 1980 to about 165 000 t in 1983. A traditional weir fishery for young herring, for canning as sardines, operates in NB.

Six other members of the family are found in Canadian waters. Atlantic round herring (*Eturumeus sadina*), Atlantic menhaden (*Brevoortia tyrannus*) and Pacific sardine or pilchard (*Sardinops sagax*) are ocean spawners most abundant in southern US waters. They are now rare and of no commercial importance in Canada, although Pacific sardines supported a major fishery in BC during a period of high abundance (mid-1920s to 1940s). Alewife or glut herring (*Alosa pseudoharengus*), American shad (*A. sapidissima*) and blueback herring (*A. aestivalis*) are anadromous (ie, live in the sea but spawn in fresh water) on the Atlantic coast. They are also most abundant in the south, but alewife and American shad are relatively common in Canadian coastal waters, where they are fished commercially. American shad, introduced on the Pacific coast in 1871, is now found in the Fraser R and Rivers Inlet. A landlocked form of alewife is plentiful in the Great Lakes; many of its local names include the word herring. At least 4 other freshwater fishes (2 ciscos, goldeye and mooneye) are also known by names sometimes containing the word herring.

A.S. HOURSTON

**Hertel de La Fresnière, Joseph-François**, soldier (bap at Trois-Rivières 3 July 1642; buried at Boucherville, Qué 22 May 1722). As a youth, he was captured and adopted by the Iroquois (1661), escaped, and took part in retaliatory raids, accompanying FRONTENAC to Lk Ontario (1673). Though he was fined and briefly jailed for illegal fur-trading activities, his knowledge of Indian languages and warfare was valuable. Under Frontenac's orders, Hertel led numerous expeditions using the Indian method of rapid movement and ambush, including a devastating raid on the New England town of Salmon Falls in which the French claimed 43 Englishmen were killed. Hertel was called "the Hero," the "terror of the English." He commanded FR FRONTENAC 1709-12 and, by marriage with Marguerite de Thavenet, he inherited the Chambly seigneurie. After long delays due to his humble birth, he was granted letters of nobility in 1716.

JAMES MARSH

**Herzberg, Gerhard**, physicist, Nobel laureate (b at Hamburg, Germany 25 Dec 1904). He began an academic career at Darmstadt Technical U after earning his doctorate in engineering there. He left Nazi Germany in 1935 coming to Canada on the initiative of J.W.T. SPINKS, who had worked at his Darmstadt laboratory 1933-34. Herzberg taught at U of Sask 1935-45. He went to the Yerkes Observatory, Chicago, in 1945, seeking better opportunities for research, and returned to Canada in 1948 to join the staff of the NATIONAL RESEARCH COUNCIL. As director of physics 1949-69, Herzberg and NRC president E.W.R. STEACIE laid the foundations of the NRC's post-war reputation as a scientific "centre of excellence."

Herzberg's own research field was molecular SPECTROSCOPY, the analysis of the spectra of molecules in order to determine their structure. He specialized in free radicals, important intermediates of chemical reactions that have very short lifetimes (microseconds) under laboratory conditions. Free radicals are also found in interstellar space, where they can last for long periods, and their spectra can thus be recorded by special instruments. Herzberg and his associates developed new methods for their spectroscopic analysis. His personal career included more than 200 scientific publications and earned him

Gerhard Herzberg, winner of the Nobel Prize in 1971 for his work in molecular spectroscopy, was director of physics at the NRC 1949-69 and a vigorous participant in the debate over Canadian science policy (courtesy National Research Council).

many honours, such as fellowship in the Royal Soc of London (1951), the Order of Canada and the Nobel Prize for chemistry in 1971. He was also a vigorous participant in the SCIENCE POLICY debate following the Lamontagne report of 1970. The NRC created its highest grade, Distinguished Research Officer, especially to allow Herzberg to continue personal research after he reached retirement age in 1969 (in 1984 he still worked in his laboratory 5 days a week). In 1975 the NRC's astronomy and spectroscopy units were reorganized as the Herzberg Institute of Astrophysics.

DONALD J.C. PHILLIPSON

**Hespeler**, Ont, Town, inc 1901, located in SW Ontario, 14 km S of GUELPH. It was first settled by Swiss Germans from Pennsylvania, and originally called Bergytown after an early resident, Michael Bergy. Subsequently the name became New Hope, then Hespeler (1858), after Jacob Hespeler, an operator of mills and small manufacturing factories who moved to the community 1844. His enterprises formed the core of the local economy for most of the 19th century and he was the first reeve of the village. In 1973 Hespeler amalgamated with Preston and GALT to form the new city of CAMBRIDGE.

DANIEL FRANCIS

**Hessian Fly**, see MIDGE.

**Hétiu, Pierre**, conductor, pianist (b at Montréal 22 Apr 1936). After studying in Montréal with Germaine Malépart (piano), Jean PAPINEAU-COUTURE (acoustics), Gabriel Cusson and Conrad Letendre (harmony, counterpoint), Hétiu studied in Europe and the US. In 1960 he founded the Canadian Trio in Paris and in 1961 came first in the International Competition for Young Conductors in Besançon, France. As musical director for the Kalamazoo Symphony Orchestra, Mich (1968-72), associate conductor of the Detroit Symphony Orchestra (1970-73), artistic director of the Edmonton Symphony Orchestra (1973-1979), he has helped promote the work of Canadian composers. Since 1973 he has been guest-conductor for orchestras and opera houses across Canada.

HÉLÈNE PLOUFFE

**Heward, Efa Prudence**, painter (b at Montréal 2 July 1896; d at Los Angeles, Calif 19 Mar 1947). A figure painter of distinction when landscape painting was uppermost, Heward studied in Montréal and Paris. She was a founding member of the Canadian Group of Painters (1933), and joined the Contemporary Arts Soc (1939), differing from her women contemporaries by a strong, individualistic approach to

figure painting. Brilliant acid colours, sculptural treatment and an intense brooding quality pervade her pictures, whatever the subject. In her determination that structure would win over pretty landscape, she sometimes isolated the figure against a backdrop of complex, modelled shapes.

ANNE MCDUGALL

**Hewitt, Charles Gordon**, administrator, economic entomologist, conservationist (b at Macclesfield, Eng 23 Feb 1885; d at Ottawa 29 Feb 1920). Hewitt received a doctorate from Manchester U where he also lectured in economic zoology. He was appointed Canada's second Dominion entomologist in 1909. He was instrumental in the passing of the Destructive Insect and Pest Act in 1910 and expanded entomological services of the federal Dept of Agriculture by creating separate units, each headed by an entomologist, to deal specifically with field-crop, garden, forest and stored-product insects. Regional laboratories were established to study insect pests and devise controls. He was also successful in furthering the Canada-US treaty for the protection of migratory birds. A book on the protection of wildlife (1919), one on the housefly, annual entomological reports (1910-16) and many circulars and bulletins are part of his legacy.

P.W. RIEGERT

Reading: P.W. Riegert, *From Arsenic to DDT: A History of Entomology in Western Canada* (1980).

**Hewitt, Foster**, broadcaster (b at Toronto 21 Nov 1902). He worked briefly as a sportswriter for the Toronto *Daily Star* before switching to the new radio desk. On 22 Mar 1923, using an upright telephone, he made the first radio broadcast of a HOCKEY game (a Senior League match between Toronto Parkdale and Kitchener). Although this success led him to try his hand at broadcasting a wide variety of sports and public-affairs events, his name is most indelibly associated with hockey. He broadcasted the first game from Maple Leaf Gardens when it opened in 1931 and, from that time, his play-by-play descriptions became familiar to fans from coast to coast. His high-pitched voice would rise to a crescendo with his famous phrase, "He shoots! He scores!" He probably did more to popularize hockey in N America than any other person. In 1933 he participated in Canada's first experiment with TV, and when that medium came of age in the 1950s, he readily adapted to it. He was a TV commentator for 15 years. J. THOMAS WEST

**Hewitt, John**, cooper, labour leader, editor (fl1860-90s). After extensive experience in American labour reform, Hewitt became a major Toronto labour leader. He helped found the Toronto Trades Assembly, led the NINE-HOUR MOVEMENT, and backed the labour paper, the *Ontario Workman*. He was elected first secretary of the Canadian Labor Union (1873). He resigned as secretary of the Toronto Trades Assembly to take a Tory patronage job at the Toronto Water Works, and later was an editor of the *Sentinel*, the Orange Order's weekly. Hewitt's Toryism stemmed from his belief in a coalition of labour and small producing employers. While an anomaly from today's perspective, he represents the radical Tory workingman of his day.

G.S. KEALEY

**Hewton, Randolph Stanley**, painter (b at Maple Grove, Qué 12 June 1888; d at Belleville, Ont 17 Mar 1960). He studied under William BRYMER in Montréal (1903) and at the Académie Julian in Paris (1908-13). In Paris he met A.Y. JACKSON (1912), whose influence on his style would be considerable. This influence and the impressionism to which he was exposed in Paris can be seen in his early Canadian landscapes. His interpretation was sympathetic to that of the GROUP OF SEVEN but was not initially well received in his native Québec (1913). Perhaps his strongest development was in figure

painting and portraiture, in which he successfully combined the traditional fundamentals with contemporary influences, as in *Sleeping Woman* (1929). He was a founding member of the Canadian Group of Painters (1933) and was elected to the Royal Canadian Academy of Arts in 1934.

ERIK J. PETERS

**Hibernia Case** (*Newfoundland Reference Re Continental Shelf*) On 19 May 1982 the governor-in-council asked the Supreme Court of Canada whether Canada (the federal government) or Newfoundland has the right to explore and exploit the mineral and other natural resources of the seabed and subsoil of the Continental Shelf in the area offshore Newfoundland, approximately 320 kilometres E-SE of St John's, and whether Canada or Newfoundland has legislative jurisdiction to make laws in relation to such exploration and exploitation (see RESOURCE RIGHTS). The Court held, in March 1984, that continental shelf rights are an extraterritorial manifestation of external sovereignty, and hence these rights fall under the jurisdiction of the federal government. The Court held also that the federal government has legislative jurisdiction in relation to the right to explore and exploit in the Continental Shelf by virtue of the PEACE, ORDER AND GOOD GOVERNMENT power in its residual capacity.

GÉRALD-A. BEAUDOIN

**Hickman, Albert Edgar**, businessman, politician (b at Grand Bank, Nfld 2 Aug 1875; d at St John's 9 Feb 1943). Newfoundland's seventeenth prime minister, he held that office for just 33 days from June 11 to May 10, 1924, the shortest administration in Newfoundland's history. He was a prominent St John's businessman when he entered politics in 1913 and became a minister in several cabinets. He succeeded William WARREN as prime minister when Warren resigned but was soon defeated in a general election by Walter MONROE. Hickman continued as leader of the Opposition until he retired from politics in 1928.

ROBERT D. PITT

**Hicks, Henry Davies**, lawyer, politician, university president, philatelist (b at Bridgetown, NS 5 Mar 1915). Educated at Mt Allison, Dalhousie and Oxford (where he was a Rhodes scholar) and an officer of the Royal Canadian Artillery 1941-45, Hicks, a Liberal, was elected to the NS legislature in 1945. Minister of education 1949-55, he implemented a system of regional and vocational schools. In 1954 he was elected by a badly split party to succeed Prem Angus L. MACDONALD and became leader of the Opposition in 1956. Resigning from the legislature in 1960 to become dean at Dalhousie, he became president in 1963 — a position he held for 17 years. President of the Canadian Commission to UNESCO 1963-67 and member of the Canada Council 1963-67, he was appointed to the Senate in 1972.

MARGARET CONRAD

**Hide, Peter Nicholas**, sculptor (b in Surrey, Eng 15 Dec 1944). Hide studied under British sculptor Anthony Caro at St Martins School of Art, London, 1964-67, then was instrumental in establishing studios and annual exhibitions for painters and sculptors at Stockwell Depot in S London. He accepted a teaching post at U of A, Edmonton, in 1977 and has since divided his time between Canada and England, where he works at Stockwell Depot for brief periods each summer. Like many sculptors today, Hide works in welded steel. He is one of the few to have broken away from the overpowering influence of Anthony Caro, whose art tends to sprawl and spread through space; Hide's tends to be compact and upright. As such, it looks back to the monolithic sculpture of the past, though fully abstract. Composed of rhythmic folds, pleats and projections, his sculptures are often more than 2 m high and have a unique

presence. Though influential in Edmonton and London, Eng, his work has unfortunately seldom been exhibited outside those 2 centres.

TERRY FENTON

**High Level**, Alta, Town, pop 2194 (1981c), inc 1965, is located 300 km N of the town of Peace River. It began as a stopping point on the MacKenzie Hwy and later the Great Slave Lake Ry (1963). It is a shipping centre for timber and grain and serves numerous oil rigs at Rainbow Lk to the W. The town is named for its location at the height of land separating the HAY R system from the PEACE R. The weekly newspaper is the *High Level Echo*.

ERIC J. HOLMGREN

**High River**, Alta, Town, pop 4792 (1981c), inc 1906, is located 55 km S of Calgary, and was named for the nearby Highwood R, known to the Blackfoot as *ispitsi*, "tall trees." Traces of Indian hunting villages have been found throughout the area, which was opened to ranching in the 1880s. In 1890 the CPR arrived in High River and it became an important shipping point for cattle. Today ranching and wheat growing are the mainstays of the local economy. The ranching past and the life of the homesteaders is preserved in the Museum of the Highwood. W.O. MITCHELL set the scene of many of his stories in the area. The town is the birthplace of Rt Hon Joseph CLARK, prime minister of Canada 1979-80.

ERIC J. HOLMGREN

**High School**, the term usually applied to the school grades following those of the elementary school. Because the elementary grades have varied from province to province over the decades, high schools have included grades 7, 8 or 9 to 12 or 13. These schools vary in type (academic, vocational, technical, composite) and may be public (free) or private (fee-charging). Originally tending to be somewhat elitist, public high schools have become open and free to all children who have completed elementary schooling. As a result, the number of courses offered has increased markedly. See SECONDARY SCHOOL.

WILLARD BREHAUT

**High Technology** Technology, along with labour, capital, resources and management, is one of the essential components of industrial production. Most classes of INDUSTRY require some technological input but the amount varies widely among industrial sectors. Some sectors, eg, AEROSPACE, computers, TELECOMMUNICATIONS and PHARMACEUTICALS, are particularly dependent upon advanced TECHNOLOGY (ie, technology that rests on advanced scientific and ENGINEERING knowledge) and are referred to as "high-technology" industries.

Success in high technology depends upon the interaction of highly skilled engineers, scientists, technologists and business managers, operating in an environment which is receptive to new products, processes and services. Thus, high-technology industries flourish in countries with advanced economies, well-developed educational systems and sophisticated markets. High-technology industries form an important component in the economies of most major Western industrial countries, particularly the US, West Germany, Japan, France and Great Britain. Within these countries, the managerial and design headquarters of high-technology firms tend to concentrate in particular regions,

usually regions served by strong universities with scientific and technological orientation.

There has been a long-standing debate on the importance of high-technology industry to Canada's economic development. One view is that Canada, as an advanced industrial country with a highly educated work force, should seek to become a major player in international markets for high-technology products. Proponents of this view believe that high technology offers the best growth potential, that it corresponds most closely with the aspirations of individual Canadians and that it is essential if this country is to keep open the widest choice of economic and political options. The opposing view is that the most appropriate economic strategy for Canada, a country rich in natural resources and with comparative advantages in resource-based industries, would be to build on those comparative advantages. The latter view coincides with the interest of foreign investors who seek reliable supplies of raw materials and semiprocessed goods from politically stable resources.

In practice, Canadian policy has been to encourage simultaneously both high-technology and resource-based industries. Hence, Canada has demonstrated less national commitment to high technology than have most of its industrial trading partners. The federal government has shown the greatest interest in high-technology industries; provincial governments have held policies generally more favourable to resource development. The aggregate impact of these mixed policies, combined with a high degree of FOREIGN INVESTMENT and the natural economic forces stemming from Canada's rich resource base, has produced an industrial structure that is much more resource than high-technology oriented. Since the end of WWII Canada has consistently been in a net deficit position in its trade in high-technology products. This deficit has been growing (ie, from \$1.5 billion in 1968 to \$7.6 billion in 1982), while Canada has enjoyed a very favourable trade position in natural resources and resource-based industries. Many Canadians see this increasingly poor performance as a major national concern, not only because of its immediate impact on economic growth and employment but also because of the constraints that it may place on Canada's future economic, social and political development.

Despite the disappointing overall performance of Canadian high-technology industries, certain individual firms have been highly successful. Northern Telecom, one of Canada's few world-scale technology-based companies, has grown over the past 10 years from essentially a domestic company, operating mostly in Ontario and Québec, to a truly multinational company with manufacturing plants in 6 countries and sales in 90 countries. Its sales rose from \$608 million in 1973 to \$3.3 billion in 1983. Some smaller firms, eg, Mitel Corporation, have experienced even more rapid growth. Mitel's sales grew from \$0.3 million in 1975 to over \$225 million in 1983, more than doubling each year. Despite these kinds of growth rates, such high technology companies can and do experience difficulties (including Mitel in 1984). Nonetheless, these firms demonstrate that Canada can be a fertile ground for high-technology industry and that overall performance could improve rapidly, given the right conditions. Recent federal and provincial government initiatives to encourage and strengthen the capacity of Canadian industry to innovate will assist in improving conditions for high-technology industry in Canada. See BIOTECHNOLOGY; ELECTRONICS INDUSTRY; RESEARCH, PROVINCIAL ORGANIZATIONS; ROBOTICS; SCIENCE POLICY; SCIENTIFIC RESEARCH AND DEVELOPMENT; SCIENCE AND SOCIETY.

P.L. BOURGAULT

**High Wines**, liquor adulterated for use in the FUR TRADE. Fur traders who supplied liquor to the

Indians often diluted their brandy, rum, whisky, etc. with flavoured water. The term "high wines" is a misnomer, for the trade goods are not wines but spirits. Trade liquor, whether diluted or not, was also known as "Indian liquor" or "fire-water." JOHN ROBERT COLOMBO

**Highland Games** originated among the Scots' Celtic ancestors and became a customary part of their life. Events such as tossing the caber and putting the stone, and competitions in playing bagpipes and Highland dancing formed the core of the festivities, along with footraces, wrestling and tug-o-war, and novelty events such as three-legged races or the Best-Dressed Highlander competition. Emigration from Scotland dispersed the Highland Games and brought them to N America (where they are often referred to as the Caledonian Games). Given the influence of Scots in Canadian history, it is not surprising that their Highland Games have flourished.

A Highland Society was organized in Glengarry, Ont, in 1819 but lapsed after "many successful gatherings." More permanent games were established by the Caledonian Club of PEI in 1838. Similar games followed in Lancaster, Toronto, Cape Breton, Montréal and Zorra, and by Confederation in Halifax, Antigonish, Chatham, Ottawa and Vancouver. Within a few years, they were established in many Ontario townships and in Fredericton, Québec City and Victoria. In 1880, the St Andrew's Society of Winnipeg held the first of its many successful Dominion Day Games at Dufferin Park. The marquis of LORNE patronized these games and others, as did other governors general and many famous Scottish political figures, among them GEORGE BROWN and Sir JOHN A. MACDONALD. Former PM John Diefenbaker carried on the tradition when he visited the 1975 Glengarry Games, appropriately dressed in a kilt.

It has become customary to hold provincial track and field championships in conjunction with the Highland Games. The festival has thus undoubtedly helped to produce some of Canada's greatest athletes — for example Duncan Bowie, George GRAY and Walter KNOX — who have won international renown. More significantly, perhaps, it has thoroughly permeated Canadian culture (for example, the novels of Ralph Connor — C.W. GORDON), and Canada is now said to have more bagpipes and Highland dancers than even Scotland itself. Canadian Highland Games remain a vivid reflection of the Scottish tradition in Canadian life.

GERALD REDMOND

Reading: Gerald Redmond, *The Sporting Scots of Nineteenth-Century Canada* (1982).

**Hiking** can be defined as walking over long distances (preferably in a scenic, natural setting), for pleasure or exercise. For many people, hiking means backpacking; others prefer simply to go rambling. Whatever the definition, more and more Canadians are participating in the activity. In 1976 about 1% of the population 14 years and over had participated. By 1981 this figure had grown to about 5%. About 50% of Canadians walk for pleasure, an activity that includes nature walks, which may or may not involve carrying a pack. Hiking's increase in popularity has resulted in part from a more urbanized population that is interested in the outdoors, in part from increased concern for physical fitness, and in part from easier access to wilderness or park areas. Although one can go hiking almost anywhere, the most likely site is in a park or open space setting — whether an urban park (High Park, Toronto, or Capital City Park, Edmonton) or a true wilderness setting such as the Canadian Rockies or ALGONQUIN PARK. Formerly an activity for the serious nature lover or outdoor enthusiast seeking solitude in nature, hiking today includes people from all levels of society, al-

though most participants tend to be in the 20-35 age bracket. This sport has also become a group or family activity.

Many people pursue hiking by becoming members of a hiking club or association such as the Bruce Trail Assn, Ontario Federation of Naturalists or Waskahagan Trail Assn. Many clubs were formed to promote the development and use of a particular hiking trail. There is even a newly formed National Trail Assn of Canada promoting the development of a long-distance hiking trail across the entire country from coast to coast. These trails may represent an historic aspect of Canada's heritage or simply provide access through a scenic environment, for example the Cabot Trail and BRUCE TRAIL. Many are considered long-distance trails, extending for many kilometres and requiring the hiker to "overnight" along the route before completing the hike. Trails exist at all levels of difficulty, from the easy-to-walk rural trails (WASKAHAGAN TRAIL, Alberta) to the more stamina-testing and rugged ones such as WEST COAST TRAIL, Vancouver I. See also HERITAGE TRAILS. BART F. DEEG

**Hill, James Jerome**, pioneer transportation official, railway magnate (b at Rockwood, UC 16 Sept 1838; d at St Paul, Minn 29 May 1916). In 1856 Hill settled in St Paul. His many business ventures there included the Red River Transportation Co, which had a monopoly of the steamboat business on the Red R. With George STEPHEN and others he acquired the St Paul and Pacific Ry in 1878 (reorganized as the St Paul, Minneapolis and Manitoba Ry in 1879) and became its president a few years later. Although an original director of the CANADIAN PACIFIC RY, he resigned in 1883 to protest the decision to build the main line N of Lk Superior. He later expanded the St Paul line into the Great Northern Ry, of which he was president from 1893.

JOHN A. EAGLE

Reading: A. Martin, *James J. Hill and the Opening of the Northwest* (1976).

**Hill, Philip Carteret**, lawyer, politician, premier of NS (b at Halifax 13 Aug 1821; d at Tunbridge Wells, Eng 14 Sept 1894). Called to the Bar in 1844, he began his political career as mayor of Halifax 1861-64. In 1867 he was nominated provincial secretary in the first Cabinet under Confederation, but had to resign following the ministry's defeat at the polls. He was returned in 1870 as Reform (Liberal) member for Halifax County. Reappointed provincial secretary in a new Reform administration in 1874, he replaced William ANNAND as premier in 1875. Hill retained both offices until his administration was defeated 1878. He retired to England 1882 where he published several pamphlets, chiefly theological in nature. LOIS KERNAGHAN

**Hill-Tout, Charles**, anthropologist (b at Buckland, Eng 28 Sept 1858; d at Vancouver 30 June 1944). After studying theology, Hill-Tout immigrated to Canada and in 1891 became headmaster of a boys' school in Vancouver. He bought land in the Fraser Valley and eventually moved out to farm it and carry on field studies among the Indians. Hill-Tout became perhaps Canada's most important amateur anthropologist, largely through his friendships with the SALISH people. He became president of the anthropological section of the RSC, to which he was elected in 1913, and a fellow of the Royal Anthropological Institute of Great Britain. He published *The Native Races of British North America: The Far West* (1907), but his most important work appears in the field reports collected by Ralph Maud in the 4-vol *The Salish People* (1978). GEORGE WOODCOCK

**Hill 70**, see WORLD WAR I.

**Hiller, Arthur Garfin**, film director (b at Edmonton 22 Nov 1923). He has represented since the 1960s the beau ideal of the successful

Canadian filmmaker in Hollywood. He began at CBC Radio in 1949, moving to CBC-TV 1953-54 and then to American network TV. His films display an admirable slickness and ease, though arguments over their ultimate artistic value remain unresolved. They include *The Wheeler Dealers* (1963), *The Americanization of Emily* (1964), *Tobruk* (1967), *Papi* (1969), *The Out-of-Towners* (1970) *Love Story* (1970, Academy Award nomination for direction), *Plaza Suite* (1971), *Man of La Mancha* (1972), *The Man in the Glass Booth* (1975), *Silver Streak* (1976) and *The In-Laws* (1979).

WILLIAM BEARD

**Hilliard, Anna Marion**, physician (b at Morrisburg, Ont 17 June 1902; d at Toronto 15 July 1958). She studied at U of T (BA, MB), did post-graduate work in Britain (MRCS, LRCP) and in 1928 joined the staff of Women's College Hospital, Toronto, where she headed the Dept of Obstetrics and Gynaecology 1947-57. In 1947 she helped devise a simplified Pap test, which she introduced the following year at WCH's newly formed Cancer Detection Clinic, and she was the driving force in getting WCH accepted as a U of T teaching hospital (1956). Her commonsense approach to women's problems, especially those connected with childbirth, brought her many devoted admirers and led to a series of articles which were the basis of her book, *A Woman Doctor Looks at Love and Life* (1957). She was also the author of *Women and Fatigue*, published posthumously in 1960. CARLOTTA HACKER

Reading: Marion O. Robinson, *Give My Heart: The Dr. Marion Hilliard Story* (1964).

**Hime, Humphrey Lloyd**, photographer, surveyor, businessman, financier (b at Moy, Ire 17 Sept 1833; d at Toronto 31 Oct 1903). Noted as a pioneer photographer on the Canadian Prairies, Hime was photographer and surveyor on the Canadian government's 1858 Assiniboine and Saskatchewan exploring expedition led by Henry Youle HIND. Hime's photographs include views and portraits taken along the route and in the Red River settlements, various HBC forts and native encampments. A portfolio of prints was published in 1860. Hime's subsequent career included mining, business and presidency of the Toronto Stock Exchange. RICHARD J. HUYDA

Reading: H.L. Hime and Richard J. Huyda, *Camera in the Interior: 1858* (1976).

**Hincks, Clarence Meredith**, physician, mental-health reformer (b at St Mary's, Ont 8 Apr 1885; d at Toronto 17 Dec 1964). He received his MD from U of T in 1907 and, finding general practice unsuitable, obtained a part-time post as medical inspector for Toronto schools. In this capacity he was the first to introduce the newly developed Binet-Simon tests for intelligence into Canada. In 1917 he met Clifford W. Beers, founder of the US National Committee for Mental Hygiene, an organization dedicated to improving conditions in America's insane asylums and to promoting sound mental health. With Dr C.K. CLARKE, Hincks founded the Canadian National Committee for Mental Hygiene in 1918, serving first as secretary and then as general director. In 1930 he was also appointed director of the US National Committee, a post he retained until 1939. He remained director of the renamed Canadian Mental Health Assn until his retirement in 1952. THOMAS E. BROWN

**Hincks, Sir Francis**, politician, colonial administrator (b at Cork, Ire 14 Dec 1807; d at Montréal 18 Aug 1885). He established the *Toronto Examiner* 1838 and the *Montreal Pilot* 1844. Convinced of the need for an English-French partnership in the United Province of Canada, Hincks and Robert BALDWIN joined with L.H. LAFONTAINE in 1841 to create a Reform Party. The 3 entered the executive of Gov Gen BAGOT in 1842 but resigned over control of patronage in 1843. Hincks became inspector gen-

eral in the Baldwin-LaFontaine ministry 1848, restoring provincial credit and promoting railway construction, and replaced Baldwin as leader in 1851. Unable to deal with growing sectional feeling and tainted by railway corruption, Hincks's ministry was defeated in 1854. He was governor of 2 Caribbean colonies 1856-69. On his return to Canada in 1869, he became federal minister of finance in Sir John A. Macdonald's government and concentrated on banking and currency regulation. He left politics for business in 1874. His writings include his *Reminiscences* (1884).

DAVID MILLS

**Hind, Ella Cora**, journalist, women's rights activist (b at Toronto 18 Sept 1861, d at Winnipeg 6 Oct 1942). Denied a position on the *Free Press* upon arriving in Winnipeg in 1882, Hind learned to use the recently introduced typewriter and worked as a secretary, in 1897 becoming a public stenographer even while submitting articles on agriculture. She became agricultural editor of the *Free Press* in 1901, often accurately predicting the western Canadian wheat crop yield, thus achieving renown among grain speculators. The first western female journalist, Hind became president of the Canadian Women's Press Club in 1904. In 1914 she participated in Manitoba's Mock Parliament, in which women sardonically defeated a motion to permit men the vote. Often rebuffed because of her gender, she agitated for WOMEN'S SUFFRAGE, a concern she combined with interest in WOMAN'S CHRISTIAN TEMPERANCE UNION. At 75 she travelled around the world to observe agricultural methods, writing *Seeing for Myself* (1937). She was awarded an honorary LLD by U Man.

ELIANE LESLAU SILVERMAN

**Hind, Henry Youle**, geologist, naturalist (b at Nottingham, Eng 1 June 1823; d at Windsor, NS 8 Aug 1908). Hind was educated at the Nottingham Free Grammar School, a Leipzig commercial college, and Caius College, Cambridge, but graduated from neither of the latter. In 1846 he immigrated to Canada to become in Oct 1847 second master of science and mathematics at the Normal School at Toronto and 1851-63 professor of chemistry at Trinity College. He then supported himself as a consulting geologist in the Maritimes.

Hind was closely associated with the establishment of the Canadian Institute, a loose association of engineers and surveyors, and acted as editor of their journal, the *Canadian Journal* 1852-57. It reflected the growing nationalist spirit, as did Hind's other work. He was a prolific author of popular scientific and exploration materials, producing 4 major government reports on the North West and Labrador, and 6 books, 25 pamphlets and 22 articles ranging from railway policy to geology to spectrum analysis. The high points of his career were the 2 expeditions into the Red R, Assiniboine and Saskatchewan countries in 1857 and 1858, for which Hind was the scientific observer, naturalist and geologist. These expeditions did much to effect an awareness of the potential of the great North West in the Canadas. The most important work resulting from these explorations is the 2-vol *Narrative of the Canadian Red River Exploring Expedition of 1857 and of the Assiniboine and Saskatchewan Exploring Expeditions of 1858* (1860).

FRITS PANNEKOEK

Reading: W.L. Morton, *Henry Youle Hind* (1980).

**Hind, William George Richardson**, artist (b at Nottingham, Eng 12 June 1833; d at Sussex, NB 18 Nov 1889). His older brother Henry Youle HIND arrived in Toronto in 1848 and William seems to have followed 3 years later. He set up an art studio but returned to England 8 years later where he was influenced by the paintings of Millais, Hunt and Rossetti, with their attention to minute detail. He joined his brother's ex-

W.G.R. Hind, *The Third Rapid on the Moisie*, from sketches made on an expedition with his geologist brother, Henry Youle Hind (courtesy Public Archives of Canada/C-13979).

pedition to the Moisie R in 1861 and produced over 100 pencil, watercolour and oil studies of the wilderness, native people, as well as sentimental flights of imagination. In 1862 he set off with the OVERLANDERS, completing over 160 sketches and paintings of the journey from Ft Garry to Victoria. Among his best-known works are scenes of farm life and *Oxen With Red River Cart* (1870) from the Red River Colony and *Bar in a Mining Camp* (1865) and studies of Lil-loet miners during the Cariboo Gold Rush. By 1870 Hind was living in NB and NS and working for the Intercolonial Ry.

JAMES MARSH

**Hinduism**, the religion of about 400 million people in India, Africa, Indonesia and the West Indies. Immigration from these countries (principally India) to Canada has provided the base for a Canadian population of about 69 500 Hindus (1981c). Evidence of the existence of Hinduism dates back 4000 years. It reached a stage of high philosophical, religious and psychological development by 1500 BC and has sustained it to the present. Hinduism has maintained its supremacy in India despite numerous migrations into the country and attempts at evangelization by other religions, notably BUDDHISM, ISLAM and CHRISTIANITY. Hindu culture and religion possess a unique vitality which has enabled Hinduism to become the foundation of the religions practised by over half the world's population. People in China, Japan, Tibet, Burma and Ceylon all look to India as their ancestral spiritual home.

For the Hindu, God is the one supreme universal spirit that underlies all human, animal and material life, and towards which all religious feelings and theology strive. To Hindus each religion's and every devotee's particular picture of God represents a true aspect of God. But the uniqueness of the Hindu world view centres on 4 important concepts: *anadi* (beginninglessness), *karma* (the moral law of life), *samsara* (rebirth) and *moksha* (freedom or release). The basic Indian world view assumes a cycle of birth, death and rebirth leading the believer to the desire for release from this endless round of suffering — "suffering," because life in this world implies separation from the divine.

Hindu thought has no concept for the creation of the universe, assuming that everything — the universe, God, scripture and humanity — has existed without beginning. Within this view is the idea of cycles of creation with relative beginnings. Each cycle begins from a pre-existent seed state, grows, flowers, withers and dies. But, just

as a dying flower leaves seeds for its own propagation, each cycle drops a seed which begins the next state. In Hindu belief, the universe we are now experiencing is in one such relative cycle of creation.

A consequence of this view is typified in the term "karma." Each person is responsible for his or her own destiny. If one performs good actions and thinks good thoughts, this will establish the probability of a good future even in the next cycle of creation. The doctrine of karma teaches that when a person acts or thinks, a memory trace or seed laid in the unconscious will predispose the individual to that same kind of action or thought in the future. Each person is reborn (reincarnated) again and again, according to his or her karma. Many of the thoughts and desires we find when we analyse our unconscious impulses come from thoughts and actions of previous lives. What we experience in this life is in part a consequence of all the good and bad actions and thoughts of previous lives. The doctrine of reincarnation is manifested in society by the caste system, which has 4 levels at which an individual may be reborn, according to the karmic merit accumulated: *brahman* (priest or teacher), *kshatriya* (warrior or politician), *vaishya* (merchant or professional) and *sudra* (servant or labourer). Long after these categories were established some *sudras* became known as untouchables, or "outcasts."

The karmic balance in the unconscious at the time of death determines the state or level at which a person will be reborn. Through countless lives one can spiral upwards, finally to reach the level of the gods. There the individual experiences the honour of sitting in the place of a deity, exercising the deity's cosmic function until the good merit is exhausted. If through evil living one is reborn as an animal he will simply follow his instincts and experience the suffering that such instincts produce. Such is the cycle of rebirth, "samsara." How to find a way out of this cycle is an important question in Hinduism and Buddhism. The Hindu answer is called "moksha."

Moksha is release from the merry-go-round of birth, death and rebirth. The 3 ways of obtaining release are the yoga of knowledge, the yoga of action and the yoga of devotion. The yoga of knowledge involves intellectual and psychological techniques developed by Hindu holy men to control their actions and analyse their unconscious. They remove the karmic obstructions of previous lives, recovering the nature of their true selves. The true self is shown to be nothing other than Brahman, or God. The goal of all knowledge, therefore, is the experience of union with the divine. The yoga of action requires that duty be done with no thought

for oneself or for the benefit or suffering that one experiences in fulfilling it. Through the performance of one's duty as a dedication to the Lord, a kind of inner purification takes place, resulting in divine union. The yoga of devotion, the most common path, requires that prayers, the chanting of scripture and meditation on the image of the Lord be undertaken with such intensity that inner karmic obstructions are burned up and the Lord is revealed within consciousness. All that is required is willingness to surrender oneself completely in devotion to God. Regardless of which path is followed, the end is the same: the discovery of the true nature within oneself of a spiritual soul (*atman*) which is at one with God.

**Hinduism in Canada** Immigration to Canada of people from India or of Indian origin began in 1903-04 (see SOUTH ASIANS). The census records of 1911 list Hindus and Sikhs together, for a total of 1758. Most of Canada's East Indian community of the first half of this century was of the SIKH faith, and extensive Hindu immigration started only in the 1960s.

In Canada, as elsewhere in the Hindu diaspora, the structure of religious life has undergone a marked change. The practice of caste generally follows that in India, with marriages usually made along caste lines; nevertheless the practice is tempered by the egalitarianism of Canadian society. The traditional roles of temple, home altar, village festival and PILGRIMAGE to sacred sites have largely given way to a development in which temples function as the local church does for Christianity. Temples have been built in major Canadian cities from Halifax to Vancouver. A regular pattern of Sunday worship services is cultivated. These services often make reference to the Hindu sacred calendar, commemorating saints and marking seasonal or religious festivals; but the celebrations are conducted on convenient Sundays, since it is often difficult to meet during the work week. Where the Indian community is large enough several temples develop along cultural or ethnic lines. One of the older temples in Toronto (fd 1976) serves a largely West Indian Hindu community, while the Indians from Africa and India attend other temples. Informal *satsangs* (devotional meetings) take place throughout the community, bringing together people of similar cultural and linguistic background or those devoted to a specific spiritual path, such as Vedanta, or a particular *guru* (teacher), such as Sai Baba or Aurobindo.

In cities other than Toronto and Vancouver where there is a single temple it is under the influence of either the Arya Samaj or the Sanatanist tradition. Both use the *Vedas*, the ancient Hindu scriptures, as the source of their rituals. Arya Samaj worship is conducted through the Agnihotra, a ritual involving a series of purifications, the chanting of *mantras* (incantations) and scriptures, along with offerings to Agni, the god-fire who bears all sacrifices to God. Although Hindu art is noted for its magnificent depictions of the gods, Arya Samaj groups do not use images of the various Hindu deities in the act of worship. Sanatanists construct worship around a similar set of purifications, chants and offerings. However, there are lengthy oblations made to various deities through the use of their images. The gods most often called upon are Ganesa, Visnu, Siva, Suryanarayan and Devi. The services are several hours in length, requiring a knowledgeable priest familiar with the complexities of the formal ritual pattern. Both Arya Samaj and Sanatanist forms of worship are structured to make allowances for the Canadian setting and for the diversity of belief among Canada's Hindus.

Most temples in Canada are run by boards along "congregational" lines and are served by one or 2 lay priests. Trained and initiated priests,

called *pundits*, serve a Sanatanist temple in Toronto and a Samaj temple in Vancouver. A number of language programs are sponsored by temples across Canada. In some communities children gain a cursory knowledge of Sanskrit, the ancient language of Hindu scripture and ritual, and of languages such as Hindi, Punjabi, Gujarati and Tamil, in which myths and legends are told and devotional hymns sung. Traditional practice requires a series of 12 initiation rites (*samskaras*) or personal religious ceremonies. This cycle has been modified dramatically in the Canadian setting, although most Canadian Hindus are married and cremated according to tradition. Some of them practise rites associated with conception, birth, the first haircut and the initiation of boys into full caste membership (the *upanayana*, or "sacred thread," ceremony).

Hindu communities in the diaspora are visited regularly by various gurus and *swamis* (monks). These may be formally associated with an institution or movement in N America such as the Ramakrishna Mission, or may hail from one of the great *ashrams* (religious communities) of India. The Sri Ramakrishna Mission actively circulates swamis throughout the Vedanta societies in Canada. Although Hindu religious life in Canada is circumscribed by a shortage of priests, a lack of sacred sites and a new set of cultural norms, numerous Hindus remain in contact with gurus who guide their personal religious paths.

**Hinton**, Alta, Town, pop 8342 (1981c), inc 1958, is located in the Alberta foothills, 285 km W of Edmonton. It began as a coal-mining town, and was named for the manager of the Grand Trunk Pacific Ry, W.D. Hinton. In 1956, North West Pulp and Power Ltd (now St Regis Ltd) opened Alberta's first pulp mill nearby, and a new town grew up 1 km N of the original settlement. The old town survives as a centre for motels and service stations on Hwy 16 to Jasper. Coal mines have recently been reopened to the S.

ERIC J. HOLMGREN

**Hippies**, a term (possibly a variation of "hipster") coined in the mid-1960s to describe the adherents of a subculture (or counterculture) associated with the political and social protest movements of that decade. Although the hippy culture originated in Greenwich Village, New York, and in San Francisco, California, it spread throughout N America. In Canada hippies congregated primarily in the Kitsilano district of Vancouver and around Yorkville Ave in Toronto. They were characterized by long hair, beards and unconventional clothing, by their celebration of drugs (in particular LSD and marijuana) and rock 'n roll, by their affinity to non-Occidental religions (see NEW RELIGIOUS MOVEMENTS) and the cultivation of "self-awareness," by sexual experimentation, by their language ("trips," "acid," "flower power"), by economic marginalism and by their youthfulness and middle-class origins. Although they were widely disparaged and ridiculed, their ideals corresponded to the effort of the New Left in general to propose political and cultural alternatives to the institutions of capitalist society; they upheld PACIFISM, communal life, egalitarianism, self-help and the inviolability of the person, and were hostile to private property, bureaucracies and technology. Many of their ideas were inspired by Marshall McLuhan and his notions of the postliterate tribal society. In Vancouver, hippie culture was associated with the

Easter "be-ins" at Stanley Park, with the underground newspaper *Georgia Straight* and, briefly, in a cross-fertilization with political activism, with the Vancouver Liberation Front. In Toronto hippies gathered at "love-ins" in Queen's Park, Digger House, Rochdale College (an experiment in "free education") and a mass sit-in on Yorkville Ave. As a mass phenomenon the hippies were short-lived. The Festival Express, a coast-to-coast rock 'n roll festival on board a train in 1970, was probably the last major hippie event. In the end hippies were unable to devise a strategy that linked the forms of cultural protest to those of mass political action, and they faded into solipsism, anti-intellectualism and varieties of personal therapy. Some of their ideas were subsequently taken up by the ecology movement and community-based urban-action groups of the 1970s.

**Hiram Walker Resources Ltd**, with head offices in Toronto, is a Canadian holding company with diverse interests. The company was incorporated as the Consumers' Gas Company in 1848 in the PROVINCE OF CANADA. In 1979 shareholders of Cygnus Corporation Ltd and Home Oil Co Ltd approved their own joint merger, and subsequently one with Consumers' Gas. A year later, stockholders approved the merger of distiller Hiram Walker-Gooderham & Worts Limited with the company and its wholly owned subsidiary, Home Oil Company Limited. The name change to Hiram Walker Resources Ltd followed. Today the company has subsidiaries operating internationally in distilled spirits, natural resources and a gas distribution utility. As of Sept 1983 it had annual sales or operating revenue of \$3.4 billion (ranking 24th in Canada), assets of \$4.8 billion (ranking 18th) and 10 200 employees.

DEBORAH C. SAWYER

**Hirsch, John Stephen**, theatre director, administrator (b at Siófok, Hungary 1 May 1930). He emigrated to Winnipeg in 1947 and after graduating from U of Man established the Mud-water Puppets and a troupe for children. In 1957 he and Tom HENDRY cofounded Theatre 77, which they combined with the Winnipeg Little Theatre in 1958 to form the MANITOBA THEATRE CENTRE (with Hirsch as artistic director); it was destined to be the model for a chain of regional

John Hirsch, founder of the Manitoba Theatre Centre, was co-director of the Stratford Festival 1967-69 and sole artistic director 1980-85 (courtesy Canapress).

stock companies across Canada. From 1967 to 1969 he was codirector of the STRATFORD FESTIVAL and from 1976 to 1979 head of television drama for the CBC. In 1980 he became sole artistic director at Stratford. Between appointments he has guided productions for Ottawa's National Arts Centre, Toronto Arts Productions, Young People's Theatre and the SHAW FESTIVAL, as well as elsewhere in Canada and abroad. Several of his American productions have been honoured. He won the Outer Circle Critics' Award for *Saint Joan* at the Lincoln Center, New York, an Obie Award for *AC-DC* at the Chelsea Theater, Off-Broadway, and the Drama Critics' Award for *The Dybbuk* at the Mark Taper Forum, Los Angeles (1975), a play he translated and adapted. His work has been seen, as well, at the Tyrone Guthrie Theater in Minneapolis, the Seattle Repertory Theater and the Habimah Theatre in Tel Aviv.

DAVID GARDNER

**Hirshhorn, Joseph Herman**, mining promoter, art collector (b at Mitau, Latvia 11 Aug 1900; d at Washington, DC 31 Aug 1981). Hirshhorn immigrated at an early age to the US, rising from office boy to stockbroker to entrepreneur. In 1933 he opened an office in Toronto. In the early 1950s Hirshhorn formed a partnership with Franc Joubin, a geologist; together they made the greatest URANIUM strike in Canadian history near Blind River, Ont. Hirshhorn subsequently sold his uranium interests to Rio Tinto. His great collection of contemporary art is held in the Hirshhorn Gallery in Washington.

ROBERT BOTHWELL

**Histoire des Canadiens-français 1608-1880** by Benjamin Sulte (8 vols, 1882-84), proclaims in its own subtitle its significance as a comprehensive study of the French Canadian people (complete with statistics); it examines their "origins; history; religion; wars; discoveries; colonization; customs; domestic, social and political life; development and future." An eccentric "liberal" history, it met with the church's approval — despite its denunciation of the JESUIT RELATIONS — because of its outspoken critique of colonialism and MERCANTILISM and its nationalist concept of the French Canadians as a race. Unlike François-Xavier Garneau's *HISTOIRE DU CANADA*, which was out of favour in the ULTRAMONTANE climate of the 1880s, Sulte's history defends the habitant as the forgotten hero of his tale and views the old SEIGNEURIAL SYSTEM with nostalgia. Sulte greeted Confederation with qualified approval, stressing the need for provincial autonomy within a structure that ensures a voice for French Canadians. Sulte's *Histoire*, very popular in his day, has not been translated or reprinted.

MICHÈLE LACOMBE

**Histoire du Canada depuis sa découverte jusqu'à nos jours**, a Canadian classic by François-Xavier GARNEAU, appeared in 4 volumes, 1845-52, tracing French Canada's development from Champlain's voyages of discovery to 1840. A vindication of the French Canadian nation in the face of Lord DURHAM's assimilationist policies, it was read as a national epic and a monument to "la survivance." Garneau was first among French Canadians to treat history as a science. He was strongly influenced by French historians, taking up their liberal ideals and romantic style, and adopting Augustin Thierry's theory that interracial antagonism is the prime mover of all history. Garneau's evident patriotism and his status as a national hero tempered criticism of his liberal ideas, which included suggestions of clerical mismanagement in the colony's early history. Garneau revised his text for the second and third editions of 1852 and 1859; Andrew Bell's translation (1860) somewhat misrepresents the text. The standard, indexed edition was the eighth, published in 9 volumes, 1944-46.

MICHÈLE LACOMBE

**Historic Site**, a place designated as having some tangible link with the past through an event, person or building. It is sometimes identified by an associated building or archaeological remains, although often merely by the presence of a statue, cairn or plaque put up more recently. A confusing term associated with historic sites is "monument," which can refer to either a historic building or a commemorative structure.

To be designated a historic site, a place must have more than intrinsic significance from the past; it must be recognized later as having meaning within a larger historical context. This qualification poses a problem of definition because it is sometimes difficult to distinguish between the historical time from which the site derives its significance and its later period of commemoration. War memorials, for instance, are not usually thought of as having intrinsic historical significance, yet with the passage of time some of these have assumed the characteristics of historic sites, eg, the Nelson column erected in Montréal in 1809, the 1854 BROCK memorial at Queenston Heights, and the monument erected in honour of MONTCALM and WOLFE in Québec City in 1827, in possibly the earliest commemoration in Canada of an historic event. Another problem that makes defining historic sites difficult is the changing of criteria for their selection. In the late 19th and early 20th centuries, sites were often chosen to commemorate important battles, great men and political events, eg, BATOCHE; CRYSLER'S FARM. Today, greater concern is shown for the history of the common person, ethnic groups and industrial developments, eg, OLD FORT WILLIAM; CANNINGTON MANOR; FORGES SAINT-MAURICE; MOTHERWELL HOMESTEAD.

Interest in creating historic sites became fairly widespread in eastern Canada with the rise of nationalist sentiment at the end of the 19th century. Local patriotic and historical associations endeavoured to preserve and mark places important to the historic identity of their particular regions and some argued that their sites were important also to Canada's history. It was realized, too, that historic sites could be popular tourist attractions, especially if occupied by picturesque ruins, although efforts at development were usually limited unless supported by government funding. Following initiatives by Québec organizations in 1907, the federal government created the Québec (later National) Battlefields Commission to develop and preserve the site of the 1759 BATTLE OF THE PLAINS OF ABRAHAM. With no structures of the period to work with, the commission planned a landscape park with commemorative monuments. In 1919 the federal government created the Historic Sites and Monuments Board of Canada to advise it on implementing a national program of commemoration and preservation of historic sites, and subsequently most provincial governments appointed similar bodies to advise on the creation of provincial historic sites.

Until the 1930s efforts at developing historic sites were largely confined to interpretive plaques. If historic ruins were present they were usually left unimproved, with minimal effort made to prevent further deterioration. The prevailing preservation philosophy in the early 20th century held that reconstruction or major restoration harmed the historical integrity of a site, and the scarcity of funds for expensive restoration projects no doubt encouraged this approach. Nevertheless, some efforts were made to preserve historic buildings. A number of old forts formerly controlled by the British army were transferred to the National Parks Branch of the Dept of the Interior. Ft Anne, Annapolis Royal, NS, was made a national historic park in 1917. Other military properties — FORT BEAU-SEJOUR, NB, FORT CHAMBLY, Qué, Ft Wellington, Ont — were preserved as national historic sites until 1940, when they were designated national

historic parks. In Québec and Ontario local groups successfully preserved some important historical buildings. The Montréal Antiquarian and Numismatic Society acquired the Château de Ramezay for a museum building in 1895 and Toronto historical groups fought successfully to save old Ft York from destruction. On the whole, however, preservation projects were rare.

The success of large restoration projects in the US, particularly the reconstruction of Colonial Williamsburg in the 1920s, was largely responsible for changing this attitude. Increased spending on public works during the Depression provided further stimulation. In the 1930s the Niagara Parks Commission, an agency of the Ontario government, undertook 4 significant historic projects, 2 of which — Ft George at Niagara-on-the-Lake and Ft Erie (see NIAGARA HISTORIC FRONTIER) — involved reconstructing nonexistent FORTIFICATIONS. Subsequently the provincial and federal governments undertook the restoration of FORT HENRY at Kingston. Although in this latter case much of the original fort remained intact, the restoration went beyond structural repairs: interiors were refurbished and furnished with period reproductions and historic artifacts. The largest reconstruction project undertaken is Fortress of LOUISBOURG National Historic Park in Nova Scotia. In 1961 Parks Canada began to rebuild part of the former French fortress demolished by the British in 1758. This involved reconstructing part of the old town as well as the fortifications; interiors have been replicated and the site is interpreted by costumed guides who explain aspects of 18th-century life at Louisbourg.

Related to the reconstruction of buildings is the artificial creation of a historic community using historic buildings moved to the site. Although in a sense not historic sites because the properties lack inherent significance, artificial pioneer communities such as KINGS LANDING, NB, and UPPER CANADA VILLAGE, Ont, are an important aspect of historic preservation in Canada.

More recently, efforts have been directed at preserving historic buildings in their natural settings, retaining the original, or at least some practical, function. Examples of commercial or domestic architecture preserved as historic sites can be found across Canada. They pose special problems for preservation because they usually remain under private control and are vulnerable to destruction or improper renovation. Buildings designated National Historic Sites, for instance, although marked by distinctive plaques, are not usually protected by federal legislation. Gradually provincial governments are enacting heritage legislation to protect designated buildings. In some provinces, municipalities have been empowered to designate historic resources, which then fall under the protection of the provincial heritage Act. Agencies such as HERITAGE CANADA, along with provincial and local heritage groups, have endeavoured to raise funds for the preservation and proper restoration of privately owned historic buildings. See PARKS; HERITAGE CONSERVATION.

C.J. TAYLOR

**Historical Geography** includes the study both of the geographies of the past and of changes in geographical patterns through time; historical geographers study some aspect or aspects of the GEOGRAPHY of a region, such as population or land use, at a selected period in the past (the cross-section or horizontal approach), or some element or aspect of the evolution of a region (the vertical approach). The horizontal approach reveals the interrelationship of numerous elements of a place at a particular period and also studies the life of an area at a particular time. The vertical approach emphasizes processes and the human thought and activities underlying changes in geographical patterns.

Historical geography was not recognized as a distinct field of university teaching and research in Canada until the 1950s. However, the term geographical history was used in 1749 in a British pamphlet describing NS, although the first major historical geographical study of Canada was by J.D. Rogers, *A Historical Geography of the British Colonies - Canada - Part III Geographical* (1911) — a description and analysis of the settling of Canada, published in England. In 1936 Carl Schott, a German geographer, analysed agricultural settlement in southern Ontario. In the 1950s and 1960s geography departments in Canadian universities expanded as young historical geographers established courses and published research. A distinct area of specialization developed, stimulated by the work of Canadian historians and economic historians, eg. H.A. INNIS. However, the emphasis that geographers place on the spatial patterns of the Earth and how they evolve distinguishes their work from that of historians. A considerable number of historical geographers received graduate training in the US. Andrew H. CLARK (born in Canada and influenced by Innis) of University of Wisconsin was particularly important. Others trained in British universities.

Canadian historical geographers concentrate on their country but a few specialize on other parts of the world and have published research on China, Europe, Latin America, the USSR, South Africa and the US. Within Canada a few scholars have adopted the cross-section approach and have reconstructed the geography of a region at a particular time, but most research is concerned with geographical change through time. Topics include the cultural historical geography of native peoples and their relationship to the FUR-TRADE economy; spatial patterns of IMMIGRATION and the transfer of culture from the Old World to the New; rural settlement; land-use and settlement patterns as they relate to primary-resource development; the founding of urban settlements and their functional development and evolution in relationship to staples and corridors of movement; and the origins and evolution of distinctive rural and urban landscapes, including buildings. Although culture is increasingly recognized as an important factor in determining geographical development, research has just begun on attitudes to and influences on the environment, and the historical geography of manufacturing is barely developed. The history of the mapping of Canada is studied, and facsimile atlases have been prepared showing how maps can be used to interpret the evolving geography of an area. In the late 1970s and early 1980s historical geographers, cartographers and others were preparing a massive 3-vol historical atlas of Canada from the Ice Age to the mid-20th century scheduled for publication in 1986.

Specialists are not responsible for all research in historical geography. Geographers who normally work on contemporary geographical problems may adopt an historical geographical approach for a particular research topic. Historical geographers in their turn may occasionally work on contemporary problems, but they usually concentrate on the past and are thoroughly familiar with the archival and field sources and the scholarly literature related to a particular area and period.

J. WARKENTIN

Reading: R.C. Harris and J. Warkentin, *Canada Before Confederation* (1974).

**Historical Societies** in Canada have as their primary purpose the study and promotion of the Canadian historical experience. Through publication of scholarly and amateur works, public education programs, assistance to and co-operation with archives, museums, heritage groups and other similar organizations, hundreds of historical associations provide a valu-

able service to Canadian life. The first such association, the LITERARY AND HISTORICAL SOCIETY OF QUEBEC, was established in 1824. The Nova Scotia Historical Society began in 1878 and its publication, *Report and Collections of the Nova Scotia Historical Society*, started the following year. The Ontario Historical Society traces its roots back to 1888 with its journal, *Ontario History*, beginning in 1899. Historians in most other provinces have since established similar organizations.

On the national level the CANADIAN HISTORICAL ASSOCIATION, fd 1922, was an outgrowth of the Historic Landmarks Assn of Canada. The latter, established in 1907, had as its main objectives the planning for the 1908 Québec tercentenary and the appropriate recognition of Canada's HISTORIC SITES. The CHA now boasts over 2500 members and serves the interests of both professional and amateur historians through an active publications program and an annual conference.

Recent years, particularly since Canada's centennial celebrations in 1967, have witnessed a tremendous growth in regional and local historical associations. Societies large and small operate almost exclusively on volunteer assistance. Their activities have increased the awareness among Canadians of the richness of their own history and have encouraged many others to examine their past through local history studies, GENEALOGICAL research and other research projects.

CARMAN V. CARROLL

**Historiography**, the published product of the historian's declared interest in the past; the writing of history. It is not by itself "history," but is by necessity part of the historical record. The serious study of history therefore also requires an awareness of the historical conditions and social assumptions that give rise to different forms of historiographical interpretation. The Canadian historiographic corpus has developed separately in English Canada and French Canada, but similarities exist. History, once the amateur's preserve, has come to be written principally by professional scholars, both anglophone and francophone. The establishment of such national agencies as the PUBLIC ARCHIVES OF CANADA (PAC) and such bodies as the ROYAL SOCIETY OF CANADA was of benefit to both. Approaches to the recording of history still differ, as do preoccupations in the choice of subject matter; but conferences and journals now provide forums for the sharing of historiographic materials, knowledge and methodology.

#### Historiography in French

Various descriptive works and narratives dealing with Canada and published in France during the 17th and 18th centuries were entitled "histoires." Although written by Frenchmen who in many cases had only visited NEW FRANCE, these publications profoundly influenced French Canadian historiography. They provided later historians with otherwise unattainable information about events witnessed by their authors, as well as valuable descriptions of the daily lives of colonists and Indians. One historiographic work of this period stands out from the rest: *Histoire et description générale de la Nouvelle France*, by the Jesuit P.F.X. CHARLEVOIX (Paris, 1744). Already a published historian, the author stayed in New France 1705-09 and returned 1720-22, when he travelled from Québec down the Mississippi Valley to New Orleans. His abundantly documented *Histoire* gives a faithful account of political, military and religious events from the early 16th century to 1736. For a century it remained the best history of the French colony.

The Canadiens paid little attention to the historical genre until the early 19th century, when a feeling of FRENCH CANADIAN NATIONALISM developed. The versatile Montréal writer Michel Bibaud brought out *Histoire du Canada* (3 vols, 1837-78) which had some documentary and lit-

erary merit. This conservative author criticized French Canadian nationalists, Papineau in particular.

The first volume of François-Xavier GARNEAU's *Histoire du Canada*, the most important historiographical work ever published in French in Canada, appeared in Québec City in 1845. Two more volumes followed in 1846 and 1848, and the work went through 8 printings in a century. Garneau voiced the ideals that guided French Canadian nationalists until the mid-20th century. He painted vivid accounts of the saga of New France, including the exploits of the explorers and COUREURS DE BOIS and the work of French missionaries. He celebrated the military deeds of Frenchmen and Canadiens who defended their land against the British and, later, the Americans. For the Canadiens, the CONQUEST was not the end of the conflict: after 1791 it simply moved indoors to the Parliament. Garneau's vision of a perpetual struggle for survival as the central element of Canadian history has marked all French Canadian historiography until the present day. Garneau disapproved of the REBELLIONS OF 1837 but strongly criticized British policies toward Canadiens. He vigorously denounced the ACT OF UNION as an attempt to destroy the French Canadian nation. A self-taught historian, Garneau made judicious use of official sources and existing publications, and modelled his *Histoire* on the works of his favourite author, French historian Augustin Thierry, who held that racial antagonism was the driving force of history.

Garneau showed French Canadians the power of history as an element of national identity. Those who came after him, proponents of the conservative ideology that dominated Québec from the mid-19th century to the 1960s, produced a host of historical works exalting the national and religious past of the people. In their syntheses and monographs, priest-historians Jean-Baptiste-Antoine Ferland, Etienne-Michel Faillon and Henri-Raymond CASGRAIN stressed the role of the great religious figures of New France. Such accounts complemented Garneau's works which, in the opinion of the clergy, had been unduly secular. Several works stand out in the abundant historical literature of the last half of the 19th century, among them Joseph-Edmond Roy's *Histoire de la seigneurie de Lauzon* (5 vols, 1897-1904), which is still pleasant and instructive reading.

Two historians dominated the first half of the 20th century: Thomas Chapais and Abbé Lionel Groulx. Chapais established himself with biographies of key figures in New France — Intendant TALON and Gen MONTCALM. But his greatest work was *Cours d'histoire du Canada* (8 vols, 1919-34). The *Cours*, originally given as a series of public lectures at Université Laval, covered the period from the Conquest to Confederation. Chapais took up Garneau's *Histoire* in more rigorous fashion, and had the advantage of fuller documentation. He and his contemporaries benefited from the creation of the Public Archives in Ottawa. Chapais's *Cours* is still a mandatory reference work for any student of political and parliamentary history of that era. Other writers, the most famous being Groulx, opposed his criticism of the PATRIOTES and his sympathy for British policies.

In 1915 Groulx inaugurated the chair in Canadian history at the Montréal campus of Université Laval (later U de Montréal). In a few years he became the leading historian of French Canada, the only one whose name could rival Garneau's. Each of his books sparked passionate discussion in French Canadian intellectual circles. His synthesis of Garneau's nationalist ideal with traditional Catholic ideology has never been bettered. *Histoire du Canada français depuis la découverte* (4 vols, 1950-52) is an excellent summary of Groulx's work.

Gustave Lanctôt, a career archivist with the PAC, was a less outstanding writer than Groulx, but still admirable for his time. His most important work was a 3-volume study of the French regime, *Histoire du Canada* (1959-64). The most prolific French Canadian historian was Robert Rumilly, primarily known for his monumental 41-volume account of the years between 1867 and 1945, *Histoire de la Province du Québec* (1940-69). Anecdotal, written in popular style and drawn largely from printed primary sources such as newspapers, Rumilly's *Histoire* is still the starting point for any study of the period. Rumilly was also interested in the history of the ACADIANS and the FRANCO-AMERICANS.

French Canadian historiography took a new direction after WWII. In 1947 departments of history were created at the universities of Laval and Montréal, modelled on history departments in European and American universities and staffed by professors trained in the methods of professional historiography: Guy Frégault and Michel Brunet in Montréal, and Marcel Trudel in Québec City. Large numbers of students entered history departments in the 1960s, a movement that resulted in more professors, more graduate theses and more publications. The 1970s saw the creation or further expansion of departments of history at U of Ottawa, U of Sherbrooke, and U du Québec in Chicoutimi, Trois-Rivières, Rimouski and Montréal. History, which had been the preserve of amateurs and a very few university trained scholars before 1945, had in a quarter-century become a major discipline in universities and research institutes. The vitality of the profession in Québec is reflected in the conferences of the Institut d'histoire de l'Amérique française (fd 1948), a gathering of historians whose specialty is the history either of Québec or of Francophones originating there. These annual conferences constitute the province's best forum for Québec historiography, and their methodological and ideological horizons are constantly being enlarged. The Institut publishes the *Revue d'histoire de l'Amérique française*, which has become the most notable journal for scholarly publications on the history of Québec and French Canada. Other periodicals, such as *Histoire sociale/Social History* (fd 1968 in Ottawa), also publish articles by historians who are studying Québec with new methodologies developed in France, Britain or the US.

Several works stand out from the mass of material that has been published since 1945. Groulx's disciples, unconcerned with religious ideology, developed strong political positions in their historical works: the writings and teachings of Maurice Séguin and Michel Brunet, for example, largely shaped the thinking of the sovereignty movement of the 1960s. The appearance of history as a university discipline led to greater critical rigour in historical works; the abundant and methodical writings and teachings of Marcel Trudel illustrate this development. But the impact of the SOCIAL SCIENCES on historiography since the 1960s has been especially fruitful. Fernand Ouellet's *Histoire économique et sociale du Québec, 1760-1850* (1966) was a major event in Québec intellectual life. Ouellet integrated economic and social factors much more firmly than did anyone before him, and drew perceptive conclusions which played down the Conquest as an explanation for French Canadian economic inferiority. He subsequently refined his model, provoking fruitful debates with fellow historians such as Jean-Pierre Wallot. Louise Dechêne's *Habitants et marchands de Montréal au XVII<sup>e</sup> siècle* (1974) is another example of historical work based on today's best historiographical methods.

After 1970 historians began concentrating on various specialized areas. Some of the most active are the labour historians (see WORKING-

CLASS HISTORY), whose writings appear or are analysed in the periodical *Labour/Le Travailleur*, (fd 1976). There are also urban historians (see URBAN STUDIES), whose writings are documented in *Urban History Review/Revue d'histoire urbaine*. Women's history attracts increasing numbers of active researchers. Greater attention is being paid to historiography itself, and more ties are being formed between the 2 historiographies of Canada. English Canadians continue to include French Canada in their analyses of Canada and endeavour to follow Québec's rapid evolution since the 1960s (see QUIET REVOLUTION). Perceptive analyses of French Canada in the 19th and 20th centuries, such as the works of Ramsay Cook, have been translated into French and are appreciated by Anglophones and Francophones alike. Many Franco-Québécois historians, although generally interested in Canadian history only to the extent that it helps them understand Québec, carefully follow English Canadian historiographic production and profit from its methodologies. When Franco-Québécois historians look outward, they tend to disregard the US and turn to the historiography of France, which has enjoyed great prestige since the 1960s. Québec historiography, flourishing in the 1980s, has been at the heart of the great debates waged about the society and "nation" of Québec. More importantly, however, the discipline — having benefited significantly from the historiographical renewal experienced throughout the Western world in recent decades — retained the prestige and influence in the culture of French Canada it has enjoyed for more than a century.

PIERRE SAVARD

#### Historiography in English

Canadian historiography in the English language began virtually with British settlement in America. By necessity, it developed regionally, and it was practised by enthusiastic amateurs. Its *raison d'être* was less to examine the past for its own sake (for in the prevailing Eurocentric view Canada had little "real" history) than to depict the physical features of the land, compile social and economic statistics, and chronicle political advances in a way that encouraged further settlement and investment. It is best regarded as a literary genre aimed at promotion, descriptive rather than analytic. The first example appeared in 1749, with the anonymous publication in London of *A Geographical History of Nova Scotia*. Other such accounts followed, culminating with Thomas Chandler HALIBURTON's *An Historical and Statistical Account of Nova Scotia* (1829), a tract intended to encourage a continued imperial connection.

Other British North American colonies and regions also contributed to this promotional literature during their formative stages. With the opening of the PRAIRIE WEST to European settlement in the 1870s, there appeared such works as Joseph James Hargrave's *Red River* (1871) and George Bryce's *Manitoba* (1882), tracts equally promotional but also reflecting an embryonic regional consciousness. In part this insistence on a distinctive western past was a reaction to the growing historiography produced by Ontarians in the 19th century. In what is now Ontario, the first counterpoint to François-Xavier Garneau's *Histoire du Canada* was John Mercer McMullen's *The History of Canada from Its First Discovery to the Present Time* (1855). Unlike Garneau, McMullen stressed the "positive" implications of the DURHAM REPORT of 1839: the necessity and goodness of material progress, commercial expansion, British parliamentary institutions and colonial self-government. In this view Canada West (Ontario) was seen as both harbinger and guardian of such virtues; other regions were shunted to the periphery, regarded (as with Québec) either as impedimenta or (as with the West) as soil for possible Ontario-based expansion.

The Maritime colonies were largely ignored.

The progress of Ontario in the latter 19th century lent an aura of legitimacy to this central-Canadian view. CONFEDERATION in 1867 helped forge an equation of Ontario's past with the nation's past. Historical writing in Ontario, obsessed with material progress, preservation of the British connection and the achievement of RESPONSIBLE GOVERNMENT, remained promotional, but now was cast in the language of national destiny. By the mid-1880s journalist John Charles DENT had produced 2 major paeans to progress through political moderation: *The Last Forty Years* (1881) and *The Story of the Upper Canadian Rebellion* (1885). In the next decade another dedicated amateur, engineer William Kingsford, produced the massive 10-volume *History of Canada* (1887-98), stressing the growth of local self-government out of the structures of imperial authority. At the end of the century the writing of Canadian history still remained largely the preserve of literary enthusiasts such as William KIRBY (*The Golden Dog*, 1877), Charles MAIR (*Tecumseh, A Drama*, 1886) and Charles G.D. ROBERTS (*History of Canada*, 1897).

Overlapping with this romantic approach to historical writing, however, was the growth of institutions that provided for gradual professionalization. This resulted ultimately in a profound shift from an emphasis on literary skill to an emphasis on professional discipline. In 1882 the formation of the Royal Society of Canada gave members their first national outlet for reading and publishing scholarly papers for an audience of peers. A second source of professionalization was the rapid expansion of English Canadian university curricula between 1880 and 1920. In 1880 McGill University Principal J.W. DAWSON could write that an educated man could gain a general knowledge of history "in an easy and delightful manner by his own reading." A specialized approach, it was thought, could be made simply by gaining a more thorough acquaintance with language and literature, not necessarily with historical documents. But by 1900 the study of history had achieved independence from classics, English literature and political economy, with which it had earlier been associated. By the 1890s chairs of Canadian history existed at U of Toronto and Queen's U, and the subject was also taught by professors of history elsewhere, including U of Manitoba and Dalhousie U. By then, too, the historical romances of American historian Francis Parkman (eg, *Montcalm and Wolfe*, 2 vols, 1884) and the historical criticism of Goldwin SMITH (*Canada and the Canadian Question*, 1891) had shown that Canada's history was not necessarily parochial or lacking in significance. At U of T, George Wrong combined moralistic narrative with a serious attempt to examine original sources, especially in *A Canadian Manor and its Seigneurs* (1908). George Bryce at Manitoba did likewise in his *Remarkable History of the Hudson's Bay Company* (1900).

Perhaps as important were the continuous efforts made by Wrong and Bryce to divorce the writing of history from mere antiquarianism. Bryce was active in the Historical and Scientific Society of Manitoba (fd 1879), and by 1897 Wrong had founded the *Review of Historical Publications Relating to Canada* at U of T. The energies of both men were directed at introducing principles of historical criticism into Canadian historiography. Kingsford's approach was now deemed fundamentally inadequate because of its weak citation of archival sources and its insubstantial interpretive perspective. With the creation in 1872 of the Public Archives of Canada under Douglas Brymner, there was increasingly little excuse for failing to consult basic manuscript and public records. The new preoccupation with empirical verification was also expressed in the writings of Adam Shortt, who

taught Canadian history at Queen's from the early 1890s to 1907. First in a series of studies of Canadian economic and financial institutions, and later in *CANADA AND ITS PROVINCES* (23 vols, 1913-17) which he conceived and edited with Arthur Doughty, Brymner's successor as Dominion Archivist, Shortt refused to engage in the nationalistic moralizing which was characteristic of Bryce and Wrong. Moreover, *Canada and Its Provinces*, focusing on the growth of Canada as a nation-state, nevertheless remained sensitive to regional distinctiveness and "provincial history." Like the idealist philosophers under whom he had studied while a student at Queen's, Shortt sought to reconcile multiplicity and unity while undermining the significance of neither.

The new academic historians' commitment to empirical verification and "objective" judgment in the first 2 decades of the 20th century did not, however, mean the death of the earlier literary and romantic approach. Instead, "men of letters" turned to BIOGRAPHY, greatly aided by the decision of Toronto publisher George Morang to create a multi-volume biographical series to chronicle the lives of the "Makers of Canada." The 20 volumes published 1904-09, written by academics and laymen, marked the apogee of Carlylean hero worship and whiggish progressivism. All subjects were, in some manner, Canada's "Founding Fathers," usually in politics. They were portrayed as "makers" of Canada's national and independent future, not as contributors to its colonial past. Egerton RYERSON was therefore suitable for inclusion; Bishop John STRACHAN was not. Nor was serious criticism of these "makers" to be brooked. When William Dawson LESUEUR, an editor of the series, submitted a manuscript on William Lyon MACKENZIE that was critical of the rebel, his volume was unceremoniously rejected. It was 71 years before this first "modern" Canadian historical biography was published as *William Lyon Mackenzie: A Reinterpretation* (1979).

In spite of the broad emotional appeal of the Makers of Canada series, by 1920 biographical history as represented by the series no longer represented the work being done by the historical profession, increasingly trained at British and American graduate schools. In 1922 the CANADIAN HISTORICAL ASSOCIATION was founded, its publishing vehicle the *Canadian Historical Review* (which supplanted Wrong's *Review of Historical Publications*). English Canadians had emerged from WWI with a new sense of psychological distance from the British Empire. An emotional attachment still existed, but there was a sense that soon Canada must declare full independence, except in allegiance to the British monarch. The relationship between empire and nation was to preoccupy the next generation and more of English Canadian professional historians. As a consequence, the interwar years witnessed the publication of several major attempts at understanding Canada's complex international status. Most notable among these were W.P.M. Kennedy's *The Constitution of Canada* (1922) and Chester Martin's *Empire and Commonwealth* (1929).

One legacy of the Great War had been an increase in autonomist forms of nationalism and an acceptance of the US as a genuine world power. Accordingly, some historians began to study Canadian-American relations. Young Canadian historians such as Arthur Lower and F.H. UNDERHILL, influenced by American progressive historians such as Frederick Jackson Turner and Charles A. Beard, began to stress common geographical, political and economic attributes of 2 nations sharing a continent. This view gained further legitimacy from the growing interdependence of the Canadian and US economies and cultures. Books internationalist in scope and comparative in structure began to

appear, most notably by John Bartlet BREBNER: *New England's Outpost* (1927), *The Explorers of North America, 1492-1806* (1933) and *The Neutral Yankees of Nova Scotia* (1937). The search for continental links found popular expression in journalist J.W. DAFOE's series of essays, *Canada: An American Nation* (1935). Increasingly, the categories of American historical analysis were used to give new meaning to Canada's past. This tendency increased as American scholars turned to the study of American-Canadian relations. One massive expression of this CONTINENTALISM was the Carnegie series on Canadian-American relations, 25 volumes by scholars from both countries under the editorship of James T. Shotwell and published 1936-45. In 1945 appeared Brebner's summary volume for the series: *North Atlantic Triangle*.

English Canadian historical scholarship between the wars was dominated by a concern for establishing the environmental determinants of Canadian history. Underhill, for example, stressed north-south political and economic continental links much as had his intellectual mentor, Goldwin Smith. A different form of environmental determinism was set forth by U of T political economist Harold INNIS. In a series of comprehensive studies of Canadian economic history (especially *The Fur Trade in Canada*, 1930) Innis gradually articulated what came to be known as the STAPLE THESIS. This complex argument, made with great attention to historical detail, stressed that the fundamental material and economic determinants of Canadian history were ones that linked the hinterland economy of Canada to the metropolitan centres of Europe, particularly Britain (see METROPOLITAN HINTERLAND THESIS). The reciprocal relationship between the exploitation of Canadian products and the demands of Europe forged a transatlantic east-west economic axis that transcended north-south continental imperatives. Other aspects of historical development, such as cultural, political and urban growth, were in his view of secondary importance.

Innis's interpretation provided an important means for Canadian historians dissatisfied with continentalist views to remain environmentalists while stressing European, especially British, economic and cultural ties. This was particularly true of Donald CREIGHTON, whose *The Commercial Empire of the St. Lawrence* appeared in 1937. This seminal book owed much to Innis's focus on the transatlantic nature of staple development, but concentrated on the centrality of the ST LAWRENCE RIVER system and the colonial merchants who, after the Conquest, shaped a transcontinental economy. Thus was born the LAURENTIAN THESIS, the dominant interpretation of Canadian history until the 1960s. Creighton himself expanded upon it, most notably in his magisterial biography, *John A. Macdonald* (2 vols, 1952-55), in which Macdonald became the personification of national will, and his great achievement, the construction of the CANADIAN PACIFIC RAILWAY, marked the transcontinental extension of the empire of the St. Lawrence to the Pacific in the age of industry. Much of Creighton's great appeal in the 1940s and 50s was due to the fusion in his works of previously differentiated characteristics in Canadian historiography, especially heroic initiative and will with social and economic factors, "character" with "circumstance."

The effect of Creighton on his generation was profound. His *Dominion of the North* (1944), *Canada's First Century* (1970) and other works kept the Laurentian thesis at the forefront of interpretations of nation-building in Canada, and his biography of Macdonald helped rehabilitate biography as a genre of history. Other scholars produced major studies of neglected figures, most notably J.M.S. Careless (*Brown of the Globe*, 2 vols, 1959-63) and Roger Graham (*Arthur Mei-*

*ghen*, 3 vols, 1960-64). By 1960, in fact, political biography had become the dominant form of historical writing in English Canada, in part because of the extraordinary literary power of Creighton's *Macdonald* and in part because of the post-1945 generation's reaction to the rigidities and restrictiveness of economic determinism in the social sciences. At mid-century, the practice of Canadian history was still very much part of the humanist's domain.

The "Laurentian school" was not without its critics, most notably W.L. MORTON, whose 1946 essay "Clio in Canada: the Interpretation of Canadian History" had been a major indictment of the hegemonic and exploitative implications of Laurentianism for regions other than central Canada. In his own writings, including *The Progressive Party in Canada* (1950) and *Manitoba* (1957), Morton had made major contributions to the history of a region neglected (except in its role as hinterland) by Laurentian historians, just as G.F.G. STANLEY had done earlier in *The Birth of Western Canada* (1936). But in the 1960s the assumptions of the Laurentian school began to be codified for a new generation in the Canadian Centenary Series, a projected 18-volume comprehensive history of Canada edited by Morton and Creighton. By 1984 most volumes in the series (now expanded to 20) had been published.

The exponential growth of Canadian universities, especially graduate schools, in the 1960s and early 1970s fundamentally altered the direction of Canadian historiography. More scholars produced many more books and articles reflecting increasingly divergent areas of specialization and methodologies. The financial support of the CANADA COUNCIL (and later the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL) greatly facilitated scholarly research, writing and publication. Graduates from "regional" universities were less enamoured with the Ontario-centered "Laurentian" approach than the earlier generation had been, and, reflecting a growing division of labour within the profession, they turned increasingly to studies of urban, ethnic, working-class and feminist historiography, often within regional settings. International scholarship, especially the New Social History of the 1960s, markedly influenced such scholars, and major works were often set within a framework critical of capitalist social and economic relations. Specialized journals, such as *Acadiensis*, *B.C. Studies*, *Labour/Le Travailleur* and *Urban History Review/Revue d'histoire urbaine*, met with an enthusiastic response from the scholarly community, challenging the profession to extend the conventional boundaries of historical investigation. By the late 1970s the earlier attempts at a "national synthesis" had become the subject of much criticism for their failures to account for forms of regional distinctiveness and their singular emphasis upon members of the English and French middle class and their political representatives. Carl Berger's study of the national historians, *The Writing of Canadian History* (1976), was an eloquent capstone to this earlier historiography. Most of the energies of the generation of historians writing in the 1970s and 1980s went in completely new directions.

See INTELLECTUAL HISTORY. A.B. MCKILLOP

**History Since Confederation** The years from 1867 to 1919 were the formative period for the transcontinental nation-state and its maturing economy. A dependent colonial existence gave way to a semiautonomous nationhood rooted in dynamic growth at home and then manifested in impressive wartime achievements. Yet the rapid growth also brought urban slums, rising labour discontent and social disharmony, as well as an acceleration of linguistic, ethnic and religious divisions. And the military glory of WWI came at a heavy price in blood and national division.

The new state of 1867 — 4 provinces on the Atlantic and along the Laurentian Basin — expanded extraordinarily in less than a decade to stretch from sea to sea. RUPERT'S LAND, from Ontario to the Rockies and N to the Arctic, was purchased from the HUDSON'S BAY COMPANY in 1869-70. From it were carved Manitoba and the North-West Territories in 1870. A year later, British Columbia on the Pacific entered CONFEDERATION on the promise of a transcontinental railway. Prince Edward Island was added in 1873. In 1905, after mass immigration at the turn of the century began to fill the vast PRAIRIE WEST, Alberta and Saskatchewan won provincial status (see TERRITORIAL EVOLUTION).

Under the leadership of the first federal prime minister, Sir John A. MACDONALD, and his chief Québec colleague, Sir George-Étienne CARTIER, the CONSERVATIVE PARTY — almost permanently in office until 1896 — committed itself to the expansionist NATIONAL POLICY. It showered the Canadian Pacific Railway with cash and land grants, achieving the CPR's completion in 1885. The government erected a high, protective customs-tariff wall to shield developing Canadian industrialism from foreign, especially American, competition. The third objective, mass settlement of the West, largely eluded them, but success came under their LIBERAL successors after 1896. Throughout this period there were detractors who resented the CPR's monopoly or felt, as did many westerners, that the high tariff principally benefited central Canada. On the other hand, the tariff had strong support in some parts of the Maritimes.

The earliest post-Confederation years saw the flowering of 2 significant movements of intense emotional NATIONALISM. In English Canada the very majesty of the great land, the ambitions and idealism of the educated young and an understanding that absorption by the US threatened a too-timid Canada, spurred the growth of the Anglo-Protestant CANADA FIRST movement in literature and politics. Existing political parties, however, were quick to strangle potential competition, and the materialistic ethos of the age largely overrode idealistic reformism. There was also an incompleteness about the Canada Firsters' confusing, nationalist-imperialist vision of grandeur for their country: their vision did not admit of the distinctiveness of the French, Roman Catholic culture that was a part of the nation's makeup (see IMPERIALISM).

Their counterparts in Québec, the ULTRA-MONTANES, believed in papal supremacy, in the Roman Catholic Church and in the clerical domination of society. Their movement had its roots in the European counterrevolution of the mid-19th century, and it found fertile soil in a French Canada resentful at reconquest by the British after the abortive REBELLIONS OF 1837-38 and distrustful of N American secular democracy. The coming of RESPONSIBLE GOVERNMENT in the PROVINCE OF CANADA by 1850 and of federalism in the new Confederation encouraged these clericalist zealots to try to "purify" Québec politics and society on conservative Catholic lines. The bulwark of Catholicism and of Canadian distinctiveness was to be the French language. Confederation was a necessary evil, the least objectionable non-Catholic association for their cultural nation. Separatism was dismissed as unthinkable and impractical, in the face of the threats posed by American secularism and materialism. But a pan-Canadian national vision was no part of their view of the future.

These 2 extreme, antithetical views of Canada could coexist so long as the English-speaking and French-speaking populations remained separate and little social or economic interchange was required. But as the peopling of border and frontier areas in Ontario and the West continued, and as the industrialization of Québec accelerated, conflicts multiplied. The harsh

Federal government poster promoting western Canada, "The New Eldorado" (courtesy Public Archives of Canada / C-85854).

ultramontane attacks on rouge radicalism, liberal Catholicism and freedom of thought in Québec alarmed Protestant opinion in English Canada, while the lack of toleration of Catholic minority school rights and of the French language outside Québec infuriated the Québécois (see MANITOBA SCHOOLS QUESTION). Increasing social and economic domination of Québec by anglophone Canadians exacerbated the feeling.

Economic growth was slow at first and varied widely from region to region. Industrial development steadily benefited southern Ontario, the upper St Lawrence Valley and parts of the Maritimes. But rural Ontario W of Toronto and most of backcountry Québec steadily lost population as modern farming techniques, soil depletion and steep increases in American agricultural tariffs permitted fewer farmers to make their living on the land. Emigration from the Maritimes was prompted by a decline of the traditional FOREST and SHIPBUILDING industries, among other factors. Nationwide, from the 1870s through the 1890s, 1.5 million Canadians left the country, mostly for the US (see POPULATION).

Fortunately, prosperous times came at last, with a rising tide of IMMIGRATION — from just over 50 000 in 1901 to 8 times that figure 12 years later. A country of 4.8 million in 1891 swelled to 7.2 million in 1911. The prairie "wheat boom" was a major component of the national success. Wheat production shot up from 8 million bushels in 1896 to 231 million bushels in 1911. Prairie population rose as dramatically, necessitating the creation of the provinces of Alberta and Saskatchewan in 1905 and the completion of 2 new cross-Canada railways — the GRAND TRUNK PACIFIC and the CANADIAN NORTHERN. Western cities, especially Winnipeg and Vancouver, experienced breakaway expansion as entrepôts. Nearly 30% of the new immigration went to Ontario, with Toronto taking the lion's share for its factories, stockyards, stores and construction gangs. Both Toronto and Montréal more than doubled their population in the 20 years before 1914.

As Canada increasingly became an urban and industrial mass society, the self-help and family-related social-assistance practices of earlier times were outmoded. The vigorous SOCIAL GOSPEL movement among Protestants and the multiplication of social-assistance activities by Roman Catholic orders and agencies constituted

impressive responses, however inadequate. Governments, especially at the provincial level, expanded their roles in education, labour and welfare. An increasingly significant presence in social reform work was that of women, who also began to exert pressure for the vote.

Through the new immigration, Canada was becoming a multicultural society, at least in the West and in the major, growing industrial cities. Roughly one-third of the immigrants came from non-English-speaking Europe. Ukrainians, Poles, Russian Jews, Germans, Italians, Dutch and Scandinavians were the principal groups. In BC there were small but increasing populations of Chinese, Japanese and East Indians. There were growing signs of uneasiness among both English and French Canadians about the presence of so many "strangers," but the old social makeup of Canada had been altered forever.

There was a reduction in the extent of territories controlled by NATIVE PEOPLES and in their degree of self-determination. In the Arctic the Inuit remained largely undisturbed, but most western Indians and Métis lost their way of life as white settlement encroached on much of their hunting lands. In 1869-70 in the Red River region and in 1885 at Batoche in the Saskatchewan country there were unsuccessful armed Métis rebellions led by Louis RIEL (see RED RIVER REBELLION; NORTH-WEST REBELLION). During the second rising some Indians were directly involved. Otherwise the "pacification" of the West was generally peaceful, by purchase in exchange for treaty and reservation rights for the Indians, and through land grants to the Métis. Order was kept by the NORTH-WEST MOUNTED POLICE.

In 1896 the prime ministership of Canada passed to the Québécois Liberal Roman Catholic Sir Wilfrid LAURIER. He presided over the greatest prosperity Canadians had yet seen, but his 15 years of power were bedeviled and then ended by difficult problems in Canada's relationships with Britain and the US. During Laurier's tenure as prime minister, Britain's interest in a united and powerful empire intensified. Many English Canadians joined pan-Britannic emotion to Canadian nationalist ambition to call for an enlarged imperial role for Canada. They forced the Laurier government to send troops to aid Britain in the SOUTH AFRICAN WAR, 1899-1902, and to begin a Canadian navy in 1910. In the same spirit came a massive Canadian contribution of men and money to the British cause in WWI.

By then the Laurier administration had been defeated, in part because too many English Canadian imperialists thought it was "not British enough," and because the growing *nationaliste* movement in Québec, led by Henri BOURASSA, was sure that it was "too British" and would involve young Québec boys in foreign wars of no particular concern to Canada. But the chief cause of Laurier's defeat in the general election of 1911 was his proposed RECIPROCITY trade agreement with the US, which would have led to the reciprocal removal or lowering of duties on the so-called "natural" products of farms, forests and fisheries. The captains of Canadian finance, manufacturing and transport excited the naturally strong Canadian suspicions of American economic intentions and, with their support, the Conservative opposition under Robert BORDEN convinced the electorate that Canada's separate national economy and imperial trading possibilities were about to be thrown away for economic, and possibly political, absorption by the US.

The new Borden government faced the terrible decisions and divisions of WORLD WAR I. There was extraordinary voluntary participation on land, at sea and in the air by Canadians (see WARTIME HOME FRONT). But in 1917 the country was split severely over the question of CONSCRIPTION, or compulsory military service. The

question arose as a result of a severe shortage of Allied manpower on the Western Front in Europe. The subsequent election of a pro-conscription UNION GOVERNMENT of English Canadian Liberals and Conservatives under Borden, over Laurier's Liberal anticonscriptionist rump with its support drawn largely from French Canadians, non-British immigrants and radical labour elements, dramatized the national split.

Yet the war also had a positive impact on Canada. Industrial productivity and efficiency had been stimulated. A new international status — as a separate signatory to the TREATY OF VERSAILLES and as a charter member of the new LEAGUE OF NATIONS — had been won. And the place of women in Canadian life had been upgraded dramatically. They had received the vote federally, primarily for partisan political reasons. But their stellar war service, often in difficult and dirty jobs hitherto thought unfeminine, had won them a measure of respect; they had also gained a taste for fuller participation in the work world. Canadian men and women, on a much broadened social scale, had been drawn into the mainstream of a Western consumer civilization.

Yet the attempted shift to a peacetime economy was soon clouded by high INFLATION and UNEMPLOYMENT, as well as disastrously low world grain prices. Labour unrest increased radically, farmer protests toppled governments in the West and Ontario, and the economy of the Maritimes collapsed. Resentment over conscription remained intense in Québec. The early national period of Canadian innocence was over.

RICHARD T. CLIPPINGDALE

### The Interwar Years

Canada's population between the world wars rose from 8 to 11 million; the urban population increased at a more rapid rate from 4 to 6 million. WWI created expectations for a brave new Canada, but peace brought disillusionment and social unrest. Enlistment in the ARMED FORCES and the expansion of the munitions industry had created a manpower shortage during the war, which in turn had facilitated collective bargaining by industrial workers. There had been no dearth of grievances about wages or working conditions, but the demands of patriotism had usually restrained the militant. Trade-union membership grew from a low of 143 000 in 1915 to a high of 379 000 in 1919, and with the end of the war the demands for social justice were no longer held in check. Even unorganized workers expected peace to bring them substantial economic benefits.

Employers had a different perspective. Munitions contracts were abruptly cancelled and factories had to retool for domestic production. The returning veterans added to the disruption by flooding the LABOUR MARKET. Some entrepreneurs and some political leaders were also disturbed by the implications of the 1917 Russian Revolution and were quick to interpret labour demands, especially when couched in militant terms, as a threat to the established order. The result was the bitterest industrial strife in Canadian history. In 1919, with a labour force of some 3 million, almost 4 million working days were lost because of STRIKES AND LOCKOUTS. The best-known of that year, the WINNIPEG GENERAL STRIKE, has a symbolic significance: it began as a strike by construction unions for union recognition and higher wages, but quickly broadened to a sympathy strike by organized and unorganized workers in the city. Businessmen and politicians at all levels of government feared a revolution. Ten strike leaders were arrested and a demonstration was broken up by mounted policemen. After 5 weeks the strikers accepted a token settlement, but the strike was effectively broken.

Industrial strife continued, with average annual losses of a million working days until the mid-1920s. By then the postwar recession had been reversed and wages and employment levels were at record highs for the rest of the decade. Some labour militants turned from the economic to the political sphere; some labour candidates were successful early in the decade in provincial elections in Nova Scotia, Ontario and the 4 western provinces, and J.S. WOODSWORTH was elected in N. WINNIPEG in the 1921 federal election.

The war also left a heritage of grievances in RURAL SOCIETY. Rural depopulation had accelerated during the war, but the farmers' frustration was directed against the UNION GOVERNMENT of Sir Robert Borden, which had first promised exemptions and then conscripted farm workers. A sudden drop in prices for farm produce increased their bitterness. In postwar provincial elections, farmers' parties formed governments in Ontario, Manitoba and Alberta, and in the federal election of 1921, won by W.L.M. KING's Liberals, the PROGRESSIVE PARTY won an astonishing 65 seats on a platform of lower tariffs, lower freight rates and government marketing of farm products.

These social protests declined by the end of the decade. Industrial expansion, financed largely by American investment, provided work in the AUTOMOTIVE INDUSTRY, in PULP AND PAPER and in MINING. Farm incomes rose after the postwar recession, reaching a high of over \$1 billion in 1927. The political system also offered some accommodation. Most provincial governments introduced MINIMUM WAGES shortly after the war, and the federal government reduced tariffs and freight rates and introduced OLD-AGE PENSIONS. By the end of the decade the impetus for social change had dissipated. Even wartime PROHIBITION experiments had given way to the lucrative selling of liquor by provincial boards.

The GREAT DEPRESSION of the 1930s followed. For wheat farmers it began in 1930 when the price of wheat dropped below \$1 a bushel. Three years later it was down to about 40 cents and the price of other farm products had dropped as precipitously. Prairie farmers were the hardest hit because they relied on cash crops, and because the depressed prices happened to coincide with a cyclical period of drought, which meant crop failures and a lack of feed for livestock. Cash income for prairie farmers dropped from a high of \$620 million in 1928 to a low of \$177 million in 1931 and did not reach \$300 million until 1939. Disaster also struck those industrial workers who lost their jobs. UNEMPLOYMENT statistics are not reliable partly because there was no unemployment insurance and so no bookkeeping records, but it is estimated that unemployment rose from 3% of the labour force in 1929 to 20% in 1933. It was still 11% by the end of the decade. Even these figures are misleading: the labour force included only those who were employed or looking for work, excluding most women. Those who were identified as unemployed were often the only breadwinners in the family.

Voters turned to governments for an economic security that the economic system could not provide. Most governments were slow or unable to respond and were replaced by others at the first opportunity. King's Liberals, elected in 1926 after a brief period of Conservative rule, were again rejected in 1930, this time in favour of a Conservative government under R.B. BENNETT. New political parties contested the 1935 federal election — the CO-OPERATIVE COMMONWEALTH FEDERATION (CCF), SOCIAL CREDIT and the short-lived RECONSTRUCTION PARTY — with promises to regulate credit and business. Even Conservative leader Bennett promised improvements (see BENNETT'S NEW DEAL), and Mackenzie King and the Liberals, who won the election, spoke vaguely of reform. At the provincial level, the UNION NATIONALE was elected in Québec under

Maurice DUPLESSIS and Social Credit in Alberta under William ABERHART, with the older parties in other provinces often turning to new and more dynamic leaders who promised active intervention on behalf of the less privileged.

Governments tried to provide emergency relief, but they too soon needed help. Prairie farmers needed relief in the form of food, fuel and clothing, but they also needed money for seed grain, livestock forage and machinery repairs. Neither municipal nor provincial governments could meet these demands for assistance; in the drought year of 1937 almost two-thirds of Saskatchewan's population required some relief. Other provinces had declining revenues but were not as close to bankruptcy, with the possible exception of Alberta. Inevitably, as the Depression continued, the federal government had to contribute to relief costs.

The role of governments changed, but not dramatically. Most governments would have preferred to provide jobs by undertaking major public-works projects, but with declining revenues and limited credit the cost of materials and equipment was prohibitive. Direct relief was cheaper in the short run. Governments did become more involved in the regulation of business: mortgages and interest payments were scaled down by legislation, and new regulatory institutions such as the BANK OF CANADA and the CANADIAN WHEAT BOARD were established. The major expansion of the bureaucracy, however, would come only after the outbreak of WORLD WAR II in 1939. Trade-union activity revived with the beginning of industrial recovery: by 1937 trade-union membership was back to the 1919 level. Canadian auto workers and miners followed the American lead and formed INDUSTRIAL UNIONS. Their effectiveness was limited by the opposition of Mitchell HEPBURN in Ontario and Duplessis in Québec, and the significant gains, once again, would come only during the war.

In the years between the wars, 2 machines may have done more than the BUSINESS CYCLE to alter the Canadian way of life: the automobile and the radio. The 1920s were the decade of the automobile; in 1919 there was one car in Canada for every 40 Canadians and 10 years later it was one car for every 10. The car created Canadian suburbs and altered the social patterns of the young. In the 1930s it was the radio: there were half a million receiving sets in 1930 and over a million by 1939, bringing news and entertainment into most Canadian homes. The changes brought about by mass production and popular entertainment posed problems for Canadian identity. The tariff (see PROTECTIONISM) provided Canadian jobs by ensuring that cars and radios would be assembled in Canada. There was little concern at the time for this expansion of a branch-plant pattern, but there was concern for the BROADCASTING of American programs by Canadian radio stations. The result was the CANADIAN BROADCASTING CORPORATION, with French and English networks broadcasting a combination of Canadian and popular American programs. In one way or another, by 1939 Canadians looked to governments to provide cautious assistance to maintain a Canadian way of life.

H. BLAIR NEATBY

### History Since 1945

Canada's political landscape had been fundamentally changed by WWI. During WWII many Canadians predicted another transformation. In 1943 the CCF, a product of 1930s political discontent, stood highest in new public opinion polls. It became the official opposition in Ontario in 1943 and in 1944 won decisively in Saskatchewan. In Québec, Maurice Duplessis's Union Nationale recaptured power. Federally, Québec's BLOC POPULAIRE retaliated against conscription in 1944. Once again it seemed that

the Canadian party system would become a casualty of a European war.

In the federal election of 11 June 1945, held while thousands of veterans were just beginning to come home, Canadians returned the LIBERAL PARTY to office. Mackenzie King's majority was very small, but his survival is nevertheless remarkable: among Allied wartime leaders, only Stalin and he led through both the war and the peacemaking. In 1945 the Liberals added a new commitment to social welfare and Keynesian management of the economy (see KEYNESIAN ECONOMICS). Liberal welfare policies — not least among them the FAMILY ALLOWANCE, begun in 1945, and UNEMPLOYMENT INSURANCE, begun in 1940 — attracted many workers and farmers, and rebuffed the challenges from the CCF on the left and the Conservatives on the right. Although the national Liberals continued to enjoy some support in all regions and from all economic groups, CCF and Social Credit held, respectively, Saskatchewan and Alberta throughout the 1950s and into the 1960s, and Social Credit governed BC from 1952 to 1972. Historians have attributed Liberal success to the period's unparalleled prosperity, to consensus on foreign policy arising from COLD WAR fears (few had objected when Canada joined the UNITED NATIONS in 1945 or, 4 years later, signed the North Atlantic Treaty and then sent troops to Europe in 1951), to the nation's need for stability after depression and war, and to a highly competent Cabinet and bureaucracy.

After 1954 these advantages began to disappear. There was a sharp economic slump in 1954, followed by worries that Canada's post-war boom was too dependent upon (mainly American) FOREIGN INVESTMENT. The Cabinet's competency obviously weakened in 1954 when 3 prominent ministers, Douglas Abbott, Lionel CHEVRIER and Brooke CLAXTON, resigned. In 1956 the PIPELINE DEBATE revealed apparent Liberal arrogance and political clumsiness. Western allies divided during the SUEZ CRISIS when France, Britain and Israel attacked Egypt, and the US and Canada did not support them.

On 10 June 1957 the Conservative Party was elected. Probably most significant in explaining the victory is the Conservatives' choice of John Diefenbaker as leader. He brought a flamboyance and a populist appeal that his predecessor, George DREW, completely lacked. He was also a western Canadian who understood and shared the area's grievances against Ottawa. Diefenbaker's brief first term saw taxes cut and pensions raised. The new government also took Canada into the NORAD agreement with the US, and 2 years later scrapped the AVRO ARROW interceptor and purchased BOMARC MISSILES, effective only with nuclear warheads. Seeking escape from the confines of a minority government, Diefenbaker called an election for 31 Mar 1958. Although the Liberals had Lester PEARSON as leader, Diefenbaker won 208 of 265 seats on the strength of his charisma, his "vision" of a new Canada and his policy of northern development. His support was well distributed, except in Newfoundland.

No one had predicted the extent of the Conservative triumph, but that did not prevent many commentators at the time forecasting a Conservative dynasty and a return to the 2-party system. Historians and political scientists tend to consider the 1958 election as an aberration that neither reflected nor affected the fundamental character of Canadian politics. Yet closer scrutiny reveals a lasting imprint. Since 1958 Conservatives have commanded western Canadian federal politics, and Liberals have found western seats increasingly difficult to obtain. On the other hand, Conservatives, who won 50 seats in Québec in 1958, by the early 1980s had not yet recovered from Diefenbaker's failure to build upon his victory there.

The CCF and the Liberals began rebuilding almost immediately, the Liberals by appealing to urban Canadians and Francophones, and the CCF by strengthening its links with organized labour. Provincial bases were important in this reconstruction. Social Credit governments in Alberta and, to a much lesser extent, BC assisted the Liberals. Within 5 days in June 1960 the party was elected in Québec and NB. In Québec Jean LESAGE modernized Québec Liberal traditions and introduced the QUIET REVOLUTION. In Saskatchewan the CCF sacrificed most for its federal counterpart. Longtime Saskatchewan Prem Tommy DOUGLAS went to Ottawa to lead the CCF's heir, the NEW DEMOCRATIC PARTY, whose formation was an explicit attempt to create a closer link with the labour movement. Without Douglas, the NDP in Saskatchewan bravely introduced medicare in 1962 and, under the lash of a scare campaign, lost the next election to the Liberals. Medicare, however, proved immensely successful and soon became a popular national program.

By 1962 Diefenbaker's 1958 "vision" of Canada had become a nightmare to some and a joke to others. There had been postwar peaks in unemployment, record budget deficits and, in May 1962, a devaluation of the dollar. But neither Pearson nor Douglas made much impact as leaders before the election of 18 June 1962; the Conservatives stayed in power as a MINORITY GOVERNMENT. By early 1963 the Cabinet began to bicker, members resigned ostensibly on the issue of Canadian defence policy, and finally the government collapsed. In a bitter 1963 election campaign Diefenbaker charged that the US, which had openly criticized his refusal to accept nuclear weapons, was colluding with the Liberals to defeat him. The Liberals brushed off the attack and excoriated Diefenbaker for alleged incompetence. The NDP declared a pox upon all who stayed outside its camp. On 8 Apr 1963 the Liberals won a minority government.

The campaign left its mark on subsequent parliaments. The Pearson government sought to be innovative, and in many ways it was — the armed forces were unified and social welfare was extended; but the foul atmosphere obscured its merits. The party became ever more identified with the "politics of national unity," dedicated to containing Québec's aspirations through "co-operative federalism." The NDP argued that this focus distorted the voters' view of their economic circumstances. The Conservatives held that the Liberal approach to national unity was concerned too much with Québec and too little with problems elsewhere. In reality all parties shared a commitment to reform and to the need to deal with Québec's demands for changes in Canada's federal system. Hence, these years were marked by personality quarrels and numerous political scandals, especially the MUNSINGER AFFAIR. They were also notable for the establishment of the CANADA PENSION PLAN and the signing of the CANADA-US AUTOMOTIVE PRODUCTS AGREEMENT, a treaty intended to give Canada a larger share of the continental auto market. Desperate to escape from the minority straitjacket, Pearson called an election for 8 Nov 1965. He won only 2 more seats, remaining 2 short of a majority. Diefenbaker ran a stirring campaign, picking up strength in Atlantic Canada, and took 46 of the 72 western seats. Regional voting patterns persisted as the Liberals took 56 seats in Québec.

In 1967 the Conservatives replaced Diefenbaker with Nova Scotia Prem Robert STANFIELD. Pearson resigned at the end of 1967, to be succeeded by Pierre TRUDEAU, who largely restored party unity. The choice of Trudeau emphasized the Liberals' commitment to finding a solution to the "Québec problem." Trudeau's vigorous opposition to Québec nationalism (see FRENCH CANADIAN NATIONALISM) and to "special status" won

support in English Canada, while his promise to make the French fact important in Ottawa appealed to his fellow Francophones. Conservatives and the NDP found difficulty in developing a similarly appealing platform, not least because both lacked support in Québec. In 1968, Québec's place in Confederation and Trudeau's personality dominated federal political debate. This dominance endured almost uninterrupted into the 1980s.

In 1968 Trudeau won a majority, appealing across class lines and even across regional barriers. The Liberals won more seats W of Ontario than since 1953. Trudeau's harsh response to terrorism in Québec during the 1970 OCTOBER CRISIS, the growth of leftist sentiment in the NDP and Conservative leadership bickering strengthened Trudeau's position. However, when he called an election for 30 Oct 1972, the Liberals' position was considerably weaker. Their emphasis on BICULTURALISM angered many English Canadians who feared fundamental changes in their lives and their nation; many were also unhappy with the government's cuts in defence and particularly in the forces dedicated to NATO. The Liberals won only 109 seats, Conservatives 107. The NDP held the balance of power with 31, their highest number to that point. Believing that a Liberal defeat in Parliament would bring a Conservative election victory, NDP leader David LEWIS backed the Liberals. Trudeau took his government towards the left to guarantee NDP support. The Liberals benefited from this political minuet, where the partners pirouetted but never embraced.

In the 1974 election Trudeau's reformist legislation and his opposition to the Conservative policy of WAGE AND PRICE CONTROLS brought many working-class voters to his side, especially in BC and Ontario. The Liberals won 141 seats, the Conservatives 95 and the NDP 16. Political scientists have identified how the 1974 election reflected continuing trends. The regional pattern of support persisted even when economic rather than bicultural issues dominated the campaign. Liberals depend upon Québec to win elections and upon urban Ontario for majorities. Similarly, Conservatives are strongly western oriented in opposition, and they too depend upon Ontario for majorities. New Democrat strength has grown among unskilled workers but dropped among skilled. Their strength lies mainly in the West, but the NDP vote is often only a protest vote in an area where Liberalism is anathema. Nevertheless the NDP percentage of the popular vote has grown, albeit intermittently, since the 1950s. Research indicates that fewer voters remain committed to a single party than was true earlier. Bloc voting is still a characteristic of several ethnic groups and leadership has become much more significant than before. Trudeau's political success is perhaps best explained by the voters' perception that Conservative leaders Robert Stanfield and Joe CLARK were ineffective.

After 1974 Trudeau gave indecisive leadership. Personal problems, weakness in the Cabinet and intractable economic difficulties plagued his government between 1974 and 1979. He surged forward in 1976-77 when René Lévesque's PARTI QUÉBÉCOIS gained power in Québec; the Liberals clearly benefit most when Canadians focus upon their bicultural nature. When Canada did not collapse within 2 years of Lévesque's win, voters began to worry most about slow and unequal economic growth. In May 1979 Clark defeated Trudeau, sweeping English Canada. Although Liberals gained in Québec, Clark was only 4 seats short of a majority.

The Liberal situation seemed more desperate than in 1958. Provincially, especially in the West, they were pathetically weak. Their Québec base might be threatened if an Anglophone re-

placed Trudeau. Moreover, leadership material was thin, and the successor might face internal party acrimony. But Clark remained personally unpopular, and his party, which depended upon support from the resource-rich western provinces, could not develop an economic or energy strategy that satisfied central Canada, where rapidly rising oil prices were unpopular.

In Dec 1979 the government presented a tough budget and lost a subsequent non-confidence motion, and an election was called for Feb 1980. Cleverly manipulating the Conservatives' internal differences, the Liberals under Trudeau (who had resigned and then returned) regained their majority in an election in which Ontario swung strongly behind the Liberals, whose policies on resource pricing they favoured and the West abhorred. The Liberals won no seat W of Manitoba and only 2 there. Deep regional divisions in Canadian politics resulted from economic strategies marking a fragmented party system, which mirrored a fragmented nation.

After 1980 Trudeau's government followed a nationalist course for a time. The National Energy Program (soon to be modified) offered great incentives to encourage domestic ownership in the PETROLEUM INDUSTRY. There was a more independent direction taken with respect to the US. After Trudeau had been instrumental in crushing Québec SEPARATISM in a 1980 Québec referendum, the CANADIAN CONSTITUTION, in which was entrenched the CANADIAN CHARTER OF RIGHTS AND FREEDOMS, was "patriated" to Canada. But the prime minister became ever more unpopular as inflation, interest rates and unemployment rose. In 1984 the Liberals paid the price for alienating the electorate. The Conservatives had replaced Clark with a bilingual Quebecer, Brian MULRONEY, in 1983. The Liberals chose John TURNER as Trudeau's successor a year later. Turner quickly called an election. The result was an overwhelming Conservative victory, as the Tory strength in the West endured while the Liberal fortress of Québec crumbled. Mulroney won 211 seats, 58 of them in Québec; the Liberals retained only 40. The fragmentation of the Canadian party system seemed to have ended with the stunning Conservative triumph. Nevertheless, it is not yet clear how enduring this new brand of political cement will be.

**Hnatyshyn, Ramon John**, politician (b at Saskatoon 16 Mar 1934). The son of a senator, Hnatyshyn was educated at U of Sask and worked for the government leader in the Senate, 1958-60. He was called to the Saskatchewan Bar in 1957 and practised law in Saskatoon 1956-58 and 1960-74. Elected a Conservative MP for Saskatoon in the 1974 general election, he was minister of energy in the CLARK government 1979-80. The moderate, well-liked Hnatyshyn was named House leader in 1984 and after the

election that year he became government leader in the Commons.

NORMAN HILLMER

**Hobson, Joseph**, civil engineer (b near Guelph, UC 4 Mar 1834; d at Hamilton 19 Dec 1914). Trained in land surveying and engineering, Hobson served as engineer to Waterloo County and then worked on the building of the Grand Trunk Ry. In 1875 he became chief engineer of the GREAT WESTERN RY and then of the GRAND TRUNK RY. His outstanding works included the tunnel under the St Clair R at Sarnia (the first underwater railway tunnel in N America) and the replacement of the superstructure of the Victoria Bridge over the St Lawrence at Montréal, without interrupting traffic. A brilliant engineer, but an unduly modest man, he left no written record of his notable works. R.F. LEGGET

**Hobson, Robert**, industrialist (b at Berlin [Kitchener], Canada W 13 Aug 1861; d at Hamilton, Ont 25 Feb 1926). Hobson worked first for the Grand Trunk Ry and in 1896 he became secretary-treasurer of the Hamilton Blast Furnace Co. His executive abilities soon brought him to the top of a firm that before his death became Canada's leading steel producer. In 1899 he became general manager of the Hamilton Steel and Iron Co, and in 1910 VP and general manager of the new Steel Co of Canada (STELCO). By 1916 he was president. During these years he presided over a massive expansion and modernization of the corporation's steel plants and helped to build a secure base for it in widely diversified markets. Simultaneously, his personal influence in the larger business community grew enormously, as his directorships in manufacturing, transportation and finance proliferated. By the 1920s he was in the front ranks of Canada's "captains of industry." CRAIG HERON

**Hochelaga**, native village located at the present site of MONTRÉAL. The arrival of Jacques CARTIER at the village in Oct 1535, where he read the Gospel to the Indians and climbed Mt Royal to survey the new world, has become part of Canadian lore. The local inhabitants were IROQUOIS, who lived in palisaded settlements and engaged in agriculture. They likely numbered about 1500. The French offended the Hochelagans by refusing to participate in a feast prepared in their honour and by their abrupt departure. On Cartier's third voyage, in 1543, he skirted the village and followed a trail to the Lachine Rapids. When the French again returned to the area in 1603, the Hochelagans had vanished. See STADACONA.

JAMES MARSH

**Hockey, Ice** Stick and ball games were likely first played on ice in northern England, and British soldiers brought the tradition to Canada early in the 19th century. Variations of the games bandy and shinty were played on ice by British troops garrisoned in Halifax and Kingston in the 1850s, or earlier. The word "hockey" is probably derived from the French *hoquet* ("shepherd's crook"), referring to the shape of the stick, and the nickname "shinny" for informal hockey doubtless comes from the game's origins in shinty. There is evidence that New York Dutch and New Englanders also played a game similar to hockey during colonial times. But these were formless affairs, and ice hockey as we know it was first played in Montréal in 1875, with a set of rules formalized by J.G.A. Creighton, a McGill student. Substitution of a flat, wooden disc (puck) for a ball gave the players more control.

In 1879 the first organized team, the McGill University Hockey Club, was formed, and with the advent of a basic set of rules the sport quickly spread across Canada. The first "world championship" was held in 1883 at the Montréal Ice Carnival and was won by McGill. The first national association, known as the Amateur Hockey Assn of Canada, was formed in 1886, with representatives from Québec City, Montréal and Ottawa. A group of colleges, universities and military and athletic clubs formed the Ontario Hockey Assn in 1890. Gov Gen Lord STANLEY donated a trophy in 1893 for the national championship, and the first STANLEY CUP game was played 22 Mar 1894, with Montreal AAA victorious before a crowd of 5000.

Early hockey was played in rudimentary conditions, mostly outdoors on patches of natural ice, with snowbanks for boards and wooden posts for goals. There were 9 players per side on the ice, and the puck could not be passed forward. The on-side rule and primitive face-off ("bully") were adapted from RUGBY. With speed and rough play the game had immediate attraction, and strong local rivalries developed. The sport spread to US universities, beginning with Yale in 1893. Europe's hockey origins date to Vienna in 1885, Belgium, Bohemia, France, Great Britain and Switzerland formed the International Ice Hockey Federation in 1908 and Germany joined 1909. Winnipeg Falcons won the first international world championship, held at the Winter Olympics, Antwerp, 1920. Toronto Granites overwhelmed all opposition to win the 1924 Winter Olympics and U of T Grads won again for Canada in 1928.

Olympic hockey in the 1920s, when Canadian amateurs were still able to dominate international competition (courtesy Canada's Sports Hall of Fame).

was named House leader in 1984 and after the

The development of hockey in Canada was profoundly changed by the growth and final ascendancy of professionalism. In the prevailing climate, playing for money was considered immoral, but many players accepted money secretly. The first overtly professional league was formed in 1903 with teams from Pittsburgh, Pa; Sault Ste Marie, Ont; and Houghton, Calumet and Sault Ste Marie, Mich. Most of the best players were Canadian; they commanded extravagant salaries, lived nomadically from one season to the next and played for the highest bidder. At one time, Fred "Cyclone" TAYLOR was the highest-paid athlete in N America. The Ontario Professional League, organized for the 1908 season, was the first openly professional league in Canada. The Eastern Canada Hockey Assn turned professional in Nov 1908. The rival National Hockey Assn was formed 1909 and was reorganized 1917 as the NATIONAL HOCKEY LEAGUE. Professional hockey soon required indoor stadiums, artificial ice and large payrolls. Successful teams in smaller centres, such as Renfrew Millionaires, eventually disappeared; the NHL teams were all in larger cities: MONTREAL CANADIENS, Montreal Wanderers, Ottawa Senators, Toronto St Pats and, briefly, Quebec Bulldogs and Hamilton Tigers.

Montreal Maroons entered the NHL in 1924 and the league successfully moved into the lucrative urban market of the US, adding Boston Bruins (1924), New York Americans (1925), Pittsburgh Pirates (1925), New York Rangers (1926), Chicago Black Hawks (1926) and Detroit Cougars (1926). However, almost every one of the players came from Canada. The NHL dominated hockey, monopolized players and controlled salaries and player movement. A few exceptional players were paid up to \$10 000 per season, but in the 1920s the average salary had dropped to \$900, despite player protests and a threatened strike. After 1945 the controversial C-Form gave NHL teams exclusive control over the future careers of boys from age 15. The sole purpose of amateur junior hockey became the development of players for the NHL — not to win titles, or to represent a community, but to identify individual prospects.

The present form of the sport took shape in the professional leagues, the NHL and the Pacific Coast League. Key innovations were 3 twenty-minute periods (1910), 6 players (1911) and a gradual relaxation of the stricture against the forward pass: allowed between blue lines (1918), within any of the 3 zones (1929-30), across blue lines (1930-31). The red line was added 1943-44. The result was a faster game. Although competition remained keen in smaller centres for the amateur trophies, the Allan Cup and Memorial Cup, the focus remained on the NHL, though the number of teams dwindled to 6, with only TORONTO MAPLE LEAFS and Montreal Canadiens in Canada. The Ottawa Senators dominated the 1920s, with 4 league titles and 4 Stanley Cup victories, but folded in 1934. Some early exploits live on: Joe MALONE scored 7 goals in 1 game in 1920. George HAINSWORTH won the VEZINA TROPHY in its first 3 years. In Mar 1923 Foster HEWITT broadcast a game on radio for the first time. Outstanding players of the era included Frank "King" CLANCY, Charlie CONACHER, Bill COOK, Aurel Joliat, Lester Patrick and Nels STEWART. Howie MORENZ was the flashiest player, and Eddie SHORE the premier defenceman.

The schedule continued to increase, to 48 games in the 1930s and 70 games in 1949-50. The Toronto Maple Leafs, led by Walter "Turk" BRODA, Syl APPS, Ted KENNEDY and Max BENTLEY, were the dominant team of the 1940s, winning the Stanley Cup 6 times in 10 years. But Maurice "Rocket" RICHARD of the Canadiens was clearly the outstanding offensive player, scoring 50 goals in 50 games in 1944-45 — 5 goals and 3 assists in 1 game.

The outstanding team of the early 1950s was Detroit Red Wings, led by Gordie HOWE (who won the scoring championship 5 times and the HART TROPHY 4 times in the decade), Red KELLY, Ted LINDSAY and Terry SAWCHUK. In the mid-1950s the Montreal Canadiens built possibly the most powerful team in NHL history, with Maurice and Henri Richard, Bernie GEOFFRION, Jean BELIVEAU, Jacques PLANTE, Dickie Moore, Doug HARVEY and others. The Canadiens won the Stanley Cup 6 times, including a record 5 straight.

The NHL expanded into 6 American centres in 1967: Los Angeles, Oakland, St Louis, Minnesota, Pittsburgh and Philadelphia. VANCOUVER CANUCKS were added 1969-70, with Buffalo. Toronto won the Stanley Cup 4 more times before expansion, and Montréal began another string. Chicago managed its first Stanley Cup victory in 23 years in 1960-61, led by the brilliant Bobby HULL and Stan MIKITA. Scoring increased in the diluted league, and Phil ESPOSITO of Boston Bruins set new records for goals in a season (77) and points (152), while defenceman Bobby ORR revolutionized his position, becoming the first defenceman to win the scoring championship. The offensive emphasis of the sport was typified in the 1980s by the incredible scoring feats of Wayne GRETZKY.

In 1971 the WORLD HOCKEY ASSN was organized, signing more than 70 players from the NHL, including Bobby Hull. It began with 12 teams and grew to 14 before rising expenses and dwindling crowds reduced it to 7. In 1979 the feud between leagues ended with a merger, as WINNIPEG JETS, EDMONTON OILERS, QUEBEC NORDIQUES and Hartford Whalers were assimilated by the NHL. The competition for players had substantially raised salaries and finally brought NHL teams to more Canadian cities. In 1980 a team was moved from Atlanta, Ga, to become the CALGARY FLAMES. In 1983-84 Edmonton became the first of the ex-WHL teams to win the Stanley Cup, ending a 4-year reign by the New York Islanders.

Canadian dominance of hockey continued into the 1950s, and senior amateur teams were usually good enough to win international competitions. However, hockey spread rapidly in Europe, particularly in the Soviet Union after WWII, and Soviet teams won the world championship in 1954 and the Olympic gold medal at Cortina 1956. From 1963 to 1973, the Soviets won 11 of 12 Olympic and world championships, but Canadians clung to the belief that the Soviets would collapse in competition with professionals. Finally an NHL all-star team met the Soviet "amateurs" in the 1972 CANADA-SOVIET HOCKEY SERIES, perhaps the most dramatic sports event in Canadian history. Canada won 4 games, lost 3 and tied 1, but the myth of Canadian hockey supremacy was shattered. Canada managed to win the Canada Cup, an international competition held every 4 years in which Canada can use professionals, in 1976 and 1984, but the Soviets have mostly dominated encounters with NHL teams. The spread and growing proficiency of hockey in Sweden, Finland, Czechoslovakia and the US is reflected in the increasing number of players from these countries in the NHL.

Hockey is Canada's national game, the chief sports preoccupation of its male youth, and is still intimately woven into its self-image and mythology. It is now one of the world's great sports, played seriously in at least 20 countries. The Soviet style, which emphasizes speed, passing and teamwork, has developed the strongest characteristics of the sport and helped to reinvigorate the Canadian game. JAMES MARSH

**Hockey Hall of Fame**, founded in 1943, was the result of meetings of the NATIONAL HOCKEY LEAGUE and Canadian Amateur Hockey Assn. The present buildings at Exhibition Place, To-

ronto, were officially opened in 1961 by PM John G. Diefenbaker and US Ambassador Livingston T. Merchant. A governing committee comprising representatives from the NHL, CAHA, Metro Toronto and the Canadian National Exhibition Assn administers operations, as well as electing builder members. A selection committee, composed of knowledgeable persons from the game and the media, considers player candidates. A maximum of 3 player members may be elected annually, with consideration based on playing ability, integrity, character and contributions to team play and to the game of HOCKEY. Membership at the end of 1983 was 242 — 170 players, 63 builders and 9 referees.

The Hall is open year-round to the public and has outstanding memorabilia: goalenders' masks and equipment; players' sticks, skates and pucks; major trophy collections (including the STANLEY CUP); hockey art, geography, international sweaters and assorted other items of interest to hockey fans. M.H. REID

**Hocquart, Gilles**, INTENDANT OF NEW FRANCE (b at Mortagne-au-Perche, France 1694; d at Paris 1 Apr 1783). He followed his father into the Marine service and was posted to Rochefort from 1722 until 1729 when he was appointed to New France as financial commissary and acting intendant. He was promoted intendant in 1731. Instructed to expand trade to benefit France while curbing government expenditures, Hocquart was expected to develop the colony's possibilities. To do so he tried to encourage every kind of Canadian undertaking, such as the FORGESSAINT-MAURICE and shipbuilding. He eventually succeeded in getting government funds to assist both endeavours. He also promoted agriculture and to assist trade had roads built between Québec C and Montréal and from the latter to Lk Champlain. By 1740 he could claim considerable success in improving New France's economic situation, but the collapse of the underfinanced Saint-Maurice ironworks, the bad harvests of 1741-43 and war between France and Britain in N America 1744-48 destroyed his attempts to stimulate private economic efforts and caused large deficit crown expenditures. Replaced in Canada by François BIGOT in 1748, Hocquart was intendant at Brest until retiring in 1764. MARY McDUGALL MAUDE

**Hodgetts, Charles Alfred**, physician, public-health official, teacher, administrator (b at Toronto 23 Aug 1859; d at London, Ont 3 Apr 1952). Hodgetts was medical inspector and later secretary and chief officer of the Ontario Provincial Board of Health and medical adviser 1910-20 to the federal Commission of Conservation. An advocate of PUBLIC HEALTH and dispenser of practical medicine, he emphasized prevention of disease. Public-health officials in the late 19th and early 20th centuries were investigating specific diseases and how to control them, and Hodgetts in particular perceived improved housing and town planning to be important. He considered quick treatment in the case of accident or sudden illness essential, and between 1896 and 1910 devoted much of his time to the RED CROSS, being commissioner overseas 1914-18. He worked tirelessly for the St John Ambulance Assn 1910-32 and was chief officer 1921-32. GODFREY L. SPRAGGE

**Hodgins, Jack Stanley**, novelist, short story writer (b at Comox, BC 3 Oct 1938). His fiction blurs the old distinction between novels and stories which while sometimes experimental retain a love of narrative. *Spit Delaney's Island* (1976), *The Invention of the World* (1977), *The Resurrection of Joseph Bourne* (1979, Gov Gen's Award) and *The Barclay Family Theatre* (1981) all deal with characters (often the same ones from book to book) reconstructed from the author's Vancouver 1 childhood. In his hands, they are ec-

centric but realistic characters, deployed with stylistic suppleness in life-affirming situations.

**Hodgson, George Ritchie**, swimmer (b at Montréal, Qué 12 Oct 1893; d there 1 May 1983). Hodgson was Canada's first Olympic swimming champion. He received little formal training as a swimmer but practised summers at his family's cottage in the Laurentians and swam daily in winter at the Montréal Amateur Athletic Assn pool. Representing Canada at the 1911 Festival of the Empire Games, he defeated the world record holder over the 1-mile (1.6 km) distance. At the 1912 Stockholm Olympics he won gold medals in the 400 m freestyle and 1500 m freestyle, setting world records in both. They were not broken until 1924, by the famous American swimmer, John Weissmuller. Hodgson attended McGill and served with distinction in the RAF in WWI.

J. THOMAS WEST

**Hodgson, Stuart Milton**, public administrator, labour leader (b at Vancouver 1 Apr 1924). Hodgson left school in 1940 to work for H.R. MACMILLAN's plywoods division. In 1942 he joined the RCN and was discharged in 1945 after serving on the Murmansk run. Hodgson then returned to the BC lumber industry, joining the International Woodworkers of America in 1946. In 1948 he was elected financial secretary of his local and in 1955 attended the ILO Geneva Conference as the Canadian Congress of Labour delegate. He was appointed to the NWT Council 1964 and served as deputy commissioner 1965-67 and commissioner 1967-79. For his service he was presented the public service's Outstanding Achievement Award in 1976. Canadian co-chairman of the INTERNATIONAL JOINT COMMISSION 1979-81, he was appointed chairman and chief executive officer of the BC Ferry Corporation in 1981.

ROD MORRISON

**Hoedeman, Jacobus**, "Co," director of animated films (b at Amsterdam, Holland 1 Aug 1940). Trained in photography, Hoedeman made his first animated film 1956. He immigrated to Canada in 1965 and soon joined the NFB. Two years later he directed his first film. While studying in Czechoslovakia in 1971, he learned the technique of animating puppets, an art in which he has since become a master. Later he animated several Inuit legends. In 1977 Hoedeman produced *Le Château de sable*, for which he won an Oscar. He revived the characters from this film in *Le Trésor des Grotocéans* (1980). His latest film is *La Fête* (1983).

PIERRE VÉRONNEAU

**Hoffman, Abigail**, track and field athlete, sport administrator (b at Toronto 11 Feb 1947). As a 9-year-old hockey player, she unwittingly caused controversy by entering a male-dominated sport; she later joined the Toronto Olympic Club, winning her first national championship in the 880-yd (806 m) race at the age of 15. She competed internationally 1962-76 in 4 Olympics, 4 Pan-American Games (2 gold medals) and 2 Commonwealth Games (1 gold). In Ontario, and then as director of Sport Canada (the federal amateur-sport administration), Hoffman is recognized as a campaigner for athletes' rights and women in sport.

TED BARRIS

**Hoffmeister, Bertram Meryl**, soldier, businessman (b at Vancouver 15 May 1907). Hoffmeister commanded the Seaforth Highlanders in Sicily, the 2nd Infantry Brigade at Ortona (1943) and the 5th Canadian Armoured Division, which distinguished itself under his courageous leadership. One of a very few nonregular officers to command a division, he was appointed to take the 6th Division to the Pacific theatre (1945). When the Japanese war ended, Hoffmeister resumed his career in the BC forest industry and was president and chairman of MACMILLAN BLOEDEL LTD, BC's agent general in London and president of the Council of Forest Industries of BC.

W.J. McANDREW

**Hog Farming** Swine (family Suidae) were first brought to what is now Canada in 1598 by the Marquis de La Roche-Mesgouez as part of his unsuccessful venture on SABLE ISLAND. Apart from wild game, pork was the most popular meat of early settlers. It could be preserved in heavy brine and was available as a meat source during the long winters. Today, there are over 10 million hogs on Canadian farms (about 45 million in the US and 300 million in People's Republic of China). The terms "pig," "swine" and "hog" are generally interchangeable, although some farmers reserve "hog" to refer specifically to swine raised for market.

In 1983 just over 13 million hogs were sent to market, 3% more than in 1982. In 1983 marketed hogs yielded about \$1.7 billion in farm cash receipts, about 9% of the national total. The hog industry is more important in some provinces than others: in 1983 it provided 22% of agricultural income in Québec, 2% in Saskatchewan. In that year, BC produced 2% of the national total; Alta, 11.8%; Sask, 4.3%; Man, 9.0%; Ont, 32.4%; Qué, 33.7%; NB, 1.0%; NS, 1.3%; PEI, 1.2%. There are approximately 50 000 hog producers in Canada. Hog farms vary from large, specialized operations, which market several thousand hogs annually, to small mixed farms marketing 100 hogs or less. There are 5 main swine breeds in Canada. Cross-breeding programs are recommended because they result in larger litters of more vigorous pigs, and yield market animals that grow faster and more efficiently.

**Yorkshire Hogs** originated in England and are all white with erect ears. The most numerous breed in Canada, it is noted for vigour, prolificacy and efficient feed conversion. Yorkshire sows commonly farrow over 10 pigs per litter.

**Landrace Hogs** originated in Scandinavia and are noted for prolificacy, good mothering ability and a lean carcass with a high proportion of ham. They are commonly crossed with other breeds, yielding hybrid vigour in the young.

**Lacombe Hogs** are the first livestock breed developed in Canada, a hybrid of Landrace, Berkshire and Chester White. Developed at the Agriculture Canada RESEARCH STATION Lacombe, Alta, the breed was first licensed in 1957 and is propagated in 24 countries. Hogs are all white with drooping ears and have a slightly heavier bone structure than the Landrace. Rapid growth rate and high lean content characterize progeny of crosses between Lacombe and other breeds.

**Duroc Hogs** originated in the US, are all red (golden to mahogany), with drooping ears, and have a good carcass and feed efficiency. The Duroc is a hardy breed, noted for large litters.

**Hampshire Hogs** originated in Kentucky and are black with a white belt around the shoulders. They are exceptionally well muscled, but are somewhat shorter than the Yorkshire and produce smaller litters. When used correctly in a cross-breeding program, Hampshires yield superior carcass quality in offspring.

A breeding sow or boar requires about 1 t of feed annually. The market hog converts feed to gain with an efficiency of about 3:1, ie, more efficiently than beef cattle but less efficiently than broiler chickens. The market animal (100 kg) typically yields about 78 kg of trimmed carcass, following slaughter and evisceration. Carcass quality and price paid to the producer is determined by an index, measured by a government grader, which reflects lean meat yield. Slaughtered animals must be disease free and are inspected by government veterinarians. Canadian pork is produced under a high-standard national Health of Animals program (see COMMODITY INSPECTION AND GRADING; FOOD LEGISLATION; VETERINARY MEDICINE). As a result Canada is free of serious livestock diseases (eg, foot-and-mouth disease, swine fever). Since 1937 the industry has had access to a uniform national testing sys-

tem, the National Record of Performance Swine Testing Program, which provides breeders with a basis for assessing their breeding stock. The Canadian Pork Council (est 1966) represents hog producers. Hog processing provides more jobs than cattle processing, since two-thirds of the meat is sold in processed rather than fresh form. The average Canadian consumed 29 kg of hog meat (pork, bacon, ham, sausages, etc) in 1983. About 158 000 t were available for export.

R. BLAIR

**Hogg, Frank Scott** astrophysicist (b at Preston, Ont 26 July 1904; d at Richmond Hill, Ont 1 Jan 1951). In 1929 Hogg received the first doctorate in ASTRONOMY awarded by Harvard, where he pioneered in the spectrophotometry of stars and in the study of the spectra of comets. He was assistant editor of the journal of the Royal Astronomical Soc of Canada from 1937. During WWII he developed a 2-star sextant for air navigation. Head of the Department of Astronomy at U of T and director of the David Dunlap Observatory from 1946 until his death, Hogg continued its major research program, a study of the motions of faint stars in the line of sight.

PETER M. MILLMAN

**Hogg, Helen Battles**, née Sawyer, astronomer (b at Lowell, Mass 1 Aug 1905). She married F.S. HOGG in Sept 1930. She began her research in the field of globular star clusters and their variable stars in graduate school and in 1931 received a doctorate in ASTRONOMY at Radcliffe. She joined the teaching staff of U of T in 1936 and was appointed professor emeritus in 1976. Making use of the major telescopes at Victoria, BC, Tucson, Ariz, and Richmond Hill, Ont, Hogg became a leading world expert in her field of specialization and has received numerous honours, including Companion of the Order of Canada, the Annie J. Cannon Prize of the American Astronomical Society (1949) and the Rittenhouse Silver Medal (1967). Well known for the clarity of her discourses in lectures and on radio or television, Hogg has published numerous scholarly articles and the popular book *The Stars Belong to Everyone* (1976); for 30 years she wrote a weekly column for the Toronto Star. In recognition of her contribution to the public's understanding of astronomy, she was the first Canadian to be awarded the Klumpke-Roberts Award (1983). Minor Planet No 2917 has been named Sawyer Hogg.

PETER M. MILLMAN

Helen Hogg, a leading world astronomer in the field of star clusters. Minor Planet No 2917 is named Sawyer Hogg for her (courtesy National Film Board/Photothèque).

**Holgate, Edwin**, painter, engraver (b at Allandale, Ont 19 Aug 1892; d at Montréal, Qué 21 May 1977). In 1895 the Holgate family moved to Jamaica where Edwin's father was an engineer. Around 1897 Edwin returned to Toronto to study and in 1901 the Holgates settled in Montréal. Edwin became a part-time student c1905 at the Art Assn of Montréal under William BRYMNER and c1910 took a summer course with Maurice CULLEN. In 1912, during a trip to Paris, he enrolled in the Grande Chaumière. He also travelled in Ukraine and Japan. He came home

in 1915 and his first exhibition was at the Arts Club of Montréal in 1922. He taught engraving at Montréal's École des beaux-arts 1928-34, and about 1930 was invited to join the GROUP OF SEVEN. He was known primarily as a portraitist and painted an unusual series of female nudes in outdoor settings during the 1930s. In 1935 he was elected associate of the Royal Canadian Academy of Arts. The National Gallery of Canada held a retrospective of his work in 1975-76.

MICHEL CHAMPAGNE

**Holiness Churches**, a loose family of some 20 Protestant denominations in Canada that are in general biblically conservative if not fundamentalist, Arminian in theology (ie, rejecting CALVINIST predestination and holding out hope of salvation for all), and advocates of austerity and discipline in lifestyle. The term "holiness" derives from a commitment to the individual pursuit of "Christian perfection," also termed "second blessing," "sanctification" or "holiness." This state, whether achieved instantaneously or gradually, comes through the action of God's Spirit following EVANGELICAL conversion. A variety of sources in METHODISM, German pietism and American revivalism help explain a number of secondary differences in belief and practice. Holiness was a central concern of early Methodism in both Britain and the US; and some groups (SALVATION ARMY, Free Methodists and Wesleyan Methodists) stem from schismatic Methodist attempts to recover elements of this tradition. Other bodies originated in revival movements among German-speaking settlers in Pennsylvania. Thus the practices of foot-washing and adult baptism by immersion, as well as a tradition of Christian PACIFISM, reflect MENNONITE, TUNKER or BAPTIST roots of groups such as BRETHREN IN CHRIST and Church of God.

The holiness revival of the latter half of the 19th century — which gave rise to several groups, notably the Church of the Nazarene — influenced all holiness groups to some degree. Camp meetings and manifestations of religious fervour characteristic of them found renewed vigour when these were falling into disrepute in mainstream Methodism. Like other evangelicals of the period, holiness churches founded BIBLE SCHOOLS that inculcated denominational tradition along with secondary schooling; they established and supported extensive missionary endeavours outside Canada; a number joined in the evangelical crusade for Sunday observance and PROHIBITION. The authority of individual religious experience prompted a larger leadership role for women, and a few of the churches were ordaining women ministers by the beginning of this century. Modern PENTECOSTALISM originated in American holiness circles about 1900; the ensuing controversy over the Pentecostals' belief in a further blessing, "baptism of the Holy Spirit," brought schism in several bodies. This history, as much as theological divergence, explains a continuing holiness reticence towards neo-Pentecostalism, despite obvious similarities in the 2 traditions.

Historically, holiness groups were concentrated in southwestern and eastern Ontario and the Prairie provinces; recent statistics confirm this pattern, although churches are found in all regions of Canada. The movement has been traditionally prone to schism. The period since WWII, however, has seen numerous unions. Today, denominations range in size from a handful of churches to the more than 20 000 adherents to the Brethren in Christ and a similar number to the Free Methodist Church. Educational institutions have undergone upgrading, in keeping with a trend towards a more learned ministry. Distinctive standards of dress and deportment have been significantly attenuated. Holiness teaching now tends to emphasize the concept of growth toward sanctification, at the

expense of the notion of instantaneous acquisition. A significant element within several denominations (Missionary Church, Christian and Missionary Alliance and Salvation Army) would question the validity of their classification today as holiness, despite their origins and earlier history.

The following are the most significant members of this family in Canada. Groups German-speaking in origin include Brethren in Christ, formerly Tunkers or River Brethren, who entered Canada 1788; the Church of God (Anderson, Indiana); the Evangelical Association or Evangelical Church and the United Brethren in Christ, which united 1946 to form the Evangelical United Brethren. In 1968 the EUB's Ontario section entered the UNITED CHURCH; the Western Conference remained independent as the Evangelical Church in Canada and, after its 1982 merger with the Evangelical Church of N America, became known simply as the Evangelical Church.

Two Ontario Methodist ministers, Nelson Burns and Ralph Cecil HORNER, actively promoted holiness within their denomination through the organization of autonomous Holiness Associations before their deposition from the Methodist ministry (1894 and 1895 respectively). Through Horner's subsequent work 4 uniquely Canadian bodies came into existence: Holiness Movement Church (1897); Standard Church of America (the result of a 1916 schism in the HMC); the Gospel Workers Church, fd about 1902 by Frank Delaney Goff, a Horner convert; and the Bible Holiness Movement (1949). Among bodies of American origin, the Free Methodist Church and the Church of the Nazarene have enjoyed considerable success since their entry into Canada (1880 and 1908 respectively). In 1958 the Holiness Movement Church merged with the Free Methodist Church. That year most of the Gospel Workers joined the Church of the Nazarene.

Unlike all the foregoing, the Reformed Baptist Alliance, the result in 1888 of holiness schism within the Free Baptist Church, was centered primarily in NB and NS. In 1966 it united with the Wesleyan Methodist Church of America; in 1968 these were joined by the Pilgrim Holiness Church to form the Wesleyan Church. Since 1943 most holiness denominations have been loosely associated in the Canadian Holiness Federation. The Free Methodist and the Wesleyan Churches are also members of the World Methodist Council. R. GERALD HOBBS AND HELEN HOBBS

Reading: S.D. Clark, *Church and Sect in Canada* (1948); Melvin E. Dieter, *The Holiness Revival of the Nineteenth Century* (1980); Charles Edwin Jones, *A Guide to the Study of the Holiness Movement* (1974) and *Perfectionist Persuasion* (1974).

**Holland, Samuel Johannes**, surveyor, cartographer, military engineer (b at Nijmegen, Netherlands 1728; d at Québec, LC 28 Dec 1801). Holland took part in the sieges of LOUISBOURG (1758) and QUÉBEC (1759) and the BATTLE OF STE-FOY (1760), surveyed PEI and Cape Breton I, and founded a system of township surveys in Lower and Upper Canada. Prior to and during his service in the Dutch and British armies 1745-60, he apparently mastered the skills of an artillery officer, a military engineer, cartographer and surveyor — as well as displaying exemplary courage under fire. In 1764 he was appointed surveyor general of Québec and of the northern district of N America. After 1783, the massive influx of LOYALIST settlers following the American Revolution offered him a new challenge in Québec. Holland's system of rapid surveys to create new townships was effective and imaginative, and has proven accurate. And from his vantage point on Council as surveyor general, he was able to get the colonial legislature to enact professional standards for land surveys.

F.J. THORPE

**Holland Marsh**, 2900 ha of organic (muck) soil, is located near Bradford, Ont, 50 km N of Toronto. Draining to the NE by the Holland R (which empties into Cook's Bay, an arm of Lk SIMCOE), the marsh is a flat, level area lying in a shallow basin (oriented in a NE-SW direction) that was an arm of glacial Lk Algonquin. As the lake level dropped and the land rebounded when the glaciers receded, a marsh was formed containing sedges, bullrushes, various marsh grasses and some trees. Dead vegetation accumulated at about 30 cm per 500 years, forming a layer of organic material overlying a clay pan in the basin. In this natural state the marsh and river were home to many species of fish, small animals and birds. The first human use of the marsh was by local Indians (latterly the Huron) as a source of food. Early European settlers (about 1825) also fished and hunted here. Around 1900 the Bradford Mattress Factory used marsh grasses as stuffing for mattresses.

In 1904 W.D. Watson, a Bradford grocer, persuaded W.H. Day, professor of physics at the Ontario Agricultural College, Guelph, to investigate the possibility of draining the marsh. Day tested the soil and experimented successfully in growing vegetables. In 1925 drainage operations began and a canal and dikes 28 km long and 2 m deep were constructed around the marsh to divert the Holland R. Pumps were installed to control the water table within the dikes. The project was completed 1930. In 1931 and 1934, 18 Dutch families came to the marsh and formed the nucleus of an expanding and prosperous agricultural community. After WWII, more immigrants from Holland, Europe and Asia settled here. The marsh today is a market garden for the Ontario and foreign markets, producing carrots and onions in particular, as well as lettuce, potatoes, celery, parsnips, cabbage, cauliflower and beets. There are some greenhouses in which tomatoes, cucumbers and commercial flowers are produced. See SWAMP, MARSH AND BOG.

A.M. BLAIR

**Holling, Crawford Stanley**, "Buzz," ecologist (b at Theresa, NY 6 Dec 1930 of Canadian parents). One of the best-known Canadian forest entomologists, Holling had gained international recognition for his work in systems analysis, especially in relation to the management of natural resources. He was educated at U of T and UBC. He was known to his scientific colleagues for his research in forest entomology with the Canada Dept of Forestry 1952-64 at Sault Ste Marie, and 1965-67 at Victoria, but his public prominence dates from his subsequent work at UBC, where he became professor of zoology in 1967 and was director of the Institute of Animal Resource Ecology 1969-73. Addressing a variety of resource management problems using a workshop technique, Holling and his colleagues developed a worldwide reputation for incisive and perceptive analysis. Their advocacy of "adaptive management policies" has made a significant contribution to understanding resource management problems of the modern world. Holling was director of the International Institute of Applied Systems Analysis in Vienna 1981-84.

PETER LARKIN

**Holly**, common name for shrub of the holly family, Aquifoliaceae. The true hollies belong to genus *Ilex*, comprising some 400 species worldwide, mostly in Central and S America. Two species occur in Canada. Although well-known for their spiny leaves and red berries, many hollies are nonspiny with black berries. Inkberry (*I. glabra*) has black berries and shiny, evergreen leaves; black alder (*I. verticillata*) has bright red berries and dull green, deciduous leaves. The closely related mountain holly (*Nemopanthes mucronata*) is deciduous and red berried. All 3 inhabit wet woods and swamps in eastern Canada. Numerous cultivars exist, selected for their

ORNAMENTAL qualities (eg, leaf variegation) and compact growth. The name "holly" (from holy) suggests its long association with folklore and religion. The druid ritual of bringing sprigs of the plant indoors to provide winter refuge for woodland spirits continues today at Christmas-time. The hard, white wood is used by cabinet-makers. Various parts of the holly plant were used to make a tonic in Europe and N America, and species like *I. paraguayensis* (yerba maté) provide a caffeine tea in Central and S America and Asia.

ROGER VICK

**Holman**, NWT, UP, pop 300 (1981c), is located on the W coast of VICTORIA I, on inlets of Amundsen's Gulf, 925 air km N of YELLOWKNIFE. The area is the ancestral homeland of the COPPER INUIT. First established 1940 as an HBC trading post, it was likely named for J.R. Holman, a member of the Ingfield arctic expedition (1853-54). It is famous for the Holman Eskimo Co-operative which sells Inuit prints around the world. The Inuit were first taught to make prints by Rev Henri Tardi, an Oblate who settled in the area in 1939. Although the Inuit residents trap, hunt and seal, PRINTMAKING has become the major source of income.

ANNELIES POOL

**Holmes, John Wendell**, diplomat, author (b at London, Ont 18 June 1910). Holmes worked for the CANADIAN INSTITUTE OF INTERNATIONAL AFFAIRS 1940-43 before joining the Dept of External Affairs. Liberal, urbane, balanced in his judgements, Holmes served in London, Moscow, New York and as assistant undersecretary of state, 1953-60; he has written on Canada and international institutions during his period in External Affairs in *The Shaping of Peace* (1979-82). In 1960 he returned to direct the CIIA; he also taught at York and U of T and became the country's most highly respected commentator on foreign policy. Collections of his persuasive essays are *The Better Part of Valour* (1970) and *Canada: A Middle-Aged Power* (1976).

NORMAN HILLMER

**Holmes, Simon Hugh**, lawyer, publisher, politician, premier of NS (b at East R, NS 30 July 1831; d at Halifax 14 Oct 1919). One of the most prominent political figures in NS immediately after Confederation, he was influential in the development of provincial mines and railways. He began his career in 1862 as editor-proprietor of the Pictou *Colonial Standard* and was admitted to the bar in 1864. In 1871 he was elected to the legislature as Liberal/Conservative member for Pictou County, and in 1874 he was named leader of the Opposition. A Tory administration was returned in 1878, and Holmes served as premier and provincial secretary until 1882, when he retired from politics and publishing to become prothonotary and crown clerk for Halifax County.

LOIS KERNAGHAN

**Holt, Sir Herbert Samuel**, capitalist (b at Geashill, King's County, Ire 12 Feb 1856; d at Montréal 28 Sept 1941). Holt immigrated to Canada in 1873 and worked as an engineer and contractor on railway construction projects, including the mountain section of the main line of the CPR. He became prominent in the Montréal business community following the merger of several utility companies into Montréal Light, Heat and Power Company in 1902. Under Holt's direction, the company acquired a monopoly over the distribution of hydroelectric power in Montréal and a large share of the generation and transmission of power from various sites in Québec. He was briefly president of the Sovereign Bank of Canada and in 1908 was elected president of the ROYAL BANK OF CANADA, a position he held until 1934. During his presidency the Royal Bank absorbed a number of smaller banks and extended its operations to become the largest institution of its kind in Canada and the third largest in N America. In the late 1920s Holt, with J.H. GUNDY, was active in company

mergers in the pulp and paper, textiles, utilities, coal and steel industries. He was created a KB in 1915.

T.D. REGEHR

**Home Economics** describes an area of study and a group of related professional occupations, both of which aim at improving the quality of life of individuals and families by encouraging the effective management of personal resources, eg, time, money and consumer goods.

The study of home economics, which is based on both social and physical sciences, originated at the turn of the century in the US at a series of meetings of academics and national leaders in Lake Placid, NY, who were seeking remedies for the social ills of the day. Ellen Richards, who advocated the idea of "applying science for use in everyday life" is considered by many to be the founder of the field. At the Fourth Lake Placid Conference in 1902 a committee of 7 developed the first and often quoted definition of home economics: "the study of the laws, conditions, principles and ideals concerned with man's immediate physical environment and his nature as a social being and specially the relation between those two factors." One of the members of this committee was a Canadian, Mill Alice A. Chown of Kingston, Ont.

At the same time, in Canada, Adelaide HOODLESS was promoting the establishment of what was then called domestic science. She headed the first program at University of Toronto and was a founding member of the Federation of Women's Institutes, an organization that had a close association with home economics in its earlier days.

The MacDonald Institute, founded at Guelph in 1903, offered what was called "the diamond ring course" because it was seen and promoted as a means of obtaining a husband. There was a 3-month practical program, which included courses in millinery, dairying and poultry raising with strong emphasis on home production, and a 2-year program for teachers who spread theories and practices of household science to rural communities via schools. In the 1960s the institute revised its curriculum in recognition of an increasing need in society for consumer education. It was also evident that the needs of the food industry would be better met through the study of the behavioural aspect of nutrition, eg, product development, consumer acceptance and institutional food-service management. Instructors were imported from other areas (eg, anthropology) to fill out the new specializations. In 1969 the MacDonald Institute was divided into 2 departments and renamed the College of Family and Consumer Studies. Graduates received a Bachelor of Applied Science degree. The college also houses a school of hotel and food adminis-

tration; graduates are awarded Bachelor of Commerce degrees. In 1983, 30 of 925 Bachelor of Applied Science students were male, compared to 50% of those in the hotel and food administration program.

In high schools in some Canadian provinces the study of home economics is now called FAMILY STUDIES, reflecting an emphasis on the study of family living and family relationships. The 2 largest university programs in home economics are offered at University of Manitoba and University of Guelph. A new undergraduate program introduced at Manitoba in 1980 offered courses in textiles, family studies and food and nutrition. Enrolment increased 50% from 120 in 1980-81 to 186 in 1981-82, and by 1983 was over 200, including (over 2 years) 20 men. At University of Alberta, the next largest home economics training institute, the options offered to graduates now include dietetics, conservation, merchandising of textiles, etc. At McGill the School of Household Science became in 1968 the School of Food Science, and the home economics major was shifted to the Faculty of Education. U of T Faculty of Household Science was replaced by the Department of Nutritional Sciences in the Faculty of Medicine. Simultaneously, the Ryerson Polytechnical Institute developed a 4-year degree program in food, nutrition and consumer and family studies.

Graduates of 4-year degree programs in home economics (or equivalent programs) are eligible to join the national professional organization, the Canadian Home Economics Assn, and to work as home economists. Many graduates also join provincial and local organizations. The graduates are usually employed in professional or in business situations, eg, food companies, utility companies, supermarkets, home-equipment manufacturers, etc. Some home economists free-lance; others work in the media and in advertising, product promotion and testing.

A large number of home economists teach in high schools and work in agriculture-related activities and many work as credit and family counsellors.

MAY MASKOW

**Homesteading**, a late 19th- and early 20th-century phenomenon, in which immigrants were attracted to the Canadian West by government advertisements of "free" land. Under the DOMINION LANDS POLICY, 160 acres cost only \$10,

Breaking the land in bush country near Treherne, Man, 1914. A new homesteader was required to cultivate a specified area in 3 years in order to maintain possession of the land (courtesy Provincial Archives of Alberta/E. Brown Collection).

Homesteaders' shack, 1918. Homesteaders were required to build a dwelling within 3 years (courtesy Provincial Archives of Alberta/H. Pollard Collection).

but the homesteader had to build a house, often of log or sod, and cultivate a specified area within 3 years. A new homesteader required basic agricultural implements, and since horses were expensive, most used oxen to clear and break the land. A fireguard to protect farm buildings had to be ploughed, and a vegetable garden planted and game hunted to supplement the food supply. If the water was of poor quality, homesteaders had to collect rainwater or melt snow. In many areas a homestead had to be within 15 km of a railway to be farmed economically; the reservation of land for the HBC or railways within this belt was a source of frustration, for the poor or latecomers were forced to settle away from markets and towns. The railroads did provide employment for homesteaders until their farms began producing.

Homesteaders and their families were often separated from friends and relatives, and many suffered years of hardship and loneliness. One of the greatest difficulties was the absence of roads and bridges. Most trails were impassable when wet. In the autumn homesteaders waited until the ground was frozen before transporting their produce to the railhead. Farm accidents often resulted in permanent injury or, because doctors were rare, death. Drought ruined those who settled in the arid Palliser Triangle. For many the price of homesteading was too high; they cancelled their claims and moved away. Adversities, however, bound homesteaders together. Prejudices were lessened as people helped one another. Building and quilting bees were common. Doors were kept unlatched and lanterns hung at night to guide travellers. At first, recreation was confined to the lonely homestead, but as communities grew there were sport days and a variety of entertainment at the community halls. Homesteading on the Prairies declined after WWI as immigration fell off and movement toward the cities increased. See PIONEER LIFE. JANE MCCracken

**Homicide** Canadian law recognizes 3 types of culpable homicide: murder (1st and 2nd degree), manslaughter and infanticide. Murder is the killing of one human being by another with malice aforethought; infanticide is the killing of a newborn child by its mother; and manslaughter, which includes the lesser offence of criminal negligence, is any homicide that is neither murder nor infanticide. Canada is the only nation in the western hemisphere whose homicide rate is as low as that of Europe. International homicide statistics are generally unreliable and always outdated, but Canada's rate is roughly 5% that of Mexico or Colombia; 25%

that of the US; equal to that of France or New Zealand; and triple the rate of Norway and the Netherlands. After increasing in the late 1960s and early 1970s, the Canadian homicide rate began to decline in 1975 and dropped an average of 5% annually until 1981, when it again began to rise. The Maritimes have the lowest homicide rates in Canada, and Newfoundland (0.68 in 1981) has the lowest of all. Québec's rate (2.93) was lower than Alberta's (3.43) and BC has the highest provincial rate (4.02), but the NWT and the Yukon have the highest rates of all (11.57 and 4.57 respectively). These sparsely populated territories also have Canada's highest rate of increase, while in the US the increase is highest in the major metropolitan areas, but this discrepancy may reflect the location of the 2 countries' socially alienated populations, America's blacks in urban slums, Canada's native peoples in the North (see NATIVE PEOPLE, LAW). Less than 2% of the Canadian population, the INUIT, INDIANS and MÉTIS, comprised 16% of the homicide victims between 1961 and 1974. "Gangland" murders account for only 5% of Canadian homicides, but the proportion is increasing rapidly, especially in Québec and BC (see ORGANIZED CRIME).

Six of every 10 homicide victims in Canada are male, except victims between the ages of 7 and 15 who are often also victims of sexual assault. Almost half of all homicide victims are between the ages of 20 and 39, while nearly 23.5% are children under 16 or adults over 60. Approximately 43.4% of female homicide victims are killed within domestic relationships, more than double the proportion of male victims. Interracial homicide is rare. Homicide suspects are most likely to be unmarried males (females are outnumbered 5 to 1) between the ages of 20 and 39 and with little education; but the largest suspect rate increases are among females aged 16 to 19 and males aged 11 to 15 and 20 to 29, disturbing indices of social instability. Between 1961 and 1974, of 3061 homicide suspects tried, 2121 were convicted and 705 acquitted (231 because of insanity); the remainder were found unfit to stand trial or had their charges altered. Only 2 were executed during that period, and almost 50% served between 1 and 10 years in prison. Females are more likely to receive suspended sentences or be declared unfit to stand trial, a possible reflection of the broader pattern whereby more lenient sentences are imposed on domestic homicides. Despite the controversies over the parole and release of murderers, few murders have been committed by convicted murderers on parole. Between 1961 and 1974, for example, only one such murder occurred; the murderer was subsequently executed.

The causes of homicide and of varying homicide rates in different nations remain unclear,

although various and usually contradictory theories ascribe both to biological, psychological or sociological factors. LAW REFORM, such as it is, appears to have little or no effect on reducing homicide. Whether the reform involves the abolition or restoration of CAPITAL PUNISHMENT, the restriction or distribution of firearms (see GUN CONTROL), or lowering the level of brutality in prison life (see PRISON), the proponents of either side typically conduct their arguments from emotional or moral positions without reference to objective analysis, an unsatisfactory state of affairs that will undoubtedly continue.

ELLIOTT LEYTON

**Homosexuality** [from the Greek, "homo," meaning same], also called inversion, can be characterized generally as sexual preference for one's own gender. Homosexuals may be male (now widely called "gay") or female (now widely called "lesbian"). Exclusive homosexuality, like exclusive heterosexuality, is uniquely human. Homosexual preference takes many and varied forms. Some persons in whom it is limited to fantasy may try to lead asexual lives, or they may attempt to suppress their inclinations by marrying. Many, however, eventually lead double lives, anxiously hiding from their friends, spouses and children a secret world of homosexual liaisons. Some persons (widely known as bisexual) are able to combine homosexual and heterosexual activity. Where homosexual preference is allowed social expression, it tends to increase in frequency (like other stigmatized action, eg, divorce). In recent years growing numbers of homosexuals have accepted their preference as natural and inherent to their personalities. Some take pride in it and form organizations to promote gay liberation. Like heterosexual behaviour, homosexual behaviour ranges from anonymous sex, promiscuity and prostitution to romantic affairs and lifelong faithful relationships.

Homosexual practices are among the most ancient manifestations of human sexuality and different societies have reacted to them in various ways, from toleration and permissiveness to condemnation. In a 1951 study it was found that 49 of 76 societies condoned some forms of homosexuality, regarding them as normal and even encouraging them for certain groups of individuals. Some societies believed homosexuals possessed magical powers, and conferred SHAMAN status upon them. The ancient Greeks considered homosexuality normal as well. In certain societies homosexuality has generally been more tolerated for certain groups, eg, artists, actors, sailors, or among the noble "favourites" in certain royal courts.

At various times in Western history homosexuality has been savagely punished. This intolerance is rooted in the ancient Judeo-Christian disgust for sexual acts associated with paganism and decadence. Leviticus 20:13 condemns homosexuals to death. Though there is no Gospel record of Jesus' opinion on the topic, the early Christian church under the leadership of Paul condemned homosexuality, and ecclesiastical and secular law attempted to prevent, control and eradicate it. In certain periods of Western Christendom, allegations of homosexuality were enough to condemn the accused to torture and death by fire; the last recorded Christian burning of homosexuals occurred in Amsterdam in 1730.

In the 19th century the medical definition of homosexuality as an illness began to displace the religious definition as sin. To denote the practice without using the traditional epithets (sodomite, bugger, queer, etc), the Austro-Hungarian doctor and sexologist K.M. Benkert in 1869 coined the word homosexual. In their search for causes of homosexuality, scientists and clinicians have proposed heredity, hor-

mones, genital malfunction, childhood crisis, inadequate parenting, adolescent peer relationships and mental disorder, among other causes, but there is no conclusive evidence to support any of these as a single cause, and some have been effectively disproved. Recent investigations have challenged Freud's influential theory that homosexuality is an expression of a biological bisexuality common to all human beings by suggesting that human beings are psychosexually neutral at birth and that homosexuality is an adaptive response to a combination of certain experiences. Drugs, electric shock, behavioural therapy and psychotherapy are among the treatments used to cure homosexuals, but none can claim significant success.

The search for causes is frustrated because the same person, at different times and with different partners, may achieve sexual gratification homosexually and heterosexually. Some persons change from a predominantly homosexual lifestyle to one that is heterosexual, or in the opposite direction. Homosexuality and heterosexuality are probably both caused by learning experiences and social conditions. Change in social conditions, eg, confinement in prison, may result in a change of sexual preference, and release from prison may or may not result in another change. That homosexuality is simply a sexual variation (as is chastity or polygamy) won considerable international support in the 1920s as a result of the work of Dr Magnus Hirschfeld's Institute of Sexual Science in Berlin. In 1897 Dr Hirschfeld formed the Scientific Humanitarian Committee to lobby for the abolition of the criminal laws against homosexuals. But in 1933, at the instigation of the Nazi press, students raided the premises and burned the institute's books and documents. Later, from 100 000 to 400 000 homosexuals in Nazi-occupied Europe were killed in concentration camps; others were forced to wear an identifying badge, a pink triangle, which has since become the emblem of gay liberation movements.

In 1948 American biologist Alfred Kinsey published a survey of American male sexual activity, shocking many by revealing statistical estimates that 37% of males had enjoyed homosexual orgasm at least once and that exclusive homosexuals were at least as large a minority as American blacks. The black struggle for equal civil rights inspired a similar movement among homosexuals. Nevertheless most homosexuals must hide their preference in order to obtain employment and accommodation and many still dare not tell parents or close friends. Because social tolerance is greatest in large cities, many young homosexuals gravitate there and indeed only in modern industrialized societies do homosexuals develop specific subcultures. In some districts of large Canadian, American and European cities, gay men and lesbians form a large enough minority to develop their own social world, comparable to an ethnic community. The "gay world" of a city such as Montréal, Toronto or Vancouver includes bars, discos, sports teams, political and religious groups, gay businesses, medical and legal services, newspapers and publishing houses and even charitable foundations. Smaller centres have some of these facilities, but they are more covert. In the 1960s, gay urban communities became the base for political action. Gay liberation groups encouraged many secret homosexuals in prestigious positions to "come out of the closet."

In 1974, following studies revealing that no particular physical or personality type was associated with homosexual preference and public revelation that many homosexuals were respected and effective members of society, the American Psychiatric Association removed homosexuality from its catalogue of illnesses (it is now classified as "sexual orientation disturbance"). Since then, a wide range of churches,

corporations and academic organizations have adopted more tolerant positions, but other groups have strongly opposed toleration of homosexuality.

From Confederation to 1969, under Canada's criminal law, homosexuality was punishable by up to 14 years in prison. In 1969 the law was amended by exempting from prosecution 2 consenting adults of at least 21 years of age who engaged in these "indecent acts" in private. However, homosexual acts before age 21 or with a third person present are still illegal. According to a 1981 federal survey, only 33% of Canadians would support laws allowing homosexuals the same civil rights as heterosexuals, but some large cities, eg, Ottawa and Toronto, and one province, Québec, have enacted laws against discrimination on the basis of sexual preference. In several Canadian cities, however, including Toronto, police continue to enjoy public support for massive arrests of homosexuals. It is clear that homosexuality will continue to be a controversial issue in Canada for years to come.

JOHN ALAN LEE

**Honderich, Beland Hugh**, newspaper executive (b at Kitchener, Ont 25 Nov 1918). As head of the *Toronto Star*, Honderich has transformed a sensationalist but profitable working-class paper into a better modulated and equally profitable middle-class one that is less rigid in its liberalism. He began his career on the *Kitchener-Waterloo Record* in 1935 and went to the *Star* in 1943 as a reporter. Later its financial editor, he became editor in chief (1955), president and publisher (1966) and chairman and publisher (1969), and is now chairman of Torstar, the parent company. The *Star* is Canada's largest circulation newspaper but Honderich, because of his total involvement in it, remains little known outside the business.

**Honeysuckle**, common name for PLANTS, usually woodland shrubs, of genus *Lonicera*, family Caprifoliaceae. Honeysuckle leaves were a favourite goat food, hence the name *caprifolium* [Lat, "goat's leaf"]. More than 150 species of *Lonicera* are widespread in the Northern Hemisphere; 9 are native to Canada. They are distributed transcontinentally, from the subarctic to southern Canada. Flowers are in pairs or 6-flowered whorls, and are showy in some species commonly under cultivation, eg, Japanese honeysuckle (*L. japonica*), woodbine (*L. periclymenum*), trumpet honeysuckle (*L. sempervirens*) and Tatarian honeysuckle (*L. tatarica*). The most common Canadian species are: *L. canadensis*, *L. dioica* and *L. oblongifolia*, which are red berried; and *L. involucrata* and *L. villosa*, which are black berried. All of these have yellowish flowers. Seven species, including *L. caprifolium* (Italian woodbine), *L. periclymenum* (woodbine honeysuckle) and *L. tatarica*, have been naturalized in Canada from garden escapes. Woodbine and the related climbing honeysuckles are limited to the mildest regions of Canada. Tatarian honeysuckle is very cold hardy and a valuable prairie ORNAMENTAL. Berries are generally nauseously bitter and purgative. N American Indians used berries and root bark for digestive problems and gonorrhea, and as a tonic.

ROGER VICK

**Hong Kong** In 1940 the British regarded their crown colony of Hong Kong and its 20 000-man garrison as expendable in the event of war with Japan and decided against reinforcing it. But in Sept 1941 the Canadian government agreed to send the Royal Rifles of Canada (a Québec unit) and the Winnipeg Grenadiers, although they were not considered fit for action. They arrived on 16 Nov 1941 and 22 days later the Japanese attacked the colony's New Territories on the mainland. On Dec 18 the Japanese crossed to the island of Hong Kong and on Christmas Day the governor surrendered. Of 1975 Canadians, 557 were killed or died in prison camps. Political

Personnel from HMCS *Prince Robert* visiting liberated prisoners-of-war at Sham Shui Po Barracks, Hong Kong, Sept 1945 (courtesy Public Archives of Canada/PA-116808).

pressure at home forced the Canadian government to appoint a royal commission to investigate the circumstances of Canada's involvement. The sole commissioner, Chief Justice Sir Lyman Duff, misinterpreted or ignored evidence and exonerated the Cabinet, the Department of National Defence and senior members of the General Staff. In 1948 a confidential analysis by Gen Charles Foulkes, chief of the general staff, found many errors in Duff's assessment, but concluded that proper training and equipment would have made little difference. See WORLD WAR II.

Reading: Carl Vincent, *No Reason Why* (1981).

**Honours**, The achievement of excellence in any field of endeavour has always won popular respect and acclaim. From earliest times, heroism, military and athletic prowess, outstanding leadership and civic merit have been rewarded in tangible and symbolic ways. The conferment of honours was formerly a prerogative of emperors and kings, but is nowadays the practice of even the most egalitarian regimes. The many forms of honour include the victor's triumph in ancient Rome and the astronauts' ticker-tape parade, the accolade received from the sovereign's hand and the award of the Nobel prize, the badge of knighthood and the Olympic medal, military decorations worn on the uniform and the rosette displayed in the button-hole.

Marks of royal favour have been known in Canada from the beginning of European colonization. Settlers in NEW FRANCE in the 17th century took for granted that the governor and his principal officials would be of noble rank. Contrary to Old World tradition, the acquisition of land in the colony did not affect the owner's status: the SEIGNEURS as principal landholders did not, on that account, gain entry into "la noblesse." Some were ennobled by the king, however, for their part in developing and defending the colony (see CROIX DE SAINT LOUIS).

When the colony came under the British Crown after 1760, titles were not uncommon among the officials sent out to conduct civil and military affairs. Titular distinctions from the French period gradually fell into disuse. No indigenous form of honours was introduced to recognize the contributions of those who were instrumental in the growth of RESPONSIBLE GOVERNMENT and the maturing of the colony's institutions, but an attempt was made to include such a provision in the arrangements leading up to CONFEDERATION. In 1866 Lord Monck, then governor general of British North America, sent a dispatch to the COLONIAL OFFICE in London recommending the creation of an order of knighthood for Canada as an incentive to public service. Awards would be made by the new Dominion's governor general on behalf of the sovereign. In order to underline the award's Canadian character, he suggested calling it the "Order of St Lawrence." The proposal was quietly shelved by the home government. To relinquish control of honours, in the opinion of the colonial secretary, must inevitably lead to a

weakening of the imperial tie. It was concluded that there should be no separate order for Canada but that the governor general would be asked to name a few persons each year for appointment to existing British orders. This policy, to which successive British ministers adhered, was a source of recurring friction between Ottawa and London until honours for Canadians were discontinued entirely after WWI.

Sir John A. Macdonald, Canada's first prime minister, did not contest the British policy, but he pressed constantly for a more generous annual allotment of places. Alexander Mackenzie, prime minister 1873-78, would accept no title himself but became incensed upon learning that London planned to honour a prominent Canadian entirely without reference to Ottawa. In response to Mackenzie's protest to the governor general, the colonial secretary replied that if the choice of recipients were controlled by the colonial government, party affiliation would be bound to override all other factors, and he stated flatly that the responsibility to advise the sovereign in these matters was his alone.

Preparing the honours lists each year troubled PM Sir Wilfrid Laurier in his turn, and resulted occasionally in strained relations with the governor general. Honours was a touchy subject with members of Cabinet, and frustration led to a renewed attempt to gain some control of the nomination process. In 1902 an order-in-council was passed which would require the governor general to seek the advice of the ministry about the annual honours lists, but the response from the Colonial Office was little different from the position taken 25 years earlier.

By 1911, when Sir Robert Borden became prime minister, titles in Canada were being viewed with growing public disfavour. A knighthood conferred on Max AITKEN, an expatriate Canadian who had been elected to the British Parliament, provoked widespread criticism. There were further shock waves a few years later when Sir Max Aitken, with the help of influential political friends, received in quick succession a baronetcy and then a peerage, and entered the House of Lords as Lord Beaverbrook. Abuses were becoming more frequent, and Canadian public opinion hardened with the announcement of some of Borden's candidates for titles during WWI. When the UNION GOVERNMENT took office after the 1917 election, the matter came to a head. A parliamentary committee recommended and the House of Commons in 1919 adopted the "Nickle Resolution," which brought to an end the granting of both titular and non-titular honours to Canadians.

There was a brief revival of the defunct honours policy during the Conservative administration of Prime Minister R.B. Bennett, and several knighthoods and lesser distinctions were awarded 1934-35, but shortly after the Liberals were returned to office in 1935 the prohibition was reinstated. Sir Charles G.D. ROBERTS was one of the last to be knighted in 1935.

Consequently, at the outset of WWII Canadians in the armed services were not entitled to receive awards in the orders of chivalry for which other Commonwealth personnel were eligible. A parliamentary committee appointed in 1943 recommended that the ban on non-titular honours be lifted, thus clearing the way for many members of the military and civilians to receive recognition for wartime services. A further recommendation, favouring the creation of a Canadian order, led to the establishment of the "Canada Medal," a single all-purpose national honour. An initial list of suggested recipients was drawn up but was rejected by the prime minister. Mackenzie King had a deep distaste for the concept of honours, and on reflection he decided that instituting the Canada Medal had been a mistake. No award was ever made.

After the war the subject was kept alive, chiefly in military circles. In 1951 Vincent Massey, chairman of the Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS, AND SCIENCES, was asked by PM Louis St. Laurent to include a report on the subject of honours. In response a draft scheme was submitted favouring the creation of an elaborate five-tier Canadian order. The proposal came to nothing.

Fifteen years later the approaching centenary of Confederation brought the notion of national honours back into focus. PM Lester Pearson seized the opportunity of the CENTENNIAL celebration to reinforce the theme of Confederation: the fruitful union of diverse elements in a vigorous and independent state. In 1965, in the face of loud and sometimes bitter opposition, he piloted a bill through parliament giving Canada a national flag (see FLAG DEBATE). In the spring of 1967, not a dissenting voice was heard when he announced the creation of the ORDER OF CANADA. On 1 July 1967, the proposal made by Lord Monck a century before at last became a reality. Five years later the honours systems was fleshed out with the addition of the ORDER OF MILITARY MERIT and a group of DECORATIONS FOR BRAVERY. The administration of honours is the responsibility of the Chancellery of Honours, Government House, Ottawa. See MEDAL; VICTORIA CROSS. GEORGE CROSS. CARL LOCHNAN

**Hood, Hugh John**, writer, academic (b at Toronto 30 Apr 1928). Hood's extensive writings present a view of Canadian experience in this century realistic in detail and emblematic in intent. A Roman Catholic, he has dealt with characters and situations embodying religious, philosophical and allegorical themes. Numerous short stories have appeared in such volumes as *Flying a Red Kite* (1962), *Around the Mountain* (1967), *The Fruit Man, the Meat Man and the Manager* (1971), *Dark Glasses* (1976) and *None Genuine Without This Signature* (1980). *Selected Stories* appeared in 1978. Among his novels, *White Figure*, *White Ground* (1964) is noteworthy, and 4 works in his *New Age* series (12 vols) have appeared: *The Swing in the Garden* (1975), *A New Athens* (1977), *Reservoir Ravine* (1979) and *Black and White Keys* (1982). He has also published 2 essay collections and a sports biography. Educated at U of T, he has taught in the English department of U de Montréal since 1961. DENNIS DUFFY

**Hood, Robert**, arctic explorer, artist (b at Portarlington, Ire 1797; d near Starvation Lk, NWT 20 Oct 1821). Hood joined the Royal Navy at age 14. In 1819 his artistic abilities gained him an appointment with the arctic land expedition led by Sir John FRANKLIN. As primary surveyor and draughtsman, Hood plotted accurately from a birchbark canoe thousands of miles of rivers and lakes and nearly 1000 km of the northern coast of N America. He was the first to demonstrate that the NORTHERN LIGHTS is an electrical phenomenon, and made important observations on climatology, anthropology and natural history. Returning across the Barren Lands, already weakened by starvation and only 50 km from the previous winter's buildings, Hood was shot by Michel, a voyageur turned cannibal.

C. STUART HOUSTON  
Reading: C. Stuart Houston, ed, *To the Arctic by Canoe, the Journal and Paintings of Robert Hood* (1974).

**Hoodless, Adelaide**, née Hunter, educational reformer, founder of the Women's Institutes (b at St George, Canada W 26 Feb 1857; d at Toronto 26 Feb 1910). Hoodless was jolted out of a comfortable middle-class life when an infant son died in 1889 after drinking impure milk. Thereafter she devoted herself to women's causes, specifically to the better education of women for motherhood and household management. She campaigned for domestic science (home economics) in the schools and advised the

After her infant son died of drinking impure milk, Adelaide Hoodless devoted herself to women's causes, particularly better education for motherhood, and was an early advocate of home economics in the schools (courtesy Public Archives of Canada/C-85284).

provincial department of education on this subject. In 1897 she founded the first Women's Institute (Stoney Creek, Ont); within a few years this movement spread across Canada and around the world. Working with Lady ABERDEEN, she helped found the National Council of Women, Victorian Order of Nurses and the national YWCA. Basically conservative, Hoodless believed women's natural destiny lay in the home, and she never supported the suffragette cause. She was the author of *Public School Domestic Science* (1898). ROBERT M. STAMP

**Hoodoo Rock**, a strange, often fantastically shaped, naturally carved rock or earth pedestal, pillar or column. Hoodoos may range from a few centimetres to several metres in height. They result from the combined erosional action of WIND, RAIN and running WATER, which together with a variety of physical and chemical weathering processes sculpt the material into different shapes. Use of the term appears to be largely restricted to western N America. Hoodoos tend to be best developed in horizontally

Hoodoo rocks, Yoho National Park, BC. Hoodoos are formed by the combined erosional action of wind, rain and running water (courtesy Parks Canada).

bedded rocks or strata in which relatively soft units are interspaced with more resistant ones, eg, alternating layers of shale and sandstone. Differential weathering and erosion is enhanced, the soft material being removed more rapidly than the hard. Hoodoos are often capped by a resistant layer (cap rock) which protects the lower units. Removal of the cap rock results in rapid destruction of the unprotected base. Hoodoos are well developed in the BADLANDS of ALBERTA near Drumheller, in DINOSAUR PROVINCIAL PARK and near the MILK R. Excellent examples also occur in glacial-outwash deposits on the COLUMBIA R north of Cranbrook, BC, and in glacial-lake sediments in the OKANAGAN VALLEY near Penticton, BC. I.A. CAMPBELL

**Hope**, BC, Town, pop 3205 (1981c), inc 1929, is located on the Trans-Canada Hwy, 150 km E of Vancouver; it sits on the E bank of the FRASER R, surrounded on 3 sides by the mountains of the Cascade (or Coast) Range. The junction of the Trans-Canada and the trans-provincial Hwy No 3 makes it the gateway to the interior. Hope was established 1848-49 as a HBC post at the W end of their Brigade Trail from Fort Kamloops, and may have been so named in the hope that this trail would provide an all-British route between Fort Kamloops and Fort Langley. A townsitewas laid out by the Royal Engineers in 1858 during the rush for gold on the nearby sandbars of the Fraser. In 1860 Edgar DEWDNEY opened the first pack trail, the Dewdney Trail, to the E. Hope became a station on the CPR mainline in 1886 but further growth awaited the advent of automobile traffic. Today logging, tourism and mining in the district are the town's economic base. Local attractions are the Hope Slide (1965), the Coquihalla Canyon and the wilderness of Manning Provincial Park. JOHN R. STEWART

The dramatic Hope Slide (1965) is a local attraction near the town of Hope, BC (photo by Valerie L. May).

**Hopkins, John Castell**, journalist, encyclopedist (b at Dyersville, Iowa 1 Apr 1864; d at Toronto 5 Nov 1923). He became assistant editor of the *Toronto Mail and Empire* in 1890 and wrote a number of pamphlets, biographies and histories, including the deferential *Life and Work of the Right Hon. Sir John Thompson* (1895) and *Progress of Canada* (1901, rev as *The Story of Canada* (1922)). He edited *Canada: An Encyclopaedia of the Country* (6 vols, 1898-1900) — Canada's first ENCYCLOPEDIA — and succeeded George Morang as editor of the *Annual Review of Canadian Affairs*. DAVID EVANS

**Horetzky, Charles George**, photographer, explorer, civil servant (b at Edinburgh, Scot 20 June 1838; d at Toronto 30 Apr 1900). An employee of the HBC, he was at Ft Garry in 1869 during the RED RIVER REBELLION. In 1871 he was hired by the CPR survey primarily for his abilities as an amateur photographer. He is best known for his 1871-79 survey photographs of northern BC and northern Ontario. Though intelligent, fearless and innovative, he was impatient and quick to take offence, traits that

cost him his job in 1880. He worked for the Ontario government supervising public works 1883-1900 and wrote *Canada on the Pacific* (1874) and 2 other pamphlets. ANDREW BIRRELL

**Horn, Kahn-Tineta**, meaning "she makes the grass wave" in Mohawk, political activist, fashion model, civil servant (b in New York C, NY 16 Apr 1940), member of the Mohawk Wolf Clan of Caughnawaga, Qué. She attracted national attention to Indian causes in the 1960s and early 1970s by her lively and controversial criticisms of Indian conditions. She had already been a model and public speaker for some years when in 1964 she was fired from her posts in the National Indian Council in a controversy over policy and organization of centennial celebrations. Throughout the 1960s she took part in numerous Indian protests, including one in which she dumped rats in a government meeting to illustrate illegal dumping on her reserve. She advocated "Indian apartheid" or separate development, including preservation of the reserve system, teaching by Indians only, and the banning of Indian-white intermarriage. She founded and directed the Indian Legal Defence Committee, 1967-71. Since 1972 she has held various positions in the social, community and educational development policy sections of the federal Dept of Indian Affairs. BENNETT MCCARDLE

**Hornby Island** lies in the Str of GEORGIA between VANCOUVER I and mainland BC, SE of the island community of COURTENAY. It is a wooded island with a shoreline of sandbanks and rock shelves. Whaling was carried out in the 19th century from a shore station on the E coast; today it is a busy recreation area. Sandstone ledges along the shore show good examples of Indian petroglyphs. The name refers to R.A. Phipps Hornby, commander of the Pacific Station 1847-51. DANIEL FRANCIS

**Horne-Payne, Robert Montgomery**, financier (b in Eng; d at Brentwood, Eng 30 Jan 1929). Long an invalid, he rarely visited Canada, but his financial skills left an imprint on the landscape and a northern Ontario town (Horne-payne) bears his name. He has been credited with directing \$500 million of British capital to Canada 1894-1928, through the British Empire Trust Co, which he founded. So influential was Horne-Payne that when he warned British investors in June 1913 of reckless Canadian municipal borrowing, several western mayors protested. As chief fund raiser for William MACKENZIE and Donald MANN, he was London director of the Canadian Northern Ry from 1901 until the Canadian government took it over in 1918. From its inception in 1897 until its sale to Canadian interests in 1928, he was an active chairman of the board of the BC Electric Ry. He was also a director of other Canadian firms and was associated with Canadian capitalists in Latin American utility companies, notably Brazilian Traction, Light, Heat and Power Co. PATRICIA E ROY

**Hornell, David Ernest**, aviator (b at Lucknow, Ont 26 Jan 1910; d at sea 25 June 1944). He was awarded the VICTORIA CROSS for destroying a German U-boat while under extreme fire, and for fortifying his comrades in the ordeal after their flying boat crashed. Blinded and exhausted, Hornell died shortly after being rescued at sea. JAMES MARSH

**Horner, John Henry**, "Jack," rancher, politician (b at Blaine Lk, Sask 20 July 1927). He has carved a controversial public career since his election to the House of Commons in 1958. Supported by his central Alberta constituency, Horner soon earned a reputation as a spokesman for western farmers and as an arch conservative; later he was known as one of the "DIEFENBAKER cowboys." After his failure to gain the Tory

leadership in 1976, Horner crossed the floor of the House on 20 Apr 1977 to become a Liberal and the next day was appointed minister without portfolio. In Sept he became minister of industry, trade and commerce, but he was rejected by his constituents in the 1979 election. He was soon appointed to the board of the Canadian National Ry and in June 1982 was named chairman of the board. On 1 Mar 1984, he was appointed administrator of the new Grain Transportation Agency. PATRICIA WILLIAMS  
Reading: J.H. Horner, *My Own Brand* (1980).

**Horner, Ralph Cecil**, evangelist, church leader (b in Pontiac County, Canada E 22 Dec 1854; d at Ivanhoe, Ont 12 Sept 1921). After a short, stormy career as Methodist minister, he founded and led a series of HOLINESS CHURCHES. Converted and sanctified in Methodist camp meetings (1872), Horner studied theology at Victoria College, Cobourg, Ont, 1883-85 and oratory in Philadelphia 1885-86. A powerful preacher, already active in evangelistic missions, he was ordained by the Montreal Conference of the Methodist Church in 1887. Mounting criticism of his teaching and methods, and failure to submit to conference discipline brought his deposition 1894-95. Taking some Methodist clergy and laity with him, he joined the Wesleyan Methodists of NY, then formed an independent Holiness Movement Church, becoming its bishop. By 1900 his movement had a Bible College and a publishing house in Ottawa, and claimed some 6000 adherents, mainly in eastern Ontario and on the Prairies. In 1916 criticism of his leadership resulted in schism, and Horner founded the Standard Church of America. R. GERALD HOBBS and HELEN HOBBS

**Hornet**, common name for larger WASPS of family Vespidae, order Hymenoptera. The striking, black and white, bald-faced hornet (*Vespa maculata*) is common across Canada. The European hornet (*Vespa crabro*), a large yellow and black, introduced species, is found in southern Ontario. In addition, queens of various species of yellow jacket wasp, being considerably larger than workers, are sometimes called hornets. All are social wasps. They build nests of wood fibres, masticated into coarse paper, usually greyish in colour. Nests are attached to trees or shrubs, or suspended from eaves. Occasionally they may build in cavities in walls, hollow trees or under the ground. In fall workers and males die, but young, mated queens hibernate. In spring each queen may initiate a new colony. M.V. SMITH

**Horse** (*Equus caballus*), herbivorous MAMMAL possessing single toes or hoofs (ie, ungulate), contributing to its speed. Customary gaits are walk, trot, canter and gallop. Horses are friendly, moderately intelligent animals, capable of being excellent helpers and companions for humans. Indeed, the horse can share with the dog the distinction of being man's best friend. Giving more than friendship, horses have for hundreds of years been mankind's most faithful slaves, furnishing muscle and stamina for heavy work in AGRICULTURE and endurance to cope with heavy loads on long trails in pioneer transportation. When forced from traditional occupations by mechanical power, horses were immediately returned to service in new and important roles in sport and recreation. In some parts of the world, horse meat is a common item of diet but Canadians have never shown much interest in eating their best animal friends. Selection for different purposes led to wide variations and many breeds. In size, for example, the range in height would be from 10-12 hands in the case of some Shetland ponies to 17 hands in certain big breeds. A hand, the horseman's unit in measuring height at the withers, is about 10 cm. More than 25 recog-

nized breeds have been introduced and bred in Canada.

The horse is a pioneer in these parts and should be treated with appropriate respect. With the exception of the turkey, it is the only member of Canada's barnyard community whose family was native to the Americas, and much of the 40-million-year family history is written, convincingly, in the rocks. FOSSIL evidence of the primitive horse's existence has been found elsewhere, but nowhere is there such a long, unbroken paleontological record as on this continent. Written here is the step-by-step story of change from the small and primitive *Eohippus* (the size of a wirehaired terrier) to horses which, in size and appearance, resemble those of modern times. The "dawn horse" had 4 toes on each foreleg, 3 on each hindleg. The little fellow, without much means of protection, lived in swamps. There may be doubt about its diet, but from the shape of its feet, the relatively small size of stomach even today and the survival of canine teeth in males, there is reason to suspect that *Eohippus* was not a strict vegetable feeder.

Members of the race must have been extremely numerous on this continent, at least until struck by disaster and extinction in the Americas. Horses were still here when the first humans arrived some 40 000 to 25 000 years ago. Early N American humans feasted on horse meat and left the proof at campfire sites, where horse bones, arrowheads and ashes have been found together (see PREHISTORY). Some horses of that period passed from N America to Asia by way of the land bridge that admitted the first humans to this continent (see BERINGIA). Thus, they escaped extinction and spread across Asia. It is believed that the first domestication was in China, and eventually domesticated stock reached the Mediterranean and N Africa where improvement took place. Some of the improved horses, taken by invaders to Europe, were left behind and imprinted their quality upon the horse stock of Spain and France. Columbus, on his second voyage westward in 1493, may have taken Spanish horses to the West Indies. In any case, Hernando Cortez, a Spanish conquistador, landed 16 or 17 horses on the N American mainland in 1519. N American horses had gone around the world and, after a long absence, were back on their native soil.

**Horses for Settlers** North American Indians were quick to adopt the use of horses, and horses moved from one tribe to another, generally by theft. By Arthur Silver Morton's estimates, horses in the possession of the Indians were seen in the valley of the Bow R in 1730. Before long, Indians of all the western tribes had horses and, when the Selkirk settlers arrived at the RED RIVER in 1812, urgently needing livestock, they rejoiced at the prospect of obtaining horses from tribesmen.

The first horses in what is now eastern Canada were brought from France for the use of settlers beside the St Lawrence. In 1665, Louis XIV directed the shipment of 21 mares and 2 stallions from the royal stables. From these and later importations came the Québec strain of hardy black horses, ultimately recognized as the French Canadian or Canadian breed, still prized by many Québec farmers.

For settlers coming into UPPER CANADA and then westward to Manitoba and the Territories, power was one of the most crucial needs. Some used oxen for a while because they were more readily available and could "live off the land," but ultimately every farmer wanted horses and then better horses. Improvement depended on the importation of sires of approved breeds. The first purebred stallion in the West was Fireaway, a Norfolk trotter brought from England by the Hudson's Bay Company for the benefit of Red R settlers. He was an overwhelming success. Thereafter, demand was for stallions of heavy

breeds. British settlers wanted breeds from their homeland (eg, Clydesdale, Shire, Suffolk). Settlers from Europe and the US favoured Percherons and Belgians. Canadian farms became scenes of the mighty "Battle of the Breeds." Reflecting an early predominance of British settlers, the Scottish Clydesdale, with stylish white markings and showy action, led in popularity, but in time the bigger Percherons of French origin and the still bigger Belgians took the lead.

By 1921, when almost every Canadian farmer was a horseman, the horse population stood at 3.5 million. Saskatchewan had one million, mainly of Clydesdale, Percheron and Belgian breeding. The interbreed rivalry continued and reached the point where Clydesdale supporters were known to sit on one side of a country church, while Percheron and Belgian devotees sat on the other. But while the breed debates continued, the supremacy of heavy horses was being challenged by mechanical power, first by the heavy steam tractors introduced on big farms in the West (see AGRICULTURAL IMPLEMENTS). These huge steamers were excellent for belt work but slow and awkward for field work, and by 1908, when the world's first agricultural motor competition was held in conjunction with the Winnipeg Industrial Exhibition, heavy, gasoline-driven tractors outnumbered them. During WWI, when farmers were urged to increase production but were denied the needed workers, gasoline and kerosene-driven tractors of smaller kind became attractive. Horse fortunes were about to change.

**Horses in Decline** It was a landmark event in 1918 when the federal government contracted to buy 1000 2-plow Ford tractors and sell them to farmers at cost (about \$800 delivered). These light, 4-cylinder, high-speed tractors signalled a new day for farm power and horse breeding slumped. More and more horses were unemployed and seen as surplus. By 1944 farmers and ranchers were becoming impatient with the thousands of unsalable horses eating valuable grass. In March, at a meeting held at Val Marie, Sask, the Western Horse Marketing Co-operative was organized, with a double purpose: horsemen hoped to realize a return from the surplus and to make more grass available for cattle and sheep. By Oct 1945, horsemen were in the meat business, with their gaze fixed upon postwar food needs in Europe. Slaughtering and processing plants were established at Swift Current and Edmonton and by 1952 officers could report almost 250 000 horses marketed for a return of about \$19 million. Most of the return came from canned meat shipped to Europe. In 1983 horsemeat exports totalled over 9 000 t, valued at \$26.3 million. Principal buyers were France and Japan. Usually, old or crippled animals are slaughtered; horses are not bred for the purpose.

**The Ascendancy of the Light Horse** Heavy horses almost disappeared from Canadian farms; horse-drawn machinery was abandoned; harness went to pieces. Familiar old terms such as hame strap, martingale and whippetree were forgotten. But all was not lost. With the decline of the heavy or draft horse and the coming of an age when people had more leisure, Canadians discovered new interests in light horses. The ascendancy of light horse breeds was no less dramatic than the decline of heavy ones. Every type and breed of light horse was useful to some degree. A few, such as the western stock or cowboy horse, were so useful and so irreplaceable that their popularity has never changed. But the search for horses suitable for new sport and recreational uses brought a score of little-known breeds to public attention. The 2 ancient breeds, Arabian and Thoroughbred, have been influential in building and improving other breeds, which include the Hackney, French Coach and German Coach, classified as heavy harness

types; American Standardbred and Morgan, seen as roadsters or trotters; American Saddle Horses, Tennessee Walking Horses and Quarter Horses, all of US origin; and the recently popular colour breeds, Palomino, Appaloosa, Pinto and Buckskin. Various pony breeds (eg, Shetland, Welsh, Dartmoor, Exmoor, Fell, Highland, Iceland, New Forest) have been registered at some time with the Canadian National Livestock Records.

Horse racing is known as "The Sport of Kings" (see THOROUGHBRED RACING). A succession of English kings gave it their enthusiastic support and Charles II went so far as to order importation of 40 Barb, Turk and Arab mares which became the foundation of the Thoroughbred breed. Every urban centre in Canada has its race-tracks and seasonal racing programs. Canadians have demonstrated their love for the races and pleasure in betting. Thoroughbreds and Standardbreds are the principal racing breeds, the former in flat racing under saddles, the latter in HARNESS RACING, with drivers seated in sulkies. The Standardbred, developed in the eastern states, was the original American roadster, a trotter that might be trained to pace. The trotting gait is a diagonal movement, with diagonally opposite legs advancing together. The pace, which some horses do naturally and others by training, is a lateral gait, with both legs on the same side moving together. Good horses with either gait can cover a mile in under 2 minutes.

Light-horse shows became numerous and popular and the Canadian Horse Shows Association furnished uniform rules for contests. Over the years, Canadian horses made many notable records, for example that of the jumper, Confidence, in the East and Barra Lad in the West. The former, owned by Sir Clifford sifton, cleared the bars at 245.11 cm at an Ottawa show to establish a world's record, and the latter, foaled at Essondale, BC, and exhibited by Peter Welsh of Calgary, made the incredible jump of 247.65 cm for 6000 spectators at New Westminster in 1925. It was a new world's record but ended tragically; the great horse must have sustained internal injuries and died later the same evening.

Canadian horse shows reached their highest state of competition and glitter at the Royal Agricultural Winter Fair in Toronto, started in 1922. In the West, the comparatively new but excellent facilities of Spruce Meadows, near Calgary, promise to become internationally important. Among the many other light-horse events are RODEO, which reaches its pinnacle at the CALGARY STAMPEDE, and trail riding in mountain regions, started in an organized way by John Murray Gibbon after his arrival in Canada in 1913. Dressage attempts to present the art of training with show-ring finish. For the friends of the Quarter Horse and lovers of stock saddle events, there are the cutting-horse contests. See also ANIMAL BREEDING; SABLE ISLAND HORSES; VETERINARY MEDICINE; EQUESTRIAN SPORTS.

**Horseradish**, see CONDIMENT CROPS.

**Horsetail**, perennial PLANT of genus *Equisetum*, the only living representative of the very ancient and primitive class Sphenopsida, tree-sized members of which were prominent in the land vegetation of the Carboniferous era (345-282 million years ago). The stems are usually hollow, have cylindrical sheaths of reduced leaves at the nodes, and arise from creeping rhizomes (underground stems). When present, branches are often in whorls at the nodes. Stem internodes are commonly ridged longitudinally, the ridges bearing silica-containing tubercles or bands. They are herbaceous or shrubby and rarely exceed 1 m in height. Horsetails show

Spore-bearing cone of scouring rush (*Equisetum laevigatum*), one of the 10 species of horsetail found in Canada. Horsetails are representative of one of the most ancient vegetations on Earth (courtesy National Museum of Natural Sciences).

a form of alternation of generations (a sexual phase alternating with an asexual one), in which each generation is an independent plant. Spores are produced in spore cases borne on stalks which form a fruiting, terminal cone on the fertile stem. The spores germinate, forming plants (prothallia) on which are borne antheridia and archegonia (structures producing sperm and eggs, respectively). The prothallium is the sexual generation. Fertilization of the egg and subsequent development produces the familiar horsetail plant, the asexual generation.

Fifteen species of *Equisetum* (mostly of world-wide distribution) and many sterile hybrids (some widespread) now exist. Ten species occur in Canada: smooth scouring rush (*E. laevigatum*) mainly in the central regions; giant horsetail (*E. telmateia*) on the West Coast and in the Okanagan Valley; common horsetail (*E. arvense*) and variegated horsetail (*E. variegatum*) transcontinentally and far N of TREELINE. Six other species are transcontinental, but do not occur in the High Arctic. Most species occupy moist environments. Common horsetail and scouring rush (*E. hyemale*) are sometimes considered weeds. Settlers used silica-encrusted stems of both these species for cleaning and sanding. The former is still used to hone woodwind reeds. Common horsetail has been reported poisonous to livestock in Canada.

W.J. CODY

**Horton Plain**, 71 000 km<sup>2</sup>, is the most northeasterly part of the Interior Plains, extending to Amundsen Gulf on the Beaufort Sea, NWT. It consists of a series of dissected plateaus, generally below 800 m elevation, underlain by flat-lying Paleozoic sedimentary rocks in the W and by Precambrian sedimentary bedrock in the E. Drainage is provided by 2 scenic rivers, the HORTON and Hornaday. Among its numerous small lakes, the Bluenose (400 km<sup>2</sup>) and Horton (166 km<sup>2</sup>) are noteworthy. The vegetation is low arctic tundra in the N, dominated by dwarf shrubs and grasses, and woodland in the S, consisting of scattered, stunted spruce with a lichen carpet. The summer range and calving grounds of the large Bluenose caribou herd lie within this region. Paulatuk on Darnley Bay is the only permanent settlement in the area.

S.C. ZOLTAI

**Horton River**, 618 km long, rises N of GREAT BEAR LK in the NWT and empties into Amundsen Gulf. Shallowly entrenched in the upper part of its course, it cuts a deep (up to 200 m) valley into the soft cretaceous bedrock in its lower course. It originally reached the BEAUFORT SEA at Harrowby Bay, but one of its meanders cut a channel to Amundsen Gulf around 1800, shortening its course by some 100 km. Near the present delta are the Smoking Hills, where lignite and jarosite beds are burning, giving off sulphurous smoke. These beds were already burning in 1826 when J. Richardson mapped the shoreline. The river is shallow, but navigable by small craft. Its valley is wooded to within 100 km of its mouth, where the treeless, shrubby tundra begins. A trading post operated at the delta 1918-31, but there are no settlements along the river at present.

S.C. ZOLTAI

**Horwood, Harold Andrew**, columnist, politician, editor, novelist (b at St John's 2 Nov 1923). Horwood supported J.R. SMALLWOOD in the campaign which brought Newfoundland into Confederation, and he represented Labrador in the Assembly 1949-51. Horwood relinquished his editorial responsibilities with the St John's *Evening Telegram* in 1958 and became a free-lance writer and novelist. His best-known works are 2 novels — *Tomorrow Will Be Sunday* (1966) and *White Eskimo* (1972) — and *The Foxes of Beachy Cove* (1967), a thoughtful little book on the back-to-nature theme. He is founding editor of a literary magazine, *The New Quarterly*.

D.R. BARTLETT

**Hose, Walter**, naval officer (b at sea 2 Oct 1875; d at Windsor, Ont 22 June 1965). After 21 years in the Royal Navy, Hose transferred to the Canadian navy in 1912. Until 1917 he commanded the *Rainbow* on the Pacific coast, then the trade defence forces on the Atlantic coast in 1917-18. In 1921 he became director of the Naval Service ("chief of the naval staff" after 1928), an appointment he held until his retirement in 1934. Cuts in defence spending in 1922 and 1933 threatened the navy's survival, but Hose saved the service through determined leadership and by developing the naval reserves founded under his direction in 1923.

ROGER SARTY

**Hospital** Canada has numerous types of hospital, including general (858) and allied, ie, mental, rehabilitation, veterans', extended care and pediatric. Most hospitals are under provincial jurisdiction but some 155 general and psychiatric hospitals are directly under federal jurisdiction.

**Historical Development** The first HÔTEL DIEU in New France was established in 1639 by 3 sisters of the order Les Religieuses Hospitalières de la Miséricorde de Jésus in Québec City. This hospital is still in operation. By 1694, 3 other religious hospitals had been constructed, including the Hôtel-Dieu in Montréal, and in 1819 and 1829, respectively, general hospitals were opened in

Montréal and York [Toronto]. The York hospital had been built several years earlier but had been used as a temporary home for the government after Upper Canada's parliament buildings burned down in Dec 1824.

The first general hospitals were charitable institutions, relying on donations from benevolent organizations and prosperous citizens. The patients paid very little, if anything, and government support was erratic and undependable. In 1867 the Toronto General closed for a year because of lack of funds, and it was partly because of this that the Ontario government passed an Act in the early 1870s providing for annual grants to the hospital and to other charitable institutions. Today nearly all hospital operating revenues come from federal and provincial governments.

Until the early part of the 20th century, hospitals were generally devoted to the treatment of the poor, who suffered in particular from infectious and nutritional diseases, eg, influenza, pneumonia, tuberculosis, gastroenteritis and scurvy. Because the relationship between public sanitation and personal hygiene and disease was largely unknown, and because of the lack of therapeutic drugs, infectious diseases spread uncontrollably. Dirty and overcrowded hospitals were often traps for infection, and most prosperous citizens, who were treated at home, avoided them.

This situation persisted through the early 1900s when tuberculosis hospitals were established to sequester the "incurables" from the general public. "Feeble-minded" individuals were dealt with in a similar way and mental hospitals began to expand in both number and size. Between WWI and WWII, however, and before the advent of antibiotics or vaccination programs became widespread, infectious-disease mortality rates began to decrease as a result of enforced PUBLIC HEALTH measures.

By the 1880s, the introduction of safe anesthesia, asepsis (ie, prevention of infection) and of improved surgical techniques led to decreased mortality from conditions such as postoperative hemorrhage and gastrointestinal abnormalities (see MEDICINE, HISTORY OF). Because these techniques required sophisticated equipment, specially trained personnel and longer periods of observation, the use of hospital facilities increased, and hospitals became centres for curative therapy, for teaching and for MEDICAL EDUCATION and research.

In 1945 the federal government submitted recommendations for changes to the health-care system in Canada to the Dominion Provincial Conference on Reconstruction. The recommendations proposed a series of grants and low-interest loans to the provinces to improve existing health services and construct new hospitals. Because the conference representatives failed to reach agreement, the proposals were left in abeyance, but in 1948 the plans were resurrected in the National Health Grant Program. Funds granted to the provinces were to be used to construct new general and mental hospitals, to strengthen public health services, and to develop programs for specific diseases, eg, tuberculosis and SEXUALLY TRANSMITTED DISEASES, and for specific patients, eg, crippled children.

In 1958, following the lead of Saskatchewan, the federal government passed the Hospital Insurance and Diagnostic Services Act, which empowered it to negotiate agreements with each province to share the cost of provincially administered insurance programs providing for the payment of the basic cost of acute treatment, and for convalescent and chronic care in approved hospital facilities. These hospitals were guaranteed reimbursement for services rendered. By 1961, all provinces were providing federally assisted hospital insurance to their residents (see HEALTH POLICY).

In 1961 the federal government established the Royal Commission on Health Services to investigate the health-services system and to recommend measures to "ensure that the best possible health care is available to all Canadians." The commission's final report (1964) became the cornerstone of Canada's health-care system.

Both the Health Grant Program and the Hospital Insurance Act encouraged a reliance on hospital care and diagnostic service — the most expensive elements of any health-care delivery system. In response to these rising health-care costs and the royal commission recommendations, the federal government passed the Medical Care Act in 1967 empowering it to share the cost of medical insurance plans in each province. Within 3 years, all provinces had such plans; the combination of national hospital and medical insurance is called medicare.

In 1966 the federal government established the Health Resources Fund under which \$500 million was granted to the provinces to plan, build and renovate facilities to be used to train health professionals or conduct research. The money was distributed over a 14-year period ending in 1980; \$400 million of this fund was used to build new facilities or renovate old ones. The remaining funds were used to replace outdated equipment. The bulk of the \$500 million was spent on teaching hospitals, all of which are general hospitals. Some of the money was spent on medical schools, but because of the intimate relationship between such schools and teaching hospitals, it is difficult to determine precise amounts.

In the 1970s the federal and provincial governments re-evaluated their health-care funding arrangements. It was felt that the federal matching of provincial spending on hospital and medical care encouraged an overreliance on these expensive components of health care. The federal government wished to place some controls on health-care expenditures and to give provincial governments an incentive to be efficient and the latitude to meet their needs. These considerations led to the 1977 Federal-Provincial Established Programs Financing Act (EPF). Through a combination of cash grants and tax transfers, the federal government still pays for at least 50% of the cost of provincially administered hospital and medical insurance plans, but does not automatically match provincial expenditures. In response, provinces have introduced innovations, eg, home-care, day surgery, and outpatient care. All indications are that the federal government's strategy has halted the rise in hospital expenditures, though total health expenditures continue to grow.

A new Canada Health Act, which combines the 2 previous Acts (hospital insurance and medical insurance), went into effect in April 1984.

**Resources** Health and hospital costs accounted for 8.44% of Canada's GROSS NATIONAL PRODUCT (GNP) in 1982, the most recent statistics available to Feb 1985. In the same year, all hospitals accounted for 40% of health expenditures or \$12 billion (3.4% of GNP). Hospitals spend an average of 75% of their budgets on wages and salaries and employ approximately 450 000 people. In addition to the employees, approximately 48 000 volunteers devote 3.2 million person hours and millions of dollars' worth of free labour to hospitals annually.

Most hospitals are given an annual inflation-adjusted global budget by the provincial government. With these resources hospitals provide surgical suites, nursing care and a wide range of diagnostic, therapeutic and rehabilitative services. Hospitals feed and house the inpatients, offer numerous community, outpatient and emergency services, and provide training programs for health-care professionals. They also undertake research projects. Hospitals not only

train new physicians, nurses and other health-care personnel, but they are committed to educating patients in the maintenance of health and in coping with disabilities.

In the 1982-83 fiscal year, general and allied hospitals provided a total of 48.4 million patient days (ie, the number of days spent in hospital by all patients for a given period) to patients who had 3.6 million hospital stays (this corresponds to 1958 patient days and 146 hospitals stays for every 1000 Canadians). This measure does not take into account the outpatient, research, and community services that hospitals provide, but it is a commonly used indicator of hospital services. The average cost per patient day in 1982-83 was \$246.50. However, the cost of operating special intensive-care units can be as high as \$5000 a day, although, because of medicare, Canadians do not have to pay these costs out of their own pockets.

**Personnel** in hospitals includes technologists, therapists and administrative staff. Although physicians powerfully influence the operation of hospitals, very few are hospital employees. Except in the rare cases of laboratory and emergency-room specialists, and some senior professional staff in teaching hospitals, physicians do not receive payment from hospitals, although only physicians can admit patients to a hospital (patients cannot admit themselves). Physicians have complete authority to order surgery, drugs, diagnostic and therapeutic service, and nursing services for their patients. They are also the only health-care professionals qualified to discharge a patient from hospital (patients can discharge themselves but usually do not do so). Nurses, on the other hand, are hospital employees and are responsible for delivering most of the patient care in hospitals. There are about 250 000 hospital-employed nursing personnel in Canada, 130 000 of whom are registered nurses.

Patients in hospital are usually described by their age and sex, or by their illness. By age and sex, the largest users of hospital services are the elderly (people over 65 make up about 10% of the population and are responsible for about 40% of Canada's patient days) and women in their child-bearing years. By illness, the major cause of hospital use is HEART DISEASE (9.5% of patient days). Fourteen broadly defined conditions account for 67.6% of patient days.

**Future** A number of factors are changing the way in which health-care services are being

delivered, eg, population AGING, increase in chronic illness, advance in medical technology. Hospitals of the future will need to provide increasingly specialized technological care and yet meet an opposing demand for more personal, generalist care for patients with chronic conditions. It is expected that there will be a greater emphasis on community services and on outpatient and home care. JEAN-CLAUDE MARTIN

**Hotel** Accommodation for travellers in Canada derives from 2 traditions: the modest inn or roadhouse, and the urban hotel. In early settlements many households took in overnight guests; those with inn licences could charge for the service, a practice which formalized the roadside inn. Willard's Hotel (1795) and Cook's Tavern (1822), both from Williamsburg Township, Ont, and now at UPPER CANADA VILLAGE, were stopping places for commercial travellers and immigrants in coaches along the King's Hwy and on bateaux on the St Lawrence R. Symmes Inn (1831) at Aylmer, Qué, strategically located at a boat landing on the Ottawa R and immortalized by William Henry BARTLETT, boasted a table supplied "with the best the country affords." Not all roadhouses offered such amenities. An 1860s visitor at Hat Creek House, a ranch on the CARIBOO ROAD leading to BC's goldfields, complained that "the bunks were hard as a board . . . and the dark looking blankets had unwrapped too many sweaty, dusty travellers since last washed." Inns were often built to resemble large houses, but with the addition of 2 tiers of verandahs.

In the early 19th century, hotels in large Canadian cities were often planned on a lavish scale. Rasco's Hotel in Montréal, opened in 1836 and still standing today, is a 5-storey stone building that once accommodated 150 guests. Larger hotels designed in the most fashionable styles of the day achieved high levels of luxury. The Windsor Hotel in Montréal (architect G.H. Worthington, 1876-78), designed in the Second Empire style, was the most gracious in the city.

The railway age heralded a new era in hotels, one that blurred the distinction between the 2 traditions. The CPR built a series of "dining stations," with sleeping rooms, in the BC mountains to feed travellers and accommodate guests.

Early photograph of the interior of the stylish Empress Hotel, Victoria, BC (courtesy Provincial Archives of British Columbia/8208).

Glacier House (architect T.C. Sorby, 1886), perched at the summit of the Selkirk, recalled a Swiss chalet. The original wood-framed Banff Springs Hotel (Bruce Price, 1886-88) was an elaborate resort hotel in the scenic Alberta Rockies. Together with the Château Frontenac in Québec City (Price, 1892-93), it began a tradition of château-style railway hotels that became a peculiarly Canadian architectural form. The CPR's Empress Hotel, Victoria (F.M. RATTENBURY, 1904-08), and the Grand Trunk Ry's Château Laurier, Ottawa (Ross and MacFarlane, 1908-12), are notable examples of the genre.

The contemporary descendants of roadside inns and urban hotels cater to both commercial travellers and tourists, and are often managed

The imposing Château Frontenac at Québec City (1892-93) helped begin a tradition of château-style hotels that became a peculiarly Canadian architectural form (photo by Yves Tessier/Reflexion).

by international chains. The motel (or motor hotel), located along a highway or on the edge of the city, caters to the automobile traveller. Popularized in the US in the 1930s, the motel is typically one or 2 storeys high, with each room accessible from the parking lot. Many city hotels have become tall slab towers; they serve as convention centres, with large meeting rooms and internal shopping arcades. The Toronto Hilton (William Tabler and Campeau, 1975) has 967 guest rooms in 2 towers, one of which is topped by a revolving restaurant. Highway and city come together in Montréal's Hotel Bonaventure (Affleck, Desbarats, Dimakopoulos, Lebensold and Sise, 1967-68), in which a motellike series of rooms arranged around open landscaped courts is perched atop a monolithic trade and retail structure. HAROLD D. KALMAN

**Hôtel-Dieu**, first HOSPITAL in NEW FRANCE and one of the first such institutions in America, was founded in 1639 by the duchesse d'Aiguillon to care for Indians around the

colony of Québec. In Aug 1639 the first 3 nuns of the nursing order Religieuses hospitalières arrived in the colony. They soon established a hospital in nearby SILLERY to treat Indians fighting a smallpox EPIDEMIC. The hospital moved to the present site on Québec City's rue du Palais in 1644 when the IROQUOIS WARS threatened its security. Of the original building, only the foundation remains, and the oldest section of the present building dates from 1696. The Hôpital l'Hôtel-Dieu de Québec has provided medical care for almost 350 years. The second Hôtel-Dieu was founded in 1642 when Jeanne MANCE began to treat the sick in the newly founded colony of Ville-Marie [Montréal]. Granted land outside the fort in 1644, the Hôtel-Dieu de Montréal moved to its present site on Mont Sainte-Famille in 1861. It is now affiliated with UNIVERSITÉ DE MONTRÉAL. Other Hôtel-Dieu hospitals established by the Religieuses hospitalières include those at Tracadie (1868), Chatham (1869), Madawaska (1873), Arthabaska (1884), Campbellton and Windsor (1887) and Winooski, Vt (1894).

**Houde, Camillien**, politician (b at Montréal 13 Aug 1889; d there 11 Sept 1958). In 1923 and 1928 he was elected to the Québec legislature as a Conservative, and in 1949 he was sent to the House of Commons by Montréal-Papineau; but from his election as mayor 2 Apr 1928 to his retirement 18 Sept 1954, Houde so incarnated his city that he was called "Mr Montréal." His mayoralty was suspended on 5 Aug 1940 when, after calling for defiance of registration for military service, he was arrested by the RCMP, interrogated and then taken to an Ontario internment camp. Like many nationalist Québécois of the period, he supported the ideology of Mussolini's Italy and Vichy France, while still remaining loyal to the British crown, which had made him a CBE in 1935. At least 50 000 Montréalers eagerly welcomed Houde after his release 18 Aug 1944. An early split with UNION NATIONALE chief Maurice DUPLESSIS was healed, and Houde dominated Montréal as Duplessis did Québec. An enormous man with a Cyranoesque nose, he dispensed patronage generously, winked at the city's brothels and blind pigs, and saw police corruption and political payoffs as facts of life. But his obsession was immortality, not money. The flamboyant style of his mayoralty is reflected in his crypt at Montréal's Côte-des-Neiges cemetery — an Italian marble replica of Napoleon's.

BRIAN McKENNA

**House** usually refers to a building that serves as living quarters for one or several families. House forms and building styles have changed throughout history in response to socioeconomic forces as well as climatic conditions inherent to particular geographic locations. In effect, houses are like mirrors that reflect both the living conditions and the cultural heritage of their builders.

The earliest dwellings in Canada were built and inhabited by Indians and Inuit. Viewed superficially, these buildings appear primitive, but although simple, they were sophisticated adaptations to a particular lifestyle and habitat, and in greater harmony with nature than most houses are today. The simplest dwellings were built by food gatherers and hunters, nomadic people who roamed Canada's extensive grasslands, forests and the arctic barrens of the North. Their nomadic existence precluded the establishment of permanent settlements, so these migrating peoples built temporary shelters. Some were constructed of available building materials near the campsite, and others were made of materials easily transported from camp to camp.

Perhaps the most fascinating dwelling is the **IGLOO**, a snow house built by the **INUIT** living in the treeless tundra. These circular, dome-shaped structures had a raised sleeping platform facing the low entranceway. Working from the inside, the builder placed one snow block next to another in upward-spiraling rows, each block tipped slightly inward to narrow the circle until a dome structure resulted. The spiraling rows made scaffolding during construction unnecessary. Although snow may seem to be an unlikely building material for shelter, it has excellent insulating qualities. Insulation of the interior was often improved by lining walls and ceilings as well as the sleeping platform with caribou hides and seal skins. When the igloo began to melt in summer, it was abandoned and replaced by a seal-skin tent called **tupiq**, a portable dwelling like the **TUPI**, consisting of a framework of poles covered with seal skins (see **NATIVE PEOPLE**).

The **tipi** was an ingenious dwelling used by several tribes, but mostly associated with the Plains Indians, who followed the immense bison (buffalo) herds that roamed the plains. The skeletal structure of the tipi was composed of 3 or 4 poles tied together at the top and then erected; up to 20 additional poles were placed against the tripod or tetrapod thus formed. A tailored buffalo-hide cover was placed on this skeleton and was staked or weighted down with stones all around the bottom edge. A smoke hole was left on top at the intersection of the poles and could be closed or adjusted with the help of 2 flaps of the hide cover, each attached to a separate freestanding pole. The fire was built near the centre, below the smoke hole, and the bedsteads of the family members were placed on the ground around the walls of the tipi, except at

the doorway, which always faced the rising sun. Dome- or beehive-shaped and tipilike structures were the basic forms of indigenous temporary shelters in Canada, and were used by many Indian tribes.

The **LONGHOUSE** of the agricultural Indians of Canada's northeastern woodlands was a communal dwelling. The interior was subdivided into a number of bays, each allocated to a single family. Each bay had a low sleeping bench against the outside wall, and between the facing bays ran a wide corridor down the length of the building. These longhouses were not substantial, since after a few years of tilling without fertilization, the exhausted soil nearby produced scanty crops and the Indians abandoned their houses and moved on. A series of poles, arched to form a barrel-vault skeleton, supported the bark roof shingles and matting of the walls. Although each bay or cubicle was only about 2 m wide, the length of the longhouse would often exceed 20 m, from which we may conclude that it was not unusual for 20 families to live in one building.

More substantial dwellings were built by the coastal Indians of BC. Living in a temperate climate, with a plentiful supply of good building materials, the coastal Indian tribes built large communal houses, each inhabited by a number of families. Their rich environment allowed a settled existence, which is reflected in the permanence of their homes. These impressive structures were low-pitched, gable-ended, rectangular structures built of massive cedar posts and beams. Their interior arrangement, 2 facing rows of bays with sleeping platforms separated by a central corridor, was similar to the buildings of the eastern woodlands. Hearths were tended in the centre of the corridor, with the smoke escaping through apertures made when the roof planks were thrust aside by means of a pole. Most communal buildings had only a single entrance at one of the gable ends. The more leisured existence of the coastal Indians led to a significant art form of ornamentation of their dwellings and **TOTEM POLES**.

With the European settlement of the St Lawrence Valley in the 17th century, a new house form was introduced to Canada. The early French Canadian settlers created a building tradition reminiscent of French architectural styles but using Canadian building materials. Initially the farmhouses of the habitants were low, broad buildings constructed of wooden planks with a shingled high-pitched roof and gable verges. They were rectangular and usually divided into 2 rooms of unequal size, with a large masonry chimney rising from the cross wall. Timber was later replaced by fieldstone gathered from the clearing of the fields. Concurrently, other changes were introduced in response to the harsh climate: floor levels were raised well above grade and eaves became wider; the pitch of the gable verges became steeper until the hip was superseded by a gable; with the introduction of a second fireplace, chimneys were placed at the gable ends; a further extension of the eaves led to the typical curving bellcast roof covered with sheet metal. The verandah house with a gallery passage above snow level and wide eaves supported by a row of columns was a further evolution of the Québécois rural house.

The typical urban house in Québec had raised masonry gables with double chimneys and wall head corbels, and the roof structure was covered with sheet metal or tin tiles. These precautions were made necessary by the hazard of fire when houses were multistoreyed and had stone masonry walls with wooden floors and roofs. However, the use of wood planks for walls was also widespread in urban houses and, in later years, wood was often used in conjunction with an external cladding of brick. The early urban houses were attractive structures with well-

Second home built by Ivan Mihaychuk at Arbakka, Man, 1903 (courtesy Public Archives of Canada/PAC-8788).

proportioned windows and doors, having few ornaments but characterized by a simple elegance.

After the Conquest (1760), European traditions in rural house construction continued, not only with the application of the heritage brought from the British Isles, but also with an American colonial architectural influence transplanted into Canada with the influx of the **LOYALISTS**. Stone masonry walls were gradually replaced by red-brick masonry, but wood continued to be the dominant building material for rural houses. On the prairies, where wood was scarce, early settlers often built **SOD HOUSES**.

During the 19th century the most prevalent urban dwelling form in central and eastern Canada was the town house, in either attached or detached dwelling units. Reminiscent of the Georgian and Victorian town houses of Great Britain, the Canadian town house, like its American counterpart, was less formal. Since few households had servants, Canadian town-house dwellers placed their kitchen and scullery on the first floor, rather than in the basement, along with the principal reception rooms. In the Canadian town house, the living room, the entrance vestibule and stair hall occupied the front end of the house, and the dining room, kitchen and scullery the rear; the living and dining rooms were often separated from each other by an archway, with or without recessed sliding doors, a double-parlour type of arrangement. The bedrooms were located on the upper floors, with the master bedroom facing the street. The width, size and appointment of the town house reflected the wealth of its occupants, but usually town houses were 2 storeys high, with the ground-floor level raised half a floor above sidewalk level. Tenements and apartment buildings also made their appearance in cities during the 19th century. Tenements were built as minimum-standard living accommodations for low-wage earners, and apartment buildings were more commodious, designed as rental flats for the middle-income group. Neither type constituted a large proportion of the Canadian urban-housing stock and consequently the dire housing conditions experienced in Great Britain and in many large American cities never existed in Canada.

The double house, built c 1870 in London, Ont, displays classical elements (photo © Hartill Art Associates).

At the beginning of the 20th century, first the wealthy and later others moved to the outskirts of the cities to live in houses on large lots along treed avenues to escape increased air pollution, crime, overcrowding and noise; this desire for a healthier living environment eventually resulted in the proliferation of dormitory suburbs. Single-family suburban homes are usually 2-storey dwellings with a spatial organization not unlike that of town houses. The principal rooms invariably occupy the front, or street side, of the house overlooking the front lawn, and the secondary rooms are placed towards the rear yard.

The mixture of the garden-city home and new forms such as the bungalow — one of the most popular 20th-century dwelling types — can be seen in the urban landscape of Vancouver in the years 1886-1930. Vancouver's rate of home ownership ran as high as 80% in those years. Unpleasant memories of the industrial cities of Britain were still fresh, and the detached house became the ideal, appearing in surprising "imported" styles, such as Italianate and Queen Anne, as well as in simple frame houses and cottages. Within the suburbs, the most prevalent form was the California bungalow, a style which spread across N America. The bungalow bespoke a new lifestyle associated with the easier climate and informality of California. It featured indoor-outdoor rooms, deep verandahs and patios. Meanwhile, Vancouver's elite areas favoured fancier mansions and villas displaying a more pastoral imagery based on the lines of old English farmhouses or the use of half-timbered decoration in Tudor Revival mansions. These houses attempted to create an instant sense of history, of homes where generations had dwelt. This half-timbered motif was found elsewhere in Canada but was especially prevalent in Vancouver. Equal enthusiasm was shown for the simple English farmhouse, characterized by rough stucco surfaces and exaggerated rooflines. The appeal of the English Tudor cottage in Vancouver and Victoria was symbolic of the strong ties with the "Old Country," as was the California bungalow of BC's presence in the new. Only later, in recognition of an earlier heritage, did British Columbians recognize in the woodwork of the Northwest Coast Indians and in the coastal rain forests an

alternate regional style, characterized by cedar siding and the shed roof.

In comparison with the traditional multi-storeyed house, the single-level bungalow acquired increasing popularity across Canada and was used extensively in suburbs where land prices were more reasonable. Today, the suburban bungalow is usually built of wood with an external cladding of wood or masonry and gyp-rock on the inside. It is prevalent among every income group, as the modest home and as the luxurious rambling ranch house. The suburban sprawl has, however, resulted in increased distances between the city and new suburbs. To economize on land, and in response to the effects of the energy crisis on transportation, alternatives to the bungalow have been introduced, such as the split-level house, followed more recently by a return to 2 traditional house forms: the 2-storey, single-family home and the attached town house.

Along with the proliferation of single-family dwellings in the suburbs, multifamily residential accommodations in cities also underwent changes during this century. The apartment house attracted people who were not family oriented and who preferred to live in the city for proximity to work and entertainment. To spread more equitably the higher cost of urban land as well as to share the maintenance costs of amenities such as swimming pools, apartment houses evolved into large building complexes, including fitness and entertainment centres and sometimes retail space. Masonry load-bearing construction was replaced by steel or concrete structural frames, paralleling the development of office towers. With higher buildings, upper-storey apartments offered more dramatic views

Contemporary condominium and mixed housing in the St Lawrence neighbourhood of Toronto (photo © Hartill Art Associates).

and the ultimate in urban luxury living became the penthouse apartment (see CONDOMINIUMS).

The principal shared features in 20th-century Canadian housing design are informality, functionalism and hygiene. Informality has been encouraged by the increasing unavailability of servants and with it the abandonment of inconvenient and redundant features of housing design, such as sculleries, butler's pantries and service corridors. The *en suite* arrangement of drawing and dining rooms has been replaced by a less formal, open plan, where the principal living spaces flow into each other. New socio-economic realities place an emphasis on functionalism; functional houses are designed not so much to impress occasional visitors as to make living in them comfortable. Perhaps the design, size and location of the kitchen in modern houses best illustrate the new movement; the ill-equipped, dark kitchen relegated to an obscure corner of the old house has been replaced by a well-equipped, sunny and efficient space adjacent to the dining area, or often combined with it. Much greater attention is given to the layout of bedrooms and bathrooms so that reasonable privacy can be enjoyed by each member of the family. Healthful living conditions imply ample access to light and air, as well as good sanitary services. Large picture windows and glass walls in domestic architecture place a new focus on views and thereby a greater awareness of the outdoor environment. Areas such as terraces, patios and gardens are perceived as extensions, or outdoor rooms, of the house. Their connection with the interior, as well as their landscape treatment, have become important design features.

Until the 1970s the choice of housing accommodation in Canada was polarized between low-density, single-family suburban houses and high-density, multifamily urban apartment houses. With the emergence of demographic changes and a greater awareness of diminishing energy supplies, new dwelling forms are being developed that avoid both extremes. Medium-density and medium-rise urban dwellings that are well lit and ventilated, often having more than one exposure, have already made an appearance in large cities of Canada. Another emerging trend involves mixed zoning, whereby housing can be built in combination with commercial and office buildings. Occupying the upper floors of a building, this housing resembles penthouse accommodation with ample access to sun, air and view, away from street noises, but still close to the urban and cultural facilities of a lively city.

Demographic shifts and socioeconomic forces in this century have brought into existence a variety of specialized housing for the elderly, the handicapped, single persons, students, communards and others. The same common design criteria of informality, functionalism and hygiene also govern the layout of specialized housing.

The energy crisis which began in the early 1970s stirred the consciousness of many designers to conserve energy. The simplest approach was the use of passive solar energy, by means of an optimum orientation of the dwelling towards the sun. Another approach entailed the active collection of solar energy through solar panels and storage in some form of thermal mass until required. The obvious advantages inherent in subterranean structures led to the earth-shelter movement, which promised warmth, quiet and energy efficiency, but underground homes have yet to gain popularity. **House Leader**, nonofficial title of MP nominated by each party to serve as head strategist and tactician in the House of Commons. The government House leader, a Cabinet member with honorific title president of the Privy Council, negotiates among parties about the Commons timetable. In each party the House leader is responsible for the PARTY WHIP and manages matters ranging from office space to salary negotiations. House leaders meet weekly to discuss the government's timetable and choose speakers. They have sufficient power to hold their parties to the negotiated agreements.

ROBERT J. JACKSON

**House of Commons**, elected lower house of PARLIAMENT, some of whose members belong to the CABINET, others to the Opposition parties' shadow, or alternate government, and including backbenchers or private members (members who do not belong to the Cabinet and are not designated, on the Opposition side, as party critics) of the parties. There are sometimes a few Independents. The 282 members of the House (called Members of Parliament, or MPs) are elected in single-member constituency ELECTIONS or by-elections. Under the CONSTITUTION ACT, 1867, the Queen and the GOVERNOR GENERAL and the Queen's ministers and other public servants, not the House of Commons, govern Canada. The House, often incorrectly referred to as Parliament, is important constitutionally because no new statutes of any kind may be made except in response to bills that have been passed by it, and politically because, unlike the SENATE, it is an independent, elected body. Ministers are responsible to the House, not to the Senate.

Nonfinancial bills may be introduced in the Senate as well as in the House, but under the Constitution Act, 1867, both taxation bills and appropriation bills must have passed the House before going to the Senate. Although private members may introduce taxation bills, under the Act (s54), only the CROWN may initiate spending (supply) business; if the House could decide on its own to vote money for new purposes or to increase the amounts requested by the Crown, it would be well on the way to becoming the Government.

The House has important functions deriving from the Government's dependence on its co-operative support. Its constitutional function is to maintain a government for a reasonable time; to defeat one ministry after another in rapid succession would be anarchistic, a point which becomes highly relevant when no party wins a majority, as happened in 6 of the 10 elections between 1957 and 1980. The political function of the House is to foster government acceptable to the people, and it has the power to insist ministers account for their conduct and their bills and policies in their present portfolios. (In 1979 the CONSERVATIVE government proposed that Cabinet ministers, but not former ministers still in the House as backbenchers, be required to answer questions about activities that occurred during earlier portfolios). Some questions may be written down and placed on the Order Paper to receive a printed reply but during oral question period (45 minutes daily) ministers may be questioned directly (see PARLIAMENTARY PROCEDURES). Usually, leading Opposition speakers and selected backbenchers on the Opposition side of the House ask the questions. Dissatisfied questioners may indicate they will raise a matter on adjournment later in the day.

"Responsible" means both accountable and reasonable, conscientious or justifiable. Responsibility in the first sense helps ensure that ministers act responsibly in the second sense. The House could bring down a bad government by refusing to vote it money but if the system is working well this should rarely, if ever, happen. Elections were brought on by defeats in the

Interior view of the House of Commons. The Speaker's chair is at the far end, with the public gallery above (courtesy National Film Board/Photothèque).

House of minority governments in 1963, 1974 and 1979. In recent years the controversy over ministerial responsibility and growth of executive power (sometimes referred to as "Cabinet dictatorship") has generated considerable debate over the role and function of the House. The governments of Western democracies have changed fundamentally since the 19th century and, in Canada, Parliament serves increasingly as an auditor of executive government, examining their bills, policies and conduct. House COMMITTEES are particularly useful for these purposes. The basic difficulty is how to improve the House's effectiveness as auditor and critic without abandoning the principle that the government is responsible for policy.

In a sense the House is part of a permanent election, so the role of the media in transmitting parliamentary debate and generating public opinion is very important. The decision of the House to publish its debates in the form of HANSARD and to use television were prompted in part by dissatisfaction with the news media.

The House is divided into the ministers and their supporters and those opposed to the government. Since 1921 there always has been at least one third party on the field, and occasionally 2 or more third parties. Since 1974 the election ballots have shown the candidates' party allegiances, if any. Independents usually are not successful. Members do leave their parties in the House in protest to sit as Independents, but rarely.

The Opposition is allotted up to 25 days in 3 supply periods to determine the subject of debate. Supply periods occur when the government is seeking passage of appropriation bills (see BUDGETARY PROCESS). The Opposition may also move adjournment of the House to discuss an urgent, unexpected matter. The SPEAKER may hold over such motions until the evening. The debate on the SPEECH FROM THE THRONE and the debate on the budget are general debates.

At the beginning of each Parliament the privileges of the House of Commons are confirmed by the governor general. At Westminster it was found that if the House was to participate effectively in parliaments it had to have certain privileges, certain exemptions from the ordinary law that were and are the special rights, not of individual members, but of the House. For a long time one of the foremost privileges at Westminster was that its members could not be im-

prisoned for debt. The foremost privilege of the Canadian House is the right of its members to speak freely — without being liable to prosecution in the courts — in proceedings of the House and its committees. This does not mean members can say anything they please; the privilege appertains to the House, which has a responsibility to control its members, to protect ordinary citizens from vilification. The House can forbid the publication of its debates and controls the taking of pictures and the making of notes in the galleries. The content of parliamentary papers, eg, HANSARD, is privileged, but the decision of whether or not to broadcast proceedings has created difficulties; eg, does the freedom from legal penalties extend to broadcasters using the official tape? If so, might not the protection of ordinary citizens against libel be abridged?

MPs may be accused of contempt (which embraces breach of privilege and disrespect for the honour and dignity of the House) and for misleading the House not only in statements about their own conduct but possibly in ministerial answers to questions; eg, in 1982 the SPEAKER took under consideration a breach-of-privilege complaint against the minister of justice. A member of the public may be accused of contempt for publishing an attack on the Speaker, a charge against a member outside legal process, or a false or ridiculing account of proceedings in the House or in a committee. When a matter of privilege or contempt is raised in the House, the Speaker decides if there is a *prima facie* case; if so, the case is normally sent by the House to the Standing Committee on Privileges and Elections for investigation. The committee has the great power to send for persons and papers and may take sworn evidence. The House may admonish or censure offenders and is empowered to imprison them for the balance of the session. Genuine questions of privilege and contempt are serious but very rare; however, many members use points of privilege, which take precedence over most other business, to get the floor merely to voice complaints or make corrections.

All speeches in the House are addressed formally to the Speaker, although direct exchanges often break out in the heat of debate. Private members are referred to by the name of their constituencies — "the Honourable Member for Peace River" — and ministers by office — "the Honourable the Minister of Finance." The terms, "the Prime Minister" and "the Leader of the Opposition" are in order. The House does not permit members to use unparliamentary lan-

guage because it fosters bitterness and reflects on the honour of the House. Some expressions ruled unparliamentary recently include "sick animal," "pompous ass," "has not got the guts," "lies," "nazi" and "stinker."

The Speaker is the chief officer of the House. His or her election is the prime order of business when the House reassembles after an election. The Speaker, although usually a government MP, is responsible not to the government but to the House. The Speaker presides — deciding who is to have the floor, applying the rules of procedure, making rulings, putting the questions and managing the administration of the House and its permanent employees. There have been attempts to make the position permanent. The Deputy Speaker (House-elected) is usually proficient in the official language that is not the Speaker's first language and occupies the Speaker's chair if he or she is absent and chairs the committee of the whole. The Clerk, or Secretary of the House, who holds a deputy minister's rank, is not an MP but is appointed by the governor-in-council. He and one or more of the table officers are expert parliamentarians (procedure experts) and supply the Speaker with advice and information. The Clerk is also the Speaker's chief executive officer in staffing and servicing the House and is responsible to the Speaker for all the papers and the debates (Hansard), but is assisted in this work by expert branch officials.

When the first parliaments were held at Westminster, the king sent a royal sergeant-at-arms, bearing a royal mace, to attend upon the House of Commons, showing that the House was under the king's protection and was not to be threatened or molested. The sergeant-at-arms, who is appointed by the Crown, occupies a special chair in the centre aisle just inside the Bar; he leads the procession when the Speaker enters the chamber or proceeds to the Senate chamber for speeches from the throne, royal assents and prorogations. When the Speaker appears, representing the House, the mace (symbol of the authority of the House vested in the Speaker), borne by the sergeant-at-arms, is at his side.

The House of Commons normally meets in the Commons chamber at the west end of the Centre Block of the Parliament buildings. At Ottawa, unlike Westminster, every member has an assigned place in the chamber and must be in his place to speak and vote in the House (but not in committees of the whole House). There are 5 rows of desks down each of the long sides of the room; these 2 banks of desks face each other across a wide centre aisle. The Chair is at the north end of the centre aisle. This arrangement, far different from that in Paris or Washington, supposedly originated in the days when the English House met in St Stephen's Chapel, and it well suits the adversarial nature of our responsible government system. The main doors are at the south end of the centre aisle; on these the Gentleman Usher of the Black Rod raps when he comes to summon the Commons to the Senate chamber. There is a telescoping brass rail known as the Bar at the foot of the centre aisle, just inside the main doors, which can be extended across the aisle. One of its original functions at Westminster was to keep strangers from mingling and perhaps voting with the members. Occasionally, strangers have been summoned to appear at the Bar of the House to be questioned or censured.

The ministers and parliamentary secretaries are the only members of the government in the House; they receive salaries from the Crown in addition to their indemnities as members from the House. The government and its backbench supporters sit on the Speaker's right, facing east. The leader of one of the opposition parties — normally the largest — has the official role of leader of the Opposition, and in addition to his

indemnity as a member receives a salary and various other benefits — including a residence, Stormoway. He generally assigns particular topics — finance, external affairs, transport, etc — to members of his team (the shadow Cabinet), but it cannot be presumed that the assignments would be the same if he became prime minister.

The prime minister occupies the 13th place in the front row on the west side; the leader of the Opposition sits directly opposite. The other ministers are grouped in a block of seats around the prime minister; the leader of the Opposition has his key followers around him. Former ministers — styled "the Honourable" as members of the Privy Council — are given seats in the front rows, at either the north or south end. The leader of each party, through the PARTY WHIP, fixes the party seating plan — invariably by class (year of first election) and alphabetically within classes. After each election, survivors from the previous House move closer to the centre aisle. There now are 296 places in chamber for 282 members. Third parties are placed down beyond the official Opposition.

At the end of most sittings the Speaker adjourns the House — about 10:30 PM on Monday, Tuesday and Thursday, for example — under the terms of a standing order of the House. Normally a sitting takes no more than one day but may extend beyond midnight and usually does when there is an emergency debate. The sitting of 4 May 1982 continued until about 7:00 PM the following day. In 1913, before there was a fixed time for adjournment, 2 sittings each extended throughout an entire week. A new record was set in 1982, during the "long-bell sitting," which began 2 March and did not end until 17 March. Special decisions of the House are necessary for the long adjournments for Christmas, Easter and the summer. Sessions of Parliament begin with a summons by the governor general and end with prorogation by him. Minority parliaments recently have lasted only one or 2 sessions. Between 1867 and 1938 the annual sessions lasted only a few months; now they normally run a full year, with 3 long adjournments. The main purpose of prorogation is to wipe clean the Order Paper. All business unfinished at the end of a session — unanswered questions and all orders relating to bills and motions — die on the Order Paper. The House controls its own adjournments, but the Crown controls both the length of a session and the life of a Parliament.

**House Sparrow** (*Passer domesticus*), small, granivorous and insectivorous songbird with conical bill and chunky body. Males have a grey crown, black bib, streaked-brown upperparts and greyish white underparts; females are grey-buff overall. They are English SPARROWS (not related to N American sparrows but rather to African weavers) and were introduced in 1850-1852, from Europe, in Brooklyn, NY, to control INSECT PESTS. Through subsequent introductions and dispersals, the species spread across N America, reaching Québec City (1854), Ontario (1870) and across Canada (mid-1880s). In eastern Canada, it is now common to 48° N. Farther N it occurs in isolated colonies. In the West, it is found N to Ft Simpson, NWT, and W to Vancouver 1. House sparrows are permanent residents of cities and farms. They build bulky, domed nests, intricately woven of grasses on buildings, in natural cavities or in trees and shrubs. Two to 3 clutches of 3-7 eggs are laid from Apr to Aug. House sparrows nest singly or in small groups. Small flocks form in summer, reaching several hundred individuals in winter. The song is repetitive, metallic and unmusical. House sparrows are agricultural pests and fierce

competitors of native birds. They are important for studies of rapid adaptation to new environments.

J.C. BARLOW

**Housework** can be defined as all work performed within a household related to house-keeping functions, childcare and personal services to an adult. Until very recently, housework was not defined as work by most social scientists unless it was performed by a servant who was paid for it. It is only since feminist scholars have pointed out the extraordinary significance of housework for the functioning of the economy and for society that it has received any attention.

During this century, although housework has been industrialized (the products of housework can now be purchased, and services, eg, childcare, nursing the sick, cooking, cleaning, etc, can be bought), no less time than before is actually spent on unpaid housework. The nature of the work performed, however, and the conditions under which it is being performed have changed. Some neo-Marxists argue that, counter to previous assumptions, housework must be understood as productive work, but because it produces use value rather than exchange value, it has long been miscategorized as unproductive. One of its important functions includes the reproduction of society's labour power. Other analysts argue that Marxist analysis cannot suitably be applied to unpaid housework. Even today, economists tend to view housework as a noneconomic activity if no money changes hands. Neither have sociologists and historians given much thought to the subject, although recent work has revealed that unpaid housework does constitute an extremely important part of the overall amount of work performed within Canadian society; if calculated as part of the GROSS NATIONAL PRODUCT (GNP), it would increase it by about 33%. Housework has historically been, and continues to be, a predominantly female activity; although the majority of married women belong to the LABOUR FORCE (from 1941-81 the number of married women in the labour force increased from about 4.5% to 50.5%), time-budget studies reveal that women continue to do most of the housework even when they have a paying job. In 1924, for example, American housewives spent about 52 hours a week doing housework; by the 1960s it had increased to 55 hours. Until very recently, housework was commonly regarded as a natural part of the female role, and even though the majority of people now believe it should be shared between the spouses when both of them have paying jobs, this attitude has not been reflected in actual behaviour. Significantly, various provincial family law reform Acts, starting with the Ontario Act of 1978, have recognized unpaid housework as a contribution to the family's well-being, therefore entitling the performer of this work to some part of family assets upon divorce.

**Housing and Housing Policy** Housing policies and programs are actions taken by governments to affect the quantity, quality and price of housing. The objectives of Canadian housing policies have been to ensure that dwellings of a decent standard are available to all Canadians at prices they can afford. Government assistance may be provided through grants and loans to developers or consumers. In 1981 there were 8.7 million dwelling units in Canada, of which 46% were single-family detached, 18% attached or row houses, and 36% apartments. Some 65% of this housing had been built since WWI. Construction had averaged only 39 000 units a year during the GREAT DEPRESSION and the war years,

but it increased rapidly after the war to meet the needs of the returning veterans, immigrants, and people moving from rural to urban centres. Annual additions to Canadian housing averaged 77 000 units in the 1950s, 155 000 in the 1960s, and 229 100 in the 1970s. The early 1980s saw a reduced demand for housing as a result of the economic recession and the fact that most of the postwar BABY BOOM had already entered the housing market (eg, only 133 940 units were built in 1982).

In Canada, all levels of government are involved in housing programs, though the constitutional authority for housing is vested in provincial governments. They, in turn, may delegate housing responsibility to regional and city governments. Local governments are usually responsible for enforcing adequate housing standards and for land-use planning that affects the location and type of housing (see URBAN AND REGIONAL PLANNING; ZONING). At the national level, a variety of economic and social concerns, all of which have an impact on the housing sector, caused the government of Canada to become involved in housing policy.

Canadian housing policies have addressed 2 tasks: to assist the housing market to produce enough housing to meet the needs of most Canadians (see DEVELOPMENT INDUSTRY) and to provide extra assistance to people whose housing needs cannot be adequately met through the normal housing market. Prior to 1970, government programs assisted just over one-third of all housing starts. Most of this assistance was directed to market housing, and less than 5% of all starts were specifically designed to house lower-income Canadians. After 1970 government programs continued to assist close to 40% of all housing starts, and an increasing proportion of the funds was directed toward lower-income households. In 1983, for example, housing for low-income Canadians represented 8% of housing starts.

Before 1970 Canadian housing programs were almost exclusively the preserve of the federal government. The first national housing legislation, the Dominion Housing Act of 1935, provided \$20 million in loans and helped finance 4900 units over 3 years. The Federal Home Improvement Plan (1937) provided subsidized interest rates on rehabilitation loans to 66 900 homes. In 1938 the first National Housing Act was passed. These Acts served the dual purposes of providing housing and creating employment opportunities.

The federal government continued to be active in the housing market during WWII. A crown corporation, Wartime Housing Ltd, built 45 930 units at a cost of \$253 million over 8 years, and assisted in the repair and modernization of existing houses. New programs stimulated the private housing market by providing mortgage money and favourable interest rates to encourage homeownership and the construction of limited dividend rental housing. In 1946 the assets of Wartime Housing Ltd were transferred to Central Mortgage and Housing Corporation (see CANADA MORTGAGE AND HOUSING CORPORATION).

A significant milestone in Canadian housing legislation occurred in 1954 when the federal government agreed to insure mortgage loans made by private investors against borrower default. The Bank Act was also amended to allow Canada's chartered banks to lend money for mortgages. These initiatives enabled the federal government to reduce its direct involvement in lending and to become an insurer of mortgages and a lender of last resort.

During the 1970s the federal government continued to assist the private housing market by insuring mortgages and by providing direct loans in smaller communities otherwise not well served by private lenders. Incentives were

Habitat, Montréal, designed by Moshe Safdie for Expo 67 (courtesy Canapress).

introduced to stimulate home ownership such as tax-exempt Registered Home-ownership Savings Plans, Assisted Homeownership Program, and changes to the Tax Act (1971) that excluded principal residences from capital gains tax. In the early 1980s the Canadian Home Stimulation Program provided grants to home buyers; the Canada Mortgage Renewal Plan assisted those who were experiencing difficulty renewing their mortgages at higher interest rates; and the Graduated Payment Mortgage Plan helped homeowners offset the rising costs of home ownership by lowering initial monthly mortgage payments. The federal government also assisted the construction of private rental housing through a combination of grants, preferential loans and taxation concessions, eg, Multiple Unit Residential Building deductions, the Assisted Rental Program and the Canada Rental Supply Plan. Some 40% of Canadians are renters, most of whom live in urban areas.

The housing industry is supported by a continuing commitment from all levels of government to improve housing quality and community standards. The National Building Code and the National Fire Code encourage uniform building and safety standards across Canada. Municipalities inspect to ensure that standards are maintained and, through zoning bylaws, regulate what can be built and where. Municipalities are also responsible for planning and providing water, sewer, roads, parks, schools and other public services. In unincorporated or rural areas, regional districts or provincial governments regulate land use and provide services.

Government programs have assisted cities in improving the quality of housing and services. During the 1950s the federal government funded land assembly programs. In the 1960s cities received funds for urban renewal and municipal infrastructure. During the 1970s the federal government shifted funds into residential rehabilitation assistance, neighbourhood improvement and home insulation programs. Most cities used the neighbourhood improvement program to upgrade and preserve older neighbourhoods. Homeowners and landlords used the rehabilitation and home improvement funding to upgrade over 250 000 homes between 1974 and 1984.

The provision of housing for lower-income Canadians has been another continuing concern of governments. Social, public, community or nonmarket housing are terms used interchangeably to describe housing for people whose needs for adequate and affordable shelter cannot be met through market housing. Non-market units are built by governments and non-profit or co-operative societies and are operated and assisted by government subsidies to ensure a continuing stock of affordable housing. The first Canadian social housing legislation was introduced in 1938 when the National Housing Act made provision for construction of low-rent housing. In 1949 the NHA was broadened to include federal-provincial programs (sometimes with city participation) to build publicly owned and provincially managed housing for low-income families, seniors and the disabled. From 1947 to 1983, 205 000 public housing units were built across Canada. Ontario has the largest share (43%), followed by Québec (22%), Alberta (7%), Manitoba (7%) and BC (6%). The location of public housing reflects the ability of provincial governments to participate in cost-shared programs and to a lesser extent, areas with traditionally low vacancy rates.

Between 1969 and 1974 the public housing program underwent extensive evaluation. A \$200 million program in 1970 stimulated innovative solutions for housing low-income Canadians; the Ministry of State for Urban Affairs, 1971-78, initiated research and implemented policy, and included CMHC in its mandate. In 1974 the NHA was amended: existing public housing was to continue to provide accommodation for low-income households; rural and native programs were added; and new social housing was to be built by municipalities, non-profit organizations and co-operatives. The legislation encouraged consumers to be more involved in the design and management of housing, and encouraged a mix of modest and lower-income households. Funding for social housing was provided mainly by the federal government, with some assistance from the provinces and cities. More than 185 000 units were provided between 1974 and 1983, to house families (50%), seniors (40%) and others (10%) (see also NATIVE PEOPLE, GOVERNMENT PROGRAMS).

During the 1970s provincial and city governments assumed a more active role in housing. Prior to 1970 Ontario had the most active pro-

vincial housing agency. By the mid-1970s all 10 provinces had created new or stronger housing departments and assumed more responsibility for policy development and for setting priorities for spending housing funds. Most provinces offer home-ownership grants and contribute to the cost of nonmarket housing. Some provinces assist renters by providing tax credits, shelter allowances, and through rent control. Amendments to the NHA in 1978 and negotiations surrounding the CONSTITUTION ACT, 1982 supported provincial housing activities and, in turn, senior governments encouraged cities to create municipal nonprofit corporations to build and manage social housing.

In 1984 government housing programs were again undergoing review. Governments examined the ongoing cost of housing subsidies and changing housing demand. The projected decline in demand for housing during the 1990s may result in fewer programs to encourage new construction and more emphasis on renovation and on programs which assist households to afford existing housing. More information on housing can be obtained from such bodies as Canada Mortgage and Housing Corporation, the Canadian Housing Design Council and the Canadian Home Builders Assn (See also REAL ESTATE).

**Houston, James Archibald**, artist, author and filmmaker (b at Toronto 12 June 1921). Houston studied art in Toronto before serving in WWII. After studies in France (1947-48), he spent 14 years in the Canadian Arctic, serving as civil administrator at W Baffin, teaching the Inuit the techniques of printmaking, and popularizing their art in the US and southern Canada (see INUIT ART). From 1962 to 1972, he was with Steuben Glass of NY. Houston's first children's story, *Tikta'liktak: An Eskimo Legend* (1965) was named the Canadian Children's Book of the Year. *The White Archer* (1967) and *River Runners* (1979) won the same award. Houston has been active on many national and international boards, promoting native art. A fellow of the Royal Soc of Art, he holds several honorary doctorates.

Houston's children's books are of 3 types. Some, like *Tikta'liktak*, are expanded versions of legends he has been told by the Inuit. Others portray the growth to maturity of West Coast native youths. Three novels, *Frozen Fire* (1977), *River Runners* (1979) and *Black Diamonds* (1982), have modern settings. Houston has illustrated all these books himself. Houston's adult novels — *The White Dawn*, 1971; *Spirit Wrestler*, 1980; *Eagle Song*, 1983 — depict the powerful emotions involved in confrontation between traditional native cultures and Europeans. JON C. STOTT

**Howard, John George**, né John Corby, architect, surveyor, artist (b at Bengoe, Eng 27 July 1803; d at Toronto 3 Feb 1890). Immigrating from England in 1832, Howard enjoyed a successful career, primarily in Toronto, as an architect, surveyor and artist. He produced fine watercolours (many of which survive), was instrumental in organizing the Toronto Soc of Artists in 1834, and was drawing master at Upper Canada Coll from 1833 to 1856. He received many contracts for street improvements following the incorporation of the city of Toronto in 1834 and was city surveyor 1843-55. One of the busiest architects in the city, he was responsible for many private and public buildings. His most important commission was the provincial lunatic asylum (1845-49, demolished 1976), but he is best remembered for bequeathing his estate, High Park, and his home, Colborne Lodge, to the city. VICTOR L. RUSSELL

**Howe, Clarence Decatur**, engineer, politician (b at Waltham, Mass 15 Jan 1886; d at Montréal 31 Dec 1960). Howe was the most successful businessman-politician of his day, and provided a link between the Liberal Party and Canadian industry. Although he claimed relationship to the Nova Scotian Liberal statesman Joseph HOWE, C.D. Howe's Canadian connections were remote until he came N to Halifax with an engineering degree from the Massachusetts Institute of Technology to teach engineering at Dalhousie. Howe's years there (1908-13) were successful, if unexciting, and he readily abandoned academia in 1913 to work with the Canadian Board of Grain Commissioners designing wheat elevators across the Prairies. Howe found the job congenial and in 1916 formed his own engineering firm, specializing in grain elevators. Between 1916 and 1935 the C.D. Howe Co built elevators in Vancouver, Saskatoon, Churchill, Pt Arthur, Toronto and Prescott, as well as Buenos Aires, Argentina. Howe became the foremost grain-elevator builder of his day. His straightforward, blunt personality, and his ability to build elevators at a fixed price, commended him to his customers, especially in western Canada. But the 1930s Depression ended his business, and in 1935 he entered politics and Parliament as a Liberal, representing Pt Arthur (Thunder Bay, Ont). He was promptly made a member of Mackenzie KING's Cabinet, becoming minister of transport in 1936. In that capacity Howe helped create Trans-Canada Airlines (later Air Canada).

In 1940 Howe became minister of munitions and supply, with the task of running Canada's war-production program. He succeeded brilliantly, working beside a group of largely Conservative businessmen who came to appreciate his efficient and daring conduct of economic affairs. This stood him in good stead when in 1944 he was asked to preside over the new Dept of RECONSTRUCTION. He reconverted the Canadian economy to a free-enterprise system, with minimal government controls. During the 1950s Howe was concerned with developing certain sectors of the Canadian economy, such as steel, and with expanding Canada's trade, as minister of trade and commerce. In that capacity, in 1956, he sponsored a trans-Canada pipeline, with government aid to a private firm. The move stirred up a parliamentary storm, and Howe's increasingly short-tempered response to criticism helped undermine the government's position. In 1957 the Liberals were defeated, as was Howe.

ROBERT BOTHWELL

Reading: R. Bothwell and W. Kilbourn, *C.D. Howe* (1979).

C.D. Howe, who made his fortune building grain elevators, went on to become a powerful Cabinet minister through the 1940s to 1956, when his short-tempered responses during the Pipeline Debate helped undermine his government's position (courtesy Public Archives of Canada/JC-472).

Gordie Howe in action against Toronto Maple Leafs goalie Johnny Bower (courtesy Canada's Sports Hall of Fame).

**Howe, Gordon**, hockey player (b at Floral, Sask 31 Mar 1928). Gordie Howe's record of 32 outstanding seasons in hockey may be the most remarkable in professional sport. He played junior in Saskatoon and Galt, Ont, before turning pro with Omaha and joining Detroit Red Wings in 1946. His career started slowly with 7, 16 and 12 goals in his first 3 years and in his third year he suffered a severe head injury after colliding with Ted KENNEDY and crashing headlong into the boards. He won the ART ROSS TROPHY (leading scorer) 4 straight years 1950-54 and again in 1957 and 1963, the HART TROPHY (most valuable player) in 1952, 1953, 1957, 1958, 1960 and 1963 and was NHL all star 21 times. Howe retired from Detroit in 1971, but returned to hockey in 1973 to join his 2 sons, Mark and Marty, with the WHA Houston Aeros. He finished his career, at age 52, with Hartford Whalers of the NHL in 1980.

Gordie Howe was doubtless the finest athlete ever to play hockey. He possessed great physical strength, incredible stamina and speed, and his wrist shot was clocked at 183 km/h. His professional totals, including playoffs, are 2421 games, 1071 goals, 1518 assists and 2589 points. Though the NHL does not recognize his 6 WHL seasons, he holds the NHL records for most seasons (26), most games, including playoffs (1924), most goals (869), most assists (1141) and most points (2010). Howe dominated his sport as much by his intimidating strength as by his mastery of skills; he accumulated 2419 minutes in penalties.

JAMES MARSH

**Howe, Joseph**, journalist, politician, premier and lt-gov of NS (b at Halifax 13 Dec 1804; d there 1 June 1873). Taking over the *Novascotian* in 1828, Howe quickly made it the leading provincial newspaper. Originally defending the political status quo, he gradually became convinced through personal experience that serious ills abounded throughout the government. Charged with criminal libel in 1835 for criticizing local government officials, he was acquitted in the province's most celebrated trial. He entered politics in 1836 and was primarily responsible for the election of a majority of Reformers (Liberals). A conservative Reformer, he entered a coalition with the Tories in 1840, hoping to achieve his aims step by step. Having failed, he prepared the way for the Reformers' success in the election of 1847. As a result, Nova Scotia secured RESPONSIBLE GOVERNMENT in Feb 1848, the first colony to do so, and Howe could boast that it had been done without "a blow struck or a pane of glass broken."

Seeking to rise above "the muddy pool of politics," he tried unsuccessfully to arrange the building of the Halifax to Québec Ry. As chief commissioner, he began the Nova Scotia Ry in

Despite his oratorical powers, Nova Scotian patriot Joseph Howe could not prevent his province's entry into Confederation and he later went on to serve in the federal Cabinet (courtesy Public Archives of Canada/C-22002).

1854, however, and saw completion of the lines from Halifax to Windsor and Truro. Devoted to Britain, he recruited forces in the US in 1855 for the British Crimean War, one outcome of which was a rupture with the Catholics and the defeat of the Reformers in 1857. Following the Liberal victory of 1859, he was premier 1860-63 and imperial fishery commissioner 1863-66 under the RECIPROCITY Treaty of 1854. Between 1866 and 1868 he led the movement against CONFEDERATION on the grounds that it was being effected without popular consent and that it conflicted with his plans for the organization of the British Empire. Although overwhelmingly successful in the provincial elections of 1867, as a delegate to Britain in 1866-67 he could not prevent passage of the BNA Act or, a year later, secure its repeal. Having no further means of opposition he entered the federal Cabinet in Jan 1869. In a celebrated midwinter by-election in Hants his health was so impaired that he never fully recovered. As a federal minister, he played a prominent role in bringing Manitoba into the union. Becoming lieutenant-governor of Nova Scotia in 1873, he served only 3 weeks before his death.

Despite his failings, many consider Howe to have been the greatest of all Nova Scotians. The Nova Scotian patriot par excellence, he could use his oratorical powers to influence his compatriots as no other man has ever done. He sought, in his own words, to elevate them to "something more ennobling, exacting and inspiring, calculated to enlarge the borders of their intelligence, and increase the extent and area of their prosperity."

J. MURRAY BECK

**Howe Research Institute**, a nonprofit organization established 1973 to conduct nonpartisan research and analysis of Canadian economic-policy issues. The staff is located in Montréal and Calgary and operations are conducted by Policy Research and Analysis, which publishes an annual *Policy Review and Outlook* surveying Canada's economic performance and policy options; Economic Reports, which publishes comprehensive studies about trends affecting the Canadian economy; and Institute Services, which publishes studies and statements prepared on behalf of the Canadian-American Committee and the British-North American Committee.

GREGORY WIRICK

**Hoyles, Sir Hugh William**, politician, judge, prime minister of Newfoundland (b at St John's 17 Oct 1814; d at Halifax 1 Feb 1888). The son of Newman Hoyles, a wealthy merchant and politician, he was educated in St John's and Nova Scotia, and was called to the Newfoundland Bar in 1837. He participated in various political, social and religious organizations, and in 1848 was elected Conservative member of the House of Assembly for Fortune Bay; he sat in the House until 1859 and again 1860-65. Hoyles quickly became a major force within his party, and succeeded to its leadership in 1855. In the late 1850s and early 1860s long-standing tensions between the Island's Irish Roman Catholic and English Protestant inhabitants flared up in severe civil disorders. In Feb 1861 Gov Alexander Bannerman dismissed the Liberal administration of Catholic John Kent and called on Church of England member Hoyles to form a government. Hoyles was subsequently confirmed in office in a bitter, violence-marred election. His main concern as prime minister was to ease ethnic and religious tension. Although his efforts met with mixed results, his conciliatory actions helped prepare the ground for later accommodations. Hoyles resigned as prime minister in 1865 and subsequently served as chief justice of Newfoundland 1865-80.

GEOFF BUDDEN

**Hubert, Jean-François**, Roman Catholic bishop (b at Québec City 23 Feb 1739; d there 17 Oct 1797). Educated at the SÉMINAIRE DE QUÉBEC and ordained a priest 1766, he became in Dec 1774 the first Canadian superior of the Séminaire, but he resigned in 1778 and joined the church's Illinois mission. Coadjutor bishop in 1786, in 1788 he became bishop of Québec, and in 1789 he successfully opposed establishment of a non-confessional university at Québec. He supported the British government against revolutionary France in the 1790s and was allowed to bring refugee French priests to his diocese, which was suffering an acute shortage of clergy. Worn out by a momentous and active episcopacy, during which he favoured moderation and traditionalism, Hubert resigned Sept 1797 and died the next month.

JAMES H LAMBERT

**Hudson, Henry**, explorer (fl 1607-11). Little is known of him before the famous voyages of his last 4 years. He searched twice (1607, 1608) for a polar route to Asia via Norway and Russia, and in the service of the Dutch East India Co ascended the Hudson R in 1609. English patrons financed his search for a NORTHWEST PASSAGE in 1610. He sailed in the *DISCOVERY* to Iceland and entered HUDSON STR in early June, navigating his tiny vessel through fog and ice, passing through the narrow gap between Cape Wolstenholme and Cape Digges (named for his patrons). He descended the E shore into desolate JAMES BAY, tacking to and fro in a futile search for an opening to the Spice Islands. He beached the *Discovery* and spent a bleak winter, likely by the Rupert R. Resentment among his crew broke into mutiny in the spring when Hudson announced his intention to continue the search. The leaders, Henry Greene, Robert Juet and William Wilson, forced Hudson, his son and 7 others into a shallop and cut it adrift in the open sea. Robert Bylot piloted the *Discovery* home. Greene and Wilson were killed by natives at Cape Digges; Juet died of starvation. Four of the 9 survivors were tried for murder but acquitted — saved as much by mercantile interest in their knowledge of the Northwest as by the blame laid on the dead. Nothing is known of Hudson's fate. He did not discover Hudson Str — both Frobisher and Davis had noted its entrance — but in navigating its treacherous course he far outdistanced his predecessors and discovered a route to the continent's interior of inestimable value to England.

However, his favouritism and weak leadership vitiated his accomplishment. The quaint, contentious account by Abacuk Prickett, a survivor, is the sole record of the voyage and mutiny.

JAMES MARSH

**Hudson Bay**, 637 000 km<sup>2</sup>, is an immense inland sea that penetrates deeply into north-eastern Canada. It is virtually landlocked but is joined to the Arctic Ocean to the N by Foxe Channel and Fury and Hecla Str, and to the Atlantic Ocean on the E by HUDSON STR. Baffin I lies athwart the entrance to the bay, and Southampton, Coats and Mansel islands are lodged across the northern gap. The W coast is devoid of islands, but lying off the E is a string known as the Sleepers, Ottawa, Nastapoka and BELCHER groups. The maximum length of the bay is 1500 km and its greatest width 830 km. The bay, including Hudson Str, is fed by numerous rivers, large and small, including, from W to E, the KAZAN, THELON and DUBAWNT, flowing into the bay via Chesterfield Inlet; HAYES, NELSON and CHURCHILL on the W; WINISK and SEVERN in the SW; Grande, EASTMAIN, Nottaway, Moose and Abitibi, ALBANY, ATTAWAPISKAT and Nastapoka flowing into James Bay; and KOKSOAK flowing into Ungava Bay. The total area of the Hudson Bay drainage is about 4 million km<sup>2</sup> and the mean discharge of all the rivers flowing into it is 30 900 m<sup>3</sup>/s — greater than those discharging into the Atlantic and Pacific oceans combined.

The bay lies in a huge saucer-shaped basin, fringed by uplands of the Canadian SHIELD. The basin was inundated by seawater after the retreat of GLACIATION some 7500 years ago. The bay is generally shallow, and the land is rising steadily at around 60 cm per 100 years because of isostatic uplift, exposing more and more of the coast. The surrounding Hudson Bay Lowland (see PHYSIOGRAPHIC REGIONS) is a low plain, locked in PERMAFROST and characterized by marshes, peat and innumerable ponds. Much of the hydroelectric potential of the area develops at the point where powerful rivers surge out of the Shield on to the lowlands. An almost unnatural feature of the E coast is the great, semi-circular bight, centering on the Belcher Is, which it has been suggested was caused by a stupendous meteor strike. The W coast is generally without indentation, low and bleak up to Eskimo Pt, and increasingly broken and indented farther N, particularly at the great gashes of Chesterfield Inlet and Rankin Inlet. The shores are mostly covered with brush, aspen, willow and dwarf birch growing among moss, lichen and grass. Cliffs of ancient sedimentary rocks are found at points on the E coast.

The climate of the region depends largely on the water surface. In Jan and Feb the bay is covered with pack ice, preventing any warming effect on the air, and temperatures are consequently very low. The ice begins to melt in May and rapidly disappears in June, when cloudiness and fog increase. The water temperature rises up to 10°C in July and Aug as a result of the influx of fresh water. During Oct and Nov the waters of the bay yield heat and moisture, bringing showers of rain and snow. Fog is most frequent in June, July and Aug, as warm air cools over the colder water. Winds are strong in all but the summer months and rise to 110 km/h and even 150 km/h in autumn. Hudson Bay contains great quantities of nutrient salts and small CRUSTACEANS occupy the open waters, providing food for molluscs, starfish, sea urchins, worms and other invertebrates. Cod, halibut, salmon and polar plaice are the most common fish. Walrus, dolphins and killer whales live in the northern regions and polar bears migrate S to hunt seals among the ice. Some 200 species of birds, including ducks, snow geese, gulls, swans, sandpipers, owls and crows gather on the coasts and islands.

Archaeological evidence has shown that the shores of the bay have been occupied for thousands of years. Many of the excavated campsites are far from the present, receding coastline. At the time of the appearance of Europeans, Algonquian groups inhabited the area around James Bay and Chipewyan groups the Churchill area, and Inuit groups were found on the N and E coasts. NORSE seafarers possibly found, and even colonized, the bay, but if so their discovery was forgotten. Martin FROBISHER mistakenly sailed into Hudson Str in 1578 but Henry HUDSON was the first European we know to have braved the dangers of the strait and sailed into the bay (1610). He was followed by BUTTON (1612), Bylot and Foxe (1631) and JAMES (1631) in a futile search for a passage to the Orient. The voyages were perilous, often disastrous; in 1619 only 3 members of Jens MUNK's expedition survived. The mutiny of Hudson's crew passed into exploration mythology. The journals of Luke Foxe found their way into Coleridge's harrowing tale, "The Rime of the Ancient Mariner." The W coast was not mapped until the 1820s and the first detailed investigation was carried out from 1929 to 1931.

The bay played a crucial role in the early development of Canada after it was realized that it provided a direct route to the fur resources of the Northwest. In 1668 DES GROSEILLIERS, in the service of the English, sailed into the bay and built a small post at the mouth of the Rupert R. In 1670 RADISSON founded what later became YORK FACTORY at the mouth of the Nelson R, and the trading rights to the entire watershed of the bay were granted to the HUDSON'S BAY CO. Posts were later built at the mouths of the Moose and Albany rivers and drew Indian traders from a vast area of the Shield, with the CREE playing an important middleman role. From 1682 to 1713, the French made a determined effort to rout the English from the bay. Temporary successes were achieved by de TROYES overland (1696) and IBERVILLE in several expeditions by sea. However, after the TREATY OF UTRECHT in 1713, the bay was firmly in the hands of the English, and after the HBC merger with the NORTH WEST CO in 1821, it became the primary route to the interior. On the transfer of RUPERT'S LAND to Canada in 1869, sovereignty over the bay and its watershed passed to Canada. Since that time it has ceased to play an important role as a transportation route and it has been sparsely populated. The primary occupants continue to be Indian and Inuit bands, living by fishing and hunting. The 2 largest settlements are CHURCHILL, Man (pop 1200), at the mouth of the Churchill R, and MOOSENEE, Ont (pop 1400). Both are connected by railway to the interior, but their potential as saltwater ports is more often talked about than exploited. The bay remains much as it has been designated for conservation purposes — a *mare clausum* ("closed sea").

JAMES MARSH

**Hudson Bay Railway** Two of western Canada's earliest railway charters, granted in 1880, authorized construction, with government help, of railways paralleling old water transportation routes to Hudson Bay. The projects were amalgamated in 1883 and the first 64 km built northward into the Manitoba interlake region. Financial problems and a political scandal led to the abandonment of the original mileage in 1888, and the subsequent absorption of the charter by the CANADIAN NORTHERN RAILWAY. The Canadian Northern, with government aid designated for the Hudson Bay Railway, built a new northwesterly line from Winnipeg to Hudson Bay Junction as part of its east-west system. The Canadian Northern refused to build north of Hudson Bay Junction without further massive government assistance.

In 1909 the federal government undertook rail construction north of Hudson Bay Junction

and improvement of harbour facilities at the proposed terminus of Nelson. During WWI work was suspended, and in 1923 the project became a part of CANADIAN NATIONAL RAILWAYS. Construction advanced only slowly and at great expense, particularly when Nelson was abandoned and the line deflected to the more northerly port of CHURCHILL. The railway opened officially on 10 Sept 1929 as the Hudson Bay Railway. Total cost exceeded \$45 million. Intended as a grain road, the railway was a disappointment until mineral discoveries around The Pas and Thompson, Man, generated larger traffic volumes.

T.D. REGEHR

**Hudson Strait**, arm of the sea connecting the Atlantic Ocean with HUDSON BAY and Foxe Channel and separating BAFFIN I from the Ungava Peninsula of Québec. The eastern gap is between Cape Chidley, at the northern tip of Labrador, and Resolution I. There are 250 km of open sea across UNGAVA BAY and the strait trends NW from Cape Hopes Advance to Cap de Nouvelle-France and then westerly to Cape Wolstenholme. Across the western gap is a group of 3 islands: Mill, Salisbury and Nottingham. The strait is never completely frozen over, and open water adds heat and moisture to the air, creating precipitation, cloud and fog. Resolution I is one of the foggiest places on Earth, with fog reported an average of one day in 2. The "insurance date of entry" into the strait is July 23, but ICE-BREAKERS extend the sailing season.

Hudson Str provides access by sea to the heart of Canada and has been used commercially for 3 centuries, chiefly in connection with the FUR TRADE. Hudson's Bay Co vessels have used it since 1670. Navigation of the strait is not intricate; the route is wide and free from shoals. However, fog, current and the tidal stream made it tricky for early sailing vessels. The NORSE almost certainly knew the route. Martin FROBISHER mistakenly entered the strait in 1578, but Henry HUDSON — for whom it is named — was the first European known to have explored it and followed it into the bay. JAMES MARSH

**Hudson's Bay Company**, chartered 2 May 1670, the oldest incorporated joint-stock merchandising company in the English-speaking world. Formerly headquartered in London, Eng; since 1970 its head offices have been located in Winnipeg. The HBC is the largest retailer in Canada, operating nearly 600 stores in 3 retail groups: The Bay, SIMPSON'S LIMITED and Zeller's. It is a major wholesaler through Hudson's Bay Wholesale, and still one of the largest FUR-TRADE companies in the world. The HBC also has extensive interests in natural resources through major investment in Roxy Petroleum. It is actively involved in REAL-ESTATE development through Markborough Properties.

*York Fort, Hudson's Bay (1821), watercolour by Peter Rindisbacher. The fort was long the main depot of the HBC (courtesy Picture Division, Public Archives of Canada/C-1918 2-1-18).*

Médard Chouart DES GROSELLIERS and Pierre-Esprit RADISSON were the first to propose a trading company to reach the interior of the continent via HUDSON BAY. After failing to obtain French support on their terms, in 1665 they went to England and interested Prince Rupert, cousin of Charles II. Rupert persuaded the king and some merchants and noblemen to back the venture. The first ships, the *Eaglet* and the *NON-SUCH*, were dispatched in 1668 and the royal charter was proclaimed on 2 May 1670. The "Governor and Company of Adventurers" were granted wide powers, including exclusive trading rights in the territory traversed by rivers flowing into Hudson Bay. This vast region was named RUPERT'S LAND.

Unlike most contemporary trading concerns, the HBC evolved as a joint-stock company with a centralized bureaucracy. At the annual General Court, shareholders elected a governor and committee to organize fur auctions, order trade goods, hire men and arrange for shipping. They appointed a governor to act on their behalf in the bay area. Each post was commanded by a chief factor (trader) and his council of officers. The London governor and committee set all the basic policies implemented in Rupert's Land, basing their decisions on annual reports, post journals and account books supplied by the officials on the bay.

Until 1763 the HBC struggled with the French for control of the fur trade of southern Rupert's Land. In the early years a series of naval and land battles took place on Hudson and James bays. In 1713, by the TREATY OF UTRECHT, France acknowledged England's claim to Hudson Bay. For the next 60 years the HBC erected posts only at the mouths of major rivers flowing into the bay, with the single exception of Henley House, a small outpost erected in 1743 on the Albany R, 200 km from the coast. After the TREATY OF PARIS (1763) the company's French rivals were replaced by a much more formidable opposition, the Montréal-based overland trade network taken over by the British. By 1774 HBC trade had been undercut enough that the governor and committee embarked on an aggressive policy of inland expansion beginning with the building of CUMBERLAND HOUSE on the lower Saskatchewan R. Intensive competition with the NORTH WEST COMPANY spilled beyond Rupert's Land into the Mackenzie drainage basin and the Pacific slope, combining economic conflict with occasional physical violence (see SEVEN OAKS INCIDENT). In 1821 a merger of the 2 parties was arranged, and the British Parliament confirmed and extended the company's monopoly privileges to include the North-West Territories.

The bringing together of different business traditions required changes in the administrative structure of the new company. BRITISH NORTH AMERICA was divided into trading departments which were then subdivided into districts. District managers met annually in departmental council meetings presided over by the governor in N America, a post held 1826-60 by Sir George SIMPSON. These councils passed regulations governing local trade, determined the deployment of men and posts and established the logistical requirements of the various districts. The officers had a vested interest in these concerns since they shared in the profits of the trade according to the terms set out in deed polls in 1821, 1834 and 1871. Council members theoretically had an equal voice and vote, but Simpson had considerable power, and the London governor and committee could overrule council decisions.

After 1821 a group of independent free traders among the Métis population at the RED RIVER COLONY opposed the company's monopoly rights, which had been renewed by Parliament for another 20 years in 1838. The issue culminated in the famous Sayer trial of 1849, in which Pierre-Guillaume Sayer was tried and convicted of

trading with the Indians in violation of the company's legal privileges. Fearing a Métis riot, however, the court did not pass sentence. The decision effectively opened the trade of southern Rupert's Land to many small-scale competitors.

Although the company's primary concern remained the fur trade, it became increasingly involved in providing government for settlers in the Red River Valley and on Vancouver I. Between 1812 and 1834 the governors of ASSINIBOIA were agents of the SELKIRK estate, although they were overshadowed by the HBC. In 1834 the company resumed jurisdiction and, until transfer to Canada, provided the Selkirk colony's government. In 1849 Britain granted to the HBC the colony of Vancouver's I, which was to be developed as an agricultural settlement. In 1851 Chief Factor James DOUGLAS was appointed governor. In 1858, following the discovery of gold, the mainland colony of British Columbia, including most of present BC, was created out of NEW CALEDONIA. Douglas was required by the British government to resign his HBC commission before becoming governor of BC. In this way the company began to relinquish its colonial responsibilities.

In 1863 the International Financial Society bought controlling interest in the HBC, signalling a shift in the company's outlook: most of the new shareholders were less interested in the fur trade than in real estate speculation and economic development in the West. Negotiations conducted with the COLONIAL OFFICE and, after 1867, with the Canadian government eventually resulted in the sale of Rupert's Land to Canada in 1870. As part of the agreement the company received £300 000 and one-twentieth of the fertile areas to be opened for settlement. In addition, it retained title to the lands on which it had built trading establishments. The terms of the agreement strongly influenced company development after 1870. By retaining large landholdings on the prairies and the parcels adjacent to its posts, many of which were located in developing urban centres in the West and North, the HBC was able to become one of the most important developers in western Canada. Since the 1874 establishment of the Land Commissioner's Office, the company has continued to be a major real-estate developer, acquiring control of Markborough Properties in 1973.

Involvement in natural-resource development stemmed naturally out of the HBC's fur-trade and real-estate activities. In 1926 it co-founded Hudson's Bay Oil and Gas, and in 1973 acquired 35% of Siebens Oil and Gas. In 1979 it disposed of the latter and in 1980 bought controlling interest in Roxy Petroleum. In 1982 the HBOG investment was sold to Dome Petroleum.

As economic development in the PRAIRIE WEST accelerated after 1870, the company did an increasing amount of business with settlers. Initially most of this activity was carried on at its trading posts. Since it differed in many respects from the Indian trade, separate sales shop accounts were kept. From this modest beginning the HBC's retail and wholesale divisions eventually emerged, with outlets entirely separate from the fur trade. Expansion was augmented by the 1978 acquisition of controlling interest in the Simpsons and Zeller's retail chains. In 1983 HBC had some 279 Bay and northern stores, 23 Simpsons stores, 181 Zeller's stores and 58 wholesale branches. With 44 000 employees it had sales or operating revenue of \$4.37 billion (ranking 13th in Canada) and assets of \$980 million (ranking 87th). Since 1972 most of the Bay's senior officers have been located in Toronto, although official headquarters remain in Winnipeg.

ARTHUR J. RAY

Reading: E.E. Rich, *The History of the Hudson's Bay Company 1670-1870* (3 vols, 1960) and *The Fur Trade and the Northwest to 1857* (1967); Douglas Mackay, *The Honourable Company* (1966).

**Hudson's Bay Record Society**, est 1938 by the HUDSON'S BAY CO to publish selections from its extensive company records accumulated since 1670. The idea of forming such a society originated in the late 1920s, but it had to be abandoned during the Depression of the 1930s. Under an agreement with The CHAMPLAIN SOCIETY, 12 volumes appeared, 1938-49. Thereafter the publications became the sole responsibility of the London-based HBC. Since 1960 the volumes have been published biennially; they are available only to the approximately 1150 members. The society's headquarters was transferred to Winnipeg in 1974, and the following year Hartwell Bowsfield of York U became the first Canadian general editor. By 1983, 33 volumes of minutes, correspondence and journals of trade and exploration dating from 1671 to 1889 had been published. Of special interest is the 2-volume history of the HBC written by E.E. Rich of Cambridge U, the society's editor for the first 22 years.

SHIRLEE ANNE SMITH

**Hughes, Edward John**, painter (b at N Vancouver 17 Feb 1913). A realist landscape painter, he has produced work that is as unique an expression of BC's geography as is that of Emily CARR. He studied under F.H. VARLEY and Jock MACDONALD at Vancouver's School of Decorative and Applied Arts 1929-34. With colleagues from the art school, he established a commercial art firm which executed pencil portraits and designs for calendars and posters, and did several mural commissions. Hughes enlisted in the army in 1939 and was appointed a war artist in 1940, in that post producing about 1600 works. During these years, his style became more decorative and expressive, influenced by his study of Mexican artists and the French primitive painter Henri Rousseau. Hughes returned to Victoria after the war and tried unsuccessfully to make a living as a landscape painter. In 1951 he moved N to Shawnigan Lk and signed a contract with Max Stern of Dominion Gallery, Montréal.

Hughes's love of privacy has kept him in seclusion on Vancouver I. Though concentrating on scenes of southeastern Vancouver I, Hughes has produced paintings of the BC interior, Alberta and major Canadian cities. He usually includes people or evidence of a human presence in the landscape — ships, boats or buildings. *Dawson's Landing, River's Inlet* (1963) is typical of his mature style with its balanced composition and clear, strong colours. His drawings range from light landscape sketches to highly finished graphite studies and elegant pencil portraits.

JANE YOUNG

Reading: Jane Young, *E.J. Hughes 1931-1982* (1983).

**Hughes, James Laughlin**, educator, author (b near Bowmanville, Ont 20 Feb 1846; d at Toronto 3 Jan 1935), elder brother of Sir Sam HUGHES. Educated at Toronto Normal School, he became principal of its associated Model School at age 24. In 1874 he was appointed inspector of public schools for Toronto, and later chief inspector, a position he held until his retirement in 1913. During these years Hughes adapted Toronto's public schools to the demands of an emerging urban-industrial order, increasing pupil attendance, improving the quality of instruction, introducing kindergartens and manual-training classes. In the 1890 provincial election he was defeated as the EQUAL RIGHTS candidate in Peel constituency. Throughout his life he was active in the Orange Lodge, the Methodist church and Toronto athletic organizations. He wrote a number of educational books, including *Froebel's Educational Laws* (1898) and *Dickens as an Educator* (1900), plus several volumes of poetry, including *Songs of Gladness and Growth* (1915) and *In Nature's Temple Shrines* (1921).

ROBERT M. STAMP

**Hughes, Monica**, née Irse, author (b at Liverpool, Eng 3 Nov 1925). After a childhood in Cairo, education in London and Edinburgh, and 2 years in Rhodesia [Zimbabwe], Hughes immigrated to Canada in 1952 and began writing professionally in 1971. Winner between 1980 and 1984 of 7 major Canadian awards for literature, she is best known for her young-adult science-fiction and contemporary novels. Underlying exciting plots are serious treatments of such Canadian themes as survival in hostile environments, exploitation of resources by multinationals, and the distinctive features of Canadian minorities. Hughes has portrayed contemporary Inuit, Cree, Blackfoot and Alberta Hutterite communities. Her heroes and heroines are always psychologically credible: whether in contemporary or exotic settings, they are realistic adolescents struggling towards maturity and social responsibility. **GERALD J. RUBIO**

**Hughes, Sir Samuel**, teacher, journalist, soldier, politician (b at Darlington, Canada W 8 Jan 1853; d at Lindsay, Ont 24 Aug 1921). A Conservative and an enthusiastic supporter of Sir John A. Macdonald's NATIONAL POLICY, Sam Hughes was elected to Parliament for Victoria North in 1892. Vain, colourful, charming and splenetic, Hughes made a 30-year public career of politics and militia service. A longtime proponent of the volunteer militia and the imperial connection, he helped force PM LAURIER to send Canadian troops to the SOUTH AFRICAN WAR in 1899. Hughes was dismissed from that war for military indiscipline and public exposure of incompetent British generalship. These experiences produced a Canadian nationalist slant to Hughes's imperialist leanings. By 1911, with years of solid caucus and parliamentary service — including 10 years as Opposition militia critic — and personal loyalty to R.L. BORDEN behind him, Hughes won the militia portfolio in Borden's new government. Hughes promoted citizen-soldiers over professionals (to the latter's detriment), and preached the social value of military training and national preparedness.

Early in WWI, Hughes was hailed as the genius of the war effort. Unfortunately, favouritism, confused civil-military functions, disrespect of Cabinet, administrative incompetence and scandals like the Ross rifle fiasco (see ARMAMENTS) forced Borden to fire Hughes in Nov 1916. He died in 1921, a reluctant and sometimes bitter Conservative-Unionist MP for Victoria-Haliburton. Although Hughes was a sincere Canadian and a successful constituency politician, his erratic talents never matched the demands of high office during total war.

**RONALD G. HAYCOCK**

**Hughes, Stanley John**, mycologist (b at Llanelli, Wales 17 Sept 1918). A naturalized Canadian, Hughes worked as an assistant mycologist, Commonwealth Mycological Institute, Kew, Eng (1945-52), and in 1952 joined Agriculture Canada in Ottawa as a research scientist. Hughes initiated a new era in the systematics of conidial fungi by focusing attention on the mechanisms of spore ontogeny. He has also contributed an elegant taxonomic analysis of the "sooty-mold" complex. He received the Jakob Eriksson Gold Medal, Swedish Academy of Science, 1969, and the George Lawson Medal, Canadian Botanical Assn, 1981. In 1975 he was president of the Mycological Soc of America, and from 1971 to 1983 VP of the Intl Mycological Assn.

**K.A. PIROZYNSKI**

**Huguenots**, a popular term used since 1560 to designate French Protestants, some of whom became involved in the Newfoundland fishery and Canadian fur trade, and in abortive colonization attempts in Canada (1541-42), Brazil (1555) and the Carolinas (1562-64). The Edict of Nantes (1598), granting limited toleration, enabled Pierre Chauvin and the Sieur de Monts

Federal government building complex at Hull, Qué. Ottawa, Ont, is located across the river (top of photo) (photo by Jim Merrithew).

to found bases at Tadoussac (1600) and PORT-ROYAL (1605), and Reformed pastors to serve fishermen and sailors. Missionary work was restricted to Roman CATHOLICS, however, and after 1627 in Canada and 1659 in ACADIA neither Protestant worship nor Protestant teaching was permitted. A trickle of Protestants came to Canada as merchants, soldiers, indentured servants and even FILLES DU ROI. Under British rule the term "French Protestant" came into use, and Huguenot immigration to Nova Scotia and recruitment of Channel Island pastors for Québec were encouraged.

In 1834 the independent Lausanne Missionary Society established a centre at Grande-Ligne, Lower Canada. In 1839 the French Canadian Missionary Society was organized in Montréal, and in 1846 a Bible college was established at Pointe-aux-Trembles, and the publication *Le Semeur canadien* was launched in 1853. The Montréal Presbyterian College, est 1867, assured the training of French Reformed clergy after 1880. In 1875 a synod was called to organize a national Reformed church, but the scheme was abandoned in 1877 in favour of independent local congregations. Although the Grande-Ligne missions joined the BAPTISTS, many French Protestants affiliated with the PRESBYTERIANS, eventually to become francophone congregations of the UNITED CHURCH OF CANADA. **CORNELIUS J. JAENEN**  
Reading: Marc-André Bédard, *Les Protestants en Nouvelle-France* (1978); Cornelius J. Jaenen, *The Role of the Church in New France* (1976).

**Hull**, Qué, City, pop 56 225 (1981c), inc 1875, is located on the N shore of the OTTAWA R. W of the Rivière Gatineau, across from OTTAWA. Part of the National Capital Region (NCR) and of the Communauté régionale de l'Outaouais (CRO), it is the hub of the AYLMER-HULL-GATINEAU urban area and the regional capital of western Québec, commonly called the Outaouais.

**History** Prior to the arrival of Philemon WRIGHT from Woburn, Mass, in 1800, Hull shared a common history with all the areas along the Ottawa R, which was the primary water route to the West. Explorers, missionaries, fur traders and the military of the French and English regimes used the portage paths that crossed Hull. One of these, the Second Chaudière Portage, situated in Brébeuf Park, still shows the crudely hewn stone steps built there by the VOYAGEURS. Hull was the first permanent town established on the Ottawa R. Wright and his associates were given ownership of large tracts of land in Hull and Templeton townships. The small agricul-

tural community, called Wrightstown, quickly turned to the production of squared timber for the British market. The first lumber raft from the area, the "Colombo," reached Québec City in 1806, heralding the beginnings of the lumber industry in the Ottawa Valley.

Ezra Butler EDDY, a citizen of Vermont, settled in Hull in 1851 and built up his equity by manufacturing handmade matches, washboards and clothespins. In the 1870s he became one of the leading sawmill operators at the Chaudière Falls. His match and indurated fibreware production, as well as his pioneering efforts in pulp (1889) and paper manufacture (1890), made Hull one of the main centres of the pulp and paper industry. Axe factories, meat-packing establishments, textile firms and other related industries followed. This industrial development attracted numerous French Canadian workers to Hull and radically changed its ethnic and religious composition. From 1861 to 1871, Hull Township's French-speaking population increased tenfold (from 420 to 4461) while its English-speaking population grew by less than 20% (3291-3857). Today, 88% of Hull's citizens have French as their mother tongue, 7% English and 5% Portuguese and other languages. Some 97% are Roman Catholic.

On its incorporation in 1875, the town was renamed Hull after a city in Yorkshire, Eng.

**Economy** The Hull economy, essentially based on manufacturing in the 1940s, has changed radically. The majority of its labour force are now white-collar workers, with civil servants forming the largest bloc. The change began after WWII, with the closing of steel foundries and textile factories. The Trudeau government's decision to relocate a large number of federal civil servants in Hull has accelerated the rate of change. Linked to the economy of its sister city, Ottawa, and labouring under the weight of Québec's heavier regulations and taxes, Hull has had to fight hard to grow.

**Cityscape** The city of Hull covers somewhat more than 30 km<sup>2</sup>; its core is an island linked to Ottawa by 4 bridges. It has been shaped by its original division into half lots by the Wrights, for rental purposes, and by the Great Fire of 1900, which destroyed two-thirds of the town. In the early 1960s it was a typical medium-size industrial Québec town, with 2-storey brick worker dwellings surrounding a few public

parks and buildings, linked together by its business section. As fire, demolition and renovation took their toll, the main public landmarks fell, the city core was changed radically and large developments — Place du Portage and Terrasses de la Chaudière — were built. The city extended into suburbia, with typical bungalows and shopping centres, and the old business section started to decline. Hull's population fell from 63 580 in 1971 to 56 225 in 1981, while that of its suburban sister cities (Gatineau and Aylmer) swelled from a combined 72 163 in 1981 to 101 683 in 1981.

Hull's cultural and social life is closely linked to that of Ottawa, Gatineau and Aylmer. It offers services that do not exist in the surrounding Québec municipalities, such as Université du Québec à Hull, the Conservatoire de musique de l'Outaouais, the Centre régional des Archives nationales du Québec, the Palais des Congrès convention centre and the Théâtre de l'Île. It is well served by radio, TV and newspaper, though some of these are based in Aylmer, Gatineau and Ottawa. Many Hull residents attend University of Ottawa, and Carleton and St-Paul universities. Two festivals highlight Hull's yearly calendar of events: the Festival international de la bicyclette (May) and Hull en août (August). The city is the gateway to Gatineau Park (administered by the NATIONAL CAPITAL COMMISSION), giving access to lakes, parks and 40 km of cycling paths.

PIERRE-LOUIS LAPOINTE

**Hull, Robert Marvin**, hockey player (b at Pointe Anne, Ont 3 Jan 1939). He played junior hockey in Hespeler [Cambridge], Woodstock and St Catharines and joined Chicago Black Hawks in 1957. Though he scored only 31 goals in his first 2 seasons, Hull developed a fearsome slapshot (clocked at 187 km/h) and went on to become the highest-scoring left-winger in hockey history. His nickname "Golden Jet" aptly described him in motion, and his speed, power and drive epitomized the sport of hockey. He led Chicago to its first STANLEY CUP victory in 23 years (1960/61), dramatically equalled the record of 50 goals in a season (1961/62) and raised it to 54 (1965/66) and 58 (1968/69). He won the ART ROSS TROPHY 3 times, HART TROPHY twice and LADY BYNG TROPHY once, scoring 610 goals and 1170 points in 15 NHL seasons. In 1972 he accepted \$1 million to jump from the NHL to the WINNIPEG JETS, giving immediate credibility to the fledgling WORLD HOCKEY ASSN. He continued his prolific scoring, with 77 goals in 78 games in 1974/75, adding 303 goals and 638 points to his totals. He attempted a comeback in 1980-81 with NY Rangers but was released in training camp.

JAMES MARSH

**Human Rights**, claimed by individuals and groups, are considered so fundamental to human dignity that they receive special protection under the law and usually under the constitution of a country. They differ from CIVIL LIBERTIES, which refer to traditional Western values, eg, freedom of religion and expression, in that they are more substantive than procedural. The distinction was even more crucial in Canada before the entrenchment of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS; rights were defended by law, but liberties were merely tolerated and could be removed by government. After WWI, and more particularly after WWII, it became apparent that other needs basic to human dignity were not being met through civil-liberties legislation. To protect those who suffered discriminatory treatment from private persons, groups or governments or who suffered economic deprivation because of loss of health or job, legislatures would have to enact laws to forbid discrimination, to provide administrative assistance to victims of discrimination and to provide compensation for injury or loss of employment to the economically deprived. When

these needs are recognized as fundamental by law or under a constitution, they are called human rights. A series of treaties after WWI imposed upon several European countries the obligation for the protection of racial, religious and national minorities and authorized the LEAGUE OF NATIONS to supervise the execution of these obligations. In 1948 the UNITED NATIONS General Assembly proclaimed the Universal Declaration of Human Rights as the "common standard of achievement for all peoples and all nations to the end that every individual and every organ of society, keeping this declaration constantly in mind, shall strive by teaching and education to promote respect for these rights and freedoms, and by progressive measures national and international, to secure their universal and effective recognition and observance." Included were the fundamental freedoms and legal rights (known internationally as civil and political liberties or rights), as well as those of equality, and economic, social and cultural rights. The declaration was accepted by unanimous vote, with the 6 members of the Soviet bloc, Saudi Arabia and the Union of S Africa abstaining. In 1966, the 1948 declaration became 2 binding covenants — the International Covenant on Civil and Political Rights and the International Covenant on Economic, Social and Cultural Rights. Canada ratified both covenants in 1976 (with the unanimous consent of the provinces) and they are now binding upon Canada in INTERNATIONAL LAW. Canada also ratified the Optional Protocol to the Civil and Political Rights Covenant, and every individual in Canada can now complain to the Human Rights Committee if a Canadian government is not meeting covenant requirements.

The human rights of equality have only recently been proclaimed in Canada. Before the British Emancipation Act of 1833, SLAVERY was practised in the colonies, and after Confederation discriminatory laws were enacted to discourage the immigration of nonwhites (see IMMIGRATION POLICY). Those who had already entered or continued to do so despite the restrictions, as well as native peoples, were subject to laws placing them in segregated schools, denying them the franchise, restricting their entry into professions and certain types of employment, restricting their areas of residence, prohibiting their consumption of alcohol and even denying them equal access to public facilities. In the 19th century, women and children were treated as chattels; property rights were restricted (see MURDOCH CASE), and the male head of the family could disinherit his wife and children in his will. Women could not vote in federal elections until WWI, and in all provincial elections until 1940. Women were not considered "persons" eligible for appointment to the Senate until 1932. By WWII most laws restricting rights of women and children were changed, but racist laws and those denying the franchise to native people were not altered until after the enactment of the CANADIAN BILL OF RIGHTS in 1960. The history of the Bill of Rights reveals how recently, in Canada, the concept of human rights has been expanded to include minority rights. The result of 2 petitions submitted to Parliament by the JEHOVAH'S WITNESSES, many of whom were arrested in Québec during the 1940s, the Bill was championed by John Diefenbaker, who had been a strong defender of the Witnesses during WWII. The Bill of Rights was not entrenched, however, and could be amended in Parliament by the normal legislative process. Moreover, it applied only to the federal jurisdiction.

Although Saskatchewan had had a Bill of Rights since 1947, fair-accommodation and fair-employment-practices Acts were enacted throughout Canada only after 1951, followed by equal-pay Acts for women. In the 1960s the provinces started to consolidate fair-prac-

tices statutes into comprehensive human-rights codes, administered and enforced by permanent human-rights commissions. By 1975 every province had done so. The federal Canadian Human Rights Act and Commission were created in 1977. Alberta, Saskatchewan and Québec also provide protection for the fundamental freedoms, and Saskatchewan and Alberta added limited legal-rights protections in their Human Rights Code and Bill of Rights. The Québec Charter of Rights and Freedoms (1975) provides for extensive legal-rights protections, and even proclaims certain economic and social rights.

The Constitution Act, 1982, not only provides for future amendment of all Constitution Acts to be made in Canada, but includes the Canadian Charter of Rights and Freedoms guaranteeing fundamental freedoms, democratic rights (of participation in elections), mobility rights (to and from and within Canada), legal rights, equality rights (including equal rights of men and women, and protection of the multicultural heritage of all Canadians), language rights (and minority-language education rights), as well as the right to enforce these. But although the Constitution is "the supreme law of the land" and "any law that is inconsistent with the provisions of the Constitution is, to the extent of the inconsistency, of no force or effect," the adoption of the Charter does not of itself guarantee human rights. Although its primary purpose is to restrain government action through judicial enforcement, the scope of civil liberties such as freedom of expression will not be known for some time. To what extent is censorship inconsistent with the Charter? Is obscenity a valid basis for restricting freedom of expression? When is it reasonable to limit freedom of assembly for reasons of public security or order? Are actions taken under the WAR MEASURES ACT a reasonable restriction on civil liberties? These questions can only be answered by the courts. However, because section 33 of the Charter permits any government to enact laws "notwithstanding the Charter," a majority government wanting to do so must be restrained through the combined action of individuals, public-interest groups, political parties, the media and members of the legislature.

Many human rights are better promoted through administrative agencies than through the courts. In addition to creating human-rights commissions, most Canadian jurisdictions have established the institution of the OMBUDSMAN, to which people can complain against unfair exercise of valid discretionary power, or failure to exercise it. To protect cultural rights, government funds have to be expended. This is particularly true with economic and social-welfare rights, which require positive government action rather than judicial restraint.

WALTER S. TARNOPOLSKY

**Humane Societies** are societies for the prevention of cruelty to animals (SPCA). Following a long struggle by Richard Martin, British landowner and parliamentarian, and others to secure legislation against cruelty to children and livestock, the first SPCA was begun in England in 1824. Although Martin was a founding member, the organization was formed by the Rev Arthur Broome, an Anglican clergyman, and Lewis Gompertz, a Jewish author. At Queen Victoria's command, the society became known as the Royal Society for the Prevention of Cruelty to Animals in 1840. The RSPCA was the forerunner of the Children's Aid Society.

The humane or animal-welfare movement was introduced to N America by Henry Bergh. Following a visit to the RSPCA, he organized the American SPCA in New York in 1866. In the same year the first law for the protection of animals was passed. The first humane society in Canada was the Canadian SPCA in Montréal (est

1869). Societies were soon established in Québec (1870), Ottawa (1871) and Toronto (1873). Humane societies now exist in major Canadian cities and in some 75 municipalities throughout the provinces. All are nonprofit, charitable organizations; most operate shelters, which take in lost and abandoned animals (mostly cats and dogs). They are often also responsible for municipal animal-control activities. Many operate under provincial SPCA or Animal Protection Acts, with authority to investigate complaints of cruelty to animals and to lay charges where necessary. Society inspectors may use the Cruelty to Animals Section of the Criminal Code of Canada. They may not carry firearms but may, with court permission, remove suffering animals from the possession of their owners.

As the number of SPCAs involved in animal-welfare work at the provincial and municipal levels increased, so did the need to respond collectively to problems of national scope, eg, transportation and slaughter of food animals. Thus, in the mid- to late-1950s Dr A.E. Cameron, a retired veterinary general of Canada, Lieutenant-Colonel Richard Taylor, president of the Ottawa Humane Society, Senator F.A. McGrand and K. Switzer, managing director of the Ottawa Humane Society, organized meetings to discuss formation of a national SPCA. The Canadian Federation of Humane Societies received its federal charter in 1957 and has its headquarters in Ottawa. It is an umbrella group for 38 autonomous member societies across Canada; most are SPCAs but other organizations concerned with specific animal-welfare issues are included. CFHS does not engage in the daily activities of shelter operations, but addresses issues that have broader implications. CFHS interacts with 10 federal government departments having jurisdiction, in some way, over national, international and interprovincial aspects of man's use of animals (see VETERINARY MEDICINE).

NEAL R. JOTHAM

**Humber River**, 153 km long, drainage basin 7680 km<sup>2</sup>, is the principal river of western Newfoundland. Named for the English river, it rises in the LONG RANGE MOUNTAINS W of White Bay and flows SE and then SW to Deer Lk, where it is joined by a tributary draining 100 km long Grand Lk. The Humber flows SW from Deer Lk into Humber Arm at CORNER BROOK and on into the Bay of Islands, having fallen nearly 660 m from its sources. The river is rich in ATLANTIC SALMON and was, from the 1800s, a waterway for European trappers. Though its mouth had been charted by James Cook in the 1760s, there was little permanent settlement in the region until the mid-1800s. Flowing through great stands of timber, the Humber has been used by loggers since the late 1800s.

ROBERT D. PITT

**Humboldt**, Sask. Town, pop 4705 (1981c), inc 1907, is located at a CNR-CPR junction, 105 km E of Saskatoon. Founded on the arrival of the Canadian Northern Ry (1904), it assumed the name of a nearby Dominion Telegraph Line office named for German scientist Alexander von Humboldt. Its designation as a railway divisional point fostered growth, as did the establishment of St Peter's Colony (50 townships) by German-American RC settlers (1903). Situated on the black soil of the aspen parkland in a relatively risk-free crop area, Humboldt became the colony's largest centre and is now the province's largest town. While certain early commercial enterprises such as wholesale grocers and a tannery have disappeared, others (eg, a flour mill) still operate, and the town continues to grow as a service centre. It is also a judicial and administrative centre of some consequence and in 1975 became the Prairie provinces' central testing station for agricultural equipment with the opening of the Prairie Agricultural Machinery Institute.

C.O. WHITE

**Hummingbird**, common name for New World family Trochilidae, which numbers 341 species. It is one of the largest BIRD families and contains the smallest known bird (bee hummingbird, 2 g). Males, in particular, come in an astonishing variety of sizes, shapes, colours and plumage. In flight, the wings of some beat so rapidly that they produce a humming sound (hence the name). They are the only birds able to hover in midair and fly backwards. Their energy comes from flower nectar; small insects supply protein for growth. The hummingbird has a very fast metabolism. Feeding on almost 1000 flowers daily, it consumes almost half its body weight in sugar. At night and in periods of bad weather, certain species fall into a semiconscious state to conserve energy. Four species nest in Canada, breeding as far W as Alberta. The ruby-throated hummingbird (*Archilochus colubris*) is the only species in eastern Canada. The black-chinned, small calliope and rufous hummingbirds (*A. alexandri*, *Stellula calliope*, *Selasphorus rufus*, respectively) nest only in western Canada, only the last in widespread areas. Canadian species nest in trees, laying 2 white eggs. Hummingbirds can be attracted into gardens if flowers with long corollas are grown or small flasks of sugar water are set out, and can be induced to perch on a person's finger while feeding.

JEAN-LUC DESGRANGES

**Humorous Writing in English** It is perhaps paradoxical that the first major work of Canadian humour — Thomas MCCULLOCH's "Letters of Mephibosheth Stepsure" (1821-23) — should have been written by a man whose other credits included *Popey Condemned* and *Calvinism*. There has always been a perception of something dour, grim and northern about our national literature; critics seeking our defining images have talked of "survival" in a "harsh and lovely land." Our stories are often of failures and victims, our heroes freeze in snowdrifts, and our marriages (like most of our shipping) end up on the rocks.

One major factor inhibiting the early growth of a humorous tradition in Canadian literature was that most writing in the 19th century was dominated by a colonial mentality which looked to the "high seriousness" of English romanticism for its model. A poet who takes himself solemnly (which is not quite the same thing as taking himself seriously) finds it difficult to devote a whole poem to anything as trivial as a joke. One mark of an immature writer, or indeed of a whole literature which has not yet attained self-confidence, is the straining after big, "serious" topics. Robertson DAVIES comments that as late as 1920 to 1935, "we were not sufficiently sure of ourselves in this country to realize that a humorist may be a serious literary artist." The Canadian inferiority complex (which even today leads to much unprofitable anguish over the need to supply a recipe for "the Canadian identity") did not allow a writer the luxury of making a fool of himself in public.

The Canadian tradition of humorous writing has generally been stronger in prose than in poetry. McCulloch's satirical letters, which began appearing in the Halifax weekly *Acadian Recorder* in 1821, have been described by Northrop FRYE as exhibiting a tone "quiet, observant, deeply conservative in a human sense, [which] has been the prevailing tone of Canadian humour ever since." McCulloch's use of a satirical persona — the "conventional, old-fashioned, homespun" farmer — places him in a classical tradition which reaches back to Addison and Swift, and forward to Davies's Samuel Marchbanks and John METCALF's James Wells in *General Ludd* (1980). Whereas McCulloch's style was dry, subtle and understated, his immediate successor, Thomas Chandler HALIBURTON, proclaimed similarly conservative social values through the brash, colloquial, overstated persona of Sam

Slick, the Yankee Clockmaker. From his first appearance in *The Clockmaker* (1836), Sam Slick proved immensely popular and ironically has influenced American humour as much as Canadian.

After these promising beginnings, however, Canada had to wait until 1910 for the appearance of its next major comic writer. That year *Literary Lapses* launched the national and international reputation of Stephen LEACOCK. Leacock's masterpiece, *SUNSHINE SKETCHES OF A LITTLE TOWN* (1912), was followed 2 years later by the finely satirical *Arcadian Adventures with the Idle Rich*. In Leacock's more than 30 books of humour there was much inferior work; Robertson Davies ascribes his failure to develop into a major comic novelist as due, at least in part, to his unwillingness to carry through the darker implications of his comedy. Critical debate on *Sunshine Sketches* continues to centre on the balance between its irony and its indulgence, and between Leacock's criticism of the townspeople and his nostalgic affection for them.

One of Leacock's more permanent legacies was the establishment of the Stephen Leacock Medal for Humour, of which a most worthy early recipient was Paul Hiebert's SARAH BINKS (1947). Hiebert offers a broad but telling pastiche of the academic biography, but the true genius of the book lies in the creation of what John Moss has called "some of the world's best bad poetry." The verses of the "sweet songstress of Saskatchewan" are fine parodies of Canadian poetry. *Sarah Binks* is a comic creation which derives from Canadian literature while simultaneously making a contribution to it. In this it has few rivals, though one may be George BOWERING's *A Short Sad Book* (1977).

As we move into the period of the full maturity and expansion of the Canadian novel, we find an increasing use of humour, in many forms. There is the good-natured humour of W.O. MITCHELL, a born teller of tall tales, as reflected in the conservative, traditional comic world of *WHO HAS SEEN THE WIND* (1947). A much sharper edge of satire is to be found in the work of Mordecai RICHLER, but even in a novel such as *The Apprenticeship of Duddy Kravitz* (1959), the most memorable scenes are those — like the Bar Mitzvah movie or the epileptics' newsletter — in which the exuberance of comic exaggeration outstrips the strict necessities of satirical mordancy. A blacker, wilder, more fantastic strain of humour illuminates the novels of Leonard COHEN, especially *BEAUTIFUL LOSERS* (1966). And in novels such as Sheila Watson's *The Double Hook* (1959) humour deepens into a more profound sense of comedy as a redemptive vision of life.

Recent Canadian comic novels have moved towards an exuberant, overstated comedy of exaggeration and fantasy. This is evident in Ray Smith's *Lord Nelson's Tavern* (1974) and in Leo Simpson's *The Peacock Papers* (1973), in which an angel announcing the end of the world regrets particularly the demise of the Hamilton Tiger-Cats. (Like Simpson, Robertson Davies, in *The Rebel Angels*, 1981, pays homage to the comic novels of Thomas Love Peacock.) The sharp satirical observation of Margaret ATWOOD's novels may not strike some readers as exaggerated at all. Robert KROETSCH, however, has elevated the Prairies' beer-parlour tall tale to mythic proportions in *The Studhorse Man* (1969). In Kroetsch's *What the Crow Said* (1978) the exuberance of invention attests the influence of S American novelists such as Gabriel García Márquez. The same influence may be traced in the equally extravagant comedy of Vancouver I's Jack Hodgins, especially in *The Invention of the World* (1977). The full range of a comic voice following the possibilities of inventive licence to their limit may be heard in the short stories of Leon Rooke and in his novel, *Shakespeare's Dog* (1982).

Although much 19th-century Canadian po-

etry may strike the contemporary reader as unintentionally comic, as W.A. Deacon proved in his satirical *The Four Jameses* (1927), this period contains few and scattered examples of truly humorous verse. The first major Canadian poet for whom humour formed an essential and serious part of his vision was F.R. SCOTT. "The Canadian Authors Meet" (1927) remains a wickedly accurate deflation of literary pretension and colonial mediocrity. Unlike the prose satirists, Scott operated from left of the political centre; his poetry was only one aspect of a most distinguished career in Canadian cultural and political life. During the Depression, Scott's satire, like that of Dorothy LIVESAY, was aimed against the "efficiency" of an economic system which left so many unemployed and impoverished. In his *Trouvailles* (1967), Scott also used the "found" poem to great satiric effect.

Scott coedited with A.J.M. SMITH the first major anthology of Canadian "satire, invective and disrespectful verse," *The Blasted Pine* (1957). Although many of the poems in this collection are not necessarily funny, it was a milestone in the development of Canadian humour. Adopting a more eclectic editorial stance and insisting on the importance of "poetry" rather than "verse," Douglas Barbour and Stephen Scobie coedited the anthology *The Maple Laugh Forever* (1981).

Scott's tradition of acerbic classical wit has been notably carried on by George JOHNSTON and Francis Sparshott, but the majority of Canadian comic poems are more boisterous or fantastic in tone. Earle BIRNEY has twisted language into many ingenious and whimsical games, though his laughter often seems a thin disguise for his deeper pessimism. Irving LAYTON has used a loud and sometimes crude humour as part of his general assault on stuffy proprieties and life-denying restrictiveness. Most impressively, Al PURDY has created a kind of comic persona for himself, shambling, expansive and all-embracing, which provides the ideal medium for his wide range of poetic concerns.

Among younger poets, there is a similar use of the comic persona in Tom Wayman's creation of himself in the distanced third person of *Waiting for Wayman* (1973). The seemingly naïve idealism of bill BISSETT is accompanied by shrewd irony and a poker-faced relation of the modern world's sometimes lethal absurdities (as in "Th Emergency Ward"), and Frank DAVEY has also exploited an apparently neutral style of description, which allows the material to reveal its own satiric potential, in his "War Poems" and in *Capitalistic Affection!* (1982). Dennis Lee has written whimsical children's poems which shade, as the age of the intended audience grows, into pointed political satire. The influence of Atwood's bitter satirical treatment of sexual relations in *Power Politics* (1971) is continued and extended by younger women such as Sharon Thesen, in *Artemis Hates Romance* (1980), and Mary Howes, in *Lying in Bed* (1981).

For most Canadian poets, humour has now become one element in a wider and more complex view of the world. In his animal poems, Michael ONDAATJE juxtaposes the "strange case" of his beagle's sexual proclivities with the stranger horrors of the animal man; in his "Letters & Other Worlds," the absurd eccentricities of his parents' characters are inseparable from the tragedy of their lives. *The Martyrology* (1972 and continuing), by bp NICHOL, begins with a play on words: all words beginning in *st* are concealed saints' names (eg, *stand* is written as *St And*). On this is built a whole cosmology, a life-work-poem which stands at the centre of contemporary Canadian literature.

Humour in Canadian drama is less advanced than it is in either fiction or poetry, though comic elements were present in the complex poetic plays of James REANEY and in the multimedia extravaganzas of Wilfred WATSON. Recent

works like *Billy Bishop Goes to War* (1978), by John Gray and Eric Peterson, and Linda Griffiths's *Maggie and Pierre* (1980) indicate a new willingness to get out on satirical limbs. Canada has a strong comic tradition in shorter dramatic forms, such as the review sketches of many years' *Spring Thaw*, and this tradition has found fertile ground in radio (*Royal Canadian Air Farce*) and television (SCTV). Indeed, second only to Leacock, the Canadian comedians who were best known internationally in the early 1980s were SCTV's McKenzie brothers, whose precisely timed mockery of Canadian gullibility and boorishness ("Take off, eh?") harks back to the deepest roots of Canadian humour. Sam Slick was fully familiar with "hosers." STEPHEN SCOBIE

**Humphrey, Jack Weldon**, painter (b at Saint John, 12 Jan 1901; d there 23 Mar 1967). Humphrey was the most significant eastern Canadian painter of his generation. He studied under Charles Hawthorne at NY's National Academy of Design from 1924 to 1929 and with Hans Hofman in Munich in 1930. He later visited Europe, Mexico and New York, but his deepest sentimental attraction was to his birthplace, in spite of its isolation from artistic developments. Humphrey's paintings of the harbour, streets and workers of Saint John established his reputation as a regional artist and his work extended to numerous portraits of friends and the city's children. Making no concessions to fashion, Humphrey's tough, honest approach made him a respected member of Montréal's CONTEMPORARY ARTS SOCIETY and the Canadian Group of Painters. Returning from France in 1954, he developed abstract and nonobjective tendencies in gouache and oil landscapes, while his beautiful watercolours focused on the intimate details of nature. J. RUSSELL HARPER

**Hungarians** Compiling exact historical statistics on Hungarian immigration is complicated because until WWI immigration statistics did not differentiate between Magyar and non-Magyar Hungarian subjects. Today, "Hungarian" refers to Magyar-speaking peoples, but before 1914 the term might have included some SLOVAKS, CROATIANS, ROMANIANS and various other peoples.

Until the late 19th century, very few Hungarians came to Canada and even fewer stayed for more than a brief period. In the 1880s Hungarian immigrants to the US began migrating to Canada and, through the efforts of immigration agent Paul Oscar Esterhazy, they established colonies in what were to become Manitoba and later Saskatchewan. In time these pioneers were

followed by about 100 000 other Hungarian immigrants. Today, there are about 140 000 Canadians of Hungarian descent. They constitute a culturally and socially diverse group whose members live throughout most of the country and can be found in all walks of life.

**Origins** Most Hungarians emigrated from Hungary, or from Czechoslovakia, Romania or Yugoslavia, countries with substantial Hungarian minorities. Throughout most of the past 11 centuries, Hungary occupied the entire Middle Danube Basin and was the home of Hungarians as well as a few other nationalities. Prior to WWI, uneven economic development, lack of agrarian reform, a nationality problem and other factors caused hundreds of thousands of Hungarians to emigrate. After the defeat of the Austro-Hungarian Empire, Hungary was dismembered. The resulting economic and social malaise drove still more Hungarians to emigrate, while Hungarians who had been transferred to neighbouring states often chose immigration to Canada over life in a hostile political environment. WWII and the imposition of a communist dictatorship forced more Hungarians into exile.

**Migration and Settlement** Hungarians came to Canada in 4 major waves. In the period before 1914 about 8000 immigrated; from 1925 to 1930 about 26 000; between 1948 and 1952 some 12 000 postwar displaced persons arrived, and between 1956 and 1957 about 37 000 Hungarian REFUGEES came to Canada after the collapse of the 1956 uprising against Soviet authority. Since then several hundred Hungarians have immigrated to Canada annually. Most of the pre-1914 settlers were peasants; in general disappointed transmigrants from the industrial slums of the US. The interwar arrivals were a somewhat more mixed lot socially, while many of the post-WWII immigrants were from Hungary's dispossessed middle and upper classes. Young adult males predominated in all but the last wave of immigrants.

The first groups of Hungarian immigrants settled mainly on prairie homesteads (Saskatchewan was sometimes called "Little Hungary" before 1914), but later immigrants established themselves in towns and cities. Whether in rural or urban areas they usually congregated in their own residential groups. From the 1920s onwards, more Hungarians settled in cities, especially in central Canada. The GREAT DEPRESSION interrupted these trends, but the shift to the cities, and especially to southern Ontario, resumed after WWII. Today, one out of every 2 people of Hungarian origin lives in Ontario, and 4 out of 5 live in a city, although residential concentrations have all but disappeared.

**Economic Life** Most of the early Hungarian immigrants worked as homesteaders, miners, navvies and loggers. The post-1945 immigrants tended to be more skilled and better educated. In times of prosperity most Hungarians did well, in times of recession they were particularly hard hit. During the Depression most of them lost their jobs, farms or businesses. Today, many are economically comfortable and a few have become rich.

**Social and Cultural Life** The majority of Hungarians are Roman Catholic; others are Jewish, and many belong to the United, Presbyterian and Lutheran churches, are dispersed among other Protestant denominations, or belong to the Greek Catholic Church. Many of the churches constitute social and cultural centres and provide instruction in the Hungarian language.

To smooth the effects of social isolation and to reduce economic instability, Hungarians have maintained various types of organizations since the establishment of their first settlements.

The Canadian Hungarian Federation, an umbrella organization of clubs, societies and churches, represents many Hungarian Canadi-

ans. The Hungarian School Board, an arm of the federation, promotes schooling in the Hungarian language. The Hungarian language is offered as a credit course in 2 Toronto high schools. Many local and professional organizations also exist. The Hungarian Canadian Cultural Centre in Toronto is the largest Hungarian community centre outside Hungary. Two Hungarian museums, one in Toronto and one in Oshawa, have been founded. Hungarians began publishing Hungarian-language newspapers before 1914. Today, Toronto is the centre of Hungarian publishing activity in Canada; publications include *Kanadai Magyarok* (*Canadian Hungarians*), *Magyar Elet* (*Hungarian Life*) and many more specialized papers. The *Kanadai Magyar Munkás* (*Canadian Hungarian Worker*) has been the primary press organ of the Canadian Hungarian left since 1929.

**Group Maintenance** Adjustment to Canadian life tended to come first in the workplace and last in the family home. Hungarian women acquired greater influence as they gained more economic power. Hungarian customs and rites have gradually been abandoned, and the process of adjustment has often been followed by that of assimilation. Social and economic stratification among the immigrants has often hindered intra-ethnic unity and interaction and thereby hastened the loss of the immigrant cultural heritage.

Although maintenance of the native culture was encouraged at home and within the immigrant community's institutions, the adjustment to Canadian conditions has been promoted through the schooling of children in regular English- or French-language schools. Some of the most remarkable contributions of Hungarians to Canadian culture have been in fields in which the immigrant heritage is compatible with the Canadian environment, eg, in the arts, the sciences and music.

N.F. DREISZIGER

**Hungerford, Samuel James**, railway executive (b near Bedford, Qué 16 July 1872; d at Farnham, Qué 7 Oct 1955). After beginning as an apprentice machinist for the Southeastern Ry in 1886 and holding various positions in the operating departments of the CPR, Hungerford joined the Canadian Northern Ry as superintendent of rolling stock in 1910. During the 1920s, as a VP of operation, maintenance and construction, he played an important role in the integration and expansion of the CNR. Appointed president of the CNR in 1934, Hungerford reduced operating expenditures and defended the company's autonomy amid demands for amalgamation with the CPR. He retired from the presidency in 1941. First president of TRANS-CANADA AIRLINES and president of National Ry Munitions Ltd, a crown corporation that produced guns and gun carriages in WWII, he was created CMG for his wartime services.

J. LINDSEY

Reading: G.R. Stevens, *History of the Canadian National Railways* (1973).

**Hunt, George**, ethnographer, museum acquisitions collector (b at Ft Rupert, Vancouver I, BC 1854; d there Sept 1933). Most of our knowledge of traditional KWAKWILT culture is based on Hunt's rich ethnographic notes and artifact collection. Son of an English HBC trader and a Tlingit mother, Hunt lived at Ft Rupert, a trading post and Kwakiutl settlement. He spoke Kwakiutl as his first language, married a high-ranking Kwakiutl woman and achieved a prestigious position in the native culture. Most of anthropologist Franz BOAS's Kwakiutl publications are based on Hunt's ethnographic notes; their collaboration extended for over 40 years until Hunt's death. Hunt greatly assisted most other leading Northwest Coast field-workers and artifact collectors of the day, even arranging and directing an ethnographic film for Edward S. Curtis.

KATHLEEN MOONEY

**Hunt, Henry**, Kwakiutl artist (b at Fort Rupert, BC 16 Oct 1923). A principal carver at the BC Provincial Museum for nearly 20 years, Henry Hunt began his career apprenticed to his father-in-law, Mungo MARTIN, and Arthur Shaunnessy, another well-known Kwakiutl carver. From 1962 to 1974 he was chief carver at the BC Provincial Museum, the successor to Martin. There he trained his sons Tony, Stanley and Richard. He and his sons created the magnificent Mungo Martin memorial pole at Alert Bay (1971) and an impressive pole for the Totem Marina at Shuswap Lk. Hunt's masks, totem poles, ceremonial screens and serigraphs are found in major international museum collections.

CAROL SHEEHAN

**Hunt, Thomas Sterry**, chemist, geologist (b at Norwich, Conn 5 Sept 1826; d at New York C, 12 Feb 1892). After studying at Yale under Benjamin Silliman Jr, Hunt joined the GEOLOGICAL SURVEY OF CANADA in 1846 as a chemist and mineralogist. While in this position, he taught at Laval 1856-62 and McGill 1862-68. In 1872 he left Canada to accept the geology chair at Massachusetts Institute of Technology. He officially retired in 1878, but continued to conduct research, remaining an important member of the scientific community. As a chemist and geologist with original and controversial ideas, Hunt was known for his contributions to defining the Laurentian and Huron geological systems. In 1859 he was elected fellow of the Royal Soc of London and was appointed president of both the American Institute of Mining Engineers (1877) and the American Chemical Soc (1880). Throughout his career, he maintained close ties with Canada. He helped found the RSC in 1882 and became its president in 1884.

RAYMOND DUCHESNE

Thomas Sterry Hunt, chemist and geologist who helped define the Laurentian and Huron geological systems (courtesy Public Archives of Canada/C-37794).

**Hunt, Tony**, Kwakiutl artist (b at Alert Bay, BC 24 Aug 1942). He is a leader in the social and ceremonial life of Alert Bay, a master of traditional performance as well as of the visual arts, and has established an international reputation as a carver of Kwakiutl-style NORTHWEST COAST INDIAN ART, after studying with his illustrious grandfather, Mungo MARTIN, and his father, Henry HUNT. He was assistant carver (1962-72) at the BC Provincial Museum's Thunderbird Park. In 1970 he established the Arts of the Raven Gallery, overseeing an apprenticeship program for aspiring young native carvers. Among his major works

Tony Hunt, a Northwest Coast Indian artist known for his fine masks and totem poles (courtesy Canapress).

are TOTEM POLES in Victoria's BC Provincial Museum and Bastion Square. In 1982 he was commissioned to do a 4 tonne stone sculpture for the NATIONAL MUSEUM OF MAN, called "Raven Transforming into Man."

CAROL SHEEHAN

**Hunter, Thomas James**, Tommy, singer (b at London, Ont 10 Mar 1937). Hunter and his weekly CBC-TV show have long been important in Canadian country music. He got his start on "Main Street Jamboree," on CHML Radio in Hamilton in 1953 and by 1956 was a rhythm guitarist on CBC-TV's "Country Hoedown," which in 1965 was replaced by the "Tommy Hunter Show." The show has become one of the longest running network variety shows in N America and has provided national exposure for Canadian country singers. Hunter won the Juno Award 1967 to 1969 as Canada's best male country singer.

RICHARD GREEN

**Hunters' Lodges**, largest of the secret societies pledged to liberate the Canadian provinces from "British thralldom," founded in early 1838 in the northern US by Canadian rebels who had fled there after the REBELLIONS of 1837. The movement quickly became American, with support from widely varied groups in the border states and membership estimated at 40 000-60 000. Abandoning plans to invade Upper Canada on 4 July 1838, the "patriot hunters" attempted numerous unsuccessful incursions in the following months. Rebels were soundly defeated at Napierville, Lacolle and Odelltown, LC, and at Prescott (in the "battle of the windmill") and Windsor, Upper Canada. They then undertook a series of border provocations calculated to drive Britain and the US to war, including burning the steamship *Sir Robert Peel* in the Thousand Is and blowing up the Brock monument at Queenstown, Upper Canada. On 25 Sept 1841, US Pres Tyler warned them to disband, and within a short time the lodges were a thing of the past.

CURTIS FAHEY

**Hunting** is the purposeful pursuit to the death of wild ANIMALS by humans. People hunt for different purposes: subsistence, trade, WILDLIFE CONSERVATION AND MANAGEMENT, training, recreation and prestige. Subsistence hunters are dependent on wild animals for food and shelter or for cultural survival. Evidence suggests that the earliest humans, and their ancestors, hunted animals; some claim that the earliest tools were weapons. Subsistence hunters or their traces have been found on all continents except Antarctica, and from tropical to polar climatic zones. The varieties of technique and organization seem almost endless. Weapons have included the trap, gorge, noose, net, pitfall, dead-fall, bolo, throwing-stick or boomerang, club, knife, spear, javelin, blowpipe, bow and arrow, and harpoon. Dogs and horses have often been employed in tracking and pursuit. There can be little doubt that Pleistocene (Ice Age) hunters exterminated some, perhaps many, species.

In Canada, hunting at will for food is possible for natives of groups that obtained that right

when they ceded lands under treaty, and for natives of other groups by virtue of acknowledged aboriginal title. Some spokesmen for native associations have claimed rights over the disposition of all game in Canada (see INDIAN ACT; LAND CLAIMS).

Presumably, commercial hunting began as trade developed: first, for surplus commodities, between communities of subsistence hunters; later for commodities to be traded on a wider scale. Besides ivory, from walrus and elephant, commercial products of the hunt include feathers, skins, furs and meat. Such products have been traded for millennia. Excessive harvesting has been a recurrent problem, becoming chronic in the last 200 years, with widespread affluence creating demands, which are filled by efficient means of hunting, transport and trade. Species bearing the most valuable products (eg, SEA OTTER) have suffered severe depletion. At present, several species are endangered by commercial hunting, particularly certain whales, sea turtles, rhinoceroses and elephants. Commercial hunting for feathers and plumes declined early in the 20th century with the imposition of strict import controls in Europe and N America. Fur animals have generally proved well able to sustain harvesting. The FUR TRADE, although subject to the swings of fashion, remains viable; its future depends perhaps on philosophical rather than resource issues. In many countries, the meat of hunted animals enters the market, where it competes with domestic meats, and returns money to landowners, collectives or hunting associations, to set against management costs. The culling of herds and the reduction of vertebrate pest populations are examples of hunting directed to husbandry or the protection of economically important resources.

Trophy hunting, a kind of recreational hunting, demands time, money and effort, and is essentially competitive in nature, the object of the trophy hunter being to get a large specimen. The measurements used for N American trophies are formally detailed by the Boone & Crockett Club, which appoints qualified judges, adjudicates conflicts, provides standards and, in particular, rules on questions of whether or not specimens were taken in "fair chase." A similar system exists for ranking trophies taken by archery.

Today, most hunting in Canada is recreational and motivated by the tangible as well as intangible rewards of success. Under the common law, game is public property until killed or crippled or "brought to bag," although in the case of game on private land the owners control access. Under administrative laws and regulations, competent jurisdictions set out rules governing hunters. These rules may include strictures on age and qualifications of applicants for hunting licences, as well as defining hunting zones, seasons and bag limits. The rules, largely designed to divide hunting opportunities among participants and reduce the risk of accidents, are enforced by provincial game officers and federal migratory bird convention enforcement officers, including members of the RCMP. They are under continuing review by local clubs making up provincial fish and game associations, which are loosely affiliated to the CANADIAN WILDLIFE FEDERATION.

Recreational hunting opportunities are found in all parts of Canada, except in preserves such as national parks and provincial wildlife preserves. All game resources are under provincial administration except migratory birds, which are managed by the Canadian Wildlife Service, with the co-operation of the provinces. Populations of WATERFOWL, which breed in agricultural parts of Canada, have declined in recent years, and the conservation of wetlands, although greatly assisted by governments and by the private agency Ducks Unlimited (Canada), needs continuous effort. Arctic-nesting geese,

particularly Canada geese and snow geese, although subject to the vagaries of weather on their breeding grounds, have prospered in contrast to southern-nesting species. As human populations and demand on limited hunting opportunities increase, there must be international co-operation to ensure equitable sharing of these migratory resources.

Judging by the some 400 000 waterfowl licences sold each year in Canada, it can be estimated that perhaps 1 million Canadians hunt. Canada also attracts hunters from all over the world to enjoy its unique hunting opportunities. A stay at a goose camp in the coastal marshes of James Bay is unforgettable. The expected encounter with an excited, antlered bull makes a late Sept moose-calling hunt the experience of a lifetime. Superb landscapes await the hunter on a pack-horse trip through mountain valleys, searching the heights for bighorn or Dall rams. For the hardy and daring, a spring hunt for grizzly or polar bear is sure to prove memorable. However, not all Canadians approve of recreational hunting. Some are opposed to it on ethical grounds, and some native Canadians are opposed to non-native Canadians hunting because of violations to native treaty rights.

Canada possesses many upland game birds, from the rock and willow ptarmigan of the arctic TUNDRA to the sage and sharp-tailed grouse of the shortgrass PRAIRIES. They and the introduced gray partridge and ring-necked pheasant vary in numbers from year to year. There is a tendency for some species, particularly the ruffed grouse of the mixed forest and scrublands, to exhibit a cycle in numbers. These cycles may be related to similar rhythms shown by snowshoe hare populations, and by their predators.

The most widely distributed big-game species of settled Canada is the white-tailed deer, formerly confined to the eastern provinces but now found as far west as the Okanagan Valley. The western mule deer is common in river valleys and rough terrain; in coastal BC, it is replaced by its relation, the black-tailed deer. The moose, adapted to deep snow with its long legs and typical of boreal and subalpine forests, is well distributed from coast to coast, and now prospers in Newfoundland, to which it was successfully introduced in 1904. Woodland caribou also frequent the boreal forest. Barren-ground caribou migrate seasonally between the barrens, where they calve early in June, and the northern coniferous forest, where they pass the snowiest parts of winter. They are hunted only by natives and residents of the northern territories. The George River herd of Ungava caribou is hunted both by residents and nonresidents. Of more localized interest are the pronghorn of the southern prairies, the mountain goat, bighorn, stone and Dall sheep of the western cordillera, and the muskox of the High Arctic. Other game species include black, grizzly and polar bears, grey wolf and cougar.

Roughly 4 million ducks and half a million geese are harvested annually in Canada, and close to half a million beaver, which are used for food as well as pelts. A survey of game harvests in 1976-77 found the native grouse harvest to be 3-4 million, of which most were the uniquely succulent ruffed grouse. Some 2 225 000 snowshoe hare were killed. Of some 200 000 hoofed mammals taken, 110 000 were white-tailed deer, 50 000 moose, 23 000 barren-ground caribou and 10 000 mule deer. Pronghorn, elk and woodland caribou were next, at around 2500 each, followed by mountain sheep and goat at about 1000 each. Some 8000 bears were taken, of which 7000 were black bear and the rest polar bear and grizzly.

**Huntsman, Archibald Gowanlock**, marine biologist, administrator, editor, teacher (b at Tintern, Ont 23 Nov 1883; d at St Andrews, NB 8 Aug 1973). Huntsman was a provocative thinker and innovator who decisively influenced fisheries science in Canada. His professional career, characterized by keen intellect, verve and indefatigable effort, combined fisheries research with postgraduate teaching and was intimately linked 1904-53 with what later became the Fisheries Research Board of Canada. In serving 1934-53 as the board's scientist, curator, director, editor and consulting director, Huntsman helped shape the research philosophies, the staff of the biological and technological stations and their programs. As professor of marine biology at University of Toronto 1927-54, he taught most fisheries research scientists trained during the 1920s and 1930s. In his lifetime he was honoured frequently by scientific societies in Canada, the US and the UK and in 1952 was awarded the RSC Flavelle Medal.

L.M. DICKIE

Archibald Gowanlock Huntsman, marine biologist who greatly influenced Canadian fisheries science (courtesy the Huntsman family).

**Huntsville**, Ont, Town, pop 11 467 (1981c), inc 1900, is located 215 km N of Toronto on a short section of the Muskoka R connecting Vernon and Fairy lakes. Settlers took up land in the area after surveys of the township in 1862 and extension of the Muskoka road to the site in 1870. Capt George Hunt, for whom the town is named, first visited in 1868 and settled here in 1869. He was superintendent of the road, first postmaster and opened the first store. The railway arrived in 1885 and, with a population of 400, the village was incorporated the following year. The export of local white pine supported 6 sawmills in the town at one time. Huntsville still has a small lumber industry, but is sustained primarily by the year-round tourist trade, being within easy access to the Lake of Bays resort area to the SW and to ALGONQUIN PROVINCIAL PARK some 30 km NW. Madill Church, 6 km S, is one of the few remaining pioneer square-timber churches; it was built 1872-73 by Wesleyan Methodists.

JAMES MARSH

**Huot, Charles**, painter (b at Québec C 1855; d there 28 Jan 1930). The director of the École normale Laval in Québec organized a subscription fund to help him enrol in 1874 at Paris's École des beaux-arts; he spent much time there in the studio of painter Alexander Cabanel and won a silver medal. The French government bought his painting, *Le Bon Samaritain*, during the Universal Exposition of 1878. In 1898 he finally returned to Québec and produced works for numerous churches throughout the province. He won a contract to decorate Québec's parliament building, and produced 2 large historical murals, *Séance du Premier Parlement du Bas-Canada, le débat sur la langue* and *Le Conseil Souverain de 1663*; he also painted *Je me souviens* for the ceiling of the National Assembly, and *Je puis mais n'épuise* for the library's massive stained-glass window. He illustrated many books as well.

MICHEL CHAMPAGNE

**Huron**, a confederacy of 5 Iroquoian-speaking tribes who occupied northern Simcoe County, Ont, during the first half of the 17th century. The nickname "Huron" was given to them by the French and means "ruffian" or "boar's head," from the hairstyle of Huron men. Their own confederacy name was *Ouendat* (Wendat), commonly thought to mean "people of the island." The tribes of the confederacy were the Attignawantan ("bear people"), Attigeneongnahac ("cord makers"), Arendaronon ("rock people"), Tahontaenrat ("deer people") and Ataronchronon ("swamp people"). By the early 17th century the latter 3 tribes had migrated into Huron country from southern and eastern Ontario to join the other 2 tribes in a loose defensive alliance against their common enemy, the 5 Iroquois tribes of upper New York state.

Prior to 1600, the Huron numbered from 20 000 to 25 000, but between 1634 and 1640 they were reduced to about 9000 by a series of epidemic diseases, particularly the smallpox epidemic of 1639. The Huron lived in 18 to 25 villages, some with up to 3500 people. Their subsistence economy was based on corn, beans, squash and fish. Hunting was of minor importance. At the time of French contact (1615-49), these efficient farmers occupied a territory of about 880 km<sup>2</sup>, achieving an average population density of 23 people per km<sup>2</sup>. Most villages were well fortified with palisades. Villages usually stood on a slight rise, adjacent to a permanent water supply and close to good farming soils. Every 10-15 years, when soils and firewood were exhausted, villages were moved. The Huron formed monogamous nuclear families; however the fundamental socioeconomic group was the matrilineal extended family, made up of a number of families whose female members traced common descent to a mother or grandmother, who was in charge of daily affairs. The extended family lived in longhouses, which were about 7 m wide and varied in length with the size of the family. Houses up to 90 m in length have been reported from archaeological work. Huron individuals belonged to one of 8 matrilineal clans. Clan members considered themselves cousins and were not permitted to marry each other. Village affairs were run by 2 councils, one in charge of civil affairs, the other of war. All men over 30 were members. In theory, matters were decided by consensus, but in reality the old men and elected chiefs of large families decided things because of their community standing and powers of oratory.

The Huron were experienced traders, with close relations to the PETUN, NEUTRAL, OTTAWA, Nipissing and ALGONQUIN bands of the Ottawa Valley. In 1609 they contacted the French under Samuel de Champlain and concluded a military and trading alliance which drew the French into the Huron-Iroquois conflict (see IROQUOIS

WARS). Recollet missionaries were sent to the Huron in 1615, followed by the Jesuits in 1635. By the 1620s the Huron had become the most important suppliers of furs to the French, with a trade network that encompassed most of Ontario and western Québec. The Iroquois defeated and dispersed the Huron in 1649. Many Huron joined the Iroquois; others fled westward with remnants of the Petun and now live on the Wyandot Reservation in Oklahoma. The largest surviving group settled near Québec City at Loretteville. See also NATIVE PEOPLE, EASTERN WOODLANDS and general articles under NATIVE PEOPLE.

C.E. HEIDENREICH

**Huron, Lake**, 59 570 km<sup>2</sup>, elev 177 m, 332 km long, 294 km wide, max depth 229 m; total shoreline length, including islands, 6159 km. Lk Huron is the second largest of the GREAT LAKES and fifth-largest lake in the world. Samuel de Champlain visited GEORGIAN BAY and Lk Huron with the French scout Étienne BRÛLÉ and a fleet of Indian canoes in 1615. Four interconnected bodies of water — the main lake, Saginaw Bay, the North Channel and Georgian Bay — form the lake. Major inflows are the Straits of Mackinac and the St Marys, Mississagi, Saginaw, French and Spanish rivers. Lk Huron discharges into Lk ERIE through the ST CLAIR R. Lk ST CLAIR and the DETROIT R. The longest suspension bridge in the world (Mackinac, 2625 m) spans the Straits of Mackinac between Lks Huron and Michigan.

Air masses from the Arctic, Pacific and Atlantic oceans and the Gulf of Mexico converge on the lake, which therefore experiences 4 distinct seasonal patterns and extremes of weather conditions. Its basin is composed of Precambrian SHIELD and Phanerozoic rocks and it was formed during the most recent ice age, with its present form developing only 2000-3000 years ago. The Canadian side of the basin is primarily covered with mixed forest consisting of red and white pine, hemlock, birch, maple, oak, beech, walnut and hickory.

The total Canadian population of the basin was less than one million in 1970, but a 50% increase is expected by the year 2020. The northern basin is an isolated, underdeveloped hinterland, with a few settlements engaged in the exploitation of forest and mineral resources. Southern settlement is founded on lumbering and agriculture. Important industries include mining, pulp and paper, food processing, chemical production, transport equipment and metal fabricating. SUDBURY, the centre of the mining and smelting industry, is the only major urban centre in the area. One of the world's largest nuclear power plants is located at Douglas Pt on the BRUCE PENINSULA. The lake supports commercial fishing (whitefish, perch, walleye, chub, carp:

6000 tonnes/year) and sportfishing (bass, perch, walleye, pike, rainbow trout).

The Canadian side of Lk Huron is renowned for the beauty of its scenery. The North Channel and Georgian Bay shorelines provided subject matter for several of the GROUP OF SEVEN painters. Excellent beaches extend from the Bruce Peninsula to SARNIA. The basin offers wide, unpolluted waters for swimming, boating, cottaging and camping.

M. MUNAWAR

**Huron County Jail**, Goderich, Ont (architect Thomas Young, 1839-42) adopts the panopticon system for prison design promulgated by British utilitarian philosopher Jeremy Bentham. Surviving in a remarkable state of preservation, this stone building features an octagonal central core, intended to ensure constant supervision of prisoners' activities, and radiating wings with wedge-shaped exercise yards for the proper separation of different types of offenders. The Toronto architect designed a similar octagonal jail for Simcoe County. Construction of this prison with its third-floor courtroom enabled Huron to qualify as a district separate from London, with Goderich as its seat.

CHRISTINA CAMERON

**Huronion** To all early travellers the territory occupied by the Huron was called *le pays des Hurons* ("the country of the Huron"). A resident in the HURON country described himself as being *aux Hurons* ("among the Huron"), or in *le pays des Hurons*. On 17th-century maps the Huron country is usually given as *Contree des Hurons*, *Pays* (or *pais*) *des Hurons*, or simply *Hurones* or *Hurons*. The name "Huronion" does not occur in any of the early 17th-century sources. The earliest reference in that form seems to be in a Jesuit vocabulary written in 1745, which refers to *la défunte huronie* ("the deceased or defunct Huronion"). The term came into common usage during the late 19th century. Today, it refers to the area occupied by the Huron during the period of direct French contact (1615-50) as well as a tourist area comprising the townships of Simcoe County, Ont, N of Barrie.

C.E. HEIDENREICH

**Hurtubise, Jacques**, painter (b at Montréal 28 Feb 1939). He studied at the École des beaux-arts of Montréal. A grant in 1960 enabled him to spend time in New York and become acquainted with the art of the abstract expressionists. Hurtubise's energy-filled canvases reflect a combination of his personal experience and the forces of nature. In the early 1960s he began using a hard-edge technique, producing a unified surface with well-defined edges. Geometric patterns and repeated motifs combine with controlled "splashes" of paint to produce an effect of a foreground that recedes into an emerging background. In 1967 his research into the effects of light led him to produce fluorescent canvases and later neon works. As of 1970, the principal structure of his works became the square. In 1977 he began to use shapes and chromatic contrasts on a neutral background to produce linear motifs, evoking abstract landscapes (*Takaraks*, 1979). His "spontaneous" works combine impulse and rigour.

LOUISE BEAUDRY

**Hutchinson, Leonard**, printmaker, painter (b at Manchester, Eng 1896; d at Thornhill, Ont 9 May 1980). He came to Canada in 1912 and settled in Hamilton. He studied with impressionist painter John S. Gordon at the Hamilton School of Art. Together with printmakers such as Toronto's Mary Wrinch, Hutchinson was part of a movement in the 1920s to revive the colour woodblock print. His work in this medium is especially remarkable for its delicate colorations. During the Depression, he also recorded workers' lives in powerful black-and-white woodblock prints, an expression of his sympathy for "the cause." He helped organize an artists' union in Hamilton in 1936, and was curator of the Hamilton Art Gallery.

JOAN MURRAY

**Hutchison, Alexander Cowper**, architect (b at Montréal 2 Apr 1838; d there 1 Jan 1922). One of Victorian Montréal's most prolific and prestigious architects, he epitomized the generation of native-born, self-taught men who shaped the city during the second half of the 19th century. Trained as a stonemason, he supervised the cut-stone work on Montréal's Christ Church Cathedral and the East Block of the Parliament Buildings, Ottawa, before establishing a private practice in Montréal shortly after 1865. The firm was known until 1890 as Hutchison and Steele, thereafter as Hutchison and Wood. Hutchison deserves credit for the careful detailing that characterizes all of the firm's output, including the Redpath Museum, testimony no doubt to his apprentice years as a craftsman-builder. Hutchison and Steele gained international reputation as ice-palace designers.

JULIA GERSOVITZ

**Hutchison, William Bruce**, journalist, author (b at Prescott, Ont 5 June 1901). Hutchison grew up in the Kootenay region and in Victoria, BC, becoming a reporter for the *Victoria Times* in 1918. He travelled throughout Canada, the US and UK, gathering material for his columns on national and international affairs. He was associate editor 1944-50 of the *Winnipeg Free Press*, editor 1950-63 of the *Victoria Times*, and in 1963 was appointed editorial director of the *Vancouver Sun*. His many books include descriptions of Canada past and present, political histories of its prime ministers (eg, *The Incredible Canadian*, 1952, on W.L.M. KING) and studies of Canadian-American relations. Written with feeling and humour, all seek to define Canada's "fortunate but vulnerable" national identity. JEAN O'GRADY

**Hutt, William**, actor, director (b at Toronto 2 May 1920). From his novice days at Hart House Theatre, he has been a distinguished leading player in Canada, the US and England. After making his professional debut in 1947 in summer stock, he worked at Ottawa's Canadian Repertory Theatre. He joined the STRATFORD FESTIVAL in its inaugural 1953 season, and appeared in more than 60 Stratford productions, playing nearly every great role in the Shakespearean canon, including Lear, Hamlet, Macbeth, Prospero, Falstaff and Titus Andronicus. He toured N America with the Canadian Players and in Noël Coward's *Sail Away* (1961). In 1964 he created the lawyer in Edward Albee's *Tiny Alice* on Broadway. He was made a companion of the Order of Canada in 1969 and in 1975 won an ACTRA Award for his portrayal of Sir John A. MACDONALD in CBC's telecast of Pierre BERTON's *The National Dream*. In 1976 he was appointed an associate director of the Festival Stage Stratford, and artistic director of Theatre London (Ont), overseeing the rebuilding of the Grand Theatre. In 1983-84 he was featured in Robin Phillips's London season, and his Canadian movie *The Wars*.

DAVID GARDNER

**Hutterites** are one of 3 major sectarian groups (the others are the Mennonites and the Amish) surviving today and the only group to insist rigorously on the communal form of existence. Hutterite history dates to 1528 when to escape religious persecution a group of about 200 Anabaptists established a communal society in Moravia (now a region in Czechoslovakia). Under the initial leadership of Jakob Hutter, they established the basic tenets of Hutterian beliefs which they have followed with little deviation to this day. These beliefs, based on early Christian teachings and a belief in a strict separation of church and state, include a form of communal living, communal ownership of property, nonviolence and opposition to war, and adult baptism. Also, they have retained the dress, the customs, the language and the simple austere life-style of their ancestors.

Hutterite colony near Cayley, Alta (photo by Jim Merrieth).

**Migration and Settlement** Because of their beliefs, Hutterites were subjected to periodic persecution which invariably resulted in migration. They moved from Czechoslovakia to Hungary, Romania, Tsarist Russia, the US, and finally to Canada. They emigrated en masse to Canada in 1918 because of harassment and persecution in the US that resulted from their refusal to participate in any type of military service. Initially, they settled in Manitoba and Alberta; later settlements were established in Saskatchewan and some were re-established in the US. The world Hutterite population is about 25 000 — more than 66% of whom live in Manitoba, Saskatchewan and Alberta, while the remainder are in the US.

**Social and Cultural Life** Hutterites believe that their society could be best preserved in a rural setting, and hence agriculture for them is a way of life sanctioned by religion. Their belief in communal living has led them to establish village-type settlements on each of their farms (or colonies, as they are known). In Manitoba the average size of a colony is about 1700 ha, but in Saskatchewan and Alberta, because of drier conditions, the colonies are each about 3200 ha. Despite these relatively large landholdings, each Hutterite family has less than 50% of the land of a typical single-family farm on the prairies. The average colony has about 14 families with a total population of about 90. When the population reaches 125 to 130, the settlements subdivide and form new colonies, on the average every 14 years. In 1982 there were 67 colonies in Manitoba, 37 in Saskatchewan and 99 in Alberta.

The Hutterite respect for the nuclear family is reflected in their provision of private apartments for each family in the row houses they traditionally build. Kindergarten facilities are provided for children from the age of 2½ years. The regular curriculum is studied in colony schools by all students until the eighth grade, after which about 50% of students proceed to grade 10 by means of correspondence courses. Following this a few Hutterites may proceed to take special diploma courses off the colonies such as animal nutrition or veterinary science, and some take teacher training. There are now several fully qualified Hutterite teachers.

The structure of Hutterite colonies remains unchanged, although the nature of the particular economic activity in which they are in-

involved may vary. Each colony elects an executive council from the managers of various enterprises, and together with the colony minister, the executive deals with important matters that will be brought before the assembly (all baptized male members — in effect, men 20 years of age and older). Although women have an official subordinate status, their informal influence on colony life is significant. They hold managerial positions in the kitchen, kindergarten, the purchase of dry goods, and vegetable production.

Although there is co-operation among the colonies, each colony operates as an independent economic unit. The Hutterites practise a highly mechanized and efficient mixed-farming economy. Because of their well-managed, large-scale operations, when compared to the amount of land they own, the Hutterites produce more than their proportionate share of agricultural produce within the prairie economy. Until fairly recently, the basic nature of the Hutterite settlements had been misunderstood, especially in regard to the relatively small amount of land that they own, and their productivity and contribution to the economy had been unappreciated. This had resulted in the past in various restrictions and forms of discrimination against the Hutterites.

**Group Maintenance** The survival of the Hutterites and their unique way of life is largely the result of their ability to retain their basic and fundamental beliefs, while simultaneously adopting all the features of contemporary society essential for their economic and social well-being. This strategy of survival includes uncompromising adherence to their religious beliefs and customs, retention of their ancestral German dialect, insistence on their own colony schools and a sound agricultural economy. Although some young people leave the colonies, most of them usually return, hence assimilation is not a serious problem for the Hutterites. See also COMMUNAL PROPERTIES ACT CASE. JOHN RYAN Reading: J.A. Hostetler, *Hutterite Society* (1974); John Ryan, *The Agricultural Economy of Manitoba Hutterite Colonies* (1977).

**Hutton, Sir Edward Thomas Henry**, soldier (b at Torquay, Eng 6 Dec 1848; d at Chertsey, Eng 4 Aug 1923). Hutton was general officer commanding the Dominion militia, 1898-1900, historically the most significant of the 8 British officers who held that appointment between 1880 and 1904. He conspired with the governor general, Lord Minto, and the British colonial secretary, Joseph Chamberlain, to involve Can-

ada in the SOUTH AFRICAN WAR, quarrelled with government over the issue of political patronage in the militia, and was finally recalled to London at the Dominion government's request. He subsequently commanded Canadian troops in S Africa, 1900-01.

BRERETON GREENHOUS

**Hydro-Québec**, a provincial CROWN CORPORATION, is Canada's largest ELECTRIC UTILITY and, judged by assets (\$25 billion in 1983), Canada's largest corporation. More than 95% of its production is from renewable HYDROELECTRICITY. First created as a legal entity in 1944, Hydro-Québec did not become a major force until the early 1960s. René LÉVESQUE, then resources minister in the Liberal government of Jean Lesage, oversaw the nationalization of the province's larger private electrical utilities. In the late 1970s and early 1980s, Parti Québécois governments led by Lévesque further reorganized Hydro-Québec. The utility enjoys formidable economic advantages: once dams are in place, operating costs are very low; furthermore, it has a contract to buy power from the CHURCHILL FALLS project in Labrador at 1969 prices until the year 2041. Hydro-Québec can thus underbid ONTARIO HYDRO in the US export market, provide cheap power within Québec and still pay a dividend to the provincial government.

Québec's first hydroelectric-generating stations were built by private entrepreneurs at the end of the last century. In 1903 N America's first long high-voltage transmission line was placed in service. The 50 kV line ran 135 km from the Shawinigan powerhouse to Montréal. Although the new industry attracted many entrepreneurs, regional monopolies soon dominated the market. By the end of the 1930s, 8 companies served nearly all of the inhabited areas of Québec.

Responding to public criticism of poor service and high rates, the Québec government expropriated Montréal Light, Heat and Power Consolidated and its subsidiary, Beauharnois Light, Heat and Power Co, and empowered the Québec Hydro-Electric Commission to administer these 2 companies. Thus Hydro-Québec was born on 14 Apr 1944. Between 1944 and 1961 Hydro-Québec's installed generating capacity increased from 616 MW to 3488 MW.

On 1 May 1963 Hydro-Québec extended its activities to cover the whole province. It purchased the shares of nearly all remaining pri-

Hydro-Québec LG2 electric-power generating site, showing spillway and dam (photo by Jim Merrihew).

Manic 3 dam on the Manicouagan R in northern Québec (photo by J.A. Kraulis).

vately owned electrical utilities then operating in Québec and took over their debts. The total amount involved was \$600 million. Hydro-Québec subsequently undertook construction of the Manic-Outardes hydroelectric complex. The project's Daniel Johnson dam is the world's largest arch-and-buttress dam; its Manic 2 is the largest hollow-joint gravity dam. In order to transmit the complex's annual production of about 30 billion kWh over a distance of nearly 700 km, Hydro-Québec had to innovate. It became the first utility in the world to transmit electricity at 735 kV. Since then, its research institute, created in 1967, has pursued intensive research in electric-power transmission. In the early 1970s Hydro-Québec embarked on the JAMES BAY PROJECT.

ANDRÉ BOLDUC

**Hydroelectricity** is obtained from the ENERGY contained in falling water; it is a renewable, nonpolluting energy source and Canada's largest source of ELECTRIC-POWER GENERATION.

In N America in the 1850s the energy content

of moving water was exploited through the use of small-capacity waterwheels and turbines for the direct drive of machinery, for example, in gristmills and sawmills. By the 1860s many hundreds of turbines, ranging up to 1000 HP capacity, were manufactured annually in the US and by the early 1870s the production of at least one Canadian factory was averaging about 20 machines per year. Hydroelectricity was introduced in the 1880s, soon after Thomas Edison invented and began manufacturing direct-current (DC) electric generators, which were initially belt driven by steam engines. It was not long before enterprising mill owners began to install generators of up to 10-12 kW capacity, with belt drives from existing mill turbines, to provide electric lighting in the mills and adjacent premises. The manifest advantages of electric lighting spawned a ready and increasing market for such service. Where waterpower was close at hand, turbines were installed for the express purpose of driving electric generators for lighting service, initially provided during evening hours only. By the late 1880s generation of electricity by waterpower had become well established. Early use of hydroelectric generation was limited by the capacity of the generating station, which was governed by the waterpower resource (streamflow and net height of fall), or by the electric-lighting load near the station. Beyond a few kilometres, the resistance loss inherent in the transmission of direct-current electricity became excessive. Copper conductors large enough to ensure satisfactory service over longer distances were prohibitively expensive. High-voltage alternating current (AC) transmission, made possible by the development of commercially viable transformers in the 1890s, permitted transmission of electric power over significant distances without excessive loss, and made possible the development of more remote hydroelectric sites. For example, in 1896 hydroelectric power was transmitted approximately 32 km from NIAGARA FALLS to Buffalo, NY, at 11 000 volts (then considered a phenomenally high level). The possibility of long-distance transmission encouraged great increases in the capacity of hydroelectric-generating equipment: by the early 1900s, 5000 HP directly coupled turbine-generator sets were being produced. For comparison, hydroelectric turbine-generator units of over 600 000 HP capacity are now in service. Beginning in the early 1900s, there was rapid growth in the development of hydroelectric-power sites and progressive increases in transmission-voltage levels. More remote sites were exploited and transmission lines were extended to supply the gradual but strong growth in demand for ELECTRIC POWER. In 1903 electric power was transmitted to Montréal from a hydro station at Shawinigan, Qué, via a 135 km long, 50 000-volt transmission line, the first high-voltage long-distance transmission line in N America; by 1910 ONTARIO HYDRO was transmitting hydroelectric power from Niagara Falls at 110 000 volts.

By 1900 a total of 133 000 kW of hydroelectric-generating capacity had been installed in Canada. Most of this capacity was in Québec and Ontario, where attractive hydroelectric-power sites were found reasonably near urban centres; there were some smaller developments in the Maritimes, Alberta and BC. In the next 10 years, major hydro-generating stations were established in all provinces except PEI and Saskatchewan and, in 1910, a hydro development was constructed by a gold-mining company in the Yukon. By the early 1950s, hydro facilities were serving both northern territories. Hydroelectric generation was not developed in Saskatchewan until the early 1960s, when the S Saskatchewan R Development provided control and regulation of the province's major river system.

Growth of hydroelectric generation in Canada continued at a modest rate until the mid-1920s, followed by 10 years of more intensive development, then at a much slower rate through WWII. After 1945, there was a sharp increase in hydro- and thermal-power installations to meet the progressive growth in demand. This growth, which in some provinces exceeded 10% annually, did not slacken until the mid-1970s, when the impact of the international energy crisis of 1973 on economic activity led to a decline in the annual growth rate of electric-power consumption.

In the years 1920 to 1950, hydroelectric stations accounted for over 90% of Canada's total generating capacity. Hydro's share of this capacity declined after 1950, dipping to under 60% in 1976. The decline occurred because fossil-fueled thermal-generating stations then offered a cost-competitive alternative, and because few good hydro sites remained near major population centres and the cost of transmission substantially increased the cost of more remote facilities. However, the cost of competing sources of electricity, principally NUCLEAR POWER and thermal stations burning coal, oil and natural gas, has risen substantially since 1973, and hydro is expected to maintain its 55-60% share of Canadian electrical-generating capacity at least through the 1990s.

Because most hydroelectric installations have been sized to extract the maximum amount of energy available at the power site, based on historical data of average annual streamflow, many stations are able to operate at full output for 70-100% of the time; most other utility systems have annual load factors (rates of average to peak demand) of 50-60%. Consequently, in 1981 approximately 76% of the consumption and 69% of the production of electrical energy in Canada was generated by hydroelectric stations that contained only about 59% of Canada's total electrical-generating capacity.

Waterpower resources basically depend on topography and climate, and development of such energy sources is related to the magnitude and proximity of load centres and to the availability and price of competing energy sources such as coal. The development of hydroelectric power and its share of the total electrical production in Canada varies considerably from province to province. Practically all hydroelectric-power sites in Canada that are reasonably close to load centres have been developed, as have several of the more remote large-scale sites. However, a significant amount of hydroelectric potential remains untapped, chiefly in northern Québec, Manitoba and BC, and in Labrador and the YT. Although this potential is far from existing or foreseeable load centres, much of it may well be developed over the next 2 or 3 decades. The

Massive underground powerhouse at the James Bay Project (photo by Mike Döbel/Masterfile).

main drawbacks of conventional, large-scale hydroelectric power are the initial high capital cost, the long construction period and the environmental effects of flooding. These factors are offset by the long life and low operating costs of hydro facilities. Interest in smaller-scale or "micro-hydro" projects has revived recently.

Factors that influence the viability of technically feasible hydro sites are almost exclusively economic. Hence, development of such sites would require significant decline in construction and financing costs, greatly enhanced costs of competing energy supply from other sources, development of markets for large amounts of power within reasonable proximity of such remote sites, or prices that would support the cost of transmission to southern markets. Development of the 35 000-40 000 MW of theoretical capacity which is considered not technically feasible is restricted primarily by environmental constraints. Of the 100 000 MW of technically feasible potential, 10-15% is made up of comparatively small-scale sites of less than 50 MW capacity. Most large-scale sites would exceed 500 MW capacity; several would exceed 1000 MW, and at least 2 sites in each of Québec and BC are approximately 3000 MW capacity. The foregoing estimates are mostly preliminary assessments on the basis of map studies with minimal actual site inspection; more comprehensive

studies and economic analysis will be required to confirm or reject many of these potential sites on technical or economic grounds.

These estimates of hydroelectric potential do not include the long-recognized but still undeveloped TIDAL POWER potential of the Bay of Fundy in NS, a major source of low-head hydro power adjacent to populated areas of NS and NB. Like river-based hydro, tidal power is a natural hydraulic source that can be converted directly to mechanical and electrical energy by means of a turbine. However, tidal power is very expensive to develop, and the cyclical nature of the energy makes it less useful than river-based hydro.

E.W. HUMPHRIES

**Hydrogen (H)**, the simplest, lightest and most abundant chemical element, is the main fuel for the NUCLEAR FUSION reactions which power the sun. Intensive research is underway to harness fusion energy but hydrogen also shows considerable promise as a potential replacement for conventional fuels.

At normal temperatures and pressures, molecular hydrogen is a tasteless, odourless, colourless gas in which 2 atoms are combined as a diatomic molecule,  $H_2$ . It has substantial energy content, reacting readily with oxygen to give pure water and heat as the only products. Using hydrogen as a fuel eliminates the POLLUTION caused by burning conventional hydrocarbons. Hydrogen can be manufactured from a wide variety of renewable and nonrenewable energy sources; however, compared to other fuels, it is still very expensive and difficult to produce, store and transport. In Canada, most molecular hydrogen is produced by the reaction, at high temperature and pressure, of steam with methane (natural gas). Hydrogen also can be produced by applying energy (electricity, heat, solar energy, or some combination) to split water into hydrogen and oxygen. Hydrogen is now used in a wide variety of chemical processes and some scientists and energy planners expect it will become an important fuel for transportation and other applications.

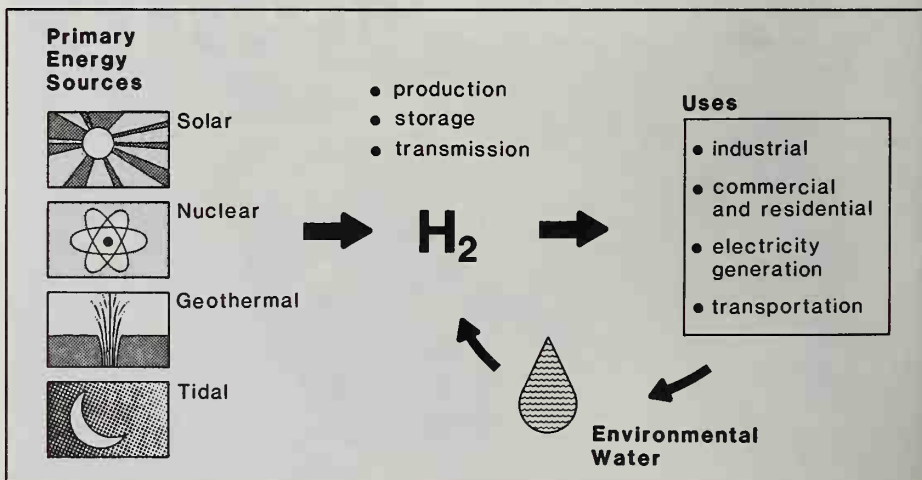

The International Energy Agency maintains an active program of research and development on the production of hydrogen from water, to which Canada is a contributor. In its 1981 report "Energy Alternatives," the House of Commons' Special Committee on Alternative Energy and Oil Substitution recommended that Canada make major investments to establish a leading position in hydrogen technology and systems. In its Oct 1981 report, the Ontario government's Hydrogen Energy Task Force reached similar conclusions. These reports have been followed by formation of 3 organizations dedicated to advancing hydrogen technology. The new Hydrogen and Energy Storage Division of the NATIONAL RESEARCH COUNCIL OF CANADA is co-ordinating

rapidly expanding, federally funded research and development in this area. The Institute for Hydrogen Systems has been established in Toronto, with Ontario government support, and is initiating research programs in hydrogen-use technologies. The activities of the Montréal-based Hydrogen Industry Council (est 1982) reflect the interests of approximately 2 dozen industrial members.

**Applications** Alberta and Saskatchewan have rich deposits of BITUMEN in oil sands and heavy oils, which could satisfy Canadian energy needs for generations. The key to producing pipeline-quality fuel from these resources is to increase their hydrogen-to-carbon ratio. In processing plants now in operation, this increase is achieved by coking to reduce the carbon content, but the trend in future could be towards hydrogen addition, to extend the hydrocarbon resource. Similarly, hydrogen could be used to produce methanol from BIOMASS: for example, with hydrogen addition, the dry wood required to produce 1000 t of methanol can be reduced from 2300 t to 900 t.

The substitution of hydrogen for gasoline and other hydrocarbon fuels is a long-term prospect, especially because of the requirements for on-board hydrogen storage. Liquid hydrogen is attractive as an aircraft fuel because its energy content per unit weight is 3 times that of conventional fuels. It is the fuel of the US Space Shuttle and is being considered for use in commercial aircraft. In small vehicles, however, the cost and weight of the cryogenic container for this very low-temperature liquid fuel is likely to be prohibitive.

**Production** After a decade of intensive work, direct electrolysis of liquid water remains the most viable technology for large-scale hydrogen production from nonfossil energy sources. Groups working in Belgium, Canada, the Federal Republic of Germany, France, Japan and the US have made advances which have sharply reduced capital costs and increased energy conversion efficiency to 85% and more. Canada is in the forefront of these developments. The experimental plant which was opened at Varennes, Qué, in June 1982, is the first commercial-scale demonstration of advanced hydrogen-production technology. RODNEY L. LEROY

**Hydrography** is the SCIENCE of SURVEYING, charting and describing physical features of OCEANS, seas, RIVERS and LAKES. Originally, hydrography encompassed much of OCEANOGRAPHY, plus the general observation, measurement and description of scientific phenomena at sea, but since the voyages of HMS CHALLENGER (1872-76) there has been increasing specialization in the marine sciences. Oceanography has developed as a separate field and hydrography now concentrates on sea-floor surveys, studies of tidal phenomena and provision of navigational charts and associated publications. These publications include TIDE and current tables, current atlases and sailing directions ("pilots"). European oceanographers sometimes refer to the measurement of the physical properties of WATER as hydrography.

Data collected in the field are considerably refined and condensed. Only a representative set including all critical information, such as the least depth over shoals, appears on the published chart. Typically, there is a scale reduction of 2-4 times from the field document to the chart. The chart also includes data from other sources, foreign surveys and charts, engineering drawings of wharves and structures, dredging plans, details of navigational aids (eg, LIGHTHOUSES, BUOYS), etc. Tidal data are analysed for astronomical influences and are used to predict future tides. An international depository of worldwide tidal information is held at the Marine Environmental Data Service (MEDS) in Ottawa. The charts are complemented by "Sailing

Modern hydrographic chart of Hamilton Harbour (1969). Such charts are frequently revised because they are essential for navigation (courtesy Hydrographic Service, Dept of Fisheries and Oceans). NOT TO BE USED FOR NAVIGATION

Directions," providing a written description of information which cannot be shown clearly on the chart itself. These volumes are referenced to the chart and include information on courses, environmental conditions, dangerous hydrographic features (eg, shoals, strong currents) and port facilities. A volume on arctic Canada also includes the history of early exploration.

Nautical surveying can be traced to medieval times, and a form of sailing directions is reputed to have been available much earlier. Major advances in marine CARTOGRAPHY took place in the 16th century in conjunction with the expansion in EXPLORATION. Early hydrographic surveys and charts resulted from private initiatives. The establishment of national hydrographic departments in France (1720) and Great Britain (1795) was important to Canada, as early surveys of the Canadian coast were conducted by these agencies, with contributions by the Spanish on the Pacific coast. On the Atlantic coast the surveys of Joseph Frederick Walle DESBARRES and Captain James COOK were particularly notable. Cook's surveys of the St Lawrence R contributed to the success of the British navy in bringing Wolfe's troops to Québec in 1759. In the Arctic, early hydrographic knowledge was gained from the explorations for the British navy of William EDWARD PARRY and JOHN FRANKLIN, and from those who came in search of Franklin in the latter part of the 19th century (see FRANKLIN SEARCH). In 1883, following the loss of the steamship *Asia* in Georgian Bay, the first Canadian survey, the Georgian Bay Survey, was formed under Staff Commander J.G. Boulton, RN. In 1904 the Canadian government formed the Hydrographic Service, taking over completely from the British the charting of Canadian COASTAL WATERS. However, the task of completing the work is so great that today many charts still include data collected by British and French naval hydrographers.

Over the years the Canadian Hydrographic Service has evolved, and today operates from headquarters in Ottawa and regional offices in Sidney, BC; Burlington, Ont; Québec City; and Dartmouth, NS. The Canadian Hydrographic Service, headed by the Dominion Hydrographer, is now part of the Department of Fisheries and Oceans. The service is responsible for conducting surveys of all navigable Canadian waters, including inland waterways. It maintains over 1000 navigational charts.

During recent years there has been a determined effort to develop expertise in hydrography in industry, and an increasing proportion of the work, particularly that required for offshore oil and natural-gas exploration, is now done outside government. Hydrography is now taught as a specialization of survey engineering U of New Brunswick. Hydrographic surveyors are usually graduates of technical survey courses or university MATHEMATICS or ENGINEERING programs who receive special training, often from the CHS. Humber College (Toronto) offers a diploma program in hydrographic surveying.

Canada is a member of the International Hydrographic Organization (est 1921), which has its headquarters in Monaco. This organization works towards ensuring chart uniformity and chart exchange on a worldwide basis and, in collaboration with the Intergovernmental Oceanographic Commission, is responsible for the General Bathymetric Chart of the Oceans. Canada has been particularly active in contributing to this mission. A. J. KERR

**Hydrology** studies the behaviour of WATER: its origin, distribution and circulation; its physical and chemical properties; and its interaction with the physical and living ENVIRONMENT. Applied hydrology is primarily concerned with precipitation, with the occurrence and movement of frozen, impounded or flowing water (on or below the Earth's surface) and with evaporation. More specifically, hydrology generally refers to the study of water on or over land rather than in the OCEAN. Hydrology is concerned with gathering information to determine quantities and rates of movement of water. Quantitative measurements of rainfall, snowfall, the rate at which water penetrates into and moves through soil, streamflow, the rise and fall of LAKE and groundwater levels, and the evapotranspiration of water into the atmosphere are vital. The science also encompasses study of the physical laws governing the movement of water through the hydrologic cycle and the interaction of water with the rest of nature. Hydrology depends upon various mathematical techniques to define and describe empirical relationships between the movement of water and the conditions and forces influencing it.

**History** Practical application of hydrological principles preceded a thorough understanding. As early as 4000 BC the Sumerians developed a complicated, extensive irrigation system which lasted some 5000 years. Large-scale FLOOD-irrigation agriculture in the Nile Valley developed at least as early as 3400 BC. In China waterworks date from before 2000 BC. The earliest known hydrological measurements date to 3500-3000

bc, when nilometers were first used to measure the levels of the Nile. Primitive rain gauges existed in India as early as the 4th century bc.

A few early thinkers seem to have had an exceptional understanding of hydrology, but it was not until 1580 AD when Bernard Palissy, a French natural scientist, wrote that rivers and streams were sustained by RAIN and snow, that the scientific world possessed a realistic description of the hydrologic cycle. A century later, Pierre Perrault and Edmé Mariotté, French physicists, measured rainfall and runoff in the Seine River Basin and proved that rainfall was sufficient to account for river discharge. Soon afterward the English astronomer, Edmond Halley, measured evaporation and demonstrated that evaporation from the Mediterranean Sea could supply the rivers discharging into it. In the late 1600s and 1700s the Italians Giovanni Cassini, Bernardino Ramazzini and Antonio Vallisnieri pioneered the theory of artesian water pressure, and important advances took place in hydraulic theory and instrumentation. Advances in GEOLOGY near the end of the 18th century set the stage for progress in groundwater hydrology. In the latter half of the 19th century, pressure to develop water supplies in Europe forced an intensive study of the field.

In the New World, early emphasis was placed on the measurement of streamflow. In the US and Canada, government programs to measure streamflow and compile records began before the 1900s. A network of climatological observation stations was also started. Both have been continually expanding (see CLIMATOLOGY; WEATHER OBSERVATION). A statistical and empirical approach to analytical hydrology developed from continuous data collection. For example, using probability theory and the assumption that a record of rainfall or river flow is representative of the rainfall or flow that will occur in the future, hydrologists have derived methods for describing the likelihood of occurrence of hydrological events. Approximate relationships between snowmelt and temperature, rainfall rate, ground cover and runoff, DRAINAGE BASIN area and flood magnitude, permeability and groundwater yield, radiation and evapotranspiration, etc., have been defined and used in the solution of practical problems. Such techniques are continually refined to fit new data.

**Education** In 1948 the first Canadian university course titled "Hydrology" was established by R. H. Clark for engineering students at U Man. Thirty years later courses in various aspects of hydrology were being offered in over 40 universities across the country, generally by ENGINEERING and GEOGRAPHY departments. All CIVIL ENGINEERING students now receive some training in hydrology. While there are no faculties dedicated exclusively to hydrology, several universities have hydrological postgraduate programs. Enrolment in these courses varies from year to year; approximately 40 MSc and PhD students graduated annually from Canadian universities during the late 1970s and that figure will probably be higher even during the recession of the 1980s. Postgraduate courses tend to concentrate on the same topics (surface water, erosion, sedimentation, groundwater and soil and water) touched on more briefly at the undergraduate level. The widespread use of computers has made hydrological modelling an important field of graduate study.

**Relationship to Other Fields** Because of the interrelatedness of water and nearly every other aspect of the natural environment, the lines dividing hydrology from other fields of study are blurred. METEOROLOGY is concerned with precipitation and evapotranspiration, GEOMORPHOLOGY with runoff patterns, geology with groundwater flow, SOIL SCIENCE and soil mechanics with subsurface flow and PLANT physiology with transpiration. Supporting sciences, such as PHYS-

ICS, MATHEMATICS and fluid mechanics, are necessary for detailed work.

**Applications** Hydrologists advise water managers in the use and manipulation of water. A few examples of projects and programs heavily dependent upon hydrological advice include allocating limited water supplies among various users; sizing structures (eg, spillways, bridges) designed to pass flood flows safely; planning water management or HYDROELECTRIC systems intended to make optimum use of available supplies; forecasting floods and low flows; designing and operating RESERVOIRS, dikes and floodways; designing EROSION-control structures; discovering, inventorying and allocating water from deep underground sources; applying hydrologic principles to soil-plant-water relationships to aid in the production of food and fibre; planning FORESTRY operations for water yield.

**Societies and Journals** Canadian hydrologists enjoy professional contacts and journalistic outlets through a variety of associations. The Associate Committee on Hydrology of the NATIONAL RESEARCH COUNCIL sponsors hydrological symposia at regular intervals. The journal of the Canadian Meteorological and Oceanographic Society is *Atmosphere-Ocean*. The Canadian Water Resources Association publishes the *Canadian Water Resources Journal*. The Canadian Society for Civil Engineering publishes through the *Canadian Journal of Civil Engineering*. The *Canadian Journal of Earth Sciences* serves the groundwater hydrologist. The American Geophysical Union's *Water Resources Research*, the Society of American Foresters' *Forest Science*, and various publications of the American Society of Civil Engineers and the National Water Well Association serve both American and Canadian needs. UNESCO's International Association of Hydrological Sciences, which produces the *Hydrological Sciences Journal*, provides a worldwide scientific community for the hydrologist. The year 1965 marked the beginning of UNESCO's International Hydrological Decade, designed to promote international research in scientific hydrology. Canada was a member of the co-ordinating council for 6 years.

R K. DEEPROSE

**Hymns** The simple verse-songs of the early Christian church and the chorales and metrical psalms of the Reformation have been sung by Canadians since the 17th century. Prior to the 20th century, hymn singing was not only a method of propagating religious doctrine but also a popular social activity and a means of cultivating knowledge of music. A missionary working among natives near Québec recorded in 1676 that the natives had "much aptitude and inclination for singing the hymns of the church" that were rendered into their language. Annals of 17th-century New France abound in similar comments. The "Huron Carol" ("Jesous Ahathonhia"), attributed to Jean de BRÉBEUF, adapted a French folk melody to Huron words; it remains in popular use at Christmas.

The singing-school movement of 18th-century England and New England became transplanted 1760-1800 to NS, NB and the Canadas by immigrants and Loyalists. After 1800, tunebooks in Canada catered to the psalm and hymn styles of this movement. Significant publications were Stephen Humbert's *Union Harmony* (1801), notable for its emphasis on fuguing; A. Stevenson's *The Vocal Preceptor* (1811), the earliest Canadian example of engraved music; Mark Burnham's *Colonial Harmonist* (1832); Zebulon Estey's *New Brunswick Church Harmony* (1835); *The Harmonicon* (1836); Alexander Davidson's widely used *Sacred Harmony* (1838); Lemuel C. Everett's *The Canadian Warbler* (1863), adapted from a US collection, and one of the first tunebooks addressed specifically to children; George Linton's *The Vocalist* (1865 or 1867). During the same era several publications for Anglican wor-

shippers appeared, notably George Jenkins's *A Selection from the Psalms of David* (1821); William Warren's *A Selection of Psalms and Hymns* (1835); James Paton Clarke's *The Canadian Church Psalmody* (1845). For francophone Protestants, hymn publications were Theodore Molt's *La Lyre sainte* (1844 or 1845) and *Chants évangéliques* (1862).

In the later 19th century, publication became more diversified; several books of hymn texts in native languages appeared, and the "gospel" style attracted popularity. Church authorities began making their own compilations, pioneer instances being *The Presbyterian Psalmody* (1851) and *Methodist Tune Book* (1881). The interdenominational *Canadian Hymnal* (1889) had wide popularity. A Canadian hymnologist, Stanley L. Osborne, remarks that the number of recognized Canadian composers writing hymns appears larger than the number of Canadian poets. Exceptionally productive, however, was David Willson (1778-1866), founder of the Children of Peace sect, whose published and unpublished hymn verses total over 1400. The sect's barrel organ, renovated and in working order at the temple-museum, Sharon, Ont., provides valuable evidence of how the early settings sounded. Despite denominational distinctions, a large common repertoire unites the publications noted. At the same time, all contain originally composed tunes.

In 20th-century Canadian hymnbooks, a notable selection of locally composed tunes continues. *The Canadian Baptist Church Hymnal* (London 1902), the *University Hymn Book* (Toronto 1912) and especially the *Methodist Hymn and Tune Book* (Toronto 1917) contain tunes by prominent musicians such as A.S. VOGT, Alfred Whitehead, W.H. Hewlett, H.C. Perrin and the youthful Ernest MACMILLAN. *The Presbyterian Book of Praise* (London 1904) and *The Hymnary of the United Church of Canada* (Toronto 1930) place less emphasis on locally written music, but set new levels of editorial accuracy. Alexander MacMillan (1864-1961), a major figure in Canadian hymnology, worked on both publications. A Toronto magistrate, James Edmund Jones (1866-1939), was partially responsible for the Anglican Church's *Book of Common Praise* (Oxford 1908), although the influence of the composer Healey WILLAN is strong in the 1938 edition. Of the handsome joint effort *The Hymn Book of the Anglican Church of Canada and the United Church of Canada* (Toronto 1971), Osborne, secretary of the joint committee, states that 10% of the tunes are by Canadians. Responding to revised congregational usages following the Second Vatican Council of the early 1960s were the *Livret des fidèles* (1966) and the *Catholic Book of Worship* (1972).

Whatever changes in taste and performance habits have affected hymn singing, Canadians still respond familiarly to a repertoire embracing "Our God's a fortress firm and sure" or "What a friend we have in Jesus," although an extensive number of Canadian compositions await the revival they deserve. Questions of taste and standards often concern hymnologists and editorial committees as much as the cultivation of a broad repertoire. In 1851 Presbyterians were exhorted to sing their hymns "without any grace notes or ornamental flourishes"; in 1908 Anglicans were allowed such beloved hymns as "Tell me the old, old story," with the reminder that these "would be out of place in many churches"; and in the *Encyclopedia of Music in Canada* (1981) Osborne judged that hymn singing in the 1970s showed immense improvement over that of the 1920s and 1930s. Recordings and radio broadcasts in the mid-20th century were a prevalent means of fostering hymn singing. An outstanding tradition is found in Winnipeg with the work of W.H. Anderson's Choristers and the CBC "Hymn Sing" directed by Eric Wild. See RELIGIOUS MUSIC. JOHN BECKWITH

**Ian and Sylvia**, folk music duo composed of singer-songwriter **Ian Dawson Tyson** (b at Victoria 25 Sept 1933) and **Sylvia Fricker Tyson**, (b at Chatham, Ont 19 Sept 1940). An accident when he was 19 ended Ian's ambition to be a rodeo cowboy, but the guitar he obtained while recuperating opened up new opportunities. In 1959 he moved to Toronto, started to sing in coffeehouses, and met Sylvia Fricker. Sylvia had grown up in southern Ontario and been exposed to a wide repertoire of music. By 15 she knew she wanted to be a folksinger and, after finishing high school, moved to Toronto.

They soon became full-time professionals and, with their first recording (1961), among the leaders of the folk-music boom in N America. Their repertoire expanded to include their own songs — "Four Strong Winds," written by Ian, was an international hit in 1962, and Sylvia's "You Were on My Mind" was a hit for We Five in 1965 — songs by contemporaries such as Bob Dylan, Gordon LIGHTFOOT, and Joni MITCHELL, and songs taken from their knowledge of country and blues. They were among the first of the "folk" musicians to use electric guitars, strings and other instrumentation. By 1970 their music was a synthesis of country, rock and folk, and they had created a band, The Great Speckled Bird, to help achieve that sound.

In 1970 they started a CTV Network show, "Nashville North," subsequently known as "The Ian Tyson Show" with Sylvia as an occasional guest. As the 1970s began, Ian and Sylvia's professional and marital lives began to split. (They had been married in 1964.) Their last appearance together was in 1975.

In 1974 Sylvia began to host a CBC Radio show, "Touch the Earth." During its 5-year run, the show provided important exposure for Canadian folk artists and established Sylvia as an independent personality. In 1975 she recorded the first of 2 solo albums for Capitol Records and in 1978 established her own company, Salt Records, to handle her albums and recordings by other folk artists. She has done a CBC TV series and numerous TV specials.

After he took his TV show off the air in 1975, Ian tried unsuccessfully to establish himself in Nashville, Tenn. Following a tour of Canada in 1978, he devoted most of his time to his cattle ranch in Alberta, limiting his musical life to periodic club dates. In 1983 he returned to the recording scene with the critically acclaimed album *Old Corrals and Sagebrush*, and in 1984 followed it with the equally successful *Ian Tyson*.

RICHARD GREEN

**Iberville et d'Ardillières, Pierre Le Moyne d'**, soldier, adventurer (bap at Ville Marie [Montreal] 20 July 1661; d probably at Havana, Cuba 9 July 1706), third and most famous of Charles Le Moyne's 12 sons. Iberville displayed his bravado on the expedition led by de TROYES against the English on James Bay, and was rewarded with the governorship of the conquered posts. He returned to the Bay in 1688, 1690 and 1694, raiding English posts and seizing furs. On 5 Sept 1697, his lone ship *Pélican* defeated 3 English warships near YORK FACTORY, sinking 2. Iberville's fierce courage and ruthlessness were forged in desperate colonial competition and savage border wars. In 1689, he took part in a brutal guerrilla attack on Corlaer, New England, in which some 60 settlers were massacred. In 1696-97, he led militia, Indians and French soldiers on a rampage across Newfoundland, burning, looting and killing some 200 men. In 1698-99, 1699-1700 and 1701-02, Iberville commanded expeditions to Louisiana, establishing Forts Maurepas, Mississippi, Louis (Old Mobile), collecting furs and negotiating with the Indians. His last campaign (1706), the plundering of the English colony of Nevis in the West Indies, was clouded by controversy. Iberville died that

year, likely of yellow fever, but was convicted of various charges, and most of his estate was seized in reparation. His career was an uneasy mixture of commercial ambition and military zeal but, though his conquests were ephemeral and his actions often cruel, his daring roused the admiration of even his enemies. He was the first native Canadian to receive the CROIX DE SAINT LOUIS, for valour.

JAMES MARSH

Reading: Guy Frégault, *Iberville the Conqueror* (1944).

**Ice** is the solid phase of WATER. It is useful to think of it this way rather than as "frozen water" because water can achieve the solid phase through the freezing of liquid water or by direct deposition (sublimation) of water vapour, its gaseous phase. These different processes can produce distinct ice forms in the atmosphere or on or below the Earth's surface. The form taken by the solid phase of water is often important in determining its environmental and other roles. Snow is one distinctive form of ice; others include GLACIER ice, river ice, lake ice, SEA ICE, ground ice of various types, HAIL, CLOUD crystals, hoar and rime. Ice crystals are typically hexagonal, a direct result of an internal symmetry produced by the orderly packing of the 3-atom water molecules (H<sub>2</sub>O) of which each crystal is composed. This crystal form is found at scales from microscopic, in cloud crystals considerably under 1 mm in diameter, to macroscopic, in crystals of over 10 cm diameter found in some glaciers.

Ex-voto painting commemorating d'Iberville's victories. As in most votive paintings, the saint is depicted in the upper portion while the event is shown in the lower part (courtesy Basilique Ste-Anne-de-Beaupré).

Snow is one type of solid precipitation originating in the atmosphere and falling to the surface of the Earth. At below -40°C, ice crystals may be initiated from water droplets in the atmosphere by a spontaneous change from the liquid to the solid phase of water. At much lower temperatures spontaneous change from gas to solid can occur. Above -40°C a nucleus (particle of ice or another appropriate substance) is normally required to trigger ice-formation nucleation. Tiny hexagonal crystals produced in these ways form cirrus clouds and the flickers of "diamond dust" often seen on cold, sunny days. Once in existence within clouds of supercooled water droplets, such ice crystals may grow into snow crystals through the deposition of water vapour because air has a lower capacity for holding water vapour in the presence of ice. The particular hexagonal form achieved by the growing crystal is determined by prevailing humidity and, especially, temperature conditions. When a crystal begins to fall through its cloud, further growth occurs by the accretion of supercooled cloud droplets, or riming. This is growth by freezing as distinct from vapour deposition. Graupel, heavily rimed snow, is an extreme product of this process. Rime, ice produced by the freezing of tiny, supercooled droplets, is not only important in the atmosphere, where it can cause aircraft to become iced up, but also on the Earth's surface. While falling, many snow crystals may combine to produce a snowflake.

In the warmer portions of the cloud, or outside the cloud en route to the surface, snow crystals may melt or evaporate (sublimate). Much of the rain which falls in Canada results from snow melting on its way to the surface. Hail, a type of solid precipitation characterized by layers of ice which are a record of alternate freezing and thawing in turbulent thunderclouds, is a good example of the involvement of the various changes of phase of water in the production of a distinctive ice form. Much of the cloud seeding in RAINMAKING or hail-suppression experiments is aimed at producing ice in water clouds.

The freezing of water droplets or the nucleation of water vapour, in the atmosphere and elsewhere, produce various distinctive ice crystals which may combine to form bulk ice composed of many crystals. On and below the Earth's surface such bulk ice, produced by the freezing of substantial amounts of water or by the densification of the snowpack, forms most of the ice present (see PERMAFROST; PERIGLACIAL LANDFORM).

Ice forms on freshwater bodies when surface temperatures fall slightly below freezing point. As the maximum density of water is achieved at close to 4°C, LAKE surface water cooled to that temperature becomes heavier than warm water below it and sinks. The warmer water, displaced from below, is cooled in its turn and also sinks. Thus, before ice can form on a lake, the entire water column has to cool to 4°C through overturning so that freezing temperatures can be achieved at the surface. When ice does form, much of the lake will still be at 4°C. In RIVERS, the turbulence of flow prevents freezing until the entire water column has been reduced to 0°C. On lakes, the initial random orientation of ice crystals on the water surface tends to be replaced, as the ice thickens, by vertically oriented 6-sided columns. This process forms a clear sheet of "black ice." The columns often become loose during spring breakup to form distinctive "candle" crystals. Flooding of snowpack lying on a lake produces slush which, on refreezing, forms a distinctive white ice composed of randomly oriented crystals.

Ice, particularly snow, is a major control of the flow regimes of Canadian rivers. Most rivers achieve peak annual flow in spring, as the accumulated precipitation of many months runs off in a period of days or weeks. In colder areas

The St Elias Mts of Kluane National Park contain the world's largest concentration of icefields and glaciers (photo by Richard Harrington).

most annual precipitation runs off at this time. The hydrological impact of the melt season is heightened because winter precipitation is less subject to evaporation than its summer counterpart and the ground over which snowmelt runs off is often frozen so that there is little loss through infiltration. Floods associated with ice jams are another feature of this snowmelt-breakup season. As groundwater reservoirs are replenished, rivers may be fed, through subsurface flow, by the products of snowmelt throughout the summer. Rivers flowing from the mountains, as in the case of some prairie rivers, may, of course, be snow- or glacier-fed all summer. The nature of winter precipitation also controls the low-flow phase of many of our rivers. Except in warmer southern areas, where high evaporation and evapotranspiration offset rainfall to produce late summer droughts, Canadian rivers tend to achieve minimum flows in late winter. At this time, they have been deprived of runoff for months, as precipitation has been held up in the snowpack. In the north and in permafrost regions generally, flows can reach zero where rivers freeze to their beds. Naleds or "icings" are an ice form which may result in such situations. Even Niagara Falls is mainly ice at this time of year. Glacier-fed streams of the Arctic and the West behave somewhat differently. In them, the effect of spring snowmelt is extended to all the summer months by the melting of the glacier itself. In the West, some flow from beneath the glacier is normal throughout the winter; in the North, discharge stops completely in the cold season. In summer, glacier-fed streams may be subject to some particularly spectacular ice-damming effects where the glacier itself blocks a stream.

As a northern temperate region, the populated part of Canada has ice and snow in abundance, ensuring that most areas of the country have sufficient fresh water for society's needs. Snow provides other benefits, ie, to the winter recreation industry, as an insulator of the ground, etc. But there are also attendant climate hazards and adjustments which human beings must make (see CLIMATE AND MAN). Snow-removal costs exceed \$1 billion per year in Canada; indirect costs (eg, increased fuel consumption, travel delays, etc) are even greater. The centres in Canada which receive most snow are Goose Bay, Nfld, with 409 cm; St John's, Nfld, 364 cm; Québec City, Qué, 336 cm; Kapuskasing, Ont, 322 cm; and Charlottetown, PEI, 305 cm. See also GLACIATION; PINGO; AVALANCHE.

W.P. ADAMS

**Ice Age**, the Pleistocene epoch of geologic time, during which periodic, extensive glacial activity occurred in many parts of the world. The Pleistocene is generally considered to encompass the time beginning 2-3 million years ago and ending 10 000 years before the present. See GLACIATION; GEOLOGICAL HISTORY.

N.W. RUTTER

**Ice Cap**, large mass of ice that originates on land by compaction and recrystallization of snow. Ice caps flow outwards in several directions and submerge most or all features of underlying land. An ice mass constrained by bedrock to flow in one direction, usually along a valley, is called a GLACIER. This distinction is not sharp; for example, an ice cap surrounded by mountains may be drained by a series of valley glaciers. Ice caps and glaciers form where annual snowfall exceeds the amount lost by melting in summer. As a layer of snow is buried by subsequent falls, it is gradually transformed to ice. The ice flows outwards under gravity, carrying the overlying snow with it. At lower elevations, all of the previous winter's snow and some of the ice are removed by melting and runoff, and in some cases by calving of ICEBERGS into an ocean or lake. The surface profile of the ice mass does not change much from year to year, however, because the ice that flows out of the accumulation area approximately balances that lost from the lower reaches.

If snowfall increases or summers become colder, so that melting is reduced, the ice starts to thicken and, after some years, the ice front starts to advance. Conversely, a reduction in snowfall or an increase in summer warmth eventually produces a retreat. Interpretation of the record of advances and retreats is complicated because each ice mass has its own characteristic response time which depends on its size and speed.

Mountain ranges in western Canada contain many ice caps. The best known is the COLUMBIA ICEFIELD, a major tourist attraction on the Banff-Jasper hwy. It has an area of over 300 km<sup>2</sup> and is drained by several valley glaciers, including Athabasca Glacier. Its surface elevation varies from about 2600 to 3500 m, the large range being a reflection of the peaks and valleys in the bedrock underneath. The icefield's average thickness is probably no more than 100-150 m, although the thickness of parts of the outlet glaciers is more than double this. Velocities range from a few metres per year in the centre to about 100 m per year in Athabasca Glacier. About 4 m of ice is melted from the lower part of the glacier each summer. Present flow from the icefield does not quite compensate for this; thus, the glacier is retreating from the position it reached about 100 years ago, after a long period when the CLIMATE was colder than it is today.

The largest ice caps in Canada are on ELLESMERE, where 3 have areas exceeding 20 000 km<sup>2</sup>, and on AXEL HEIBERG, DEVON and BAFFIN islands. The ice in some of these caps is up to 1 km thick. Because both snowfall and melting in the Arctic are much less than in western Canada, the arctic ice caps are less active. Although few measurements have been made, velocities are probably only a few tens of metres per year.

The world's largest ice caps, covering Antarctica and Greenland, are usually called ice sheets. The Antarctic Ice Sheet has an area of over 12 million km<sup>2</sup> and a maximum thickness of about 4.5 km. If it were to melt, world sea level would rise as much as 75 m. The Greenland Ice Sheet has an area of 1.7 million km<sup>2</sup> and a maximum thickness of about 3.2 km. Glaciers in West Greenland produce icebergs hazardous to shipping and drilling rigs in the N Atlantic.

At the peak of the last ICE AGE some 18 000 years ago, an ice cap comparable in size to that of Antarctica covered almost all of Canada and the northern part of the US (see GLACIATION). The ice has left its mark on the landscape, eg, in the heavily eroded bedrock of the Canadian SHIELD. Much of the PRAIRIE is covered by deposits laid down in lakes that formed around the SW margin of the retreating ice cap. The land was depressed by the weight of ice and slowly recovered as the ice cap retreated. In parts of Canada, notably around Hudson Bay, the land is still rising (see COASTAL LANDFORM).

Taking samples from the central part of a polar ice cap by drilling through it provides a continuous record of past snowfalls. Annual layers can sometimes be distinguished; if not, the ice can be dated by other means. Chemical analyses of core samples from Greenland, Antarctica and arctic Canada have given detailed records of past climates, particularly temperatures, extending in some cases over as much as 100 000 years. Small amounts of other materials such as volcanic ash, wind-blown dust, pollen and, in recent snow, acids and fallout from nuclear tests have been found.

W.S.B. PATERSON

**Ice Skating** probably originated in Scandinavia over 2000 years ago as a means of transportation. It was also practised on the canals of Holland during the Middle Ages. Early references to skating in England date from the 17th century. The first skates were made from the shank or rib bones of elk, reindeer and other animals, and the word "skate" likely derives from the early German word *schake*, meaning shank. As a social and recreational pastime, skating was popular in Britain and France during the 18th century, and the world's first skating club was formed in Edinburgh in 1742.

In Canada, according to legends, the Iroquois Indians had skated, tying animal shin bones to their footwear with leather thongs; and in Acadia, French explorers were skating as early as 1604. Skating as a sport was introduced into Canada by British garrison officers in the 1840s, and quickly gained a strong following. It was thought especially appropriate for girls and women, and thus became an important social pastime. Canada led the world in the development of early skating rinks, and the first prepared outdoor commercial rink in the country was opened in Montréal in 1850. The first covered rink in the world was built in Québec City in 1852. The early rinks were built with natural ice; large sheds provided the skater with shelter from the wind and snow. The most famous of these early rinks was the Victoria Skating Rink in Montréal, built in 1862 and at that time the largest in the world. From this rink the game of ice hockey took its standard rink size. The first artificial rinks in Canada were built in Victoria and Vancouver, BC, during the winter of 1911-12, and artificial rinks are now found in most sizable communities. However, Canadians still skate for pleasure on frozen lakes, ponds and rivers. Ice skating is fundamental to the game of ice hockey and competitively takes the form of FIGURE SKATING, SPEED SKATING and ice dancing.

The evolution of the skate to the modern steel blade or tube variety passed through several stages. Skates made entirely of iron were introduced in the 17th century. Steel skates, fastened with screws and clamps to the wearer's shoes, were first made in the 1850s. In 1861, John Forbes of Dartmouth, NS, developed the first spring-skate; adjusted with a single lever, it eliminated the need for screws and plates. Eventually, this style was replaced by the skate with blade permanently attached to the boot. In 1887 the Amateur Skating Assn of Canada was founded, in Montréal, for both speed and figure skating. In 1939 figure skaters formed the Canadian Figure Skating Assn.

BARBARA SCHRODT

Reading: Nigel Brown, *Ice Skating: A History* (1959).

**Ice-Worm**, common name for *Mesenchytraeus solifugus*, a dark-pigmented oligochaete worm (see ANNELIDA) up to 4 cm long, found in tangled masses in melting ice of GLACIERS in the Pacific Northwest; similar ice-worms are also reported from Greenland and the USSR. The woolly ice-worm of the High Arctic is a caterpillar of lepidopteran *Gynaephora*, which is tolerant of freezing and overwinters in exposed conditions. The term "ice-worm" is also applied to the primitive INSECT *Grylloblatta campodeiformis*, a slender,

wingless animal, creamy white in colour, sometimes found at edges of melting glaciers in the Canadian Rockies. Scott of the Antarctic referred to ice-worms on the underside of spring pack ice, but these were filamentous diatoms (see ALGAE). Ice-worms are part of Canadian folklore. An Inuit myth refers to Sikusi, "a woolly and mischievous ice-worm" and a notorious melter of igloos, which freed an Inuit from Tuktoyaktuk who was frozen in ice. Robert SERVICE wrote the legendary "Ballad of the Ice-worm Cocktail."

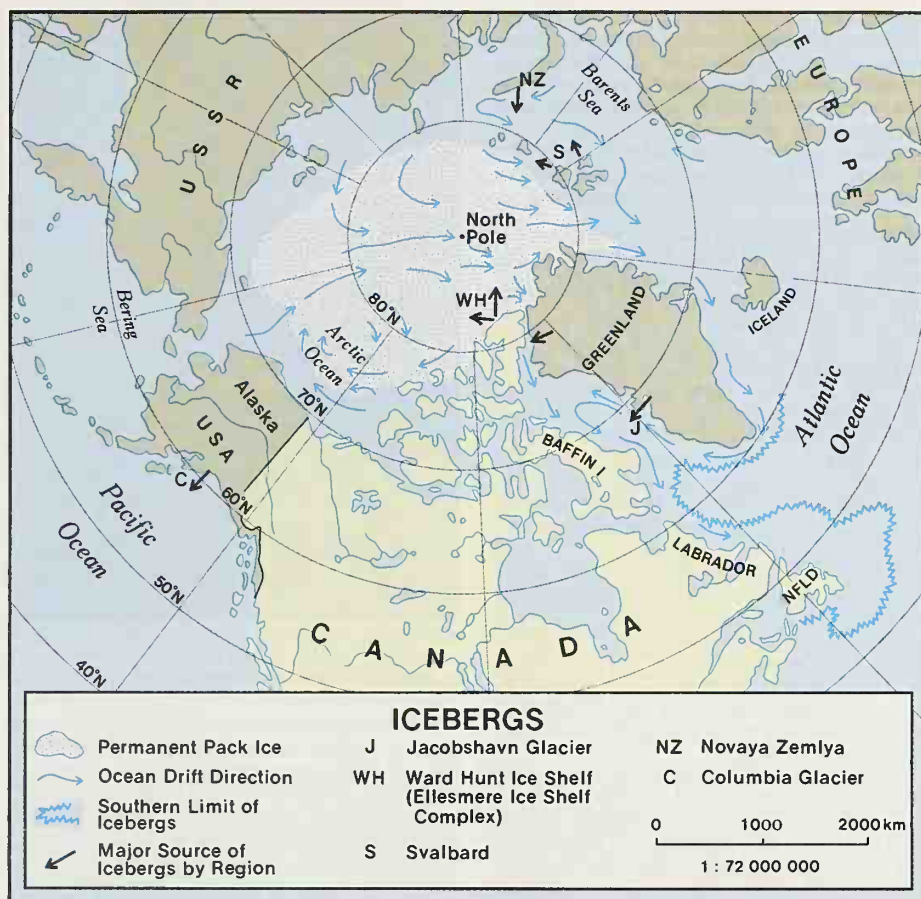

R G B REID

**Iceberg** [Dan or Nor, *isberg*, "ice mountain"], a piece of ice that has become detached from its parent GLACIER by a process known as calving. The glacier may be flowing into a FJORD, or may be an ice shelf (floating glacier of large dimensions extending beyond the coastline). Icebergs thus created may melt or disintegrate, giving rise to smaller pieces called growlers and bergy bits. Icebergs calve from a parent glacier as a result of the manner in which the glacier enters the water or, subsequently, from tidal and wave action or as a result of EARTHQUAKE shocks. Less commonly, icebergs may suddenly emerge from below water level as a result of forces acting on part of a glacier protruding under the water. In such cases, the water has failed to melt underwater ice faster than the processes acting on ice above water level.

**Appearance** Most icebergs are white except along freshly calved ice cliffs, which tend to appear blue. Others may appear green, brown or black, or combinations of these colours. These icebergs have usually rolled over, exposing basal ice, or have emerged from below water level. The various colorations are caused by differences in density, air-bubble content and impurities. For example, black ice is of high density and bubble free; dark layers indicate the presence of rock materials derived from the base of the parent glacier. Occasionally, rocks may be found on the original upper surface of the iceberg. As the iceberg melts, these materials precipitate into marine or lake sediments, forming ice-raftered deposits.

**Occurrence and Dimensions** Some icebergs are trapped in lakes; the vast majority occur in oceans. Flat-topped tabular bergs are sections of almost flat ice shelves. In the Antarctic they are commonly several tens of kilometres square and several hundred metres thick. One of the largest tabular bergs seen measured 160 km x 72 km. A typical height above waterline would be 35-45 m, implying a total ice thickness of 250-320 m, although greater thicknesses are possible. In the Arctic Ocean, the term ice island is applied to pieces of floating shelf ice that form principally on the N coast of ELLESMERE I. These thin tabular icebergs are 20-60 m thick, often up to 100 km<sup>2</sup> in area, and typically protrude 2-6 m above water. Irregularly shaped icebergs are more typical of coastal Greenland and northern Canada. Many irregular bergs originate in Greenland fjords containing fast-flowing outlet glaciers coming from the inland ice sheet. Because these glaciers usually terminate below the snowline and because they are often extremely broken up in their journey to the sea and then by tidal and wave action, they can give rise to very irregular bergs of almost pure ice, their spires occasionally reaching 100 m above sea level.

**Dynamics and Stability** The composition of antarctic tabular bergs gradually changes from snow on the top surface to ice by about the waterline. This fact, combined with their tabular shape, makes them much more stable than typical arctic icebergs, which quickly tilt and finally roll on their voyage to destruction. Calving from an already tilted iceberg may shift the centre of gravity sufficiently to cause the iceberg to roll, posing a threat to ships. Icebergs are driven principally by ocean currents; wind stresses on ex-

posed parts are generally insufficient to influence the motion significantly. Melting below sea level takes place continuously; above sea level, intermittently, according to location. Depending on the shape of the iceberg and rock content, the volume of ice submerged compared to the total ice volume is in the ratio of the density of the ice to that of seawater, or about 0.88 in arctic and 0.85 in antarctic icebergs. The above-water shape of an irregular iceberg does not necessarily provide information about its underwater geometry. This may be discovered through the use of airborne RADAR or side-scan SONAR from a ship. These studies and others (eg, towing tests and iceberg-stability investigations) are carried out at the Centre for Cold Ocean Resources Engineering (C-CORE), St John's, Nfld.

Because the ocean transmits wave energy, icebergs respond to wave action. Thus, in addition to drifting with ocean currents, icebergs are known to oscillate vertically and to roll with a periodic motion. Since icebergs possess natural periods of oscillation dependent on their density and their thickness, they may tune in to certain ocean waves. Waves possessing the right period will tend to cause resonance in the iceberg, with a consequent increase in the size of oscillation.

Iceberg in the Labrador Sea (photo by John deVisser).

This behaviour changes continually with the changing shape and thickness of the iceberg. An ideal, rectangular block iceberg with a mean thickness of 200 m would have a natural period of oscillation of about 26 seconds, which is in the range of common wave-swell periods. The thinner arctic ice islands have a much lower natural period of oscillation and, having horizontal dimensions much greater than their thickness, tend to absorb ocean waves as filtered travelling waves, which induce flexing of the ice. As the ice island thins by melting, this process may lead to its fracturing. Most Greenland bergs melt before reaching 40° N lat (roughly opposite Philadelphia, Pa), although occasionally some bergs reach almost 30° N. Satellite imagery has been used to track large bergs (see REMOTE SENSING).

**Applications** T3 and other arctic ice islands on which aircraft can land have been used intermittently by the US and USSR as mobile research platforms for about the last 30 years. Because many become trapped in Arctic Ocean current gyres, they survive for many years, melting and crumbling at the edges only slowly. In 1977 and 1980 conferences were held to investigate the technology involved in moving antarctic icebergs to places where water shortages are frequently acute, eg, Australia, California and Saudi Arabia. This controversial project has not yet materialized.

**Hazards** In the Northern Hemisphere icebergs present a threat to human activities. Off the coasts of Labrador and Newfoundland, recent PETROLEUM explorations necessitate the presence of drill platforms, which may be endangered by icebergs. In the vicinity of Valdez, Alaska, the Columbia Glacier is showing signs of disintegration in its terminal region. As a result, bergs will drift into Prince William Sound and pose a danger to oil tankers operating from the port of Valdez. US Geological Survey glaciologists have posted iceberg forecasts. Oil and

gas operations in the Beaufort Sea and between the Queen Elizabeth Is are threatened by collisions between even small ice islands and platforms and bottom structures (eg, PIPELINES). The threat to shipping in the N Atlantic is now minimal, as a result of the establishment of the International Ice Patrol after the sinking of the *Titanic* (Apr 1912). G. HOLDSWORTH

Reading: G. Schultz, *Icebergs and Their Voyages* (1975).

**Icebreakers** Canada has had an icebreaker capability for over 100 years. Indeed, one of the promises of Confederation — a guaranteed year-round ferry service between Prince Edward Island and the mainland — resulted between 1876 and 1899 in the construction of 3 small ice-breaking FERRIES. At the turn of the century Canada's first full icebreakers, the *Champlain* and *Montcalm*, were built to break up ice barriers and dams that caused annual flooding at narrow points along the St Lawrence R. Icebreakers were first used in the Canadian Arctic in the 1920s to deliver supplies and services to native and isolated settlements during the short summer season, and to back up claims of Canadian sovereignty over the NORTHWEST PASSAGE and Arctic Archipelago. In the 1930s the port of Churchill was opened for grain shipments and in 1957 the government undertook the annual supply of Distant Early Warning (DEW) line sites across the Arctic. Recent economic development in northern Canada, particularly the extraction of raw materials, has again increased the demand for icebreaker services.

Canada operates 22 of the world's estimated 100 icebreakers: 18 owned by the CANADIAN COAST GUARD (CCG) as part of Transport Canada and 4 by private oil companies. An icebreaker's chief function is to break, separate or divert ice in ice-covered waters, and the CCG icebreaker fleet has been designed and built for specified Canadian needs: to assist shipping in lakes, oceans and river mouths; keep channels open through the ST LAWRENCE SEAWAY system; and support government supply and economic development operations in the Arctic. The CCG icebreakers are classified as heavy (8 vessels), medium (7 vessels), and light (3 vessels). Canada's most powerful icebreaker, the *Louis S. St. Laurent* of 13 800 tons displacement (dwt), is smaller than the two 23 400 dwt nuclear-powered icebreakers of the Soviet Union's *Sibir* class. However, should the Canadian government give approval for construction of the "Polar 8" icebreaker, designed as a 35 000 dwt ship with 100 000 shaft horsepower (shp), it would be the world's largest icebreaker. One of the CCG's heavy icebreakers, the *John Cabot*, is also equipped for submarine cable laying and repair. The *Canmar Kigoriak* owned by DOME PETROLEUM LTD (7200 dwt), though presently used to convoy other kinds of marine units working in Arctic ice, such as drilling rigs, is basically an experimental icebreaker, the prototype for the gigantic 200 000 dwt icebreaker-tanker of the future.

Dome Petroleum's *Canmar Kigoriak*, which operates year-round in the Beaufort Sea, can maintain a speed of 3 knots through thick ice (courtesy Dome Petroleum Limited).

Gulf Canada's *Terry Fox*, a Canadian-built icebreaker classified as Arctic 4, is used in the Beaufort Sea (photo by Ranson Photographers, Edmonton, for Gulf Canada).

Canada, like all nations with icebreakers (Argentina, Finland, Sweden, Japan, W. Germany, US and USSR), operates many other kinds of ships built to function in ice conditions. These ice-strengthened marine units range from experimental cargo ships, such as the M.V. *Arctic*, to the mobile arctic caissons owned by large private companies involved in offshore oil drilling in the Beaufort Sea.

Heavy icebreakers in the CCG fleet generally operate in southern waters in the winter months and the Arctic during the summer. Though the *Louis S. St. Laurent* has worked in Hudson Bay in December, no serving Canadian icebreaker is able to penetrate Canadian Arctic water during the severe winter season from November to May. The proposed "Polar 8," which has the category of an Arctic 8 type ship, could operate year-round in Arctic waters. This Arctic numbers classification is part of the Canadian Arctic Shipping Pollution Prevention Regulations instituted in 1970. For example, an Arctic 3 icebreaker, which is the category assigned to the 3 "R" or *River* class of CCG heavy icebreakers, can maintain a speed of 3 knots through ice 0.9 metre (3 feet) thick in what is called "the continuous mode." This expression refers to the steady movement forward of the icebreaker through the water. An Arctic 7 icebreaker, which is the category given to the *Canmar Kigoriak*, can maintain a speed of 3 knots through ice 7 feet thick. The icebreakers owned by GULF CANADA LTD, the *Terry Fox* and *Kalvik*, are classified as Arctic 4. Under severe ice conditions Arctic 3 ships such as the CCG's "R" class and Gulf Canada's 2 Beaufort Sea Vessels have operated beyond their category up to Arctic 4 and 5, respectively.

Canada's future need for advanced icebreakers is not likely to be as large as that in the USSR. The composition of Canada's icebreaker fleet depends on the level of demand for their services in ice-covered waters. For example, the transportation of oil and gas from the Arctic by water would result in a considerable increase in the icebreaking capability in Canada.

JOHN D. HARBRON

**Icelanders**, coming by way of Greenland, were the first European visitors to what is now Canada. ERIC THE RED established a settlement in Greenland in 896 AD, the same year BJARNI HERJÓLFSSON made the first known sighting by Euro-

peans of the NE coast of Canada. Archaeological excavations at L'ANSE AUX MEADOWS demonstrate that Norse settled in Newfoundland. KARLSEFNI's son Snorri was probably the first European born in what is now Canada.

**Origins** Iceland, an island settled in the 9th century AD by renegade NORWEGIAN chieftains and their followers, is warmed by the Gulf Stream and has a fairly moderate climate. Its uninhabitable interior is a volcanic mountain plateau of glaciers, lava fields and desert, but the treeless coast provides grazing land for sheep and cultivation. The Icelandic *Althing* (est 930 AD) is the oldest parliament in the world. The nation has the highest literacy rate in the world, with more books, periodicals and newspapers published per capita than anywhere else.

Through the centuries Icelanders suffered many natural calamities. By 1800 the national population was reduced to only 47 000 by disease, starvation and volcanic eruptions. In the 19th century, new disasters, including sheep epidemics, a deterioration in the climate and more volcanic eruptions, followed. The Danish government, which controlled Iceland at the time, offered to relocate the entire population to Denmark. The Icelanders declined, although small parties emigrated to Brazil and Wisconsin. The first Icelander to land on Canadian shores since his Norse ancestors was 22-year-old Sigtryggur Jonasson, who arrived in Québec City on 12 Sept 1872.

**Migration** In 1873 about 150 more Icelanders arrived in Québec, encouraged by Jonasson. They were given free transportation to Ontario by the Canadian government, as well as offers of free land. Rosseau, in the Muskoka district, was selected as a site, but government employment, which had been promised until the land was cleared, was not adequate, and most settlers soon left, leaving behind a small permanent settlement. A second party arrived in 1874, settling in Kinmount, Ont. A Nova Scotian immigration officer induced a large number to relocate at what the Icelanders called Markland, NS, near Halifax, with offers of land, household appliances and financial aid. The land was not arable, however.

**Settlement Patterns** In 1875, 235 Icelanders travelled N by flatboat on the Red R from Winnipeg, Man, to the W shore of Lk WINNIPEG. There they had been promised an Icelandic reserve in what was then an unorganized part of the North-West Territories. This reserve, established by an order-in-council, became New Iceland, a unique political structure in Canadian history. In 1876, 1200 others joined the first group. Fifty immigrants had remained in Winnipeg the first year, and 200 the second, creating the basis for the first permanent urban Icelandic settlement in Canada.

In New Iceland the settlers created their own laws, maintained their own schools, and generally managed their own affairs. A series of natural disasters, including floods and a smallpox epidemic 1876-77, decimated the population, until in 1878 a general exodus to Winnipeg and North Dakota began. By 1881 the population of the New Iceland area had declined to about 250. In 1881 as well the provincial boundaries were extended N, and New Iceland became part of Manitoba, though remaining, to this day, heavily Icelandic. The main settlement in New Iceland was GIMLI. Other rural areas of Manitoba settled by Icelanders include Lundar (on Lk Manitoba); Glenboro, in the SW region of the province; SELKIRK, N of Winnipeg; and Morden to the S.

Icelanders continued to immigrate to Winnipeg throughout the last 20 years of the 19th century. Later settlements were established in rural Saskatchewan and Alberta, but these were largely settled by families and individuals moving from Manitoba and from Icelandic settle-

ments in the US. Descendants of Icelanders now live across Canada.

**Economic Life** Most of the immigrants remained in farming, generally their profession at home. Agricultural settlement in Ontario and Nova Scotia proved unsuccessful and conditions in New Iceland were not much better. The freshwater fishery contributed to the economic viability of New Iceland.

The immigrants sent their children to universities whenever possible, which may have influenced the pattern of assimilation. Icelanders did not encounter much prejudice and there was a fairly high rate of intermarriage between Icelanders and the settled population. Typically, Icelanders entered the professions, particularly medicine, law and education.

**Social Life and Community** From the time New Iceland was settled, Icelanders have preserved elements of traditional Icelandic society, culture and language. Factionalism, however, has permeated almost all of the Icelanders' endeavours, and this is reflected in their many voluntary associations, most of which, in New Iceland, were organized around religious themes and topics. The most important association historically, the Icelandic National League of N America, was founded in 1919 to assist Icelanders to adapt to Canada and to preserve elements of Icelandic heritage. Chapters of the league were established in almost every traditional Icelandic settlement and in the cities to which children of the immigrants had relocated. Icelandic Canadian clubs now exist in many Canadian cities. In 1942 the Icelandic Canadian Club began publishing the first English-language Icelandic publication in N America, the *Icelandic Canadian* magazine.

The Icelandic associations have traditionally hosted events for social and educational reasons, the most important being the Icelandic Festival (*Íslendingadagurinn*), held annually since 1932 in Gimli on August 2. Originally, the purpose was to commemorate the granting of a constitution to Iceland in 1874, but in time it has also become an event to honour the Icelandic pioneers in Canada.

**Religion and Cultural Life** The Lutheran Church (the state church in Iceland) has been the most prominent, and the Icelandic Evangelical Lutheran Synod of America held its first conference in Winnipeg in 1885. The Unitarian Church was the second-largest church among Icelanders, although it is not clear how this situation developed. The first Unitarian Church opened in 1892. Considerable political and theological rivalry existed between members of the 2 denominations in Winnipeg and this carried over into many of the smaller, rural communities. The United Church is now the second-largest denomination among Icelanders.

The first Icelandic newspaper in N America was *Framsíðari* (*The Progress*), published in New Iceland between 1877 and 1880. Between 1879 and 1910, 8 other publications originated in Gimli. In 1886 the Icelandic newspaper *Heimskringla* (*The World*) was founded. *Lögberg* (*The Tribune*) was founded in 1887, partly in opposition to *Heimskringla*. They were amalgamated in 1959 into *Lögberg-Heimskringla*.

Literature dating the sagas and the settlement of Iceland is probably the most unifying theme in Icelandic culture. The Icelanders in Canada have produced many poets and novelists writing in both English and Icelandic. Stephan G. STEPHANSSON is considered by many critics to be the foremost Icelandic poet of this century. Stephansson's contemporary, Guttormur J. Guttormsson, was born in New Iceland in 1878 and did not visit Iceland until 1939. He was best known, perhaps, for the poem *Sandy Bar*, a tribute to the Icelandic pioneers in New Iceland. Contemporary Icelandic writers include Laura Goodman Salverson, first editor of the *Icelandic*

*Canadian* magazine and author of *The Viking Heart* and *Confessions of an Immigrant's Daughter*, and William Valgardson, author of *Bloodflowers* and other works.

**Education** In Iceland literacy has long been a requirement for marriage and everyone was expected to have an intimate knowledge of the early sagas. In New Iceland a request was made for provision of a school even before homes had been built. In Winnipeg, Icelandic was first taught at Wesley College (now University of Winnipeg) in 1901. In that same year the Manitoba Department of Education approved the teaching of Icelandic in provincial schools (when requested by parents) and University of Manitoba accepted it as a second language for incoming students. In 1951 the Chair in Icelandic Language and Literature was established at University of Manitoba. The Icelandic collection in U of Manitoba library now has a full-time curator and over 14 000 volumes.

**Politics** Icelanders are not identifiable with any particular political ideology or Canadian political party, although many have distinguished themselves in political service. In 1898 Sigtryggur Jonasson was elected to the Manitoba legislature to represent St Andrews. Thomas H. Johnson was appointed attorney general and minister of public works for Manitoba in 1915, becoming the first Icelandic Cabinet minister in Canada.

J. MATTHIASSEN  
Reading: William Kristjanson, *The Icelandic People in Manitoba: A Manitoba Saga* (1965).

**Igloo**, or snowhouse, was a winter dwelling utilized by INUIT across the Arctic. Some Inuit spent most of the winter in semi-subterranean houses made of driftwood and whalebone and only used the igloo when travelling. Others relied on igloos for housing through the entire winter. The dome-shaped igloo was built spirally from within. The structure derived its strength from the key block, inserted at the apex of the roof. A series of these domes were constructed, connected by passageways, to house 15-20 people. Furniture consisted of cooking pots, oil lamps and low platforms. Temperatures inside the igloo were just below freezing or warmer.

**Igloodik**, NWT, Hamlet, pop 746 (1981c), is located on an island off the MELVILLE PENINSULA in the FOXE BASIN Lowlands, 1641 air km NE of YELLOWKNIFE. The area provides a unique record of unbroken INUIT habitation, with the oldest site established about 2000 BC. Sir Thomas BUTTON was the first *qallunaq* ("white man") to visit the area, in 1613. Umik, a local Inuk, set up a mission at the site in the early 1920s where he preached his own brand of Christianity. A Roman Catholic mission was established in the area 10 years later and an HBC post in 1939. The community's residents still subsist today on hunting, fishing and sealing.

ANNELIES POOL

**Igloodik Sites**, archaeological sites located on the islands at the northern end of FOXE BASIN, in the vicinity of the village of Igloodik. They appear to have been continuously occupied for the past 4000 years. Prehistoric hunters were attracted to the area by rich sea-mammal resources, principally seals and walrus. Isostatic uplift has resulted in a series of raised beaches, so that the archaeological remains of older beach occupations are at present found at greater elevations above sea level than are those of more recent occupations. This situation has allowed archaeologists to demonstrate an unmatched sequence of occupation and cultural development throughout the Paleoeskimo period between about 2000 BC and 1000 AD. The area was also occupied after 1000 AD by prehistoric THULE CULTURE Inuit, whose descendants continued to use the region through the historic period. See also ARCHAEOLOGY; PREHISTORY. ROBERT MCGHEE

**Iglulik Inuit** (or Igluligmiut) are known by the name of an important settlement site which translates as "it has houses." Iglulik country extends from Chesterfield Inlet on NW Hudson Bay northward along Melville Peninsula and across the northern third of Baffin I. Population estimates of about 500 were made in 1822 and in the 1920s. There were about 2500 Igluligmiut in 1980. A dialect of Inuktitut is spoken and main contacts in traditional times were with the BAFINISLANDINUIT in the NW and the NETSILIK in the southern part of the area. Intermarriage with those groups has occurred since the late 19th century. Important Igluligmiut habitation sites have been used since as early as 1700 BC. First European contact dates from the early 19th century. Explorers PARRY, RAE and HALL all travelled in Iglulik country. From 1860 to 1910 a number of US and Scottish whalers wintered in the area and were the first forces of change. After 1920 trade in white-fox furs and the influence of missionaries and police brought more change. The reports of the Danish Fifth Thule Expedition, 1921-24, are the main source of information on Igluligmiut traditional culture. The oral traditions, religion, social and material culture differ only in details from that of neighbouring groups. However, occurrence of superior marine resources, especially walrus and several species of whales, made possible a high level of subsistence.

In recent years settlement has concentrated around Repulse Bay, Pond Inlet and Igloodik, which were formerly centres of trade. After 1972 Igloodik became the site of extensive scientific research with the studies of the International Biological Program. Later, a permanent research station was established. In 1974 a silver, lead and zinc mine was opened at Nanisivik in northern Baffin I, providing employment for a number of Igluligmiut. See also NATIVE PEOPLE; ARCTIC.

**Ignatieff, George**, diplomat (b at St Petersburg [Leningrad, USSR] 16 Dec 1913). Ignatieff joined the Dept of External Affairs in 1940 and developed an expertise in East-West relations, particularly at the UN, where his service included terms as Canadian ambassador 1966-69 and president of the Security Council 1968-69. He was also ambassador to Yugoslavia 1956-58 and permanent representative to NATO 1963-66. After retirement he spoke eloquently on behalf of disarmament causes, and he was named disarmament ambassador by PM John TURNER. He was provost of Trinity Coll, U of T, 1972-79 and chancellor of U of T from 1980. ANNE HILLMER

**Igneous Rock**, one of 3 rock classes, the others being sedimentary and metamorphic rocks. Igneous rocks are the product of the solidification of magma, molten rock generated by partial melting caused by heat and pressure in the deeper parts of the Earth's crust or in the upper mantle. Igneous activity has been present throughout the Earth's GEOLOGICAL HISTORY, and igneous rocks occur throughout the geological column in Canada (see GEOLOGICAL REGIONS). However, because internal temperatures were higher in the early stages of the Earth's history, the rate of magma production has probably declined over time. Granites and basalts are well represented in the old rocks of the Precambrian SHIELD regions of Canada and in the younger, flanking mountainous regions of the Appalachians and the western CORDILLERA. Some of the best examples of the most recent volcanism in Canada can be found in BC: the Mt Garibaldi belt in the S; several centres in Wells Gray Provincial Park in central BC; and Mt Edziza and Level Mt in the N. Dates as young as 1340 years ago have been recorded for the latest activity at Mt Edziza and 220 years ago for a flow at Aiyansh, near Terrace, BC. Some of these volcanic centres, especially those associated with

mineral springs, are now under investigation as sources of GEOTHERMAL ENERGY. C.M. SCARFE

**Île-à-la-Crosse**, Sask, UP, pop 1035 (1981c), located on an expansion of the upper CHURCHILL R. called Lac Île-à-la-Crosse. The name may derive from the shape of the lake — supposedly resembling a bishop's staff — or from an island in the lake on which the Indians played lacrosse. The lake provides a connecting route from the Churchill R to Methye Portage and was thus a strategic spot in the FUR TRADE. Montréal-based trader Benjamin FROBISHER and others were active in the area in the 1770s and the HBC built a post on the lake in 1799. From here the Athabasca brigades headed NW. In 1846 Fathers Laflèche and Taché established a mission. Their episcopal "palace" was a crude log shelter smeared with mud. In 1860 Sisters Agnes, Pépin and Boucher founded a convent. A landing strip was cleared in the late 1940s as a base for BUSH FLYING. Today the community — the oldest in Saskatchewan — is a centre for trapping and fishing. JAMES MARSH

**Ilsey, James Lorimer**, jurist, politician (b at Somerset, NS 3 Jan 1894; d at Halifax, 14 Jan 1967). Educated at Acadia and Dalhousie, Ilsey practised law until his election to Parliament as a Liberal in 1926. Re-elected in 1930 and 1935, he became minister of national revenue in 1935 and minister of finance in 1940. He successfully managed the nation's finances through WWII. He believed that the Canadian federal system required renovation, but his proposals presented to a 1945-46 dominion-provincial conference on reconstruction were rejected by Ontario and Québec. Deeply disappointed, Ilsey became minister of justice in 1946, but retired to practise law in 1948. Appointed to the NS Supreme Court in 1949, he became chief justice in 1950. ROBERT BOTHWELL

**I'm Alone**, a rumrunner based in Lunenburg, NS, one of several hundred vessels that supplied illicit liquor to a PROHIBITION-bound US during the 1920s. In Mar 1929 a US Coast Guard cutter sighted it with engine trouble in the Gulf of Mexico. Coast guard vessels chased it out to sea and sank it with the loss of one crewman. Intense diplomatic negotiations followed. In 1935 the US apologized and paid damages to captain and crew. ERNEST R. FORBES

**Immigrant Labour** Canada, which is essentially a country of immigrants, has consistently required the importation of skilled and unskilled workers to assist its economic development. Prior to Confederation (1867) a vast number of immigrant workers, most of whom were from the British Isles, had already assumed an important role within the predominantly agricultural and extractive economies of the British N American colonies. Perhaps the most controversial of these immigrant workers were the IRISH, who flooded into N America during the 1840s and 1850s in a desperate search for a new life. Because of their propensity for hard work and their ethnic cohesiveness, they virtually monopolized certain jobs in the lumber camps, on the docks, and within a sprawling network of canal and railway camps which stretched from Lk Superior to the Atlantic Ocean.

Immigrant labour was also extensively used during the construction of the CPR, when thousands of British, American and European navvies resolutely pushed the ribbon of steel westward, while CHINESE navvies, many of them imported specifically for this purpose, performed the even grimmer task of building eastward through the BC mountain ranges.

The tendency to import labour became particularly pronounced after 1870, when Canada began actively participating in the transatlantic labour market. The rapid expansion of ocean and rail transportation made it possible for Brit-

Slavic immigrants working on the Ontario and Rainy River Railway, 1908. In spite of the vital economic role of workers from eastern Europe, many Canadians demanded restriction of immigrants along ethnic and racial lines (courtesy Public Archives of Canada/C-38828).

ish and European workers to hunt for jobs in N America on a mass scale; according to one source about 900 000 unskilled and skilled workers (other than agriculturalists) arrived between 1907 and 1930. British artisans, with their industrial experience and specific skills, were in high demand, particularly in the rapidly expanding industries of central Canada and BC. Although Canada officially maintained that only agriculturalists were being imported, in practice thousands of the immigrants who came from central and southern Europe (1880-1930) became either full-time or part-time unskilled industrial workers because industrialists and farmers were able to link their economic interests in demanding an "open door" IMMIGRATION POLICY.

Canada has remained a self-proclaimed homeland for immigrants seeking work, but the type of work available has often depended on ethnic background. "Preferred immigrants" (ie, British immigrants, AMERICAN immigrants of English "stock," and skilled workers from Western Europe) encountered less PREJUDICE AND DISCRIMINATION than did eastern and southern European immigrants, who as "foreigners" met with a decidedly mixed reception, the attitude of their hosts varying with time and economic circumstances. Asians and BLACKS fared even worse and many of them were only employed for the most grinding labour.

From 1945 onwards, however, with the advent of postwar prosperity and an improved attitude towards human rights, the status of non-British immigrant workers substantially changed. At the same time, 3 new waves of immigrant workers entered Canada: European displaced persons, many of whom were highly educated and soon left the unskilled labour market for professional and skilled jobs; immigrants from "preferred countries" (Britain, Germany, Netherlands, etc), who generally gravitated into prestigious jobs upon arrival in this country; and immigrant workers from the low-wage countries of southern Europe and, increasingly, the West Indies (see WEST INDIANS). It is this latter group of predominantly unskilled immigrants who have largely filled the low-paying, hazardous and itinerant or seasonal jobs that native Canadians would not accept. However, most of these jobs are no longer on the frontier, and now it is to urban factories, construction sites or service industries—most notably in Toronto and Montréal—that the vast majority of unskilled immigrant workers tend to gravitate. DONALD H. AVERY

Reading: Donald H. Avery, *Dangerous Foreigners* (1979).

**Immigration**, the movement of nationals of one country into another for the purpose of resettlement, is central to Canadian history, from the NATIVE PEOPLES, whose ancestors migrated across the Bering Strait from Asia, to the most recent arrivals. The story of Canadian immigra-

tion is not one of orderly population growth; it has been and remains both a catalyst to Canadian economic development and a mirror of Canadian attitudes and values; it has often been unashamedly and economically self-serving and ethnically or racially biased.

Throughout the 17th and much of the 18th century European colonial administrations, charged with overseeing what would become Canada, did not consider settlement a priority. French or British governments initially seemed unprepared to expend vast quantities of money or energy necessary to encourage settlement. Nor was migration to the New World popular in France or Britain. Adventurers, explorers and particularly traders acting for British or French interests feared the interference of settlers in the lucrative trade with the native people. However, policy eventually changed and colonial authorities carefully and slowly encouraged settlement in Canada, hoping that settlers would guarantee the sovereignty of colonial land claims, would Christianize the native peoples and exploit the natural resources, often on behalf of European investors. Settlements grew gradually and not without difficulty. New France's population at the time of the British CONQUEST (1759-60) was about 64 000. In NS a transplanted Scottish community was supplemented by German and Swiss settlers, and in the late 1700s Irish settlers reinforced Newfoundland's population.

Although the British victory brought an end to immigration from France, it did not instigate a tide of English-speaking immigrants. Except for a handful of British administrators, military personnel and merchants who filled the vacuum left by their departing French counterparts, few English-speaking settlers seemed interested in Canada. Indeed, it is doubtful whether settlers would have been welcomed by the new British administrators, who feared that an influx of English-speaking, Protestant settlers would complicate administration in a recently conquered Roman Catholic, French-speaking territory. Most British immigrants were far more inclined to seek out the more temperate climate and familiar social institutions of the British colonies to the south.

Many of Québec's new British rulers, content to leave the colony to languish as a quiet backwater of the Empire, were soon forced to accept many thousands of English-speaking, largely Protestant settlers displaced by the American Revolution. Known as United Empire LOYALISTS, they were largely political REFUGEES. Many of them migrated northward not by choice but by default, either because they did not wish to become citizens of the new American republic or because they feared retribution for their public support of the British. For these Loyalists, who eventually formed the core of the colony's ruling oligarchies, Canada was a land of second choice, as it would be for countless future immigrants who came because to remain at home was undesirable and entry elsewhere, often the US, was restricted. The Loyalist migration was neither uncontrolled nor unassisted, however. Imperial authorities and military personnel offered supplies to the new settlers and organized the distribution of land. Despite the hardships the settlers endured, their plight was undeniably made less severe by the intervention of government agents, a practice to be repeated in Canada many times.

Throughout the mid-19th century, the colonies, Canada West in particular, returned to a pattern of painfully slow and erratic economic growth. Officially encouraged immigration from England, Scotland and even the US gradually filled the better agricultural lands in the colony and bolstered new commercial or administrative towns. The new immigrants were generally of ethnic stock and outlook similar to that of the established community. But the great

Irish potato famine and to a lesser degree a series of abortive European rebellions in 1848 sent new waves of immigrants to N America. Of these tens of thousands, many were Irish settlers, whose arrival in Canada initiated major social and economic changes. In many respects the IRISH were Canada's first enormous wave of foreign immigrants. Although they generally spoke English, they did not mirror the social, cultural or religious values of the majority. Roman Catholic intruders in a Protestant domain, their loyalty to the Crown appeared suspect in a Canada where ardent loyalty was demanded as insurance against the threat of American republicanism. Furthermore, after escaping a life in which farm tenancy and capricious nature made agriculture synonymous with poverty and dependency, some of the famine-stricken Irish had little or no enthusiasm for farm life. Canadian cities and larger towns quickly developed Irish sections or wards. The Anglo-Protestant majority measured the Irish contribution economically and the Irish deficiencies socially, religiously and racially. On the one hand many of the Irish created a labour force ready and able to fill the seasonal employment demands of a newly expanded canal system, lumber industry and burgeoning railway network; on the other hand, because of their low income, their Catholicism, the seasonal separation from their families and differences in their way of life, they were a conspicuous minority group. They filled working-class neighbourhoods and inflated majority fears of social evils previously dismissed as peculiar to the US. For some years the Irish supplied the base of a working-class labour force necessary for the slow advance of communication, commerce and industry, but they remained an adjunct to, rather than a central component of, mainstream N American economic and social life — the basis of which was commerce and agricultural activity. Policy tied population increase to land settlement. Gradual commercial and industrial development usually serviced the agricultural sector, and, because many Irish were not farmers, Irish labourers were seen as rootless.

If agricultural roots and commitment were measured, in part, by land tenure, Canada underwent a shock when arable land began to disappear from the market. Without a large industrial base, with a relatively low death rate, a high birthrate and a small but continual inflow of immigration largely from the British Isles, the immediate post-Confederation era had its overpopulation problems. The US, with its seemingly boundless supply of free fertile land, attracted thousands of new immigrants and Anglo-Canadians, while French Canadians were drawn to jobs in the factories of New England. Canadian history has been compared to a journey through the Bible, beginning in Lamentations and ending in Exodus, but in the late 19th century Canada's future Prairie provinces were opened to settlement, although it was not until a market developed for the prairie agricultural output that serious settlement began. The demand for farm goods, especially hard wheat, coincided with the election of Wilfrid Laurier's government, which immediately encouraged the settlement of the West with large-scale immigration. Canada's new and aggressive minister of the interior, Clifford Sifton, organized a revamped and far-reaching program and was prepared, if reluctantly, to admit agricultural settlers from places other than the British Isles, N Europe and the US, explaining, "A stalwart peasant in a sheepskin coat, born on the soil, whose forefathers have been farmers for ten generations, and a stout wife and a half-dozen children is good quality." The Sifton comment, however, no matter how often repeated, is not an accurate reflection of government policy. From 1896 to the 1930s, Canadians, their

Barnardo Boys embarking at Liverpool, 1905. Dr Barnardo is bidding farewell to the young men who are being sent to learn farming in Manitoba. In the 1890s several thousand children per year were shipped to Canada to be boarded until the age of 11 or 12 (courtesy Barnardo Photo Library).

politicians and immigration officials were not receptive to peasants in sheepskin coats. Immigration policy did not involve just an aggressive peopling of the Prairies. It was enacted within the framework of the British Empire, in which Sifton, the Canadian government and most English-speaking Canadians believed. The traditional definition of ideal immigrants may have been modified but was not radically altered. Unabashedly colonial, the government defined immigrants who did not originate from the British Isles as foreign; and, unabashedly N American, excluded white, English-speaking immigrants from the US from this category. The ideal immigrants were still British or American independent farmers who would settle in the West. Sifton and the government may only have reflected their times, but Canadian immigration policy and public opinion were nevertheless racist.

Pressed to increase immigration by business and railroad interests with visions of an insatiable world demand for Canadian resources, Sifton and his immigration authorities balanced their ethnic anxieties against a frantic search for settlers. They listed ideal settlers in a descending preference. British and American agriculturalists were followed by French, Belgians, Dutch, Scandinavians, Swiss, Finns, Russians, Austro-Hungarians, Germans, Ukrainians and Poles. Close to the bottom of the list came those who were, in both the public and the government's minds, less assimilable and less desirable, eg, Italians, South Slavs, Greeks and Syrians. At the very bottom came Jews, Asians, gypsies and blacks.

In spite of government precautions, not all immigrants committed themselves to resource exploitation or agriculture. Like the Irish before them, many of the "foreign" immigrants, non-English speaking and largely non-Protestant, rejected a life of rural isolation, choosing to work in cities. Furthermore, many of these foreigners saw themselves as living in Canada or N America only temporarily, earning enough money to buy a piece of land at home, to assemble a dowry for a sister or to pay off a family debt. But the many who adopted N American definitions of success or who were unable to return home because of political upheavals established themselves in Canada, bringing wives

and children to join them. If these Jews, Italians, Macedonians, Russians, Finns, Chinese, etc, had been content to play the role reluctantly left for them, if they had accepted rural isolation as the price of their admission into Canada, hostility toward them might have been minimal, but by making their way into Montréal, Winnipeg, Toronto, Hamilton and Vancouver and other centres they awakened the old ethnic and religious anxieties and prejudices previously reserved for the Irish. They had been allowed into Canada to satisfy the need for a cheap labour force or a pool of skilled craftsmen adaptable to factory and construction. They were prepared to accept seasonal labour in mining or lumbering (which forced them to drift back into cities during the off-season), but for many Canadians the sudden influx of strange peoples so recently subject to foreign czars, kaisers and gods seemed to threaten the very fabric of Protestant Canadian society. Some Canadians responded with a dignified tolerance. They recognized that these foreigners were here to stay, that their labour and skills were necessary, their living conditions subject to improvement and, perhaps most important, that their children would become integrated, given education and time. But in spite of the vital economic role these immigrants played in urban centres — laying streetcar tracks, labouring in the expanding textile factories and digging the sewer systems — many Canadians demanded strict enforcement of immigration regulations and restriction of admission along ethnic or racial lines.

During WWI, anti-German hysteria erupted in Canada, directed largely against immigrants born in the now enemy countries or those who entered Canada as subjects of enemy monarchs, but also against foreigners who had been born in now allied countries or had come to Canada as subjects of allied monarchs. Despite Canadian military manpower needs, British and Canadian authorities alike felt that, where possible, foreigners belonged in foreign armies. Groups such as Italians, Serbians, Poles and some Jews were encouraged to return to the armies of their mother country or were recruited into specific British army units reserved for allied foreigners of various origins. Without national armies of their own to join, many Jews, Macedonians and Ukrainians volunteered for the Canadian Army.

Once in Canada many thousands of immigrants did find a place for themselves and their families, but Canadian immigration policy and administration, which bowed to economic necessity by allowing these southern and eastern

Galician immigrants entering Québec City, c1900-10 (courtesy Public Archives of Canada/C-5611/John Woodruff).

Europeans into Canada, could not bend enough to admit other would-be immigrants. Head taxes, landing taxes, bilateral restriction agreements and travel restrictions virtually prohibited the immigration of Asians. Canadian authorities refused to allow the settlement of female Asian immigrants, fearing this would encourage Asian men temporarily in Canada as railway or mine labourers to settle permanently and, perhaps more importantly, become the parents of yet another generation of the "yellow peril." In 1914 almost 400 East Indians aboard the immigrant ship *KOMAGATA MARU* languished in Vancouver harbour while Canadian authorities debated what to do with them. Canada's new navy, in action for the first time, escorted the ship from Canadian waters while many Vancouver residents cheered approvingly from shore. In 1910 and 1911 rumours spread that a group of blacks was preparing to migrate to central Alberta. Descendants of freed slaves, they were being pushed from their land in Oklahoma territory, where they had been granted holdings and hoped to build new lives. Public and political response in Alberta was immediate and predictable. Federal authorities initiated an ingeniously simple scheme. Nothing in the Immigration Act specifically barred black Americans but any immigrant could effectively be denied access to Canada for health reasons under the Act's medical provisions. The government merely instructed immigration inspectors and their medical aides along the American border to reject all blacks as unfit for admission on medical grounds. There was no appeal. Blacks were warned they should not waste their time and money by considering immigration to Canada.

As a result of the dramatic and devastating economic collapse caused by the GREAT DEPRESSION, the need for the government's selective encouragement of immigration faded. Immigration authorities worked not to stimulate admissions but to prevent them. By 1933 Hitler ruled Germany, and millions of political opponents and Jews might have survived if Canada or other countries had offered innocent victims a home. Although many Canadians responded to the refugees with a mixture of sympathy for their desperate plight and embarrassment at the lack of government aid, others, including the federal Cabinet, many in the diplomatic corps and, of course, immigration

polymakers, reacted with alarm to any pressure to accept Jews or political refugees escaping Germany. As a result, few refugees were able to break Canadian immigration restrictions.

In the postwar years, perhaps in response to new winds of antidiscrimination blowing across the Western World, perhaps in response to pressure from an earlier generation of well-integrated immigrants to Canada and their increasingly middle-class children, the government gradually removed many of the racial or ethnic barriers in immigration policy. Furthermore, if immigration was still primarily an economic policy, it now reflected the new urban industrial reality; an economic boom had generated a demand for labour. To satisfy it, tens of thousands of displaced persons and eastern or southern Europeans who would previously have been labelled undesirable were admitted. Canada also responded to the plight of refugees by admitting many Hungarian, Czechoslovakian, Ugandan, Chilean and Southeast Asian refugees (although Canada was generally able to attract the younger, healthier and better-educated candidates).

By the early 1970s, because of improved transportation, growing recognition of Canada as a land of opportunity, increased difficulty in immigrating into the US and a seeming liberalization of both Canada's attitudes and its immigration policy, Canada became a major magnet for immigrants, including many from the Third World. In the late 1970s more non-Europeans entered Canada than did Europeans. If Canadian policy was less discriminatory, it was no less tied to economic need. The economic slowdown of the late 1970s was quickly reflected in a decrease in immigration, except for those sponsored by persons already settled in Canada and therefore guaranteed economic support. See also IMMIGRATION POLICY.

HAROLD TROPER  
Reading: H. Cowen, *British Emigration to British North America* (1961); E.C. Guillet, *The Great Migration* (1963); F. Hawkins, *Canada and Immigration* (1972); R. Hurney and Harold Troper, *Immigrants: A Portrait of the Urban Experience* (1975); Harold Troper, *Only Farmers Need Apply* (1972).

**Immigration Policy** Canada's IMMIGRATION policy is the most explicit part of what might be described as a POPULATION policy. In a liberal democratic state such as Canada only the prevailing rates of immigration and not those of mortality, fertility and EMIGRATION can be effectively regulated. By regulating the means of selection and controlling the number of entrants,

the government seeks to fulfil a variety of national objectives.

According to the 1870-71 census, Canada's total population was 3.6 million. In addition to native peoples (about 136 000 in 1851) the 2 largest groups were the French (1 million) and the British (2.1 million). Excepting the Germans (203 000), other groups (Dutch, American blacks, Swiss, Italians, Spanish, Portuguese) were much smaller. During the next 100 years, about 9.3 million people emigrated to Canada and, although many went on to the US or eventually returned to their native lands, by 1971 Canada's population had reached 21.5 million. During the 19th century, the movement of individuals and groups to Canada was largely unrestricted, although in 1885, under pressure from BC, an Act was passed restricting Chinese immigration through the imposition of a head tax, the first of a series of such measures directed at the Chinese and continuing until the late 1940s. Otherwise immigration policy was concerned mainly with quarantine stations, the responsibilities of transportation companies and the exclusion of criminals, paupers, the diseased and the destitute. But after the massive immigration between 1903 and 1913, WWI and subsequent political upheavals and economic problems, a much more restrictive "white Canada" immigration policy was implemented and remained unchanged until 1962, when Canada's present universal and nondiscriminatory policy was introduced.

Three different departments or agencies have been responsible for immigration policy in Canada since WWII — the Department of Citizenship and Immigration (1950-65), the Department of Manpower and Immigration (1966-77) and the Canada Employment and Immigration Commission (est 1977). Ontario since WWII, and Québec since the mid-1960s, have been particularly concerned with immigration. More than half the total number of immigrants in recent years have settled in Ontario. Québec created its own Department for Immigration (now called the Department of Cultural Communities and Immigration) in 1968. Its major concerns have been, first, to recruit as many French-speaking immigrants as possible (or immigrants with a good knowledge of French), and secondly, to ensure that immigrants who settle in Québec form part of the francophone community. Québec was the first province to have a special immigration agreement with the federal government (there are now agreements with several other provinces). The federal government is also involved in the difficult task of increasing the numbers of French-speaking immigrants to Canada.

During the 1970s, immigration and population policies were officially reviewed, and a Green Paper on Immigration Policy and a Report to Parliament (1975) by a Special Joint Committee of the Senate and the House of Commons were prepared. Almost all the committee's recommendations were accepted by the Liberal government and absorbed into a new Immigration Act (1976, proclaimed in 1978) which established for the first time the fundamental objectives of Canadian immigration policy. They include the promotion of Canada's demographic, economic, social and cultural goals; family reunion; nondiscrimination; the fulfilment of Canada's international obligations in relation to REFUGEES; and co-operation between all levels of government, as well as the voluntary sector, in promoting the adaptation of immigrants to Canadian society. The Act also establishes a new and flexible process for the development of immigration policy, involving close collaboration between the federal government and the provinces, and requires the minister to announce annually in Parliament future immigration levels. Among its many provisions

relating to security, the determination of refugee status, immigration regulations and other matters, the Act completely revises and modernizes control and enforcement procedures. The basic statute established the Immigration Appeal Board, created in 1967 as a fully independent body whose decisions cannot be overruled by government except in relation to security.

Since Confederation, under s95 of the CONSTITUTION ACT, 1867 (formerly BNA Act), immigration has been a joint responsibility of the federal government and the provinces, and since the Immigration Act the provinces' role in immigration policymaking and planning has increased. In 1982, a 3-year immigration-planning cycle was introduced, and the immigration levels for the next 3 years announced: 1982, 130 000-135 000; 1983, 134 000-144 000; 1984, 130 000-145 000. Immigration and refugee policies are planned and must be considered together. In keeping with Canada's international responsibilities as a signatory to the UN Convention relating to the status of refugees, refugees comprise about 10% of the annual flow of immigrants, although during major international emergencies, eg, the Indo-Chinese exodus of 1979-80, the figure rose to 25%. The relationship of economic policy to immigration is usually directly concerned with LABOUR MARKET requirements. From decade to decade, or even from year to year, the need for professional, skilled or unskilled persons fluctuates significantly. The pool of available labour in any country also alters over time because of the birthrate and the acceptance, for example, of women in the work force. For most of Canada's history, the government's tools for matching the requirements of the labour market with the flow of immigrants have not been particularly refined or effective.

The immigration regulations provide for the admission of 3 categories of immigrants: family class (close and more distant relatives), independent immigrants (admitted on the basis of skill and labour-market requirements) and refugees. When processing applicants, immigration officers are instructed to give priority to persons seeking family reunification and to refugees. Independent applicants without family but possessing desired skills are considered next. Many new arrivals, however, in the family or refugee categories have tended to be unskilled or else to possess talents inappropriate to the region or community where they have settled. The priority given to persons in the family class can therefore disrupt the labour market; the resulting economic insecurity can create disappointment and hostility among the immigrants or among Canadians who feel threatened by the newcomers.

Immigration policy also encourages the dispersal of immigrants across the country. In the decades following the resurgence of immigration after WWII, Montréal, Vancouver and especially Toronto received up to 66% of all immigrants entering Canada. Current policy has attempted to encourage immigrants to settle in smaller communities in the less-populated provinces.

Administrative arrangements and practices adopted by Employment and Immigration Canada and the Immigration Bureau of the Department of External Affairs significantly affect how policy is implemented and whether it achieves its purpose. Since 1967 the selection of applicants for admission has occurred without discrimination on the grounds of ethnicity or geographic region, but because immigration officers are not situated in many states of the Third World, persons in these countries are in effect excluded from Canada even if they are members of an admissible category, unless they are able and prepared to travel to a distant immigration office in another country. ber of applicants being processed at an overseas immigration post can also be easily regulated merely by the size of the staff assigned to this task. The discretionary powers of immigration officials in Canada and abroad necessarily influence the daily administration of immigration. Criticisms of these discretionary powers can become especially intense because there are no grounds for appeal against negative decisions of processing officials. Because these and other features of Canada's immigration practices can affect this country's relations with other governments (particularly if these governments perceive Canadian procedures or policies as inequitable), immigration policy is part of Canadian foreign policy, a fact acknowledged by the Canadian government in 1981, when much of the responsibility for the administration of immigration programs was transferred from Employment and Immigration Canada to the Immigration Bureau in the Department of External Affairs.

Among the lengthy list of organizations within Canadian society that expect a role in the formulation of immigration policy and regulations are church groups, employers, and ethnic organizations striving for family reunification and financial assistance for immigrant-adjustment programs. The government has had to acknowledge as well the existence of a not altogether latent sentiment among a portion of

Canadian society favouring a reduction or even a halt in the selection of immigrants. The entry into Canada of a sizable number of nonwhite immigrants (about 33% of Canada's immigrants are from Europe, 33% from the Americas including the Caribbean, and 33% from Asia, Africa and elsewhere) has created what has been called a visible minority, one that has occasionally been the target of abuse and violence. While the government and interested voluntary associations have attempted to strengthen among the Canadian public a sense of tolerance and compassion for newcomers, the task is not easy. Immigration is an extremely emotional subject, especially when the fate of family members or economic security is involved.

Canada's immigration policy is nondiscriminatory regarding ethnicity; however, individuals suffering diseases likely to endanger public health, or those without any apparent means of financial support, or those known to be criminals or terrorists can be excluded. An undetermined number of persons in these undesired categories gain entry every year to Canada by practices and tactics contravening the spirit and letter of prevailing immigration legislation. Still others who may have been properly admitted to Canada, such as students and visitors on short-term visas, choose to remain beyond the time permitted by the Canadian authorities. The problem of illegal aliens, while not a new one,

has in recent years become more awkward for the Canadian government to resolve, especially as the total number of persons entering Canada at border crossings and airports has grown constantly. Once in Canada, illegal aliens may easily escape notice unless they try to acquire some public service which would bring them to the attention of government or the notice of officials.

The number of illegal aliens in Canada is obviously impossible to determine accurately. Estimates by police and immigration personnel range between as few as 50 000 to as many as 150 000. Where possible, without infringing upon traditional civil liberties, the government is endeavouring to close any remaining loopholes that have in the past facilitated the admission of persons not authorized under prevailing immigration legislation and regulations.

The practice of admitting to Canada highly skilled persons from less-developed countries continues to provoke some controversy. The governments of the less-developed countries, from which a growing number of immigrants to Canada originate, regard with apprehension the exodus of people they can ill afford to lose. While the view has been expressed within and beyond Canada that Canada should not encourage the outflow of trained humanity from "have not" regions, Canada, like other liberal democracies, stoutly defends the concept of freedom of movement for all persons. **GERALD E. DIRKS**

**Immunology**, branch of MEDICINE that studies the body's ability to defend itself from foreign substances, especially DISEASE-causing organisms, and seeks means of controlling that ability. Immunology had its origin perhaps 900 years ago, when the Chinese discovered how to vaccinate against smallpox. Although vaccination has an ancient history, it was only in the early 1960s that modern immunology began to unravel the mechanisms by which the body defends itself from the incredible variety of potentially lethal micro-organisms surrounding it. The subject has expanded into many fields of modern medicine and microbiology; eg, immune-system research has provided insights into the ways in which cells differentiate and function.

Students with a background in BIOCHEMISTRY, GENETICS, medicine or microbiology may receive advanced training in immunology at a number of centres across Canada, including the universities of British Columbia, Alberta, Manitoba, McMaster, Toronto, McGill and Laval. Research is carried on at the major teaching centres, and is funded primarily by the MEDICAL RESEARCH COUNCIL OF CANADA. Some funding also comes from the provinces, eg, the Alberta Heritage Savings Trust Fund for Medical Research provides substantial grants for work pursued in Alberta. In addition, research is ongoing and training is offered at the INSTITUT ARMAND-FRAPIER. Although immunology research is very new in Canada, the field is showing increasing vigour. For example, the 1986 International Congress of Immunology will be held in Toronto. Canadian immunologists may belong to the Canadian Society of Immunology and to many international associations. Canadian research findings are published in various national and international journals.

**Imperial Munitions Board**, est Nov 1915 in Canada by the British Ministry of Munitions, with Canadian government approval. Headed by J.W. FLAVELLE, a prominent Toronto businessman, the board was responsible for letting contracts on behalf of the British government for the construction of war materials in Canada. It began to establish "national factories," which it owned outright, to produce munitions that private manufacturers were unable to turn out. Under IMB direction Canada produced a wide

variety of war materiel including shells, ships, explosives and training planes. The IMB was dissolved in 1919. **D.J. BERCUSON**

**Imperial Oil Limited**, with head offices in Toronto, is an energy company incorporated in 1880 as the Imperial Oil Company. An American company, Standard Oil, bought a majority interest in 1898, and the present name was adopted in 1959. In 1978 Imperial Oil formed Esso Resources Canada Ltd to handle its resource operations. Active in all phases of the PETROLEUM INDUSTRY, Imperial Oil is the largest marketer and refiner of petroleum products and the largest producer of crude oil in Canada. It also manufactures and sells chemicals, fertilizers and building materials, and has mining exploration and development interests. Through Syncrude Canada Ltd, in which it holds a 25% interest, Imperial Oil is also participating in a plant producing synthetic crude oil from the Athabasca oil sands. In 1982 it had sales or operating revenue of \$8.6 billion (ranking 3rd in Canada), assets of \$7.5 billion (ranking 10th) and 15 476 employees. The company is 74% foreign owned, with Exxon Corp of New York holding 70% of the shares. **DEBORAH C. SAWYER**

**Imperial Order of the Daughters of the Empire** was founded in 1900 by Margaret Polson Murray of Montréal who envisioned an organization of women devoted to encouraging imperialism. Beginning with an educational mandate promoting Britain and British institutions through the schools, it became actively involved in both world wars in supporting Canada's efforts on behalf of Britain and the allies. Other areas of interest included immigration, child welfare, community health and social services. In recent years the IODE has concentrated more on community affairs, supporting Canadian educational, cultural and social developments. Although its membership has declined, it remains an active women's organization, with 14 500 members in 580 branches in 1984. **NANCY M. SHEEHAN**

**Imperial Preference** (now usually "Commonwealth preference" or just "preferences"), an arrangement by which member-countries of the British Empire or COMMONWEALTH charge lower duties on goods from other Commonwealth countries (including the UK) than from "foreign" countries. Preferences may be given unilaterally, as by Britain to Canadian wheat and timber before 1846 or by Canada to a wide range of UK goods in 1897 and since, or by Britain to Empire goods in 1919; they may be the product of bilateral bargaining, as in the OTTAWA AGREEMENTS. By entering into the General Agreement on Tariffs and Trade in 1947, Canada and other Commonwealth countries agreed not to create any new preferences unless they were to go so far as to abolish all duties among themselves. In the late 1950s Britain suggested such an arrangement to Canada, but Canada declined. Upon entering the European Economic Community in 1973 Britain had to give up preferential concessions to the Commonwealth, but many Commonwealth members, including Canada, continued the preferential plan. **IAN DRUMMOND**

**Imperial War Cabinet and Conferences**, see COLONIAL AND IMPERIAL CONFERENCES.

**Imperialism** In the late 19th century various nations entered a phase of territorial expansion often called the second great era of imperialism. Britain, France, Germany, the US and others sought colonies for commercial, military and religious motives. This imperialism coincided with growing concern in Canada about its relationship to the British Empire. Britain was still responsible for EXTERNAL RELATIONS and funded defence for Canada and other Dominions. Such colonial vestiges were increasingly unacceptable, yet there were strong loyalties to Britain

and a fear that total independence would lead to absorption by the US.

Thus Canadian imperialism was born. When British imperialists founded the Imperial Federation League in 1884, Canadian supporters established branches. They sought a way for Canada to develop beyond colonial status without separating from the empire. Led by G.M. GRANT, G.R. Parkin, G.T. DENISON and others, the movement mixed Christian idealism and anti-Americanism with an effort to have people accept the principle that the Dominions should participate in foreign policy at the imperial level.

Imperialist rhetoric late in the 19th century began to emphasize the potential of united strength. The appointment of ardent imperialist Joseph Chamberlain as colonial secretary in 1895 created a new impulse for action on specific problems. During the SOUTH AFRICAN WAR, aid to Britain was enthusiastically supported by Canadian imperialists but resisted by many elements in the population. PM Wilfrid LAURIER allowed a volunteer force, but the war served notice that imperialism had become controversial. Participation in the power of empire now also implied participation in imperial wars. From 1900 to 1914 a lively and often acrimonious debate was carried on between those who saw the imperial burden as Canada's burden and those who preferred autonomy.

WWI brought imperialism to its most advanced stage and also led to its collapse in Canada. The Dominions insisted upon joint planning and policy formation, and meetings in 1917 implied postwar consultation on matters of shared interest among the self-governing parts of the empire. However, the toll of Canadian casualties in Europe was creating a reaction which led to a postwar spirit of N American isolationism. Throughout the 1920s the Mackenzie KING government worked to establish a separate Canadian presence in foreign affairs. The empire thereafter devolved into the much more loosely connected COMMONWEALTH. **D.R. OWRAM**

**Impressment**, authority of the state to "press" men into compulsory military service. It was employed occasionally in N America, eg, by Massachusetts, in forming the 1745 LOUISBOURG expedition. When Royal Navy ships lost too many men from disease and desertion, they applied for warrants to press men in American ports. Notorious in Britain, press gangs created exceptionally bad feelings in New England, where riots, the worst of them in Boston in 1747, occurred. Similar occasions later in Halifax and Québec were rare because pickings were slim. **W.A.B. DOUGLAS**

**Improvement District**, a municipal corporation whose powers are exercised by a trustee or board of trustees appointed by the provincial government. Unlike most municipalities, which are subject to the supervision of both the province and local electors, trustees are under provincial supervision only. Normally, improvement districts are established either in a sparsely settled but vast territory which requires MUNICIPAL GOVERNMENT and services because of new development or the residents' desire for local government or in new towns, which are more compact geographic entities designated for major development, usually a new resource industry. Once the new community is established, with basic services and a sizable population, it is often replaced by a conventional municipal corporation with a local council. FORT McMURRAY, Alta, was designated as a new town because of local petroleum-resource development and now has an elected municipal government. **KATHERINE A. GRAHAM**

**Inco Ltd**, with head offices in Toronto, is the world's leading producer of NICKEL. It also produces copper, precious metals and cobalt. When it was incorporated in 1916 as the International

Nickel Company of Canada Ltd, its capital stock was held by International Nickel Company of New Jersey. In 1928 a stock exchange for stock of the former parent company altered International Nickel's ownership. The company's present name was adopted in 1976.

Inco was at one time a diversified company with overseas operations. In 1981 it began to withdraw and consolidate, first pulling out of its battery and related products subsidiary, Inco Electro-Energy Corporation. It also sold Ray-O-Vac Corporation (a dry-cell battery operation) and Exide Corporation. This left it with 2 principal business activities: primary metals and alloy products. Inco currently mines ores in Ontario and Manitoba and smelts ores at various locations throughout Canada. It has a nickel refinery in Britain and through P.T. International Nickel Indonesia is constructing lateritic mining and processing facilities in Indonesia in partnership with 6 Japanese companies. In 1982 it had annual sales or operating revenue of \$1.5 billion, converted from US dollars (ranking 57th in Canada), assets of \$4.2 billion (ranking 19th) and 25 798 employees. Its shares are widely held; foreign ownership stands at 31%.

DEBORAH C. SAWYER

**Income Distribution** refers to the share of total income in society that goes to each fifth of the population, or, more generally, to how income is distributed among Canadian households. Annual income is usually chosen as the indicator of a household's ability to meet its needs, primarily because the necessary statistical data are easily accessible. Economic well-being, however, also depends on other important factors.

#### **Determining Factors of Income Distribution**

In a capitalist economy such as Canada's, people derive their income from salaries if they are employed, from interest if they have financial capital, from profits if they are entrepreneurs and from rent if they own property. The remuneration of production factors determines what is known as the distribution of "primary" income; wages and salaries alone account for roughly 85% of this income (see also CAPITAL AND WEALTH).

The interaction between supply and demand in each market determines the income of each individual and ultimately the distribution of primary income. For example, a hockey player's salary depends upon the supply and demand in the market for hockey players' services. Because a number of variables influence the supply of and demand for factors of production, the income generated is not the same for everyone, with the result that everyone does not receive the same share of primary income. The following variables influence this distribution: skills, education, professional training and experience, working hours, compensatory salary differences, institutional restrictions, discrimination, differences in property wealth (including inherited wealth), opportunity, and age and health. Primary-income distribution is also modified by government intervention. The government influences income distribution in various ways, eg, through TAXATION, TRANSFER PAYMENTS and the provision of social goods and services.

**Income Distribution in Canada** Statistics Canada annually conducts a survey of approximately 35 000 households, including families and single persons. According to Statistics Canada's classification, an "economic family unit" is a group of persons who share the same accommodation and who are related by blood, marriage or adoption. An "unattached individual" is a person living alone or with others who are not related. Family income includes salaries, wages, net income from self-employment, investment income (interest, dividends), retirement pensions, miscellaneous income such as scholarships and food allowances, as well as government transfer payments (welfare, old-age

security, family allowance, unemployment insurance, etc). This concept of total income, therefore, corresponds to primary income before taxes and after transfer payments.

Once information about income has been gathered, families are classified by increasing levels of income, from the poorest to the richest. They are divided into 5 groups, known as "quintiles," each representing 20% of all families. The first (or lowest) quintile comprises the poorest families and the last (or highest) quintile includes the richest. The income of the families of each quintile is then calculated in proportion to the income of all families. The percentage of income going to each group in society can thus be measured. In 1982 families of the lowest quintile accounted for 6.3% of the total income, while those of the highest quintile earned 38.9%. Families of the first quintile had an annual income of less than \$15 339 and those of the fifth quintile an income greater than \$46 388 (see ELITES).

Other Statistics Canada figures reveal that families of the lowest quintile depend on government transfer payments for more than 50% of their income. This group is composed mainly of welfare recipients and the elderly (who receive the old-age security pension and guaranteed income supplements), as well as single-parent families. However, wages and salaries account for more than 90% of the income of families in the highest quintile, where there are often 2 breadwinners.

Income distribution, as measured by Statistics Canada, has been very stable over the past 30 years; ie, the share of income going to each quintile has varied only slightly. Such stability in income distribution is surprising because, during the same period, Canada experienced considerable economic growth and the average family income, corrected for inflation, nearly tripled. Moreover the WELFARE STATE, which came into existence during this time, brought a considerable increase in government transfer payments. Two factors are generally used to explain this stability. First, the differences in primary income have become more pronounced because of changes in life-style. Young adults and the elderly tend to live as independent households more often than they did a few decades ago, and the rise in the divorce rate has resulted in more single-parent families. Because these households generally have low incomes, the inequality of primary income has increased. Second, government transfer payments, a portion of which are earmarked for poorer people, narrow the disparities among total income.

Government intervention is not limited to transfer payments. The government also taxes income and provides social goods and services. The net redistributive impact of taxation and government expenditures is difficult to determine, but a number of hypotheses concerning those who carry the burden of taxation and those who benefit from government expenditures have been developed. Some observers claim that, using 1969 data, there is a slight shift in income distribution from the richest families to the poorest. The richest families, representing roughly 25% of family units, provided a net contribution of 6.2% of total income. The effect of government redistribution is certainly less than might be believed at first glance, however, because only some government programs are designed specifically for the poorest people; most consist of transfers within the middle class itself.

A number of adjustments are required to define the "real" distribution of income in Canada. First, Statistics Canada's concept of income underestimates income derived from transfer payments, particularly from unemployment insurance and welfare. Some income, such as income in kind (eg, accommodation in low-rental hous-

Income Distribution of Families by Quintiles (%)

Highest	41.1	38.4	40.0	38.9
Total	100.0	100.0	100.0	100.0

ing), capital gains and transfers between persons, is not included. Household production as well as income obtained from the UNDERGROUND ECONOMY are also omitted. In addition, since income varies with age, consideration should be given to income obtained throughout a person's life. Lastly, the size of the family should also be taken into consideration. These adjustments are difficult to make, and, as a result, the "real" distribution of income in Canada remains unknown.

**Poverty** POVERTY, a complex social phenomenon, is not caused only by inadequate income, although this is certainly a major factor. The poor in Canada are defined as those whose standard of living is below a certain level (usually called the "poverty line") and those who have serious difficulties participating actively in the life of society. Defined in this way, poverty is a relative phenomenon that can be measured by income levels.

Statistics Canada establishes the poverty thresholds (more precisely known as "low-income thresholds") most commonly used in Canada. The thresholds are derived from a family expenditures survey conducted in 1978, which revealed that the average Canadian family spent 38.5% of its income on the basic needs of food, clothing and lodging. Statistics Canada then adds 20% to this share and considers that a family that must spend more than 58% of its income on basic needs is in financial difficulties. It then defines low-income thresholds and indexes them annually to reflect increases in the CONSUMER PRICE INDEX. For example, the low income thresholds of Canadian families living in large urban areas in 1983 were \$9429 for single persons and \$19 176 for families of 4 persons.

In 1982, 13.2% of Canadian families and 37.4% of unattached individuals (representing 16.1% of the population, or 3.9 million persons) were numbered as poor. Poverty is more common in the Atlantic provinces and Québec (see REGIONAL ECONOMICS), among young people and the elderly and in families (usually single-parent families) in which a woman is the head of the household.

Percentage of Low-Income Families  
and Unattached Individuals, 1982 (%)  
(Source: Statistics Canada)

	Families	Unattached Individuals
Canadian average	13.2	37.4
By region

Female	41.9	42.4

Lorenz Curve, Canada, 1981

In deciding whether Canada's income distribution in 1982 was slightly or very unequal, it is necessary to apply an ethical standard. If the standard adopted is that of "equal sharing" of income, which would result in equal distribution, it is possible to measure and visualize the inequality using a Lorenz curve.

The vertical axis reveals the cumulative portion of the total income, and the horizontal axis reveals the cumulative portion of the population. If each family earns an identical income, 20% of families will enjoy 20% of the income, 40% of the families 40% of the income and so on. Income distribution will therefore be represented by the straight line of perfect equality. The curve located under the straight line represents income distribution in Canada in 1982. The farther the curve is from the straight line, the more unequal the distribution.

Canadian society is ambivalent in its support of the standard of "equal sharing," although numerous government income-security programs do attempt to compensate somewhat for the disparity in results. Moreover, the principle of "equal opportunity" probably corresponds, at least partly, to the moral philosophy of Canadian society. A number of government policies focusing on education for young people, for example, are based on this principle (see EDUCATIONAL OPPORTUNITY). But even if absolutely equal opportunity were achieved for children, certain income disparities would persist in their adult life because of wealth and other advantages, and because of different attitudes towards education, work and savings.

**Guaranteed Annual Income** Since the early 1960s, a universal solution to poverty and income disparities has been proposed regularly in N America: guaranteed annual (or minimum) income (known as "negative income tax" when incorporated into the tax system). It has 2 components. First, a guaranteed annual income level is determined, below which no family's income is allowed to fall. This income level is based on the needs of each family (by size) and could be the same as the poverty threshold. Such an income is theoretically now provided through welfare payments. Second, welfare payments are now taxed at \$1 for each \$1 earned, in addition to the welfare payments, but a guaranteed annual income would be reduced to a lower tax rate (eg, 50¢ for each \$1 of earnings).

Many people share the view that income disparities could be narrowed considerably if the government had the political will to tax the rich more heavily and redistribute wealth to the poor (see TAXATION, ROYAL COMMISSION ON). However, any significant redistribution would imply a major rise in taxation for families with an

income over \$40 000, and it is highly unlikely that these families, considered middle class, would accept such a tax hike. **PIERRE FRÉCHETTE** Reading: David P. Ross, *The Canadian Book on Income Distribution* (1980).

**Inconnu**, see WHITEFISH.

**Indian**, the term used by Europeans to identify aboriginal people of S, Central, and N America, is believed to have originated with Christopher Columbus, who thought he had reached Asia when, in fact, he had arrived in the Caribbean. The term persisted and has been used indiscriminately to refer to all aboriginal peoples on these continents except the INUIT of the Canadian Arctic and the Greenland and Alaska Eskimo. Under a 1939 court decision, the Inuit are classified as Indians for the purposes of the Constitution Act, 1867, although not for the INDIAN ACT.

In Canada, the legal definition of an Indian is contained in the Indian Act, legislation first passed in 1876, but stemming from similar pre-Confederation laws. People legally defined as Indians are known as status Indians. Nonstatus Indians are of Indian ancestry but, through intermarriage with whites or by abandoning their status rights, have lost their legal status while retaining their Indian identity. Among status Indians there are 2 groups: treaty Indians and registered Indians outside treaty areas. Treaty Indians are people who "took treaty." A treaty is an agreement between the Crown and a specific group of Indians who are held to have surrendered their land rights for specified benefits (see INDIAN TREATIES). Registered Indians are Indians in areas where treaties were never made or Indians with legal status in treaty areas who, for a variety of reasons, have not taken treaty. With the exception of specific promises contained in treaties, treaty Indians and registered Indians outside treaty receive identical benefits and privileges from the federal government (see ABORIGINAL RIGHTS; NATIVE PEOPLE, LAW). The status Indian population in Canada in 1981 was 323 782.

**HARVEY McCUE**

Reading: P. Cumming and N. Mickenberg, *Native Rights in Canada* (2nd ed, 1972); B. McCordle, *Indian History and Claims: A Research Handbook* (1982).

**Indian Act**, the principal federal statute dealing with INDIAN status, local government and the management of reserve land and communal monies. The present Act was passed in 1951, but its provisions are rooted in colonial law. The earliest Indian legislation was directed at regulating trade with the Indians and non-Indian settlement in Indian territories. Prior to Confederation, laws to protect Indian lands were enacted in Upper and Lower Canada and in NS, NB, PEI and BC. Indian status was a concept developed to determine entitlement to reside in Indian reserve communities; it remains a feature of the present Act (see NATIVE PEOPLE, LAW).

At Confederation, the Constitution assigned legislative jurisdiction over "Indians and lands reserved for the Indians" to Parliament. There are actually 2 distinct divisions of legislative power: civil rights and status of Indians, and reserve lands. The first federal Act was passed in 1868, based largely on the earlier legislation of the PROVINCE OF CANADA. In 1869 further legislation was passed reflecting a social policy of assimilation; Indian status was seen as a transitional measure, protecting Indians until they became settled on reserves and acquired European habits of agriculture. The new law provided for ENFRANCHISEMENT, then a voluntary relinquishment of Indian status, once this occurred.

The first "Indian Act" so called was enacted in 1876 and extensively amended over the years. Increasingly the Act suppressed Indian traditions such as the SUN DANCE and the POTLATCH, extending bureaucratic control over reserve res-

idents. The current Act is an improvement over its predecessors, but Indian people are still subject to an unwarranted degree of discretionary control by non-Indian institutions. In 1983 a special committee of Parliament recommended that Indian governments take over the tasks of local government and regulation.

Much public attention has been focused on the statutory rule that an Indian woman loses Indian status by marrying a non-Indian man, particularly since the Supreme Court of Canada ruled in 1973 that this did not discriminate against women in a way that offended the Canadian Bill of Rights of 1960 even though Indian men retain status if they marry non-Indian women (see LAVELL, Jeannette).

In a 1969 statement on Indian policy, the federal government proposed putting an end to Indian status and repealing the Act. This "White Paper" provoked strong objections from Indians, who saw it as an attempt to sever their traditional relationship with government at a time when they were insisting on greater recognition of their traditional rights, settlement of LAND CLAIMS and power to manage their lands and affairs. The policy proposal was withdrawn, but the government did not amend the Act, even though it acknowledged its many shortcomings, (see ABORIGINAL RIGHTS; NATIVE PEOPLE, POLITICAL ORGANIZATION AND ACTIVISM). The Act remains an essentially 19th-century statute, giving the government broad discretionary powers to regulate life in INDIAN RESERVES and, to a lesser degree, off reserve. Constitutional recognition of aboriginal and treaty rights in 1982 may provide a new impetus for dramatic revisions to a statute that has long resisted change. See also NATIVE PEOPLE, GOVERNMENT POLICY.

**WILLIAM B. HENDERSON**

Reading: R. Bartlett, *The Indian Act of Canada* (1980); J. Leslie and R. Maguire, eds, *Historical Development of the Indian Act* (2nd ed, 1978); D. Smith, *Canadian Indians and the Law* (1973); S. Weaver, *Making Canadian Indian Policy* (1981).

**Indian Affairs and Northern Development, Department of**, est 1966 to replace the Department of Northern Affairs and National Resources. A 1968 reorganization created 3 program areas apart from support services and an engineering and architectural branch: Indian and Inuit Affairs, Northern Affairs and Parks Canada. Parks Canada became the responsibility of the minister of environment in 1979. An Office of Native Claims was established in 1974 to represent the government in claims negotiations with native groups. The Northern Affairs Program is responsible for a wide range of activities north of the 60th parallel, eg, management of all natural resources (except game), protection of the environment and government-sponsored economic development. The department, commonly called DIAND, is responsible for the administration of the resources and affairs of the NORTHWEST TERRITORIES and the YUKON TERRITORY. The department's 1984-85 budget was \$2 billion.

Native discussions with (left to right) Alberta premier Harry Strom, Alberta Indian leader Harold Cardinal and Indian affairs minister Jean Chrétien, Dec 1970 (courtesy Prov Archives of Alberta/Edmonton Journal).

**Indian Art** The history of Indian art in Canada begins about 25 000 years ago with the migration of the Indians across *BERINGIA*. The development of native art is in many ways more complex than that of the relatively recent European settlers, and may be divided into 3 distinct periods: prehistoric art (25 000 BC to 16th-19th century AD), contact or "historic" art (16th-19th century) and contemporary native art (mid-20th century).

While historians of native art must rely to a large extent upon archaeological finds in the study of the prehistoric period, the work of ethnographers, ethnohistorians and historical archaeologists is of vital importance for knowledge of historic Indian art. Ethnographers have shown that a correct interpretation of the function and meaning of native artworks depends upon an understanding and appreciation of the ways of life, aesthetic values and principles of the peoples themselves. Ethnohistorians have examined early visual sources and written documents such as maps, paintings, captains' logs and accounts by explorers, traders and travelers, and from these documentary fragments have traced the history of native peoples from initial contact to the 20th century. Historical archaeologists have excavated postcontact sites, which give precise, chronological evidence of the interaction between native and European peoples, and also give evidence of the introduction of new materials, techniques and working methods to native artists and crafts people.

#### Prehistoric Art

Prehistoric art is the period of native art least known in Canada, and its terminal date varies from region to region across the country. While initial contact with the French in the Maritimes and St Lawrence Valley took place in the early 16th century, the Indians of the West Coast did not see Europeans until the late 18th century.

Discovery, knowledge and relative dating of prehistoric works of art depend upon meticulous excavation and careful interpretation. Recent important discoveries include the location in NW Ontario of what may be Canada's oldest artwork, a petroglyph site perhaps 5000 years old; a carving of a smiling human head, 5000-3000 BC, from the Coteau-du-Lac site on the St Lawrence R in SW Québec; and the verification that the spectacular art forms of coastal BC — most notably the totem poles — are not the product of European contact as formerly believed, but have a continuous on-site development dating back at least 2500 years. Since the wet, acidic soils of much of Canada's northland do not permit the survival of artworks in wood, fibre, hide or other perishable materials, much of Canada's prehistoric art has been lost. One major exception has been rock art: paintings in red ochre and carvings incised upon natural rock surfaces (see *PICTOGRAPHS AND PETROGLYPHS*).

Prehistoric art varies not only in genre, style, function, imagery and meaning from region to region but has undergone changes from period to period. These changes accelerated almost everywhere in Canada after about 1000 BC as a consequence of a variety of influential factors: the introduction of pottery, agriculture and settled village life from the Eastern Woodlands of the US and ultimately from Mexico, where New World civilizations developed independently from those of the Old World (see *PREHISTORY*).

There are several outstanding manifestations of prehistoric art in Canada. The Marpole culture, 500 BC-500 AD, which was centered on the Fraser R Delta and the surrounding Gulf Is of the southern BC coast, produced an abundant variety of stone and bone carvings (ceremonial bowls, effigies and utensils) that in many ways anticipate the style and iconography of postcontact *NORTHWEST COAST INDIAN ART*. Precontact Iroquoian culture, 900-1600 AD, in southern On-

Stone human-effigy pipe bowl, late Iroquoian, post-1500 AD, Simcoe County, Ont (courtesy Royal Ontario Museum).

tario (the ancestors of the Huron, Petun, Neutral) produced a pottery of high technical quality and visually pleasing effects decorated with representational and geometric designs. Iroquoian art in the Upper St Lawrence Valley is noted for its clay and stone effigy pipes of fascinating shape and iconographic variety. Both pipe bowls and stems were carved or modelled in high relief or incised with human and zoomorphic images of lizards, turtles and birds, all important power animals in the iconography of Great Lakes religious art. These tiny masterpieces had a sacred function — the ritual smoking of tobacco in the context of Indian spiritual beliefs (see *CALUMET*).

#### Postcontact Art

Postcontact or "historic" art is well known, mainly because examples have been collected, sketched and written about by explorers, traders, missionaries, artists and scholars for over 300 years and are now deposited in museums throughout the world. The various regions into which native art is customarily divided are based upon the distribution and cultural character of native groups in the early contact period, about 1800 to 1850, but this emphasis on the "ethnographic present" has resulted in a frozen time perspective, an erroneously narrow view of the great time depth, and of the diversity and richness of native art history.

Native art in Canada may be divided into 7 regional subdivisions: Eastern Subarctic (eastern Canadian Shield); Western Subarctic (western Canadian Shield and Mackenzie drainage area); Southern Great Lakes and Upper St Lawrence Valley; Prairies (southern Manitoba, Saskatchewan and Alberta); Plateau (interior southern BC); Northwest Coast (BC coast); and Arctic (arctic coastline and offshore islands eastward to Newfoundland).

**Eastern Subarctic** The art of the eastern Subarctic is the most archaic in Canada, the majority of prehistoric and early contact rock-art sites being located in this region. The largely Algonquin-speaking peoples — the Ojibwa, Cree, Algonquin, Ottawa, Montagnais, the Naskapi of Ontario and Québec and the Micmac and Maliseet of the southern Maritimes — continued a nomadic way of life based on hunting and the gathering of wild foods.

The art of the MICMAC and MALISEET of NS and NB remained distinctive until well into the 20th century. The Micmac are noted for their moosehair embroidery and porcupine quill-

work on birchbark and basketry containers, hide and textile clothing. Glass beads introduced by European traders were welcomed early by Micmac and other Indian women artists as substitutes for the more difficult quills and moosehair. The use of beads, their richness of colour and diversity of size and transparency, inevitably changed the aesthetic character of Micmac design. Micmac women's art in quills, moosehair and beads was largely 2-dimensional, secular in function and abstract in style, in contrast to that produced by men who worked in 3 dimensions with harder, more resistant materials such as wood and stone.

A well-known characteristic of Micmac design is the so-called "double-curve" motif, a bilaterally symmetrical arrangement of 2 opposing spirals or curves that is suggestive of plant forms. It appears as the basic, underlying pattern in much 2-dimensional design throughout the eastern Subarctic and becomes highly elaborate among the central Algonquians and Iroquoians of the Great Lakes area. Although this elaboration may have been influenced by young Indian girls taught needlework by Ursuline nuns, the pattern was rooted in an existing culture, for plants and their medicinal and magical properties played an important role in subarctic Indian belief and shamanistic herbal practice.

The art of the nomadic Naskapi is also remarkable for its 2-dimensional design. Especially noteworthy are caribou-hide coats incised and painted with linear geometric patterns and with the double-curve motif. Throughout the subarctic and Great Lakes areas, the colour red plays an important symbolic role, expressive of life's renewal and the continuity of the life-force in both animals and men.

The OJIBWA of subarctic Ontario and Manitoba are noted for a number of distinctive sacred art forms. The artwork of Ojibwa women was similar in technique, function and genre to much of that produced throughout the subarctic area: quillwork and beadwork on clothing, bark and basketry in both geometric and floral patterns. Ojibwa men, responsible for works of sacred, ceremonial function, produced an art that was largely symbolic, representational and documentary. Sacred art was intended to embody specific meanings, to portray spirit helpers and record ritual and mythological events and experiences. This division of artistic labour appears to have been the general pattern throughout native America: men producing public art for religious and ceremonial functions, women producing personal art, largely for the sake of sheer visual pleasure or "beauty," but often using motifs symbolizing spiritual and cosmological concepts such as the Four Quarters or the zigzag lightning of THUNDERBIRD. Ojibwa medicine men (or SHAMANS) were responsible for much of the rock art produced in Ontario and Manitoba, recording their visionary spirit encounters well into the 20th century. One of the most important forms of Ojibwa religious art in the historic period were the sacred birchbark records — rectangular pieces of bark measuring from several centimetres to over 3 m in length, which were incised in an almost imperceptible, fine-line technique with highly esoteric and symbolic images. These records served as documents of sacred lore or as memory aids for ritual, and the most detailed, extensive and valued were those produced by the MIDEWIWIN or Grand Medicine Society.

Least studied to date has been the art of the subarctic CREE. Aesthetic expression among the Cree is highlighted by exquisite quillwork and moosehair embroidery, noted for its perfection of technique and delicate colour harmonies. As nomadic hunters, living a precarious existence in a harsh climate from east of James Bay to northern Saskatchewan and Alberta, the Cree had to carry their goods on their person, so items

Man's summer jacket (courtesy National Museums of Canada/National Museum of Man/K75-956).

of clothing, especially their painted and embroidered coats, moccasins and mitts became a focus for personal aesthetic expression. Sacred art, eg, shamans' painted drums and ceremonial animal hides executed with symbolic motifs, are lesser known but equally important as aesthetic objects among both Cree and Ojibwa.

**Western Subarctic** What has been described for the Cree of the eastern Subarctic is largely applicable to the western Subarctic, a region of similar environmental conditions occupied by Athapaskan-speaking peoples. Although linguistically distinctive from the eastern subarctic Algonquians, the DENE NATION, as the Athapaskans prefer to be called, share a similar culture and art with their subarctic neighbours. Decoration of personal gear and clothing was the major form of artistic expression, as caribou and moose hide was embellished with porcupine quills, moosehair embroidery, beads and commercial threads in geometric and floral patterns. Compared to southerly groups such as the Ojibwa and Iroquois, the subarctic peoples revealed in their embroidery their delicate colour sense and exquisite precision in design.

**Southern Great Lakes and Upper St Lawrence Valley** From the late prehistoric to the early historic period, the Iroquoian-speaking peoples of this region — the HURON, NEUTRAL, PETUN, and later the IROQUOIS proper — underwent more rapid changes than the natives in any other region in Canada. Because they were farmers, living in relatively permanent villages, their political and social institutions found expression in suitable works of art. By the 19th century, however, many of the Indians had migrated westward, eastward, or were settled in reserves throughout the area. Art came to have a new purpose, as a commodity for sale to outsiders — to tourists and collectors of Indian "arts and crafts." In prehistoric times this region was already subject to outside influences. The Iroquois in particular had trade connections to the south with the highly complex and economically advanced "Mississippian" cultures of the Eastern Woodlands, which in turn were stimulated by Mexican cultural innovations (ceramic technology entered Canada from this source). In the early contact period they made alliances with Europeans through the FUR TRADE.

The history of art in this region is too complex to detail, except for a few highlights. While on the whole there is considerable homogeneity in quillwork and beadwork throughout the subarctic and Great Lakes area, Huron work is distinctive in the later historic period. Huron "personal art" favoured moosehair embroidery in floral motifs of exquisite beauty on black-dyed hide. The quality of trade goods, unmatched

elsewhere in Canada, had peaked by 1830, long after the Huron had left western Ontario to settle at Lorette, Qué. Hide and yarn shoulder pouches and bags, executed with a wide variety of geometric, naturalistic and mythological motifs, were the predecessors of the more recent loom-woven and heavily beaded "Bandler" bags of the western Great Lakes area. The most common motifs were Thunderbird and the Underwater Panther, finely rendered in quills, moosehair and beads. Typical as well were finger-woven sashes interwoven with white beads, burden straps of twined Indian hemp, wooden ball-headed clubs incised and carved in high relief and elaborately decorated knife sheaths. The noted Assomption Sash was a trade item, although, as with silverwork, the Indians adopted European techniques and designs. Even the splint baskets, prized by collectors as a typical Indian craft, employed a technique learned from Swedish settlers in the Delaware Valley.

The Iroquois proper, or Six Nations, did not settle in Canada until after the American Revolution. The most noteworthy art forms of the historic Iroquois are the False Faces, wooden masks with metal eyes and sometimes horsehair, which were carved by the men for use in curing ceremonies (see FALSE FACE SOCIETY). Strongly sculptural in character, with a variety of mouth types and painted in red or black or both, they are sacred objects believed to contain the life-force of the living tree. The masks represent mythological beings, the most notable being "Crooked Face," the one who challenged the Creator and had his nose broken. Other masks, plaited from dried cornhusks, were worn in agricultural ceremonies and represent a second group of earth-oriented supernaturals, those who taught mankind how to grow crops.

In addition to personal art (clothing) and sacred art (False Faces), the Iroquois produced another kind of art object of "political" function and meaning. WAMPUM strings and belts of several centimetres width and sometimes metres in length were made of purple and white shells traded in from the Atlantic Coast. In the absence of writing, yet with the high degree of political sophistication these Iroquoian-speaking peoples

had achieved, these wampum belts with their symbolic motifs served as a visual record of particular treaties and events. As such, the wampum belt became a symbol of friendship and co-operation between political groups, both Indian and European.

**Prairies** Prairie Indian culture, as it emerged in the 19th century, was a synthesis of native and white cultures, the product of post-contact European influences such as the horse and the gun which provided increased mobility and effectiveness in buffalo hunting. The art produced by the BLOOD, BLACKFOOT and ASSINIBOINE is similar to that of their eastern subarctic and western Great Lakes neighbours in techniques, materials and motifs, as westward migration, the consequence of new hunting opportunities, the fur trade and advancing colonization, brought eastern influences into prairie culture.

Art produced by prairie people was essentially 2-dimensional, in which painting on hides was the major genre. Large tipis that required the hides of up to 40 buffalo were their major architectural form. Among the Blackfoot of southern Alberta, tipis of important men were often lavishly painted with naturalistic and geometric motifs. Dream images depicted on rawhide shields rival contemporary surrealist paintings in visionary and aesthetic impact. As images of the warrior's personal guardian spirits, they were believed to protect him in warfare and help in the hunt. Painted buffalo robes were another major art form, with motifs ranging from the abstract, concentric "sunburst" pattern to representational images. Personal art was the focus of aesthetic attention, as deer-hide moccasins, jackets, dresses, leggings and shirts were embellished with porcupine quillwork and beads. Painted PARFLECHES, rawhide containers of various shapes and sizes, were unique to this area, and no 2 designs were exactly the same.

**Plateau** The plateau region of central BC is often ignored in surveys of Indian art but is unique in many ways. The interior SALISH left behind a major body of prehistoric pictographs. The Lillooet, Thompson, Okanagan and Shuswap of the historic period are noted for their finely crafted, watertight baskets made by the coiling technique and decorated with geometric motifs. Little research has been done on the art of the plateau peoples, on their blankets woven of mountain-goat wool, their clothing, or the religious beliefs that provide the context for art interpretation in many Indian cultures.

**Northwest Coast and Arctic** The historic art of the Northwest Coast and of the Arctic has been the subject of considerable attention in recent years, to a large extent because of the intrinsic importance of INUIT and Northwest Coast Indian art in the context of world art.

Indian art of the prehistoric and postcontact periods is "traditional" art. Even though native

art was strongly affected by European materials, techniques and motifs during the historic period, it was still largely shaped by the context of Indian cultures. In contrast, contemporary native art, like contemporary art the world over, fulfils a new purpose: that of self-expression.

#### Contemporary Indian Art

Contemporary Indian art is so recent in origin that its directions are not clear and, contrary to appearances, its interpretation and aesthetic assessment are not complete. Many significant and fundamental questions — such as criteria for critical judgement — have not been systematically addressed. Three major centres of native art, however, clearly dominate the contemporary scene in Canada: Inuit art, West Coast Indian art, and the Woodlands art of eastern Canada. A scattered group of Indian artists work independently, in the context of mainstream Western art, and may be described as internationalist in scope and intent. The Woodlands school gained recognition in the 1970s with the rise to fame of Norval MORRISSEAU, an Ojibwa from northern Ontario. The majority of Woodland artists have been influenced by Morrisseau and are known as "Legend Painters" for their rendering of tales and mythological characters in their work. Other painters include Carl RAY, a Cree from northern Ontario, Daphne ODJIG and Blake DEBASSIGE from Manitoulin I, and Jackson BEARDY, an Ojibwa from Manitoba.

The internationalist artists tend to work alone, seeing themselves as independent of any "school," and are often highly trained in contemporary Western techniques of painting. They view themselves as "artists" above all who "happen to be Indian." Nevertheless, their paintings evoke in form and content an indisputable link with Indian sensibilities. Outstanding in this group are Alex JANVIER, a Chipewyan from northern Alberta; Arthur SHILLING from Orillia, Ont, well known for his portraits of Ojibwa; and Sarain STUMP, a Shoshone-Cree from the Prairies, painter of surrealist-symbolic compositions. The Iroquois George Longfish from Oshweken, Ont, though he works essentially in an abstract expressionist manner, is able to communicate Indian spirituality through formal means alone. The portrayals of INDIAN RESERVE life by Allen SAPP are reminiscent of 19th-century realist works and typify the conservative trend among many Indian artists today. JOAN M. VASTOKAS

**Indian Head**, Sask, Town, pop 1889 (1981c), inc 1902, is located in the heart of Saskatchewan's richest farming area, the Qu'Appelle Valley, 68 km E of Regina. Its first settlers moved into the district in 1882, a few months ahead of the CPR. Indian Head was so named for a low range of hills lying a few km to the SW of the townsite known to the natives as Indian Head. The town remains very prominent in the agricultural industry of the province. Not only is it a prime wheat-growing area, but it is also the site of a federal experimental farm and the Prairie Farm Rehabilitation Administration Tree Nursery.

DON HERPERGER

**Indian Pipe** (*Monotropa uniflora*), a perennial PLANT, is the only native species of genus *Monotropa*, one of 8 genera of the wintergreen family (Pyrolaceae) found in Canada. The genus is sometimes raised to family level (Monotropaceae), or WINTERGREENS may be included in the heath family (Ericaceae). Indian pipe grows transcontinentally in shaded woodlands but is hard to find, not always appearing in the same place each year. Lacking chlorophyll, it cannot manufacture its own food and lives on partially decayed vegetation in soil, with the aid of a fungus (see MYCORRHIZAE). The plant is 10-20 cm tall. The nodding, one-flowered stalks are often clustered. The flower and stalk vaguely resemble a smoker's pipe, hence the common name. It is also called a corpse plant because of its shining, translucent white colour. If the plant is touched, the spot turns black. Indian pipe was used by the BLACKFOOT to heal wounds, and by various groups for convulsions and epileptic seizures.

**Indian Reserve** The earliest Indian reserves in Canada appear to have been established on seigniorial holdings by Catholic missionary orders and private persons in New France. Later reserves were set aside by treaty and various forms of crown grant in the British Maritime colonies, Lower Canada and Upper Canada. After Confederation, reserves were formed either under the numbered treaties or by special arrangement with individual bands. The actual means by which reserves were created is not yet fully understood.

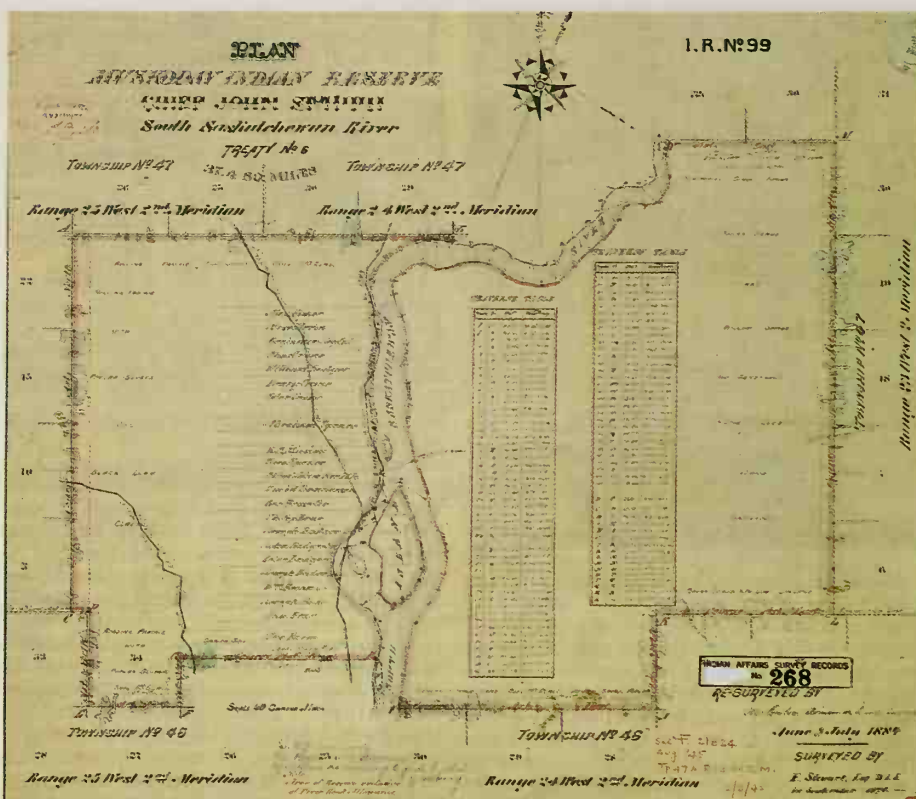

In Canada there were 2242 reserves in 1977, with a total area of about 25 954 km<sup>2</sup>. Reserves are lands set aside for the exclusive use of status Indians. A BAND is the term used to describe a community of Indians residing on one or more reserves, but some Indian bands have no reserves. In 1981 there were 323 782 status Indians and 576 bands. In the NWT and the Yukon, where few reserves have been established, the bands have been gathered into communities known as settlements, on lands which are generally held by the Crown for their benefit but which do not have reserve status. There are reserves in most parts of southern Canada, but about 65% of the INDIAN population is on reserves in areas designated "rural" or "remote" (see NATIVE PEOPLE, DEMOGRAPHY). A majority of bands in Canada have fewer than 1000 members.

The INDIAN ACT stipulates that only status Indians may reside permanently on a reserve. By-laws enacted by individual band councils enable some persons who are not status Indians to reside on reserves until such time as they may be asked to leave. Many bands have leased or otherwise disposed of portions of their reserve lands to non-Indians for various purposes, including natural-resource exploitation, rights of way for transportation or transmission, farming, ranching and recreational land use. Although many Indians believe that reserves are legally their property, the Indian Act states that the title to reserves is vested in the Crown. This legal relationship with the federal government concerns Indians, who believe that the status of Indian lands is in jeopardy as long as legal title remains outside of Indian control. The Indian Act forbids the "surrender" and sale of reserve land by an Indian or a band to anyone other than the Crown. Individual Indians who occupy particular plots of land in a reserve cannot obtain an ordinary deed or title to the land, but may acquire certificates giving them varying degrees of protection from claims by other parties. This individual title or "location" may be transferred among members of the same band. Land in a reserve which is not assigned to individuals is held as common property for the benefit of the entire band.

Social conditions in most reserves reflect the historical and political neglect that Canada has shown towards people of Indian ancestry (see NATIVE PEOPLE, SOCIAL CONDITIONS). The location of most reserves in isolated and remote areas has contributed to the high rate of unemployment among Indians, which remains at about 35% of the working-age population, rising to much higher levels on the remote reserves where traditional economies have been eroded. Of those Indians who are employed, 75% work on a reserve (see NATIVE PEOPLE, ECONOMIC CONDITIONS).

In spite of these and other conditions which have contributed to a host of problems among people who reside on reserves, the reserves remain the physical and spiritual home for many Indians, especially in the southern regions. Indian reserves have often been called rural ghettos or retreats where Indians can escape the demands of modern society. People who perceive reserves in this way believe that without reserves Indians would be forced to assimilate into Canadian society and that with assimilation, many of the problems which affect reserve pop-

Plan of the Muskoday Indian reserve in Saskatchewan, 1884, one of several such plans showing land allocated as reserves (courtesy Public Archives of Canada/NMC-8387).

ulations today would vanish. This view ignores the political and legal status that reserves have in Canada and overlooks the fact that most Indians do not want to be assimilated. It also ignores the situation in the NWT, the Yukon and northern Québec, where status Indians who do not live on reserves still maintain a separate identity, language and culture.

To many Indians, reserves represent the last visible evidence that they were the original people of this country. The reserve nurtures a community of "Indianness" and reinforces spiritual unity among Indians. Despite the manifest poverty, ill health, poor housing and lack of services, the life-style on reserves, traditional values, kinship affiliations and the land itself all contribute to an Indian's identity and psychological well-being. The relative isolation of most reserves enables Indians to socialize their children to values important to their culture: reticence and noninterference, consensus decision making and nonverbal communication. Reserves, since they are set apart both physically and legally, help Indians to maintain an ethnic identity within Canada.

**Indian Summer**, popular expression for a period of mild, summerlike weather which occurs in the autumn, usually after the first frost. The origins of the name are obscure, but it was in use in Canada early in the 19th century and even earlier in the US. The Toronto Meteorological Observatory (est 1839) recorded the date of certain periodic events, such as Indian summer, until 1871. Almost invariably, its records show that this phenomenon occurred in late Oct or the first half of Nov and lasted from a few days to about a week. Although it cannot be precisely defined, Indian summer continues to arrive most years just as thoughts of the summer past are fading into thoughts of the winter to come.

MICHAEL J. NEWARK

**Indian Trade Goods** are items of European manufacture that were traded with the indigenous peoples of Canada for furs. For the initial stages of culture contact such goods were stray bits of metal (eg, an old iron axe or knife, a handful of nails) and pieces of rope and used clothing. During this period, most of the trade in furs was carried out by fishermen who had gone ashore to dry their catches. Although the volume of trade was small, the profits were relatively large because items of little value to a European could be traded for furs that commanded an excellent price in the home market. During the 16th century, however, the fur trade gradually developed into a separate branch of commerce. Ships solely engaged in trade were sent to the eastern seaboard with cargoes of manufactured goods. At this stage, decisions had to be made about the type of trade goods that would be in greatest demand and produce most furs at the best prices.

From the beginning, one of the most important items of trade was the iron axe. Axes were imported into French Canada in such numbers that they were literally "harvested" in many parts of southern Ontario, forming the first cash crop of the settlers who were breaking the land. The axes were formed by bending a short length of bar iron around a mandrel to form a wedge-shaped eye, then welding the ends of the bar together and hammering it into a long heavy blade. A thin piece of steel was usually set into the blade so that the tool would take and hold a sharper edge. These early French felling axes are found throughout eastern Canada and are scattered across New York and Ohio and down the Mississippi drainage; however, they are concentrated in southern Ontario and western New York, the homeland of the Iroquoian-speaking peoples. Although generations of children were raised with the impression that the old trade axes were weapons, archaeological evidence suggests that they were used, primarily by women, for breaking up the dead limbs and brush that were used for firewood. They would, of course, have been used for many other purposes as well.

While the heavy French felling axe was quite acceptable to the sedentary Iroquoian peoples,

it was much too cumbersome for the hunters and gatherers of the northern forests. Hence the French introduced the lighter, more slender Biscay axe. This axe was probably introduced into the trade towards the end of the 17th century, at about the same time that the HUDSON'S BAY COMPANY was establishing trading posts on James Bay. The English also found their axes too cumbersome for the Algonquian-speaking peoples with whom they traded and introduced a lighter, hatchetlike tool. The minor stylistic differences between axe types were probably not significant to the native peoples. But to the archaeologist and historian such minor differences are of primary importance because the distribution of the different types across an area allows reconstruction of the trade routes that stretched out from the various commercial centres. In addition, if the dates at which different styles were introduced into the trade are known, the information can be used in dating archaeological sites. For example, the earliest flintlock musket that the HBC traded into James Bay had a flat cock and lock plate; however, in 1682 the Oakes pattern, with rounded outer surfaces on the cock and lock plate, was introduced. These rounded surfaces remained characteristic of the Northwest gun throughout its history. Any archaeological site which produces the Oakes-pattern musket must postdate 1682.

Styles in trade goods changed through time. Although few such changes can be precisely dated, many are known with reasonable precision. For example, a collection of kaolin pipes can usually be dated to within a 10-year period, as can a collection of glass bottles. Glass beads and brass kettles are much more difficult to date, although some clues are available. For example, larger star beads are associated only with early French sites; small brass kettles with vertical sides seem to appear only on very late sites that were supplied by the HBC.

Native peoples adopted items of European manufacture because of their technological superiority: flintlock muskets, iron axes and knives and brass kettles simply were more efficient than the bows and arrows, stone tools and birch-bark baskets they replaced. Similarly, for much of the year, woolen clothing was vastly superior to skin clothing. Trade goods, however, were not limited to utilitarian objects. A pipe of tobacco may not have made a trapper more efficient, but it did make him more serene; and his wife and daughters could have tied back their hair with strips of skin, as had their ancestors for countless generations, but they found a brightly coloured ribbon more attractive.

The volume of goods that was imported during the early fur-trade period was impressive. For example, in 1684 the HBC shipped 300 flintlock muskets, 2000 iron axes, 2160 kaolin tobacco pipes, 3000 jackknives and 5000 butcher knives to its Albany post. During this period, the fur trade was dominated by those historic rivals, the French and English. The French led the way westward, following the ancient canoe routes of the Indians. Even after the conquest of NEW FRANCE, the commercial rivalry continued, with the Montréal traders pushing farther and farther west. At the height of their power, they were following a well-established "Voyageurs' Highway" that stretched from Montréal on the St Lawrence to Fort Chipewyan on Lk Athabasca. The trade goods they carried, the muskets, kettles, beads, pipes, woolen clothing, blankets, etc, were the currency of the fur trade, a trade that opened up half a continent and gave Canada its basic configuration. See CLOTHING; FIRE ARM.

WALTER A. KENYON

**Indian Treaties** are formal agreements between Indians and the Crown involving promises of peace and friendship, land cessions and other issues and benefits. Rights promised to

INDIAN peoples in treaties are recognized and affirmed by the CONSTITUTION ACT, 1982; those included in LAND CLAIMS settlements also have constitutional force. There are, however, many areas of Canada where no treaties were made: Newfoundland and Labrador, Québec, the High Arctic, most of the NWT, the Yukon, most of BC and parts of the Maritimes are not subject to any treaty.

**NS, NB, PEI** For much of the 17th and 18th centuries, this region was hotly contested by the British and the French. Both rivals sought to neutralize Indian military prowess and to consolidate their gains from time to time. The British entered into a series of treaties of peace and friendship with the tribes between 1693 and 1794, all but the last securing only temporary peace.

Generally, these treaties did not include a purchase or cession of land to the Crown: British rights were considered to have been acquired by conquest from the French. Nor did they promise reserves or annuities (see INDIAN RESERVES). The usual provisions were for the establishment of "truckhouses," or trading posts, maintenance of peaceful relations, and noninterference with Indian hunting and fishing. Indian claims to exemption from fish and game laws are generally not recognized by local courts, but this situation may change when the Supreme Court of Canada decides the *Simon* case (1984), in which constitutional protection of a treaty right is claimed by an NB Indian.

**Ontario** After the American Revolution, Britain was faced with the problem of settling LOYALISTS and soldiers, including the IROQUOIS of upstate New York, in Canada. Initial purchases were made from the Mississauga and other tribes occupying the northern shore of Lk Ontario. This pattern of purchase continued into western Ontario and N to Georgian Bay. The dozens of treaty documents recording these purchases vary greatly; of particular interest is the so-called "Gunshot Treaty" (1787), which covered lands along the shore of Lk Ontario and as far inland as a gunshot could be heard on a clear day, about 19 km. Such ambiguities led in 1923 to a more comprehensive treaty with the Mississauga that is, however, also a contentious agreement.

The form of future treaties was set for the next century when, in 1850, Commissioner W.B. Robinson was dispatched to Sault Ste Marie to conclude treaties with Indians of the upper Great Lakes. These are known as the Robinson-Huron and Robinson-Superior treaties. They provided for cession of the Indian title in return for an immediate cash payment, annual payments to the tribes, reserves which could not be sold except to the Crown, and the "full and free privilege" to hunt and fish on unoccupied crown lands.

After Confederation, Treaty No 3, the Northwest Angle Treaty, was entered into at a time when the Dominion government believed the region to be part of Rupert's Land. Disputes over the respective land rights of the Dominion and the province led to the *St Catherines Milling* case (see ABORIGINAL RIGHTS).

The boundaries of Ontario were extended to their present limits in 1912, and Canada, having failed in an attempt to recoup the annuity expense of the Robinson treaties from the province, ensured that Ontario would take responsibility for concluding and paying for a treaty in the new lands. This led to Treaty No 9, the James Bay Treaty, in 1905-06. Québec's failure to conclude a similar treaty when its boundaries were extended (also 1912) led to the JAMES BAY AGREEMENT with the Cree and Inuit of northern Québec.

**The "Numbered" Treaties** When the new Dominion acquired the HUDSON'S BAY CO territories in 1870, it immediately began to secure land ces-

Medal used for Indian treaties signed from 1871 to 1922 (courtesy Public Archives of Canada/National Medal Collection).

sions from the Indians of the northwest. The numbered treaties, beginning with Treaty No 1 in 1871 and ending with Treaty No 11 in 1921, generally include these provisions: reserve lands in proportion to population, usually 128 acres (51.8016 hectares) per capita; a token annual payment to each person; farming and agricultural assistance; schools and educational assistance; ammunition and fishing twine; uniforms, medals and flags for the principal chiefs. Fishing and hunting were to continue as before, subject to government regulation from time to time. The interpretation of these provisions has led to disputes, which is hardly surprising since negotiations were conducted through interpreters and much of the discussion was not included in the treaties themselves.

One particularly contentious clause, which occurs only in Treaty No 6, provides that a medicine chest shall be kept at the house of the Indian agent. Native groups have argued that, in modern terms, this represents a promise of free medical care. The courts have ruled that the promise entitles Treaty No 6 Indians to free medicine but not to free medical services (see NATIVE PEOPLE, GOVERNMENT PROGRAMS). Similar arguments that the promise of certain school facilities means free education to the post-secondary level have not yet found their way into court (see NATIVE PEOPLE, EDUCATION).

Other claims arising from the numbered treaties relate to land and to hunting and fishing rights. In some areas the reserves promised were not provided or were smaller than promised; negotiations are being pursued with the Prairie provinces to resolve this issue. Under the BNA Act, 1930, the 3 provincial governments are obliged to supply the land to meet these claims, but disagreement as to the precise nature of that obligation has delayed resolution of the issue. The same Act excludes provincial regulation of Indian hunting and fishing for food on the Prairies and these rights are now defined by the provisions of the Constitution.

MÉTIS were usually given the option of taking treaty as Indians or "scrip," which entitled them to an allotment of land. Because scrip could be sold to non-natives, few such allotments were actually made to Métis themselves.

The numbered treaties are principally associated with the Prairie provinces, but they extend from Ontario across the Prairies, into northeastern BC and the Mackenzie Valley of the NWT.

**BC** For much of the 1850s James DOUGLAS was both chief factor of the HBC and governor of BC. Based at Victoria, he followed the practice

of purchasing Indian lands required for settlement and, between 1850 and 1859, entered into at least 14 agreements covering lands mainly near the southern tip of Vancouver I. Indians were given a single payment, continued ownership of village sites and fields, as well as hunting and fishing rights.

By 1860, however, the COLONIAL OFFICE refused to provide funds for such purchases, and in time local officials disagreed with the policy of making them. No further treaties were made, and Indian tribes in BC, as in other nontreaty areas, rely on this omission in continuing to assert their aboriginal title.

Treaty No 8 applies to BC generally east of the Pacific watershed and north to the territorial boundaries.

**The Territories** Treaty No 8 and Treaty No 11 apply to parts of the NWT. These were concluded between 1899 and 1921-22, but some of the treaty promises, notably the promise of reserve lands, were never fulfilled.

**Summary** Many Canadian Indians rely upon the promises made in the treaties to ensure their distinctive status in Canadian law and society; but difficulties of interpretation, coupled with the anomaly of having domestic treaties with one class of citizens, prompted the federal government in the 1969 White Paper to suggest that the treaties simply be disregarded or replaced. With treaty rights entrenched in the Constitution of 1982, with land-claims negotiations in progress across the country and with courts more willing to enforce the oral promises made to secure treaties in the first instance, there is likely to be more attention given to treaty rights and promises.

**Indonesians** are one of the smallest (about 3000 people in 1981) and one of the more recently arrived ethnic groups in Canada. They have almost all emigrated since the 1960s when political instability in Indonesia threatened certain ethnic and political groups. About 90% of the Indonesians in Canada are of CHINESE origin, but because of language differences they have tended not to be strongly associated with the Chinese community. Though most Indonesians have come to Canada directly from Indonesia, people born in Indonesia have come to Canada from the Netherlands, Hong Kong, China and more recently Vietnam. Over 75% have settled in Ontario and BC, especially in Toronto and Vancouver. Most Indonesian immigrants are highly educated and have sought occupations in the scientific, managerial or clerical fields. Indonesians are best known to a majority of Canadians for their distinct style of cooking and their famous batik fabrics.

DAVID S. MOYER

**Industrial Design**, as defined by the International Council of Societies of Industrial Design (ICSID), "is a creative activity the aim of which is to determine the formal qualities of objects produced by industry. These formal qualities include the external features, but are principally those structural and functional relationships which convert a system to a coherent unit both from the viewpoint of the producer and the user. Industrial design embraces all aspects of human environment that are conditioned by industrial production." Though allied to the disciplines of ARCHITECTURE and ENGINEERING, industrial design has a shorter history and did not

come into being until the mid-19th century. Prior to this time, the production of everyday products was mainly the result of individual manual effort within a craft-based economy, but the Industrial Revolution made possible the mass production of these same products. Thereafter, artist/craftsmen were largely excluded from the industrial process. The need for a balance between art and industry was expressed by concerned groups and individuals, and led to industrial design as we know it today.

The major early developments in industrial design took place in continental Europe, especially in Great Britain and Germany. In Britain William Morris founded a crafts-based school of design and "production" that was anti-industry, and Henry Cole advocated the introduction of art to industry; in 1837 the Normal School of Design (later named Royal College of Art) was founded; in 1849 the *Journal of Design* began publication; and in 1851 the Great Exhibition was held in London. A comparable development occurred in Germany. In 1907 industrialists, businessmen, artists and architects joined to form the Deutscher Werkbund; their manifesto protested the ugliness of the built environment and demanded the revival of artistic, moral and social ethics. This philosophical direction culminated in the establishment, in 1919, of the Bauhaus, the design school which has profoundly influenced the development of contemporary industrial design. In the US, the profession of industrial design began as a method of sales promotion, concerned with product styling and packaging. During the Depression this approach was used by designers such as Norman Bel Geddes, Henry Dreyfuss, Raymond Loewy and Walter Dorwin Teague.

Industrial design became firmly established in Canada only after 1945, as a direct result of the development of secondary industry during the war. C.D. HOWE, concerned that this industrial potential be preserved, established the Committee for Reconstruction and Re-establishment and requested that the Exhibition Commission arrange a display of industrial discoveries by the NATIONAL RESEARCH COUNCIL. The exhibit, organized by Donald Buchanan to show that design and technical competence are not mutually exclusive, opened in June 1946 at the annual convention of the Canadian Manufacturers' Association, then travelled across Canada. Buchanan pushed for further exposure to industrial design both through the NATIONAL GALLERY and in several small publications. In June 1947 he received a government grant to investigate the role of industrial design in Canada and later that year he proposed a list of recommendations, one of which led to the Industrial Design Act of 1961 and the founding of the NATIONAL DESIGN COUNCIL. During the same postwar period, industrial designers began to organize as a profession. In 1946 the Affiliation of Canadian Industrial Designers was formed, which by 1947 had incorporated itself as the Assn of Canadian Industrial Designers.

Industrial design education was not formalized in Canada until the late 1940s, when the first course was offered at the ONTARIO COLLEGE OF ART. In Québec, l'Institut des arts appliqués, formerly l'École du meuble, began the first design program, followed after 1969 by degree programs at U de Montréal and U du Québec. The School of Industrial Design at Carleton and several Ontario community colleges offer industrial design programs, as do the universities of Alberta and Calgary.

Several Canadians are well known as industrial designers. Jacques Guillon, Julien Hébert and Frank Dudas were pioneers in the profession and worked in transportation (Montréal's Métro in the 1960s, Via Rail's LRC in the 1970s), exhibition (Expo 67, Expo 70) and furniture. More recently, Douglas Ball has become known

internationally for his office furniture. Ian Bruce played a significant role in designing the Laser sailboat and in arranging for its manufacture in many countries. John Tyson, Morley Smith and André Morin have influenced several everyday products, including telephones, snowmobiles and housewares. Thomas Lamb, Keith Muller, Jan Kuypers, André Jarry and Michel Dallaire are known in Canada and abroad as leading furniture designers. A number of Canadian manufacturers have also contributed to a better utilization of design in industry, notably Bombardier, Sunar, Cooper, Bell Canada, and Black and Decker. Within Canada, both industry and the general public are slowly developing a growing awareness of the value of industrial design.

JACQUES GIARD

**Industrial Quality Control** makes use of scientific techniques to determine product and service capabilities, to enable an organization to provide economically a product or service suitable for its intended purpose. The objective of a good quality-control program is to enable all people and machines concerned to do their jobs right the first time and to provide assurance to the customer that this has been done. The detailed techniques vary from product to product and from service to service, but the principles remain the same.

In Canada quality control started in the military, aviation and electronic fields. For many years, the only standards available were those issued by the Dept of National Defence, which are still recognized throughout NATO. In line with the understanding of the early DND Standards, many major companies prepared their own quality-control standards, insisting that their suppliers meet these standards. In the early 1970s the power UTILITIES recognized the problem caused to many sections of industry by this mass of similar standards. The utilities and regulatory bodies involved formed a Canadian Standards Association committee, which developed a family of standards that were originally applicable only to the nuclear industry but were later broadened to be more generally applicable. The development of further standards in this field has been assigned to CSA by the Standards Council of Canada.

In 1946 the first industrial quality-control technical society on this continent was formed. This society developed into the American Society for Quality Control (ASQC) which now has over 40 000 members throughout the world. Canada has been active in the society virtually from the start. Canadian sections or subsections are active in Hamilton, Kitchener, London, Montréal (separate English and French sections), Toronto, Vancouver and Winnipeg. Several Canadians have been designated fellows for their contribution to the discipline. Canadians have also been active on the society's board of directors and the executive committee. In the late 1970s the Quality Assurance Education Assn of Canada was formed to correlate both university and community-college educational activities in this field. Some of the courses identified are in engineering faculties; others, in business management faculties. In 1980 the Assn of Professional Engineers of Ontario (APEO) recognized the field of assurance engineering as one of the specialist categories within its program of recognizing individuals with specialized skills. This program has not yet been extended to the other provinces or territories. Canada has been a member of the International Organization for Standardization since its establishment in 1947. In 1980 the ISO Technical Committee on Quality Assurance was formed; its first meeting was held in Ottawa. The Secretariat was awarded to Canada and has been established at Rexdale, Ont. The first secretary was a Canadian.

C.A. MILLS

**Industrial Relations** are concerned with all aspects, individual and collective, of the relationship between employers and employees. The individual aspects include planning and staffing, the selection and placement of appropriate candidates, their integration into the organization, training and development, their performance appraisal and proper compensation, productivity and discipline. Where the employees have formed a union, the relationship with management comprises labour-organization problems, union-certification procedures, the COLLECTIVE BARGAINING process, strike and dispute resolution, grievance procedure and arbitration. The employment contract, some basic employment standards, health and safety questions and all matters concerning antidiscrimination laws and charters of rights have implications both individual and collective (see also EMPLOYMENT LAW).

Law, because it regulates the employer-employee relationship, and economics, because the basic and fundamental problem of industrial relations is always the distribution of the outputs of production, are central to industrial relations. Sociology, psychology, political science, business administration, organizational behaviour, philosophy and cybernetics also contribute to a better understanding and functioning of individual and collective relationships. An important controversy exists over whether industrial relations is a discipline in itself — with its own theory and special methodology — or a subject matter to be studied with a variety of tools. The controversy, which will probably never be resolved, partly explains the variety of approaches in the study of industrial relations as well as the different structural arrangements found in institutions that teach it.

In some cases a teaching department, complete with its own staff and students, has been created as a distinct unit; in other places a centre for industrial relations functions as a forum where professors of law, economics, sociology and other disciplines gather to discuss topics of mutual interest concerning employer-employee relationships. Courses in industrial relations can all be gathered under one faculty or department, eg, a faculty of management or business administration, a department of economics or sociology, or they can be divided according to subject, eg, the study of wages and other labour economic problems in a department of economics, of trade-union movement and labour organizations in sociology, of collective bargaining and collective agreement in business administration. Some of these centres have developed courses and seminars for both management representatives and trade-union leaders and members. The activity can be the exclusive responsibility of the centre or part of the university extension or adult-education services.

Queen's University in Kingston, Ont, was the first Canadian university to offer structured teaching in industrial relations, through its Industrial Relations Section, est 1937. In 1944 Laval University opened its Department of Industrial Relations, and Université de Montréal inaugurated its own teaching department a few months later. To put these dates into perspective, the first industrial-relations section of a N American university was created at Princeton, New Jersey, in 1922, and the famous New York State School of Industrial and Labor Relations at Cornell University, from which many Canadian specialists graduated, opened in 1945. At McGill University the Industrial Relations Centre was established (1948) in the Department of Economics and Political Science and transferred to the Faculty of Management in the early 1960s. The Institute of Industrial Relations at UBC was established in 1960 but closed in the 1970s. The Centre for Industrial Relations at University of Toronto was founded in 1965.

At the undergraduate level, Laval and Montréal have teaching and degree-granting departments as well as programs leading to masters' and doctoral degrees. Queen's had a teaching department until 1961, and now has an Industrial Relations Centre. In the late 1970s, U of T opened a graduate course leading to a master's degree in industrial relations (MIR) and in the early 1980s a course leading to a PhD.

The two universities with teaching departments have always offered courses in human-resources management and collective relationships. There are about 50 undergraduate courses, 15 of them obligatory, distributed among 5 or 6 fields of study: theory and methodology, business and personnel administration, trade unionism and collective bargaining, labour legislation, labour and manpower economics. Graduate courses are offered in the same fields. In other universities, industrial-relations courses, eg, industrial relations, labour relations, collective bargaining, labour law, arbitration procedures, usually concentrate on institutional aspects of collective-relationship problems. Subjects likely to be taught in the corresponding departments include labour economics and labour market analysis, industrial sociology, industrial psychology and labour history. Personnel administration and human resources are dealt with primarily in the administration curricula, eg, personnel administration, organizational behaviour, human-resources management, human relations.

In 53 Canadian universities almost 900 courses were taught in industrial relations and human-resources management in 1977-78, 70% of them at the undergraduate level and 60% of them offered by faculties and departments of management and administration. They were attended by about 50 000 students. At the college level, courses on the same subjects are given especially to commerce and administration students, who are likely to be given less theory and more application to prepare them as technicians rather than professionals.

Industrial-relations graduates work mainly in personnel and human-resources departments of large and medium-size companies, in trade unions and labour organizations as researchers, organizers and consultants, and in governments and industrial-relations agencies, eg, labour-relations boards and arbitration services. A few operate their own consulting firms. All these graduates compete directly with other professionals working in the same field — lawyers, administrators, industrial psychologists and on-the-job company trainees. In Québec there is a corporation of industrial-relations specialists.

Laval and Queen's are responsible for most academic publications in industrial relations. The Laval journal *Relations Industrielles / Industrial Relations*, published since 1945 and bilingual since 1964, is recognized internationally. Queen's publishes a variety of studies. In 1978 Montréal started an important series of monographs on legal aspects of industrial-relations problems. Several universities publish the proceedings of their annual conferences, as does the Canadian Industrial Relations Association, a nonprofit, voluntary organization founded in 1963 that promotes industrial-relations research in Canada. The Laval journal is also the association's official publication. The longest-lived serial publication, *The Labour Gazette*, put out by the federal Department of Labour since 1900, fell victim to government economic constraints in 1980.

GÉRARD HÉBERT

**Industrial Research and Development** The history of industrial research and development (R & D) and innovation in Canada is unique and certainly has not yet been explained or understood. Prior to WWII, Canadian industry developed largely on imported technology. The few indigenous innovations were the work of

individual inventors rather than the result of systematic, planned research and development. During WWII, the manufacturing industry grew spectacularly and the R & D to support it grew almost as rapidly. Canada emerged from the war with the world's fourth-largest manufacturing output, exceeded only by the US, UK and USSR. No one expected Canada to maintain this position when countries such as Japan, Germany, France and Italy recovered from the war, but Canada's steady descent to 13th place in 1981 was not forecast.

In the primary industries, Canadian R & D has been significant but not spectacular. There have been some important innovations in most such industries, including MINING, AGRICULTURE and PULP AND PAPER. In other areas Canada has been a competent user of technology, making many minor innovations but not being a world leader in development.

After the war, Canada had a substantial lead over most other countries in many high-technology fields. The Defence Research Board and the Armed Forces, supported in some areas by the NATIONAL RESEARCH COUNCIL and other government agencies, made a valiant but usually unsuccessful effort to maintain this lead. The history of industrial R & D and innovation in Canada from 1945 to the present can be told vividly by tracing the history of some of these defence-initiated activities (see DEFENCE RESEARCH). The outstanding technological success of the postwar period has been nuclear power and the evolution of the CANDU reactor. Canada became involved in building a heavy water reactor for producing plutonium as part of the US-British-Canadian atomic bomb effort. An Anglo-Canadian NUCLEAR RESEARCH laboratory, with substantial French involvement, was established in Montréal in 1942-43. Canada's participation was based on experimental work begun by George LAURENCE and others at the NRC as early as 1939. Credit for getting the projects started so quickly and so successfully must go mainly to C.J. MACKENZIE, then acting president of the NRC who had the support of C.D. HOWE, then minister of munitions and supply. Credit for the success of the design of the early reactors NRX and NRU goes to the team led by Sir John Cockcroft from Cambridge, England. British and French involvement made a significant contribution in the early stages but, over the years, the CANDU venture has become almost completely Canadian. The project was often assailed by both political and scientific doubters but Howe and Mackenzie were able to ward off all attacks. Final success was due to the impetus provided by John ROBERTS, then premier of Ontario, who decided that ONTARIO HYDRO would order the first commercial CANDUS. The result was a series of nuclear reactors, designed and built in Canada, that in spite of their recent problems remain among the most successful power-producing reactors in the world.

The scientists at ATOMIC ENERGY OF CANADA LIMITED, led by W. Bennett LEWIS, who succeeded Cockcroft, went on to do the research and development that could lead to a successor to CANDU. Over the years they have demonstrated the scientific and technical feasibility of an organically cooled, thorium-fueled version of the CANDU reactor that would have higher efficiency, less radiation hazard and would reproduce, in the form of plutonium, a substantial fraction of the fuel that it burnt. Such a reactor would produce power at substantially lower costs than even the present CANDU but not even a prototype has been built.

Private enterprise with, in some cases, effective support from government has made significant advances. At the end of the war, Canada had developed a substantial electronic research capability partly in government and partly in industry. The Defence Research Board (DRB) set

### Research and Development Expenditures of Several OECD Countries

Source: Catalogue 88-201 Annual, Statistics Canada

out to maintain and expand this capability by supporting industry financially and through work in its laboratory, the Telecommunications Research Establishment, Shirley Bay, Ont. The NRC division of Radio and Electrical Engineering was also involved in the venture. This initiative contributed to the establishment of the Bell Northern Research Laboratory, also at Shirley Bay, and to the worldwide success of Northern Telecom Ltd, Mitel Corp and many other Canadian electronics ventures (see ELECTRONICS INDUSTRY). Work at Bell Northern Research led to advances in digital and electronics switching technology that have made Northern Telecom one of the world's major manufacturers of telephone switching equipment. In 1976 the Telecommunications Research Establishment was taken over by the Dept of Communications, which has continued the policy of supporting industry in areas such as SATELLITE COMMUNICATIONS and TELIDON.

Development in the AEROSPACE INDUSTRY has been much more complex. Col W.W. Goforth, creator of the DRB, talked about the advent of satellites as early as 1945. From the beginning, DRB programs included work on rockets and electronics for guided missiles. The DRB laboratory at Shirley Bay designed and built the first Canadian satellites, the Alouette and Isis series. RCA Victor in Montréal, involved as a subcontractor, was chosen by the government in 1962 as prime contractor for research and planning for the first Canadian COMMUNICATIONS satellite. Telesat Canada was then formed and gave the contract for construction to the low bidder, Hughes Aircraft, in California. RCA Victor was anxious to follow its successful R & D by production of both satellites and Earth stations; instead it was given another research contract to work on the next generation of communications satellites. In Jan 1977 RCA sold its R & D facilities outside Montréal to Spar Aerospace Ltd, Toronto, and abandoned satellite research in Canada. The DRB laboratory, by then transferred to the Dept of Communications, continued to work on future satellites with Spar.

In 1954 the Canadian Armed Forces expressed interest in possible future uses of technology using infrared radiation for various purposes. DRB gave de Havilland Canada a contract for R & D work under which a specialist team was brought over from England to transfer this technology to Canada. Work began in the special projects and applied research division of de Havilland, which was later purchased by

L.G.A. Clarke and became Spar Aerospace Ltd. After many years of successful participation in the US space program, Spar broke into the headlines in 1981 with the CANADARM, the remote-manipulator system built for the US space shuttle. Spar has also worked with Hughes Aircraft on the Anik series of communications satellites and was completely responsible for Anik D, launched in 1982. The company is now building 2 similar satellites for Brazil for launch in 1985. In 1984 Spar negotiated a multimillion dollar contract for the development of infrared detection equipment for the US Navy.

Canadian universities showed an early interest in COMPUTER SCIENCE. In 1952 the NRC and DRB supplied the U of T with one of the world's big computers, the Ferranti, made by the Ferranti Co in England. Shortly thereafter, Ferranti established a research laboratory in Toronto and DRB gave it a major contract. Many of the present leaders of computer technology in Canada were trained in this laboratory. Its first major project was Datar, an information management system for the Royal Canadian Navy that pioneered important new concepts and technology in information management. It was so far ahead of its time that no other navy adopted it; nevertheless, it served as a model for later systems.

Ferranti supplied the Gemini computer for Air Canada's first reservation system, which was highly advanced for its time. The company was later forced, for financial reasons, to sell its Canadian computer design facility and to withdraw from the computer field. Canadian efforts to finance the purchase of Ferranti or its latest design, the FP 6000, failed. The design for the FP 6000 was sold in the UK and the computer remained a best-seller in Europe for many years.

Under the impetus of defence production, Canada emerged from WWII with a relatively large, successful and innovative aircraft industry. At the end of the war the industry was largely government owned but, because of C.D. Howe's commitment to private enterprise, it was soon sold to British and US companies. In Toronto, the A.V. Roe Co designed, developed and produced the AVRO CF-100 fighter and the Orenda engine, both thoroughly competent and successful ventures by world standards. At the same time, as a private venture, A.V. Roe designed and built the AVRO JETLINER which first flew in 1949, only a few days after the de Havilland Comet flew in England. However, Howe ordered work stopped on the transport. By 1960 the AVRO ARROW, a new supersonic fighter, had made several spectacularly successful test flights and its Iroquois engine was doing very well on the test bed. However, costs had greatly outrun estimates and the US Air Force refused to place an order for the aircraft. PM John Diefenbaker ordered the project stopped and all prototypes and parts not just scrapped but physically destroyed. Economic and industrial historians will probably identify the cancellation of the Arrow as the turning point in Canada's history as a manufacturing nation. Subcontracts from the Arrow and other aircraft production supported a large and growing number of small companies capable of high-quality innovation and production. Although they were supported by the Arrow contract, their services stimulated progress in many related industries.

These few examples of the history of industrial R & D and innovation in Canada make it clear why Canadian high-technology industry has not prospered. Successive governments have failed to give continuing support to innovation and have, in many cases, not only failed to support success but have discouraged ventures that seem to be on the verge of breaking into new markets. Yet government cannot do it all, although it has long been customary for Canadians to blame most of their shortcomings in

initiative, creativity and even productivity on the government. Certainly, a stable and encouraging political environment is a necessary but not a sufficient condition for success. However, with a few outstanding exceptions, Canadian financial institutions have been timid and conservative and many Canadian entrepreneurs and managers have been well below acceptable world standards.

Even with uncertain government support and changing policies, the genius of Canadians continues to break through. The aircraft industry has continued to be moderately innovative with the DEHAVILLAND OTTER, which dominates northern flying, the Dash 7 and Dash 8, the CANADAIR CHALLENGER, the Pratt and Whitney (United Aircraft) PT6 gas turbine (which powers the Twin Otter) and other successful aircraft. Through companies such as Northern Telecom, Mitel and others, the Canadian communications and electronics industry is now a frontrunner in fibre optics, digital data management, microprocessors, computer software, Telidon technology, etc. Canada has repeatedly demonstrated that it has the human, educational and research resources to do first-class industrial R & D. Success, measured in industrial jobs and exports, depends on a climate favourable to research and development at all levels (including the universities) and to industry. If these can be created and maintained, Canada can be reindustrialized in the next generation. *See INVENTORS AND INVENTION; SCIENTIFIC RESEARCH AND DEVELOPMENT.*

OMOND SOLANDT

**Industrial Strategy** is a term that generally refers to any attempt by government to apply a coherent and consistent set of policies that are designed to improve the performance of the economy. These policies are frequently directed at the manufacturing sector, but an industrial strategy could also centre on the performance of a number of other sectors in the economy, ranging from resource production to services. Industrial strategies are oriented towards correcting imbalances in the economy's performance, and involve the assumption by government of a prominent role in facilitating or effecting economic change. Sometimes the means deployed are very direct (what is now called "interventionist") but attempts to restructure an economy can be undertaken using a laissez-faire, free-market approach. Whatever the method employed, the policies implemented under and pursued by an industrial strategy reflect relatively detailed and coherent economic goals.

While the debate about industrial strategy is fairly recent, the concept of using the powers of government to shape the economy is not new. In the late 19th century, there were major efforts in Canada to build an integrated continental economy through tariff protection, the construction of the transcontinental railways and the encouragement of immigration to settle the West. Each of the elements of this economic design complemented the others to yield a national framework for development which was suitably labelled the NATIONAL POLICY. The intention was to encourage manufacturing in central Canada through the use of tariffs. Markets for the manufactured goods would be expanded by creating a wheat-based agricultural economy in western Canada through settlement policies (*see IMMIGRATION POLICY*). The western wheat economy would, in turn, provide the agricultural exports needed to support the new western population and to pay for eastern manufactured goods. All of this economic activity would be tied together by a transcontinental railway, which would permit the shipment of agricultural and resource products abroad and would allow manufactured goods to be shipped from central Canada to the West and to the Maritime provinces. Like many economic strategies, the

National Policy was driven by an external imperative: the rapid growth of the US economy after the Civil War, which was expected to create pressures for the annexation of the Canadian West and for North-South economic integration (*see CANADIAN-AMERICAN RELATIONS*). The politicians of the time feared that if political means were not used to promote the emergence of a national transcontinental economy, Canada's future as an independent country would be seriously compromised.

The current interest in industrial policy has also been prompted by external factors, most notably the rapidly changing environment of INTERNATIONAL TRADE. By the end of WWII, Canada had emerged as a middle-level power both militarily and economically. In the postwar era, Canada's economic strengths lay in resource exports (principally to the US) and in the expansion of manufacturing (primarily through foreign-owned subsidiaries oriented towards domestic, as opposed to export, markets). However, by the early 1960s the manufacturing sector was under pressure. Europe had fully recovered from war and was expanding its industrial base. Moreover the US dominated the international trading system. Thus, while international demand for traditional resource products such as pulp and paper and minerals was still strong among Canada's industrialized trading partners, international trade in manufactured goods became more competitive and the manufacturing sector began to experience increasing difficulties. This resulted in a national debate about the future prospects of the Canadian economy, including the issue of whether Canada would revert to its former status as a resource producer or whether it would succeed in expanding its postwar manufacturing base.

Even in the early 1960s, there was a fairly developed national consensus about the nature of the problem. Manufacturing firms in Canada were internationally uncompetitive because they tended to be oriented towards the domestic market, because they were not sufficiently concerned with export activity, and because they were poorly managed, did little in the way of innovation or research and development (R&D), and often operated at a level of production too low to allow economies of scale (ie, lowering of the average costs of production). Debate revolved around the origins of this problem and the possibility of solutions. The majority of economists (but by no means all) argued that the root of the difficulties facing the manufacturing sector lay in tariff protection (a remnant of the National Policy) and advocated a steady reduction in the level of tariff protection enjoyed by Canadian firms and a fuller integration of the Canadian economy into the international economic system, eg, through active government support for international agreements and institutions that promoted the liberalization of world trade, such as the General Agreement on Tariffs and Trade (GATT). An increase in competition, generated by an increase in imported products, and wider export opportunities for domestic producers were anticipated to improve the health of Canadian industry, ie, to make it more efficient, innovative and export oriented.

Another school of thought stressed the structural problems of the manufacturing sector, such as the small size of most firms, excessive concentration on domestic as opposed to export markets, and a failure to give sufficient emphasis to industrial design and innovation. From this perspective, one of the major causes of the problems in the manufacturing sector was the high level of foreign ownership. Foreign ownership, it was argued, had encouraged firms to increase the purchase of parts and services from their parent firms, to rely on innovations from abroad, and to concentrate on the domestic market so as to minimize export competition with

the parent firm or its other foreign subsidiaries. Economists of this school stressed the need to reduce the level of foreign ownership in the economy and to improve the competitive capability and export orientation of Canadian-owned companies through various forms of government assistance, ranging from support for R&D to the promotion of leading sectors of industrial growth. These economists rejected the use of tariff reductions or free trade as a means of restructuring the Canadian economy, arguing that a weak Canadian economy would be adversely affected by trade liberalization. Instead, they advocated a degree of restructuring before tariff barriers were lowered to ensure that Canadian industry would be strong enough to take advantage of new international markets and compete with increased imports. Restructuring in this context meant the development of an industrial strategy focused on Canada's key economic sectors.

Over the years, the federal government's approach to the question of industrial policy has embodied major elements of the trade liberalization approach. During the last 30 years tariffs have been gradually reduced, and Canada has been a strong supporter of the GATT system and of other attempts to liberalize international trade. In the mid-1960s a modified form of sectoral free trade in automobiles manufactured in Canada and the US was introduced, allowing the major N American car manufacturers to import and export cars free of duty provided that certain minimum production levels were maintained in both countries (see CANADA-US AUTOMOTIVE PRODUCTS AGREEMENT). However, federal (and provincial) industrial policy has involved more than trade promotion and tariff reductions.

During the 1960s the federal government took a number of steps designed to improve the structural characteristics of Canadian industry. In 1963 the Department of Industry was created and was charged with assisting Canadian manufacturing firms to improve their competitive capability. This department was then fused with the Department of Trade and Commerce to form the Department of Industry, Trade and Commerce (ITC) in 1969. The 2 departments developed a number of industrial assistance programs designed to encourage investment, to improve firms' marketing capacities both at home and abroad, and to increase corporate spending on R&D. The 1960s also witnessed the emergence of a number of specialized federal departments, some of which were designed to improve the government's management of the economy (eg, the Departments of Employment and Immigration, Communications, and Regional Economic Expansion); others were special-purpose agencies designed to assist industry in meeting foreign competition (eg, the Export Development Corporation). While all of these initiatives were intended to facilitate industrial development and sometimes to encourage industry to restructure, there was little, if any, attempt to lend these initiatives coherence through the development of an industrial strategy.

During the 1960s and early 1970s, however, there was strong pressure to develop such a strategy. A number of studies commissioned by the federal government raised the problem of foreign ownership in the Canadian economy (see FOREIGN OWNERSHIP AND THE STRUCTURE OF CANADIAN INVESTMENT, TASK FORCE ON). These reports, and others, also suggested that a broader approach to the problems of the structure of the Canadian manufacturing sector was required. In addition, the growing importance in international trade of the newly industrializing countries of the Third World, the emergence of HIGH TECHNOLOGY (an area in which Canadian industry was weak) as a major factor in international trade, and increased uncertainty in the international trading system (caused by a worldwide increase in pro-

tectionism and the subsidization of domestic industries) seriously challenged Canadian firms in their efforts to expand export markets and to fight off import competition. These factors encouraged the federal government to deal with the problems of the manufacturing sector in a more comprehensive manner.

In 1974 an explicit attempt was made to control the flow of FOREIGN INVESTMENT into Canada through the creation of the Foreign Investment Review Agency. Later a number of other measures were taken in an effort to address specific structural problems in individual industries. Grants for R&D and investment were offered to the AEROSPACE INDUSTRY, and the government took over the country's 2 leading airframe manufacturers to ensure the development of new aircraft projects. Restructuring initiatives or financial assistance programs were also undertaken in other sectors, ranging from clothing and footwear to forest products.

Although these diverse initiatives were not part of an overall industrial strategy, several federal agencies such as the Privy Council Office (PCO) and ITC made attempts to design one early in the 1970s; but no agency was able to design a strategy that met with general acceptance within the federal bureaucratic system. In fact, the ITC initiative, which had started as an ambitious effort to construct a strategy encompassing a large number of public policy objectives, gradually evolved into a more modest industrial consultation process that concentrated on sectoral competitiveness.

Despite these failures, the industrial strategy issue kept re-emerging. When the Liberal government of Pierre TRUDEAU was returned to power in 1980, there was another attempt to formulate an industrial strategy, inspired by the government's National Energy Program. This attempt also failed, partly because of growing American objections to Canadian energy and foreign-ownership policies. In the end, the federal government did succeed in developing a strategy, which appeared in an economic development White Paper published with the 1981 federal budget (*Economic Development for Canada in the 1980s*). This paper assumed that resource developments both in eastern and western Canada would be the future engine of growth, and that these resource developments would both provide industrial benefits for central Canada and expand and diversify economic activity in the regions. Unfortunately, this strategy also came to grief when the collapse in energy prices in 1981-82 led to the delay or cancellation of most of the MEGAPROJECTS on which it depended.

There are various explanations for Canada's continued lack of an industrial strategy despite the immense effort and large sums of money which the federal government has expended on industrial policy. One viewpoint holds that much of the problem centers on the nature of the bureaucratic system in Ottawa, in which various CENTRAL AGENCIES compete with individual departments for influence over policy. Different federal departments have evolved very different concepts of an industrial strategy, and some departments do not even believe that a strategy is needed. Politicians also find it difficult to commit themselves to a specific course of action in the industrial sphere; because if the industrial goals of an economic development strategy are not attained, they can be held accountable for its failure. The chances of failure are high because industrial strategies are highly dependent upon ECONOMIC FORECASTING, which is a very imperfect art, as the federal government found to its detriment with oil prices.

The highly diversified nature of the Canadian economy is another reason why it has been difficult to implement an industrial strategy for secondary manufacturing in Canada. In Canada, manufacturing accounts for less than 20%

of total economic activity, compared to between about 25% and 33% in many European countries and in Japan. In fact, manufacturing has played a far less significant role in Canada than in virtually any other industrialized country. Moreover the growth of manufacturing in Canada has not been based as much on foreign-owned branch plants as on domestically owned firms. Even in the relatively homogenous economies of Europe and Japan, a consensus on industrial issues has never been easily achieved, but the structure of traditional industry-government relations in these countries and the bias towards manufacturing allows the development of a consensus on specific issues. In Canada, manufacturing interests are overshadowed by the resource sector, and fractured by disputes between large and small business and between domestic and foreign-owned firms.

In addition, and perhaps more importantly, there are marked differences of economic and industrial interest between the various regions within Canada (see REGIONALISM). For example, an industrial policy designed to assist the AUTOMOTIVE INDUSTRY will be seen by the western provinces, whose economies are based primarily on resource development and agriculture, as being favoured treatment for central Canada. Indeed the export markets of those provinces may be threatened if a policy for restructuring the automobile industry includes import restrictions on cars from a country, such as Japan, that is a major export market for western grain or coal.

The Canadian economy, with its highly industrialized centre and resource-producing periphery, frequently displays contradictions of this kind. Indeed, it was just these types of contradiction that in the end caused the breakup of the original National Policy. These contradictions explain, moreover, why provincial governments became much more active during the 1970s in implementing their own provincially based industrial policies. The provinces have fairly homogenous economies based on fewer and less diverse economic activities, and it is easier for them to develop coherent strategies that command a reasonable degree of local public support. The challenge at the federal level is to prevent the balkanization of the Canadian economy on regional lines, and at the same time to develop a national industrial strategy that is sensitive to regional aspirations. The task is daunting and may require a miracle of political compromise, but so too does the existence of the country.

**Industrial Unionism**, the dominant form of labour organization. An industrial union is one which, for organizational purposes, includes all workers in a particular industry (eg, steel, automobile) regardless of whether they are skilled or unskilled. The union's bargaining power is based upon the number of its members. In contrast, CRAFT UNIONS (plumbers, electricians) limit their membership to workers with a specific trade or skill. Their power is based upon the scarcity of highly skilled labour. Craft unions, established first, dominated the labour scene until the 1930s but are now largely confined to the construction industry. The first significant attempt to organize on an industrial basis was undertaken in the 1880s by the KNIGHTS OF LABOR, which opposed craft unionism, advocated unity of the producing classes, and (more practically) opposed employer blacklists and discrimination. It was briefly successful in organizing not only unskilled male workers but also women and minorities. After the demise of the Knights in the late 1880s, the idea of industrial unionism persisted as craft unions came to be regarded as

anachronistic in an increasingly industrialized society. Organizations such as the Catholic union movement in Québec in the 1920s (see CONFEDERATION OF NATIONAL TRADE UNIONS) and the All-Canadian Congress of Labour (est 1927) sought to combine the principles of nationalism and industrial unionism. In the 1930s, the Workers' Unity League, a Communist-sponsored organization, became interested in organizing all workers in the emerging mass-production industries.

The difficult task of organizing the bulk of the industrial labour force was not accomplished until WWII under the Congress of Industrial Organizations (CIO). This movement originated 1935 in the US in opposition to entrenched craft unions, but it also attracted thousands of Canadian workers into what would become established industrial unions such as the United Automobile Workers (see OSHAWA STRIKE) and the United Steelworkers. It was successful because the political and economic climate was ripe for a pragmatic form of "business unionism" which combined organization on an industrial basis with a philosophy emphasizing collective bargaining and strike action to improve the wages and working conditions of its members. In Canada, the new industrial unions also formed a lasting alliance with the CCF/NDP. In the 1960s and 1970s new white-collar unions have emerged which follow the industrial-union model, but their composition and characteristics are somewhat different from those of their blue-collar predecessors.

**Industrial Workers of the World** (popularly known as "Wobblies"), a REVOLUTIONARY INDUSTRIAL UNION fd 1905 in Chicago. The IWW's rapid expansion in the Canadian West demonstrated the influence of American labour ideology on the region's labour movement. Wobblies were mostly unskilled, low-status migrant workers ("blanket-stiffs") — miners, loggers, navvies and harvesters — who were recruited to the West primarily from southern and eastern Europe and were brutally exploited in the booming economy. The IWW doctrine which attracted them was a peculiar form of syndicalism (an international doctrine based upon the primacy of industrial unionism and the use of the general strike in the settlement of class

struggles). Wobbly syndicalism was essentially pragmatic; it advocated the organization of all workers into one body and supported direct action as the only form of protest open to immigrant workers, who were excluded from the electoral process. IWW propaganda was disseminated primarily in street meetings. In 1912, when Vancouver authorities tried to ban street demonstrations, the Wobblies started and won a spectacular free-speech fight. Soon afterwards the IWW led 7000 workers out on strike against the CANADIAN NORTHERN RAILWAY in BC's Fraser Valley. The Wobblies lost, and massive state repression, combined with employer resistance and economic depression, began the process of the union's collapse. The Wobblies' days of glory ended before 1914, but their syndicalist ideology was adopted by the ONE BIG UNION, created at the end of WWI. A. ROSS MCCORMACK

**Industrialization**, process in which human skills are both replaced and enhanced by the use of scientifically based TECHNOLOGY for the production of goods and services, with the aim of creating wealth by reducing per-unit costs of production. It exerts a force affecting the social, economic and political makeup of society; the process has placed Canada among the more highly developed nations in the world and has helped it to attain a high STANDARD OF LIVING.

In Canada the processes of industrialization were readily apparent by the 1850s, by which time both Britain and the US were well ahead. Before industrialization, the economy of Canada, as a colony of France and then of Britain, had been based upon the export of fish, then fur and later timber. Finally the export of wheat to various markets, including the US, played a crucial role in generating income.

By 1846, as preferential trade agreements with Britain ended, Canadian business interests and governments had embarked upon a railway-building program in order to transport farm produce more efficiently to export markets and to attempt to compete with American shipment systems such as the Erie Canal. Many analysts argue that the demand for railway materials and equipment contributed to the development of heavy industry in the 1850s, and that the increased demand for agricultural products, especially wheat in the 1860s, stimulated a demand for new and improved agricultural equipment (see RAILWAY HISTORY). Agricultural equipment was in greatest demand in Ontario,

where larger areas of tillable land made its use more efficient, possibly contributing to the decline of an emerging industrial base in the Maritimes.

By the 1870s, as demand increased, larger production enterprises were being formed to gain cost advantages of higher-volume production. In 1879 the federal government instituted the NATIONAL POLICY, which consisted of selected increases in tariffs on imported goods, the completion of a transcontinental railway and the encouragement of western settlement. Vested interests and the government hoped to stimulate and protect manufacturing enterprises, stem the flow of migration to the more industrialized US, increase the internal market for manufactured goods and improve the political unity of Canada. It is debatable whether these aims were accomplished, although steel production and the manufacture of agricultural equipment did increase. However, it was 1896 before any noticeable advances were made in the manufacture of capital equipment, consumer goods and the processing of natural resources. The transcontinental railway was completed in 1885, but concentrated land settlement did not follow until later.

Most of Canada's steel production capacity was developed from the turn of the century through WWI (see IRON AND STEEL INDUSTRY). Between the world wars, refineries for copper, zinc and magnesium were developed. SHIPBUILDING was expanded and aircraft and automobile industries were developed. Pulp and paper industries also grew as American timber supplies declined. By the 1930s transportation services and chemical and allied products production were developed. Steel and aluminum production increased again during WWII. Since then, mineral, oil and gas extraction and refining industries have expanded. These latter developments have had some stimulative effects upon the manufacture of extraction, refining and transport equipment, but the larger consequence has been an unusually high proportion of income from the export of raw materials and semi-finished goods in exchange for foreign-manufactured goods. This has caused concern about the vulnerability of Canada's economy to fluctuations in demand in external world markets. **Industry**, in its broadest sense, includes all economic activity, but for convenience commentators divide it into 3 sectors. The primary sector includes establishments involved in the exploitation and initial processing of natural resources. For example, COAL MINING includes establishments that break, wash, grade or otherwise prepare coal for use as a fuel. The secondary, or MANUFACTURING, sector is made up of primary manufacturing establishments, ie, those that process raw materials to produce IRON AND STEEL, PULP AND PAPER, PETROLEUM products, etc, and secondary manufacturing establishments, ie, those that produce consumer goods (eg, CLOTHING) and capital goods (eg, ships). The tertiary or SERVICE-INDUSTRIES sector includes establishments in both the private and public sectors that provide services. These range from bakeries to the BANK OF CANADA. All these elements make up Canada's industrial system, which has become increasingly complex over time.

#### History in Canada

Industrial development has long been linked to the exploitation of Canada's rich resource endowment. In the earliest years of the FUR

Preamble of the manifesto of the Industrial Workers of the World (courtesy Public Archives of Canada/C-57200).

TRADE, there was little related industrial development. Emphasis was on commercial activity related to the exportation of resources. But as settlement proceeded, domestic industry began to grow in areas that facilitated the exploitation of resources, such as RAILWAY equipment, SHIP-BUILDING and farm machinery. A small IRON foundry was operating near Trois-Rivières, Qué., as early as the 18th century. In the 19th century, industrial development began in earnest. By 1850 there were paper mills and foundries in both Upper and Lower Canada. Steam engines and farming implements were also being produced. To spur industrial development, the NATIONAL POLICY was set in place in 1879 by the Conservative government of John A. MACDONALD. The policy had 3 thrusts: stimulation of domestic industrial development through the establishment of tariff barriers; encouragement of immigration to develop the agricultural potential of the West and to create a large domestic market; and completion of the CANADIAN PACIFIC RAILWAY to the West Coast as rapidly as possible. The policy did succeed. With the settlement of the West, AGRICULTURE, MINING, lumbering and fishing expanded. The government supported this type of industrial development by encouraging development of appropriate infrastructures (eg, railways, ships, grain elevators, roads). Manufacturing industries that supported development of Canada's natural resources were centered along the St Lawrence R and the Great Lakes in Québec and Ontario. These developments were accompanied by the emergence of the service sector (eg, commercial and financial institutions, public administration). Canada became a major trading nation, sending raw and semiprocessed natural resources to the large metropolitan markets of Europe and the US. Industrial development was given a further boost by WWI. War materials poured out of Canadian plants, strengthening manufacturing. This growing strength encouraged the great expansion of the 1920s. By 1929 pulp and paper, the largest single industry, had captured 64% of world trade. Government continued to encourage the development of infrastructure and undertook large programs, such as mineral exploration conducted by the GEOLOGICAL SURVEY OF CANADA and plant breeding research (eg, for hardy WHEAT strains), which directly assisted the private sector in industrial development.

While primary industries dominated the scene, manufacturing in areas such as the AUTOMOTIVE INDUSTRY grew as well. This great postwar expansion required large-scale capital investment, much of which came from the US in the form of direct investment in branch plants of US firms, which were thus able to serve the Canadian market and circumvent tariff walls set up by the National Policy. In fact, US capital rapidly replaced the British capital of the previous century, which had been mainly in the form of portfolio investment. By 1920 US capital represented over 50% of FOREIGN INVESTMENT in Canada, compared with 15% in 1900.

This rapid industrial expansion came to a sudden halt with the GREAT DEPRESSION of the 1930s. Between 1929 and 1933, Canada's export income dropped by 67%. Firms closed and unemployment soared. Export-oriented industries (wheat, fish, lumber, pulp and paper) were most severely affected. Industries established to serve the Canadian market, situated mainly in central Canada, suffered least and were in a much better position to respond to the industrial requirements of WWII. The war brought demands for sophisticated products such as aircraft parts, cars and trucks as well as raw materials. Many of these products required new techniques of production, which became integrated into Canada's industrial system in the postwar period, a period which saw high and sustained economic growth until the 1970s.

### Modern Industry

Because the ravages of war had not touched Canada, the country's industrial structure was intact and it adapted readily to the requirements of a peacetime domestic economy and to the demands of postwar reconstruction in Europe. These activities shaped Canada's current industrial structure.

**Structure** Canada has an open economy, with more than 28% of its 1982 GROSS NATIONAL PRODUCT (\$356.6 billion) being exported; about 70% of this trade is with the US. This state of affairs is reflected by a current account balance that indicates a large merchandise trade surplus, caused primarily by the export of crude and semiprocessed natural resources. Canada's strength in primary industries is not matched by a strong secondary manufacturing sector. In fact, as a proportion of GNP, the manufacturing sector has shrunk from a peak of 40% in 1973 to less than 30% today. There has always been a trade deficit in fully manufactured goods in the postwar period, but this deficit increased from about \$3 billion in 1970 to \$18 billion in 1980, reflecting a growing erosion. The service sector has continued to expand. Canadians now belong to what has been called "The Information Economy," based on the manipulation of information. Over the past 30 years, the number of Canadians employed in information has grown twice as fast as the work force as a whole. Today, over 40% of Canadian workers are in information fields, up from 20% in 1931. The shift towards a service economy based on information is a characteristic of industrialized countries.

**Regional Dimension** Canada's industrial strength lies in Ontario and Québec where two-thirds of all primary and secondary industrial activity takes place, along with 80% of secondary manufacturing. The resource strength lies in the other provinces. Canada is said to have regional economies with distinct characteristics. Thus the West is strong in primary industries — agriculture, FISHERIES, FORESTRY, mining — with

some development in the resource-processing sector — wood products, paper and allied products, primary metals and nonmetallic minerals, petroleum and coal. Ontario and Québec are strong in low-technology industries — FOOD AND BEVERAGES, TOBACCO, labour-intensive secondary processing (TEXTILES, FOOTWEAR, FURNITURE, etc), metal fabricating, TRANSPORTATION (excluding aircraft and parts), and electrical products (excluding major appliances, COMMUNICATIONS and industrial equipment). Inroads are being made in the high-technology fields — aircraft and parts, electrical products (major appliances, communications and industrial equipment), chemicals and chemical products and miscellaneous scientific and professional equipment. The Atlantic region is characterized by low-technology, and primary and resource-processing industries. The resource strengths of Atlantic Canada (fishing, mining) differ from those in western Canada (oil and gas, forestry).

The differences in regional economies lead to differing emphases in industrial development and international orientation. The resource-dependent provinces seek free-trade arrangements that encourage resource exports. Ontario and Québec, which are more vulnerable to foreign competitors in manufacturing, do not favour complete free trade and seek the support of the federal government to assist their industries to sell abroad. The near independence of the industrial structures of the regions makes it very difficult to develop a pan-Canadian INDUSTRIAL STRATEGY. Industrial policymaking is becoming increasingly regional in orientation.
